ALL MEANS ALL: A COLLECTIVE VISION FOR INCLUSIVE TEACHER EDUCATION - AN INTRODUCTION

Frank J. Müller; Deirdre Forde; Lea Bussas; Leah O'Toole; Heidrun Demo; and Silver Cappello

1 What is the OpenTextbook and How Did We Get Here?

The "All Means All!" OpenTextbook represents a groundbreaking step in fostering inclusive, equitable, and intersectional approaches to teacher education. This interactive, modular, multimedia resource was created to address the complex needs of diverse learners and support educators in overcoming structural barriers in education. Conceived and developed over three years, this OpenTextbook brings together perspectives from 144 self-advocates/researchers from 28 countries, blending theory and lived experience to create a tool that empowers educators to better understand and navigate the multidimensional aspects of inclusivity.

This ambitious project would not have been possible without the contributions of its numerous participants, whose insights, lived experiences, and dedication enriched every aspect of this resource. We extend our deepest gratitude to all involved. Additionally, we would like to acknowledge the extensive funding provided by Erasmus+, which laid the foundation for bringing together diverse voices and enabling an inclusive dialogue. The collaborative spirit of this initiative underscores its mission to create meaningful change in education.

2 The Goal: Inclusive and Intersectional Education

The primary goal of the "All Means All!" project is to provide educators, especially students in initial teacher education (K-12), with a comprehensive, practical resource to promote equity and inclusivity in their classrooms. This OpenTextbook seeks to address and dismantle structural disadvantages based on gender, sexual orientation, dis/ability, socio-economic background, race, language, health, age, pregnancy and maternity, and belief systems. By integrating these dimensions into a cohesive and interconnected narrative, the project fosters a holistic approach that helps educators build empathy, dismantle systemic barriers, and empower all learners to reach their full potential.

3 The Process: Collaboration, Review, and Open Resources

The journey to create the "All Means All!" OpenTextbook was rooted in collaboration and inclusivity. Over the course of three years, the project unfolded through engagement with a wide network of advocates and researchers. Important aspects were:

- Open Review and Participatory Development: The development process was open and participatory, involving extensive collaboration with self-advocates and researchers. This ensured that lived experiences shaped the content, resulting in a resource that is both authentic and relevant to diverse educational contexts.
- Workshops in Brixen (2022), Maynooth (2023), and Göttingen (2024): Three two-week workshops served as key touchpoints for dialogue, co-creation, and exploration. Participants worked together to explore theoretical frameworks, share practical strategies, and weave their personal narratives into the content.
- Pressbooks Platform: Utilising the Pressbooks platform, the OpenTextbook was developed with accessibility and adaptability in mind. This modular format allows for easy integration into local contexts and promotes flexible, user-driven engagement.

You will find a more detailed description of the open process in the meta chapter.

4 Learnings from the Journey

Throughout the project, several key insights emerged:

- Value of Multi-Perspectives: Bringing together a wide range of voices and experiences highlighted the strength of the collective input and underscored the importance of multi-perspective content in educational resources.
- Complexity of Structural Barriers: The intersectional dimensions of diversity and structural disadvantage require nuanced understanding and context-specific strategies to enable them to be addressed effectively.
- Power of Collaboration: The collaborative model demonstrated the transformative potential of engaging both academic experts and self-advocates, resulting in a resource that bridges theoretical knowledge with lived realities.

5 Overview of Topics Covered

To provide a comprehensive resource for educators, the "All Means All!" OpenTextbook is organised into six primary sections, each addressing a key aspect of inclusive and

intersectional education. Below is an outline of the major topics explored within each section:

Section 1: Developing Inclusive Educators

Developing Empathy for Diversity through a Narrative of Activism

The opening chapter, Developing Empathy for Diversity through a Narrative of Activism (by Paty Paliokosta and Nicola Ryan—with special acknowledgments to Elizabeth Morrow, Theresa Nash-Patel, Kingston Centre for Independent Living, Bern O'Donoghue, and Eli Anderson), invites readers to discover the transformative power of empathy in education. Drawing on compelling narratives (for example, the experiences of disability rights advocate Ali Kashmiri), the chapter illustrates how storytelling dissolves barriers and cultivates inclusive learning environments. Educators are encouraged to reflect on real-world cases, challenge systemic injustices, and build a pedagogy founded on empathy and social justice. This chapter lays the groundwork for engaging with stories of resilience and advocacy while inspiring tangible change in classrooms.

The Role of Values in Inclusive Education

The Role of Values in Inclusive Education (by Petra Auer, Lydia Murphy, Tommaso Santilli, and Mahvand Sahranavard Espily) investigates the critical connection between core values and the development of inclusive settings. Using diverse examples, theoretical models, and practical applications, this chapter reveals how values shape individual behaviors and overall school culture. Through relatable narratives and case studies—such as educators rethinking conflicting priorities—it emphasizes the significance of values in guiding decision-making and influencing educational practices. Readers are prompted to reconsider their own beliefs and collaborate in fostering environments where every student is respected.

Relationships in Inclusive Education

Authored by Lina Render de Barros, Leah O'Toole, and Simon Klippert, the chapter Relationships in Inclusive Education underscores the importance of interpersonal connections in nurturing inclusive settings. By linking individual developmental needs with broader societal contexts, the chapter demonstrates how these relationships influence human growth and classroom dynamics. It offers both theoretical perspectives and practical strategies for educators to build nurturing, equitable, and responsive student-teacher interactions.

Dialogic Mentoring

Dialogic Mentoring (by Dror Simri, Ines Boban, and Linjie Zhang) focuses on the mentor–mentee dynamic, emphasizing how trust, empathy, and mutual respect foster transformative learning. Drawing from historical and philosophical insights—and using vivid metaphors such as anthropologists and photographers—the chapter illustrates the multifaceted nature of mentorship. It interweaves practical strategies that stress authenticity, emotional support, and collaborative dialogue, inviting educators and mentors to reframe their practices in ways that honor individuality while promoting inclusive, dialogic learning environments.

Continuous Professional Development for Diversity Sensitivity

In Continuous Professional Development for Staff for Diversity Sensitivity (by Fetiye Erbil, Bodine Romijn, and Valeria Occelli), the focus is on the vital role of ongoing professional development in cultivating diversity-sensitive practices. Using a detailed hypothetical case involving Alex—a middle school student facing intersecting challenges—the chapter challenges educators to critically reflect on their own approaches. It argues for prioritizing equity over equality and advocates for professional growth that is tailored, collaborative, and reflective, offering actionable strategies for creating supportive, inclusive classrooms.

Understanding Yourself as an Inclusive Teacher – Teacher Professional Identity Development

Understanding Yourself as an Inclusive Teacher – Teacher Professional Identity Development (by Ann-Kathrin Arndt, Beausetha J. Bruwer, Zhicheng Huang, and Sarah Volknant) explores the intricate journey of forming a teacher's professional identity. Examining Teacher Professional Identity Development (TPID) as a dynamic process shaped by personal experiences, educational settings, and societal shifts, the chapter combines theoretical insights with reflective exercises. It encourages educators to align their values and practices in pursuit of inclusivity and to adapt to evolving educational and technological landscapes.

Reflecting on Teacher Habitus – The Potential to Support Inclusion in the Classroom

In Reflecting on Teacher Habitus – The Potential to Support Inclusion in the Classroom (by Nico Leonhardt, Rosario Ryan, and Valerio Ferrero), the concept of teacher habitus—rooted in Bourdieu's sociological framework—is discussed as a key influence on teaching practices. Drawing on examples from Ireland, Italy, and Germany, the chapter highlights how ingrained norms and socialization can either reinforce inequalities or promote inclusion.

It emphasizes reflective practices that empower teachers to confront biases and redefine their professional approaches to better support every student.

Becoming an Inclusive Teacher

Becoming an Inclusive Teacher (by Graham Maher, Kavyta Raghunandan, Wurud Jayusi, and Declan Markey) examines the transformative journey toward embracing diversity in education. The authors argue that every teacher—regardless of background—can serve as a role model and change agent. Through real-life narratives and practical strategies (including self-reflection on privilege and culturally responsive practices), the chapter outlines how educators can actively challenge systemic inequities and view inclusivity as an ongoing process of self-discovery.

Teacher Agency and Inclusion

Authored by Sara Baroni, Tamara van Woezik, Rhianna Murphy, Madhusudhan Ramesh, and Günalp Turan, the chapter Teacher Agency and Inclusion emphasizes the role of educators as proactive change agents. Adopting an ecological perspective, it dissects the interplay between individual, contextual, and systemic factors that shape teacher agency. Through theoretical insights and concrete examples, the authors empower educators to identify disparities and actively contribute to creating equitable, inclusive learning spaces.

Anti-Bias Education

The chapter Anti-Bias Education (by Ira Schumann, Mai Trang Vu, Hazar Chaouni, and Seun Adebayo) stresses the importance of addressing biases to build inclusive, equitable classrooms. It illustrates how celebrating diversity and challenging discrimination—both at the personal and institutional levels—can empower both teachers and students. By promoting critical thinking, empathy, and family collaboration, the chapter provides practical guidance for integrating anti-bias strategies into everyday teaching practices.

Section 2: Supporting Inclusion in the Classroom and Beyond

Neuroinclusion: A School Community Approach

In Neuroinclusion: A School Community Approach (by Deirdre Forde, Alison Stapleton, Nicola Ryan, and Paty Paliokosta), the authors discuss how to design educational environments that honor neurodiversity. Using real-life accounts of a neurodivergent student's experience, the chapter illustrates how various contextual factors influence learning and well-being. Grounded in frameworks such as Bronfenbrenner's Ecological

Systems Theory, it advocates for systemic, adaptive practices that foster understanding and optimise person–environment fit.

Teamwork in the Classroom

Teamwork in the Classroom (by Silver Cappello, Outi Kyrö-Ämmälä, and Becky Ward) emphasizes the importance of collaborative practices in education. Drawing on examples such as the Erasmus+ project THRIECE, the chapter demonstrates how dismantling traditional role boundaries among teachers, assistants, and administrative staff enriches the learning experience and builds collective expertise. It outlines essential competencies, shared goals, and respectful practices that promote student success through cohesive teamwork.

"Please, Don't Sit on My Shoulder" – Shifting Perspectives on Assistant Roles

In "Please, Don't Sit on My Shoulder" – From Neo-liberal to Emancipatory Perspectives (by Marie Mc Loughlin, Eileen Schwarzenberg, Danielle Farrel—in collaboration with Melanie Eilert), the authors analyze the evolving roles and challenges faced by teaching and personal assistants. Contrasting historical and current practices under neo-liberal influences with emancipatory approaches rooted in empowerment, the chapter calls for innovative support models that balance independence with assistance while fostering cooperative, inclusive practices.

Working in Multidisciplinary Teams

Working in Multidisciplinary Teams (by Ann-Kathrin Arndt, Miriam Sonntag, Alexandra Anton, Beausetha Bruwer, Miriam Cuccu, and Lydia Murphy) focuses on the dynamics of collaboration across diverse professional roles. Transitioning from an individual "I"-perspective to a collective "We"-perspective essential for teamwork, the chapter uses case studies from Finnish early childhood education to Austrian primary schools to illustrate practical strategies for negotiating roles and integrating multidisciplinary expertise in teacher education.

To Build up a Community – Collaboration with Parents

In To Build up a Community – Collaboration with Parents (by Assimina Tsibidaki, Linjie Zhang, and Nico Leonhardt), the authors discuss the critical importance of forging authentic partnerships between schools and families. The chapter addresses challenges and benefits of connecting with parents from diverse cultural backgrounds, offering principles and practical examples for establishing meaningful, collaborative relationships.

Navigating Horizontal Transitions: Building Participation and Support

Navigating Horizontal Transitions: Building Participation and Support for Young Learners and Families in Educational and Community Settings (by Francesca Mara Santangelo, Chris Carstens, and Nariko Hashida) focuses on the challenges students face when moving between similar educational settings. The chapter emphasises the need for a strong support network—including educators, families, and community stakeholders—and offers strategies for tailored assistance, clear communication, and cooperative frameworks that bolster academic, social, and emotional well-being.

Navigating Educational Transitions for All

Navigating Educational Transitions for All (by Silver Cappello, Danielle Farrel, Paty Paliokosta, and Irati Sagardia-Iturria) addresses the profound impact of educational transitions, from shifting between home and school to progressing through various educational stages and into employment. Combining theoretical insights with practical strategies and lived experiences, the chapter underscores the value of person-centered planning and inclusive practices in empowering marginalized individuals while fostering resilience and equity.

An Introduction to Person Centred Planning – and Its Potential for Schools

An Introduction to Person Centred Planning – and Its Potential for Schools (by Petra Elftorp, Sandra Fietkau, Andreas Hinz, and Yuzhen Xu) discusses how Person Centred Planning (PCP) can be applied in educational contexts to empower individuals and enhance inclusion. Emphasising a participatory approach where stakeholders collaboratively envision a future built on individual strengths, the chapter highlights dialogue, creative problem solving, and systemic change as core components of effective PCP.

Section 3: Creating Inclusive Learning Environments and Participation

Creating a Framework for Inclusive Learning Environments

In Creating a Framework for Inclusive Learning Environments (by Deirdre Forde, Claire O'Neill, Ulla Sivunen, Chris Carstens, Cynthy K. Haihambo and Alessandra Galletti), the authors discuss what is needed to design truly inclusive educational spaces. Written in a co-participatory manner with a neurodivergent and deaf researcher/ self-advocate, they identify physical, cultural, sensory, relational, and communicative components essential for

supporting all learners and propose a multidimensional, collaborative model for planning, assessing, and refining inclusive pedagogies.

Participation of Children and Youth in Learning and Community Development

Participation of Children and Youth in Learning and Community Development (by Ines Boban, Silvia Dell'Anna, Charlie Moreno, Shichong Li, and Maryam Mohammadi) considers how involving young people as active contributors can transform both education and community life. Through examples such as creating Zen gardens, improving community nutrition, and fostering restorative justice among peers, the chapter demonstrates how participatory approaches empower youth, build leadership skills, and drive societal change.

Self-Determination in Learning

In Self-Determination in Learning (by Karen Buttigieg, Zeynep Karaosman, and Ludovica Rizzo), the focus is on the empowering effects of self-directed learning environments. By highlighting the psychological needs of autonomy, competence, and relatedness, the chapter makes the case for giving learners an active role in shaping their educational experiences. Practical strategies for offering meaningful choices, cultivating supportive classroom communities, and providing motivating feedback are outlined to help educators promote self-determination.

Democratic Schools: How They Work and Why They Are Cool

Democratic Schools: How They Work and Why They Are Cool (by Halil Han Aktaş, Abdelatif Atif, Andreas Hinz, and Konstantin Korn) outlines the core principles of democratic schooling. The authors contrast these models with traditional systems, emphasizing student agency, dialogic interactions, and community-centered learning. Through case studies and reflective insights, the chapter discusses both the challenges and transformative potential of democratic education for creating personalized, inclusive learning experiences.

Social Space Orientation

Authored by Chloe Keegan, Cynthy K. Haihambo, and Victor Tan Chee Shien, Social Space Orientation emphasises the significance of social spaces in promoting inclusion and overall well-being. By redefining social spaces as dynamic hubs of interaction, the chapter encourages readers to reconsider social encounters through the lenses of lifespan development, agency, and power dynamics while also addressing potential exclusions.

Inclusive Play: Norm Creative Approaches to Transform Integrative Play to Inclusive Play

Inclusive Play: Norm Creative Approaches to Transform Integrative Play to Inclusive Play (by Deirdre Forde, Sebastian Nemeth, Dean Vaughan, and Georga Dowling) discusses how play, an essential part of childhood development, can be reconceptualised as a fully inclusive experience. Using a case study from a Danish school, the chapter details frameworks and strategies (including dialogical methods and the capabilities approach) that encourage educators to listen to children's voices and actively contribute to creating supportive play environments.

Inclusivity in Outdoor Education

In Inclusivity in Outdoor Education (by Beausetha J. Bruwer, Maria Moscato, and Victor Tan Chee Shien with input from Ellen Beate Hansen Sandseter), the authors reflect on the transformative benefits of outdoor education. Combining personal narratives with scholarly research, the chapter demonstrates how engaging with nature promotes social-emotional growth, environmental awareness, and active participation. It also considers challenges such as risk management and parental involvement, stressing the importance of deliberate program design and teacher preparation.

The Magic of Inclusion: Transformative Action for Sustainability Education

The Magic of Inclusion: Transformative Action for Sustainability Education (by Sofia Ahlberg, Patricia Kennon, and Katarina Rončević) delves into the intersection of sustainability and inclusive education. The chapter advocates for integrative, participatory methods that dismantle systemic barriers and empower learners. Using innovative pedagogical tools, the authors demonstrate how inclusive practices can strengthen community bonds, stimulate creativity and foster critical thinking which are all essential for a sustainable future.

Section 4: Fostering Student Well-Being and Emotional Health

Understanding Social and Emotional Development and Behavioural Difficulties

In Understanding Social and Emotional Development and Behavioural Difficulties (by Julia Bialek, Francesca Mara Santangelo, Chris Carstens, and Cynthy K. Haihambo), the authors delve into the complex nature of children's social-emotional and behavioral challenges. Drawing on diverse global perspectives and real-life case studies (such as Maria's account

from Southern Africa), the chapter explains how these issues are shaped by broader societal and environmental factors. It emphasises trauma-sensitive approaches, peer engagement, co-regulation techniques, and collaborative partnerships among educators, families, and communities to promote resilience.

Children's Well-Being in Inclusive Education

Children's Well-Being in Inclusive Education (by Deirdre Forde, Anne Piezunka, Tracy McElheron, Büşra Gündeş Orman and Mahvand Sahranavard Espily) explores the multifaceted aspects of well-being within school settings. Drawing on theoretical models like Jaana Minkkinen's Structural Model of Child Well-being and practical examples (such as Fatima's experience), the chapter underscores the interconnectedness of physical, mental, social, and material well-being, and provides strategies for creating environments that honor each child's unique needs and cultural background.

Sticks and Stones: Bullying and Microaggression at School

In Sticks and Stones: Bullying and Microaggression at School (by Pamela February, Evrim Çetinkaya Yıldız, Clíona O'Keeffe, and Fatma Kürker), the authors confront the pervasive issue of bullying through case studies that reveal its enduring and far-reaching impacts. By documenting the experiences of individuals like Sam, Andrew, and Yuko, the chapter offers both theoretical perspectives and practical interventions designed to prevent bullying and nurture respectful, inclusive classroom climates.

Marginalised Students in Classrooms

Marginalised Students in Classrooms (by Silver Cappello, Tracy Fletcher, and Nysha Chantel Givans) investigates how marginalization manifests in educational settings—through unequal access, cultural and socio-economic biases, and systemic obstacles. Featuring a real-life example from Berlin-Neukölln, the chapter illustrates the positive impact of nurturing teacher-student relationships and culturally responsive teaching. It offers actionable strategies to transform classrooms into spaces where marginalized students are empowered via adaptive curricula and supportive pedagogies.

Breaking the Silence: Empowering Schools in the Practice of Trauma-Informed Education

Breaking the Silence: Empowering Schools in the Practice of Trauma-Informed Education (by Julia Bialek, Evrim Çetinkaya Yıldız, Cynthy Kaliinasho Haihambo Ya-Otto, and Ramona Thümmler) provides a comprehensive overview of trauma and its effects on children's well-being. The chapter stresses the crucial role of educators in recognizing and mitigating

trauma's impact, offering practical, community-based strategies to create trauma-sensitive, inclusive learning environments.

Being Afraid of "The Other" – Phobias in Education

Being Afraid of "The Other" – Phobias in Education (by Valerio Ferrero, Anna Frizzarin, Damini Sharma, and Jean Karl Grech) addresses the dynamics of othering within school contexts. Through illustrative case studies, the chapter demonstrates how language and social constructs contribute to marginalization. It discusses historical roots of xenophobia and transphobia and provides both theoretical insights and practical strategies for deconstructing exclusionary narratives, thus fostering culturally responsive educational spaces.

Identity Politics and Labelling in Education

In Identity Politics and Labelling in Education (by Sam Blanckensee, Özge Özdemir, Lina Render de Barros, and Josefine Wagner), the authors analyze the interplay between identity politics and labeling, and their effects on students' learning experiences. Through a combination of theoretical analysis, practical examples, and case studies, the chapter critiques the dual role of labels—as both tools for resource allocation and potential sources of stigma—and challenges educators to create spaces where all students feel recognized and valued.

Enhancing Minority Languages for Inclusion

Enhancing Minority Languages for Inclusion (by Petra Auer, Beausetha Juhetha Bruwer, Pamela February, and Federica Festa) addresses the challenges faced by learners encountering linguistic barriers. The chapter discusses how educational policies, teacher attitudes, and classroom practices can either marginalise or support multilingual learners. It advocates for strategies ranging from critical reflection on multilingualism to fostering community collaboration, emphasizing the essential role of linguistic diversity in building inclusive environments.

Section 5: Inclusive Teaching Methods and Assessment

Universal Design for Learning

Universal Design for Learning (by Margaret Flood, María Pilar Gray Carlos, and Anna Frizzarini) presents the UDL framework as a proactive approach to crafting inclusive educational environments. Focusing on the principles of Engagement, Representation, and

Action & Expression, the chapter explains how UDL addresses learner variability and neurodiversity through flexible teaching strategies that dismantle barriers and empower every student.

Cooperative Learning

Cooperative Learning (by Heidrun Demo, Vana Chiou, Miriam Cuccu, and Özge Özdemir) differentiates between traditional group work and cooperative learning, where small groups collaborate to optimize learning outcomes. The chapter emphasises positive interdependence, individual accountability, and the development of interpersonal skills, demonstrating how such approaches foster inclusive, democratic classroom dynamics.

(Digital) Media & Materials for Learning

In (Digital) Media & Materials for Learning (by Pamela February, Alessio Di Paolo, Grit Alter, Jules Buendgens-Kosten, and Frank J. Müller), the authors discuss the essential role of both digital and analogue media in creating accessible educational spaces. Drawing on theoretical foundations like Mayer's Cognitive Theory of Multimedia Learning and UDL, the chapter outlines strategies for selecting and adapting diverse media to support differentiated learning and bridge gaps in digital literacy.

Inclusive Books and Learning Materials

Inclusive Books and Learning Materials (by Tracy Fletcher, Laura Torres Zúñiga, and Lisa Johansson) analyzes how educational resources can perpetuate or challenge exclusion. Using a case study from a Swedish upper secondary school that critiqued gender representation in a history textbook, the chapter underscores the need for critical evaluation and diversification of learning materials to ensure every student feels represented and engaged.

Accessibility of Media and Materials

Accessibility of Media and Materials (by Thomas J. O'Shaughnessy, Pamela February, and Sam Blanckensee) illustrates the transformative impact of accessible media on classroom engagement. Through the example of Mx May adapting content for a visually impaired student, the chapter argues that accessible materials benefit all learners—especially those using assistive technologies—by promoting equity and fostering an inclusive school culture.

Bridging Learning and Teaching: Some Pathways to Inclusive Education

Bridging Learning and Teaching: Some Pathways to Inclusive Education (by Hermione Xin Miao, Akshita Rawat, and Brian Lynam) outlines innovative pedagogical approaches

that merge diverse perspectives. Emphasising inquiry-based learning, critical pedagogy, and feminist methods, the chapter advocates for a collaborative teaching process that empowers both teachers and students to confront societal inequities.

Differentiation

Differentiation (by Silvia Dell'Anna, Frank J. Müller, Jessica Lament, and Yasemin Acar Ciftci) explains how educators can tailor instruction to address the diverse needs of their students. Using the example of Mrs. Smith, who transitioned from a "one size fits all" approach, the chapter details strategies such as flexible groupings and adaptive objectives that create a dynamic, inclusive classroom environment.

Formative Assessment for/as Learning

Formative Assessment for/as Learning (by Eva Kleinlein, Valerio Rigo, and Alessandra Imperio) examines the dual role of formative assessment in guiding and integrating learning processes. Through practical examples, the chapter illustrates how embedded assessment techniques empower students to assume ownership of their learning journeys.

Formative Assessment Put into Practice

Formative Assessment Put into Practice (by Pamela February, Janneke Eising, Melike Özüdoğru, and Vana Chiou) provides a practical guide to implementing formative assessment strategies in diverse classroom settings. Using the case of Leah, a novice teacher managing a large class, the chapter outlines key practices—such as setting clear objectives and encouraging peer feedback—that gradually transform assessment methods into more inclusive and engaging processes.

Language Learning for All

In Language Learning for All (by Silver Cappello, Julia Schlam Salman, and Merja Kauppinen), the authors discuss approaches to making language learning accessible in multilingual classrooms. Using examples like a teacher employing translanguaging with immigrant students in Sweden, the chapter underscores the importance of integrating learners' linguistic repertoires, inclusive methodologies, and multimodal resources to create equitable language education.

Comprehensive Sexuality Education (CSE) and the Potential to Transform Young Lives

Comprehensive Sexuality Education (CSE) and the Potential to Transform Young Lives (by Zeynep Karaosman, Sevcan Karataş, Suzanne O'Keeffe, and Cynthy K. Haihambo) explores

a holistic framework for sexuality education. The chapter traces the evolution of CSE, outlining its goals to empower youth with the knowledge, attitudes, and values essential for health and respectful relationships. It critiques traditional models and advocates for inclusive, rights-based, and culturally responsive curricula that extend beyond biological instruction to foster a more equitable society.

Section 6: Building Inclusive School Cultures and Policies

Inclusive School Culture

Inclusive School Culture (by Angele Deguara, Jessica Lament, Thomas Joseph O'Shaughnessy, and Leah O'Toole) investigates strategies for fostering school environments that actively counter discrimination and prejudice. Highlighting a Human Library initiative at Westfield Primary School as a case study, the chapter demonstrates how direct engagement and dialogue can dismantle stereotypes and build a culture of empathy, collaboration, and shared leadership.

Restorative Practice in Schools

Restorative Practice in Schools (by Andrew Campbell, Leah O'Toole, Emer Byrden, and Seán Gleasure) explores the adoption of restorative approaches as alternatives to punitive measures. The chapter emphasizes how practices like restorative circles and shared value-building can resolve conflicts, foster accountability, and transform school communities into safer, more inclusive environments.

Inclusive Curriculum Development

In Inclusive Curriculum Development (by Cynthy K. Haihambo, Lisa M. Rosen, Penny H. C. Dinh, Nika Maglaperidze, and Jane O'Toole), the authors discuss the challenges and transformative potential of co-constructing curricula that reflect the lived experiences of all learners. The chapter critiques centralized curriculum models and advocates for participatory practices that disrupt traditional power imbalances and prioritise equity.

Why Are You Teaching What You Are Teaching (Policy Development and Implementation)

Why Are You Teaching What You Are Teaching (by Jean Karl Grech, Nika Maglaperidze, and Akangshya Bordoloi) discusses the crucial role of educators in shaping inclusive education policies. Using case studies—such as Malala Yousafzai's activism—the chapter highlights the need for participatory, flexible curriculum development that empowers teachers to address systemic inequities both inside and outside the classroom.

School Administration

School Administration (by Seun Adebayo, Tracy Fletcher, and Nina Goretzko) employs a case study from an inner-city secondary school in Dublin to illustrate how innovative administrative practices—such as the "student passport"—can support inclusion. The chapter stresses the value of collaborative decision-making, relationship building, and active stakeholder participation in creating tailored, supportive educational environments.

Leadership for Inclusion

Leadership for Inclusion (by Angeline Aow, Bhuvan Israni, Emma Pearson, and Heidrun Demo) examines how leadership extends beyond formal titles to encompass every member of the school community. The chapter outlines pathways for building shared understandings of inclusion, formulating inclusive policies, nurturing diverse school cultures, and cultivating robust partnerships to empower both students and educators.

School Assessment in an Inclusive Education System

School Assessment in an Inclusive Education System – Do We Measure What We Value or Do We Value What We Can Measure? (by Merve Ayvalli Karagöz, Vana Chiou, Catherine Reid, and Leslie-Ann Webster) explores how to design assessment frameworks that reflect the core values of inclusivity. Using a case study from a school striving for equity, the chapter discusses challenges in aligning assessment methods with diverse needs and offers strategies for developing evaluations that promote social justice.

Quality Development for Inclusive Schools/Institutions

Quality Development of Inclusive and Equitable Education on School Level (by Heidrun Demo, Rosa Anna Ferdigg, Valerio Ferrero, and Veronica Punzo) focuses on strategies to enhance inclusivity within educational institutions. Through a vocational school case study, the chapter identifies challenges such as high dropout rates and teacher turnover, advocating for systemic, participatory processes that continually refine school practices in support of equitable education.

Gender and School Policy

Gender and School Policy (by Hannah Solley, Cennet Engin, Ayana Pathak, and Sam Blanckensee) analyzes how gender dynamics manifest in school settings. Using the example of Bella, a transgender student navigating secondary school, the chapter discusses issues like uniform policies, restroom access, and social acceptance, and calls for gender-sensitive policies that support trans, gender-diverse, and non-binary students.

Teaching and Learning During Crisis and Unrest

Teaching and Learning During Crisis and Unrest: Strategies for Sustaining Education for All (by Pamela J. February, Julia Schlam Salman, Mridula Muralidharan, and Dua Jabr Dajani) examines adaptive strategies employed by educators during periods of disruption. Drawing on case studies from Italy, Turkey, and Iran, the chapter emphasizes rapid, flexible, teacher-driven responses (including trauma-informed practices and community resilience), to maintain safe, inclusive learning environments amid crisis.

Inclusive Education in Diverse Contexts

Inclusive Education in Diverse Contexts (by Baran Yousefi, Brian Lynam, and Yuko Uesugi) extends the conversation beyond traditional schools by addressing inclusive practices in settings such as prisons, hospitals, traveling families, and online schools. Through global examples and case studies, the chapter offers strategies to engage marginalised communities and ensures education remains a fundamental right irrespective of circumstances.

International Schools: Fostering or Hindering Equal Educational Opportunities

International Schools: Fostering or Hindering Equal Educational Opportunities (by Kristina Pennell-Götze, Baran Yousefi, and Linjie Zhang) explores the dual role of international schools as both promoters and potential inhibitors of diversity, equity, and inclusion. Using the case study of "The Peace School," the chapter critiques the socio-cultural and structural challenges within these institutions and outlines pathways to empower students as global change agents.

Conclusion: Looking Ahead; Inspiring Ideas for Schools of Tomorrow

Utopias: Where Do We Go from Here? Inspiring Ideas for 'Schools of Tomorrow'

In Utopias: Where Do We Go from Here? Inspiring Ideas for 'Schools of Tomorrow' (by Aga M. Buckley, Georga Dowling, Kerstin Merz-Atalik, and Maryam Mohammadi), the authors present transformative visions for inclusive and innovative education through the lens of utopian thought. Rather than fixed endpoints, utopias are envisioned as evolving processes that embody collective values and shared aspirations. The chapter offers a framework for creating inclusive spaces, addressing barriers, and inspiring systemic change, illustrated

by examples such as the Participatory School in Tehran, and invites readers to engage in reflective and practical co-creation.

6 A Community Effort: Why There Are No Editor Names on the Cover

The "All Means All!" OpenTextbook is a true community project. While organised and facilitated by members of three universities, its success rests on the collective contributions of all participants. The content was shaped through the dedication, insights, and lived experiences of 144 self-advocates and researchers who engaged in open processes and workshops. By choosing not to feature editor names on the cover, we recognise that the strength of this resource lies in its collaborative spirit and shared vision for equitable education. This decision reflects our commitment to inclusivity and mutual respect as the driving forces behind meaningful educational change.

7 Key Decisions and Dimensions

In shaping the content, the project drew inspiration from frameworks such as Lutz and Leiprecht, which emphasise the interconnectedness of different dimensions of social inequality. This intersectional approach was chosen to provide a holistic view of diversity, enabling educators to understand and address systemic barriers across multiple axes. The dimensions selected—including gender, dis/ability, socio-economic status, and more—reflect the project's commitment to fostering an inclusive and equity-driven educational landscape.

8 Embracing Imperfection: "If You See Something, Say Something!"

While the "All Means All!" project has made significant strides, it remains a living document open to improvement. We invite all users of this OpenTextbook to provide feedback, share perspectives, and suggest new additions. Together, we can continue to refine and enhance this resource, ensuring it evolves to meet the changing needs of educators and learners alike.

9 Where Do We Go From Here?

Moving forward, the focus will be on expanding and enriching the OpenTextbook through:

- Addressing Limitations: Adding new perspectives, examples, and local contexts to reflect diverse educational realities across regions.

- Integrating Additional Voices: Engaging more voices from marginalized and underrepresented communities to further deepen the resource's inclusivity.
- Translating it to other languages: Starting with Italian and German, we are planning to add more and morelanguages.
- Enhancing Accessibility: Leveraging technological innovations to ensure the OpenTextbook remains accessible and adaptable for all learners.
- Integrating Materials into University-Level Teaching: We will explore possibilities to integrate the OpenTextbook materials into university teaching processes, enhancing engagement and learning outcomes.

Let us know, if you want to be part of the journey.

10 Leveraging Support through Erasmus+

Over the course of three years, the "All Means All!" project fostered connections with countless individuals dedicated to promoting equity in education. Although the structured exchange has ended (for now), we encourage continued collaboration through programs like Erasmus+, which offers funding for both university-affiliated and non-university participants. By leveraging these opportunities, educators can sustain and expand the community-driven spirit that made this project possible, fostering new dialogues and building inclusive educational practices across diverse contexts.

Thank you: Lea Bussas, Anna Zimmermann, Cara Brumund, Luca Döninghaus, Gesa Richter, Sebahat Bicici, Siobhan Kelly, Virginia Professione, Verwaltung Brixen, Chris Carstens, Andrea Sanchez-Duran, Linjie Zhang, Dirk Vaihinger, Sara Cattoni, Janine Biermann, Barbara Hasenmüller and team from the International Office of the University of Bremen and all our proofreading heroines: Georga Dowling, Chloe Keegan, Yvonne Leckey, Leslie-Ann Webster, Emer Byrden and Caitriona Kearns.

About the authors

Frank J. Müller
UNIVERSITY OF BREMEN
https://www.uni-bremen.de/en/
fb12/arbeitsbereiche/abteilung-
c-inklusive-paedagogik/sekundarstufe/team/
prof-dr-frank-j-mueller

Prof. Dr. Frank J. Müller is a professor for "Inclusive Education for Learning and Intellectual

Development Impairments in Secondary Schools" following his work as a special ed teacher at the Grünauer Gemeinschaftsschule in Berlin.

He works on support structures for teachers in heterogeneous learning groups through inclusive open educational resources, research-based study programs to make the history of inclusive education accessible to future generations, and questions of including more dimensions of diversity.

Deirdre Forde

Dr. Deirdre Forde is a distinguished lecturer in Inclusive Education at Maynooth University. With a background as a qualified primary teacher and a chartered child and educational psychologist, she brings extensive experience from various educational settings and psychological services to her role. Deirdre's research and teaching interests are diverse and encompass areas such as disability and the dynamics of inclusion and exclusion within educational and societal contexts. She is particularly passionate about amplifying children's voices, advancing relational education, and shaping policies related to Equality, Diversity, and Inclusion (EDI). Her work is dedicated to fostering inclusive environments that acknowledge and celebrate diversity.

Lea Bussas

Lea Bussas studied a bachelor's degree in history and Spanish with the option to become a teacher in Berlin and a master's degree in history at the University of Bremen. She then studied inclusive pedagogy for primary schools in Bremen.

Leah O'Toole

Dr Leah O'Toole is Associate Professor of Early Childhood Education in the Froebel Department of Primary and Early Childhood Education in Maynooth University, Ireland. With an academic background in Psychology, her research interests include early childhood education, particularly accessing the voices of the youngest children from birth, relational pedagogy, bioecological theory and working with parents and communities. Inclusion across multiple dimensions is central to all elements of this work.

Heidrun Demo

Her work centers on equity in education, with a particular focus on supporting diverse learners, fostering inclusive teaching practices, and

driving inclusive school development. She is deeply involved in research and teacher training, dedicated to creating and sustaining inclusive learning environments.

Silver Cappello

Silver Cappello has accomplished a PhD in General Education, General and Social Pedagogy at the Free University of Bolzano-Bozen (Italy). He is qualified as primary school teacher with a specialisation as support teacher and he has worked as primary school teacher (mainly teaching second language), as assistant for people with disabilities, and as research assistant on different research projects at the Competence Centre for School Inclusion of the Free University of Bolzano-Bozen.

PART I
SECTION 1: DEVELOPING INCLUSIVE EDUCATORS

DEVELOPING EMPATHY FOR DIVERSITY THROUGH A NARRATIVE OF ACTIVISM

Paty Paliokosta and Nicola Ryan

Example Case

Becoming an activist as a result of teacher empowerment

"I got involved in the disability movement, not because I wanted to or because I felt it was all I wanted to do, but because I thought, hang on, why have we got all these barriers, what's going on?"

This is an extract from the oral history interview (national archive- Fighting for our Rights) with Ali Kashmiri (Kashmiri, 2017) who has been a campaigner and advocate for independent living from a young age. Having joined Kingston Association of Disabled People aged just 18, Ali has worked for a number of London Boroughs as an accessibility advisor. Ali has fought hard for his rights to own a home and have a successful career, despite the challenges of living with spinal muscular atrophy. His early experiences in school were described as limiting and presenting various barriers to pursuing his dreams due to the prejudice at the time against his physical disability. In the extract below we can see the difficulties experienced because of a placement in a special school, but also the parental struggle in working with various services, especially at the early stages of identifying Ali's condition and needs. Ali's story illuminates how school and an engaging teacher can change a person's story throughout their lifespan by being empowering and having high expectations for individuals, supporting them to reach their own full potential.

"I went to Bedelsford in Kingston, a special school. So I was there from 1981 until 1989.

Q: So you started there once you'd moved to the borough?

A: Yeah. Q: What was your time there like? A: Mixed really, I think I was at the end of the special school era, so the mentality of lots of protection, it wasn't really about–, the focus wasn't really on education, it was more on welfare, so certainly I wasn't stretched, I felt left out in lots of ways, left behind. I felt that I had more but exactly what more meant at that time I don't know, what exactly what direction I wanted to go in or what I was going to do, and there was certainly a vibe that I probably wouldn't live beyond my school years, so therefore I wasn't a child that they wanted to invest in.

Q: If that's okay, 'cause can you explain the nature of your condition?

A: So I have spinal muscular atrophy which is a neurological impairment, that affects the central nervous system, and ultimately muscle development and maintenance, so it's quite–, it's a progressive impairment, but it's slow. And to the naked eye it's unnoticeable, the change, but it's so slow, and obviously it evolves over time, so that's the crux of it.

Q: How old were you when you were first diagnosed?

A: 18 months.

Q: Oh right, okay, and how was it sort of presenting itself, do you know when you were first diagnosed?

A: Well it was my mother actually that had a hunch, and but that hunch wasn't quite good enough for the medical profession, so she had quite a hard time, but then from my diagnosis took place when I was 18 months old, after a long fight, long drawn out battle, and in fact my mum was almost sectioned because of it, 'cause she was insisting that something wasn't quite right, and she was disbelieved and, yeah, and obviously in those days. I mean I say those days, I think it still happens now, in lots of–, perhaps it's a variation on the behaviour and the attitudes, but obviously it boils down to the same kind of challenge that people have, to get the right sort of treatment, or acknowledgement or support even. So yeah, so she had a bit of a tough time, but yeah, that's it.

Q: And once you received that formal diagnosis, I assume that then support was offered, in terms of sort of medical treatment?

A: Yeah, I mean I think, yeah, advances in–, I think it's all relative to the time, I mean obviously the treatment I got would have been better than a child that was born in the '50s say, and a child that's born in today's era would be–, would receive better treatment than I had. But I think a lot of it is about attitudes, it's about a lot of the challenges we face are because of preconceived sort of ideas and value judgements and is that what–, is that life worth keeping, and having, is that person going to be of any value to society, or are they just going to be a drain on society. So whatever the clinician is, whoever they are, I mean their energy, the vigour that they put into their work, ultimately depends on their attitude.

Q: Yeah, absolutely. And so in terms of your education at Bedelsford, what age were you when you finished there? A: I was 16 and three quarters.

Q: And what qualifications had you achieved?

A: Well I was quite fortunate in the sense that in the last two years I was at school the school appointed a new deputy head, and who happened to be the English teacher as well, and she was from a mainstream school, mainstream school background, and she was definitely a no nonsense type character, and if you like she raised the bar and she pushed those kids who were capable to a different level. And I think I was one of them, so I came out with some low grade GCSEs.

Q: And did you–, what did you then go onto do, did you go into employment? A: Well the options that I was given was residential college, or working on a TV production line, television, assembling TVs. Neither of which I wanted to do, and so I rejected every single suggestion that came my way and I spent a year after school just finding out about the world, and that meant, you know, often loitering in Kingston town centre and meeting up with friends and watching films and just generally having a chilled out time. And I went to Pakistan for four months, and then did a bit more finding out about what I wanted to do, and that's when I started to hit problems 'cause I actually wanted to go into electronic engineering, and I didn't quite understand what that meant, but I knew that's what I wanted to do, I wanted to do something technical, where I could use my brain and I could make my own little inventions, perhaps you know, I suppose I–, yeah, I was an ideas person, so I wanted to actually bring some of those ideas alive. But then I started to hit barriers with colleges not wanting to take me on and people started coming out with statements like, well you know, we can't accommodate you here and who's going to help you go to the loo and it was all very basic stuff and or you won't be able to reach the workbenches, we haven't got a low down desk, we haven't got a lift, or you'll be a fire hazard, there were a whole host of barriers that actually stifled my career. I mean maybe I wouldn't have done anything with it, maybe it wouldn't have happened, but the very fact that I hit all those barriers to a young person that's really quite deflating.

Initial questions

- How can we start conversations with our pupils about discourses surrounding disability and difference in a diverse classroom?
- How can we support social justice in the curriculum?
- What could be the impact of such materials on certain age or particular cognitive stages?
- How can teachers enable children to understand and develop a narrative of activism?
- What are the strategies that promote a pedagogy where narratives towards disability (visible and hidden) support empathy while promoting strengths
- Can storytelling support empathy and the development of socially just curricula?

Introduction to Topic

In the context of this chapter, we will be approaching ways of inviting student teachers to develop empathy towards diversity and supporting their pupils in a similar journey. We will be drawing on previous interprofessional work in a faculty of Health, Social Care and Education at an English university. Our rationale is that educational environments can present established learning spaces to challenge assumptions and develop an appreciation of human diversity. In these terms, the intention behind the work presented here and this chapter, is to create conditions to enable both teachers and students to explore, in their own world views, the meaning and value of diversity. In section 1, we will engage with aspects of diversity in relation to disability and different approaches towards it over time to develop a relational understanding of difference (What is) and in section 2 we will present several types of opportunities, experiences and resources to support teachers in creating opportunities for inclusivity in the classroom (What can we do). And more specifically, we are heavily drawing on, but not exclusively, on Fighting for Our Rights project (FFR), which was co-produced by students in nursing and education, teacher educators and nursing educators in collaboration with a local charity for independent living. In section 3 we will present relevant multi-modal pedagogies for promoting empathy to hopefully further inspire and engage teachers to create their own resources.

This project helped make the disability rights movement (DRM) known to the local community and beyond by creating a national archive, exhibitions and other resources that followed. The full information about the project can be found on the relevant website https://kcil.org.uk/FFOR/ as well as all the resources and lesson plans that stemmed from working in this way can be found on 'Schools' Resource Pack – Fighting for Our Rights (https://kcil.org.uk/FFOR/school-resources/) (Paliokosta, 2017). It created a permanent historical record using oral history methodology and an education resource that related to the period of political and cultural change between the 1960s and the 1990s in London. The

information that was gathered by the participating nursing students who used oral history, was then collated and used by student teachers to develop 13 cross-curricular lesson plans (FFR1-13) addressed to primary school children in order to enhance their learning and understanding about a disability. This was called a Disability Awareness Resource (DAR) Package and it was award winning. It received the 2019 Commendation Award from the Teacher Education Advancement Network (TEAN) in the UK for effective practice in teacher education. The table below (Figure 1) gives an overview of the lesson plans that were originally developed for primary school children near their transition to secondary education. It was soon found that they can be applicable for different contexts.

Table 1: Fighting for Our Rights Disability Awareness Resource (DAR) lessons

Lesson number [subject] title	Learning objectives
FFR 1 [Personal Health & Social Education]: Understanding Disability	· To understand different types of disabilities through experiential learning and create ways to include all disabilities.
FFR 2 [English]: Developing Empathy Skills	· Developing empathy skills, by a diary entry from the perspective of disabled activist Ann Mcfarlane.
FFR 3 [Drama]: In the Shoes of…	· To be able to understand Patricia Pages' feelings through role play, and present ideas on resolving the problems.
FFR 4 [Information Computing Technology]: Researching Disability & Inclusion Campaigns using the Internet	· We are learning about the campaigning for the rights of disabled people. We are learning to research about different disability campaigns using the internet.
FFR 5 [English] Writing a Speech	· The groups will be planning a speech for their own campaign to argue what needs to be implemented to make a place accessible.
FFR6 [Drama] Enacting a Campaign	· Based on the campaigns the children have completed in their English lesson, they will create a short drama piece to present to the class in small groups of 5. Each group will need to demonstrate the hardships and solutions that were outlined in the campaign.
FFR7 [Drama] Disability in the Community	· To understand the barriers families with disability face in everyday life.
FFR8 [History] Independent Living Scheme and its Importance in the Community	· To explore how disability was seen in a selected era in local community. To know about independent living scheme (KCIL) and its importance to local community (Kingston). To show an understanding of connections over time.
FFR9 [English] Writing a Superhero Story with a Disabled Character	· Through sharing different characters, problems and resolutions with my group I will begin to create a superhero story with a physically disabled character.
FFR10 (English) Exploring the Ethos of Viewing Mental Health	· To explore the ethos of viewing society's view of mental health. Explore appropriate ways of responding to someone's life narrative with mental health difficulties.
FFR11 [History] Comparing Approaches to Mental Health – Present & Past	· Comparing approaches to mental health from 18th century to now.
FFR12 [Art] Demonstrating Inclusion Awareness through and Accessible School Blueprint	· To demonstrate my awareness of inclusive approaches by creating a blueprint of the school, which is accessible to individuals with disabilities.

FFR13 [PSHE] Building Resilience	· To explore the similarities and differences between people and discuss social and moral dilemmas they will face when dealing with challenging situations and accommodate diversity in all its forms.

This and other similar resources are viewed as a tool that teachers could be using in approaching those sensitive issues around disability. We aim in the context of this discussion to raise awareness and support the development of empathy and inclusive discourses in relation to a socially just relational education approach. Background on certain perspectives and approaches on disability over time and a series of reflection points, resources and recommendations will support this exploration.

Key aspects

Starting conversations with pupils about discourses surrounding disability and difference in a diverse classroom. Some background.

What do teachers know about disability? It is important that teachers are confident to raise their pupils' awareness of disability and difference so they can in turn become advocates of inclusive environments for them and their peers. In order to do that, teachers might benefit from some understanding of the historical and current perspectives that have attempted to explain disability and difference. We recognise there is a wide range of disabilities and differences that we cannot cover adequately in this chapter. Conversely, we are taking a broad view of the word that encompasses diverse physical, cognitive and learning disabilities (visible and hidden) but also refers to the disabling nature of historical stigmatising discourses, societal inequalities and continued injustices in society. We acknowledge the limitation of the term 'disabled', as not all people who are described as disabled choose to describe themselves this way, and there is complexity within disability identities and communities.

It is important to consider how scientific and political discourses of disability shape current global understandings of disability and how disability is conceptualised in educational contexts. One example is the International Classification Framework (ICF) that is World Health Organisation's (WHO) framework for health and disability and constitutes the conceptual basis for the definition, measurement and policy formulations for health and disability. There are various applications of this framework, but the most important one is as a planning and policy tool; ICF puts the notions of 'health' and 'disability' in a new light. It acknowledges that disability is part of human nature universally and not something that happens to only a minority. 'ICF thus 'mainstreams' the experience of disability and recognises it as a universal human experience' (WHO, 2002, p3; 2018).

When having these conversations, educators need to consider that some of our students will identify with some of the examples that we have discussed so far, but may also

have disabilities themselves, which may be learning, physical, mental health or neurodevelopmental conditions that intersect with race, culture, gender and sexual orientation. Children or young people may have a family member that identifies with some of the topics being discussed. It is important to think about how all of these intersect and contribute to our understanding of the complexity of disability. In every interaction about disability, we are consciously or subconsciously subscribing or operating at least, under perceptions of disability. This means we are not operating in a vacuum, but we are affected by several parameters and sociocultural perspectives. Perspectives and models of disability have also stemmed from various religious, cultural, medical and social perspectives that will be discussed further in the chapter.

Some theoretical perspectives around disability

A discussion around the models of disability would be a useful one, not in an in-depth way but as an invitation to further research the understanding that we are not operating in a vacuum. We are briefly presenting here some key approaches that have contributed to our understanding of disability, in an attempt to situate your own thinking and developing understanding:

- Erving Goffman's (1963) work focused on the social stigma associated with disability and how mainstream society often stigmatised and excluded from mainstream society people with disabilities rather than their impairment itself.
- Mike Oliver (1983) was a well-known disability rights activist who developed the social model of disability, which posits that disability is a result of the social and environmental barriers that prevent full participation in society. Shakespeare continued developing the social model of disability in relation to the intersection of disability and social policy suggesting that it is society which disables people with impairments, and therefore any meaningful solution must be directed at societal change rather than individual adjustment and rehabilitation' (Barnes, Mercer & Shakespeare 2010:163).
- Bronfenbrenner's (1979) ecosystemic theory, conversely considered the various systems that impact a person's life in understanding disability.
- The identity model of disability (Mairs, 1986) emphasised the importance of valuing diversity and recognizing disability as an integral part of an individual's identity while Titchkosky (2006) has focused on how our understanding of disability is shaped by dominant cultural narratives and power structures.
- Hunt was a disability rights activist who contributed to the development of the human rights model of disability, which emphasises the importance of equal rights and opportunities for people with disabilities. In a famous letter to the Guardian newspaper (1972), he maintained that disabled people with high needs were isolated in unsuitable institutions without a voice and subject to authoritarian and often cruel regimes" (Hunt, 2019).

- The medical model, that has been dominant for decades, attempts to explain disability in relation to a deficit-led approach. The medical model sees the disabled person as the problem and the solution can be found in them too. '*We are to be adapted to fit into the world as it is. If this is not possible, then we are shut away in some specialised institution or isolated at home, where only our most basic needs are met.*' Such perspectives stem from much older approaches; in the mid 1800s, for example, it was suggested that disability was a 'result of a defect or failure of a body system and was often associated with a negative view of the person' (Retief and Letsosa, 2018). Although terminology such as 'handicap' was abolished as result of the 1981 Education Act, negative terminology is still occasionally used either in ignorance or in a derogatory way and it may be that some of your pupils are exposed to such unacceptable terms through parents or through social media. At the same time the medical model can be connected to the tragedy/charity model that sees disabled people as objects of pity. The critique of the medical model and its negative impact on disabled people by Richard Reiser has been significant for years in the development of resources and activism towards a social model of disability. Relevant resources on the 'Disability History Month' approach can be found in the reflection point below.

Thinking about language and discourse used to describe those with disabilities is hence important as well as available theoretical perspectives, in order to gain a better understanding of the historical context and origins of different ways to talk about disability.

'The Disabled People's Movement supports that the 'cure' to the problem of disability lies in the restructuring of society. Unlike medically based 'cures', which focus on the individual and their impairment, this is an achievable goal and to the benefit of everyone (https://ukdhm.org/what-is-ukdhm/the-social-model/, accessed on 28.11.22, NP)

What about hidden disabilities?

It is important to consider how the above perspectives apply to hidden disabilities. Hidden disabilities may not be immediately apparent or visible to others. 'Hidden' can mean undisclosed, undiagnosed or misunderstood, not just the physical appearance of disability. They can be physical, cognitive, or neurological difficulties that can impact a person's ability to navigate daily life and can be observed by a difference in behaviour. This can also apply to those with mental health or neurodevelopmental conditions. All types of disability and mental health needs might interact and affect the individual's health and wellbeing.

Some explanations of hidden disabilities such as mental health disorders originate from the medical model of disability and suggest that mental health symptoms are attributed to a disease, a chemical imbalance attributed to physiochemical factors that needs to be fixed, and therefore the person with a disability would assume a sick role needing the help or treatment of professionals (Engel, 1977, Brown 2003). This supported medication treatment or more invasive treatments that are nowadays debatable and that run several

dangers in relation to the person's functioning and personality traits, e.g., being physically expressive or preferring to use non-verbal communications. Medication is certainly still used today particularly when there is risk to self and others, or to support children focus and learn, however there are also other psychologically oriented options for those children and young people who need to develop coping strategies in the absence of medication, or in parallel.

To combine these approaches the Biopsychosocial model (Engel 1977) addresses not only the biomedical explanation but also psychological and social factors to explain mental illness, as it was previously called, acknowledging that each person has their own thoughts, feelings and behaviours. This brings more choice and options for treatment for emotional and behavioural difficulties that can be adapted for a range of disabilities, for example a range of talking therapies such as cognitive behavioural therapy (CBT), family psychotherapy and child psychotherapy. Although more information and knowledge is available, there still exists stigma around having mental health difficulties. The Lancet Commission (2022) was recently published as a result of experts' call for radical global action to end stigma and discrimination against people with mental health conditions, and stated that this is often 'worse than the condition itself'. The double stigma of having a mental health difficulty and disability can also prevent those affected sharing their thoughts and feelings or experiences.

Although the models of disability discussed above would be applicable for hidden disabilities, cognitive load theory (Sweller, 1988) can also be very relevant and helpful; this is a theory based on the understanding that people have a limited number of cognitive resources that they can use at any given time. Hidden disabilities can increase a person's cognitive load, making it more difficult for them to complete tasks that require attention and focus, something that is common for people who are neurodiverse. If we perceive neurodiversity as a natural and valuable part of human diversity, we appreciate people with autism, ADHD, and dyslexia, not necessarily as having a disorder, but a variation in human neurology. There is no "fix" or cure for these conditions, but a need to understand and bridge the differences. Understanding these theories can help us approach hidden disabilities with more empathy and sensitivity, and work towards creating a more inclusive and accessible society. The development of empathy has been acknowledged as paramount 'for a greater educational experience for students and teachers – including wellbeing, happiness and academic excellence' (Demetriou and Khalid, 2022). Reflecting on teachers' own experiences of mental health difficulties may help support children and young people to do the same so this is normalised within the classroom setting. Children with mental health difficulties may then feel safer to share their experiences in a non-stigmatizing environment. This could also enable their peers to have some understanding of the challenges that those with lived experience face.

Hidden disabilities now and in the past

In this section we look more closely at hidden disabilities such as autism and ADHD and the way they were aligned to particular beliefs of certain times and how understandings and discourses have evolved over time; in the early 1900s autism was aligned with the idea that a person was suffering from schizophrenia and experiencing hallucinations and fantasising. Bleuler (1950) and psychologists including Piaget (1923 as cited in Evans 2023) used this meaning up until the 1950s and it was not until the 1960s and 1970s that it was challenged to mean the opposite, a description of someone who fantasised excessively to one who did not fantasise at all (Piaget 1972). Changes in diagnostic methods from the 1960s to the 1980s meant that autism came to be wrongly associated with 'profound mental retardation and other developmental or physical disorders' thereby increasing the number of children who were considered to display autistic traits (Wing and Potter 2002, as cited in Evans 2013). Parent advocacy was the driver of new ways of thinking about disability and posed a direct challenge to established practice of institutionalisation and led to the closing of institutions. Psychiatrist Michael Rutter's pioneering work on understanding autism in diagnostic terms along with Lorna Wing helped us further understand the three main features of autism as child psychology and psychiatry progressed by redefining the diagnostic criteria into areas of social communication, social interaction and restricted and repetitive behaviours and interests, the first two categories where late combined as part of the Diagnostic Statistical Manual (DSM).

Autism is more commonly referred to in mainstream school settings as autistic spectrum disorder (ASD). If the condition is not acknowledged, children can often be labelled as 'odd' or 'naughty'. If there is a hidden disability such as emotional or behavioural difficulties or ADHD and the child is seen as having the same needs as their neurotypical peers, teachers' expectations and reactions are affected by this. Where there is stigma or lack of knowledge about hidden disabilities and where something cannot be seen, children and young people that lack understanding of these difficulties can also have similar expectations which can prevent them from knowing how to respond, approach or support their neurodiverse peers. Children may often face double stigma in the context of mental health and neurodiversity.

Looking at another example of a hidden disability, ADHD, that had been described as early as the 1700s and its journey began with Sir George Frederic Still in 1902 when some of the behaviours that we recognise today were identified. Some examples of subcategories of ADHD were identified such as inattentive and hyperactive impulsive (Lange et al 2010). There are higher referral rates for assessment for boys than for girls who tend to be diagnosed with inattentive subtype. It is also recognised that children can have a range of co-occurring conditions that interact with each other (Steer 2021). However, similarly to autism spectrum disorder, due to lack of professional understanding or existing diagnosis, children can be labelled as naughty or challenging due to impulsive behaviour and their struggle to keep still or focus in the same way as their peers. As this can distract others

in the classroom it may promote a sense of irritation and intolerance by their peers, a better understanding of why these behaviours occur can reduce blame and can lead to better relationships. One strategy to counteract this, is to use successful role models with either neurodiverse or mental health conditions when teaching to promote strengths over deficits so that children and young people are aware of the successes and not focusing on limitations; this will hopefully further breakdown barriers and stereotypes and reduce stigmatisation.

What are some different cultural perspectives of disability?

There are different perspectives of disability according to different religions and western and non-western cultures. There exist various different explanations i.e. disability as a divine punishment or test of faith, a sign of spiritual enlightenment or a closer connection to the divine, being possessed by evil spirits. In the global South Disability is referred to as missing parts of the body and the inability to take part in activities in the household and community. There are no definitions for neurodevelopmental conditions and family structure and culturally relevant support are seen as an important part of care, something known as the family model of disability (Bannink et al, 2022). Therefore, children from different and non-western-centric cultural backgrounds would develop their understanding of disability differently to how it is perceived in western society and this will mean that their understanding of disability or beliefs held may be different to their peers in the classroom. Various authors have highlighted the importance of taking into account local culture context, economic and political factors when studying disability in the global South (Bannink 2021). Teachers also need to consider that there is a variety of explanations and beliefs held about disability within their classroom, asking questions about this may help develop a shared understanding of these variances.

Intersectional approaches and identity

Another important parameter is the way different aspects of the individual multiple identities and social categories intersect and overlap in the way a person experiences life and is positioned socially. This is known as intersectionality (Crenshaw, 2020; Collins, 2021, Hooks, 1994). In the context of disability, intersectionality recognises that people with disabilities may belong at the same time to other marginalised groups, adding to their challenges and contributing to the possibility of inequalities, marginalisation and discrimination. Examples of such intersections might be race and disability, gender and disability, socioeconomic status and disability, sexual orientation and disability. Pickens (2021) argues that this approach 'relies on the interrelated nature of identity as formation and lived experience' and looked at how a disabled individual is defined by historical and cultural concepts such as how disability is viewed in this context, what role the individual has in the family and community is this a role that contributes to society, and how poverty

and neo-colonialism are closely linked to the lived experiences. Pickens found that these are all key to our understanding of disability in the global South. When we refer to Global South we mean countries classified as low or middle income such as Asia, Africa, Oceana , Latin America and the Caribbean. Price et al (2019) looked at the relationship between identity-based victimisation and poor mental health and academic outcomes in adolescents in the USA through an intersectional lens. They highlighted the importance of how those who identify with multiple identities for example race, gender and sexual orientation are more oppressed and the impact that this can have on mental health and academic outcomes.

One might assume that a diagnosis of a neurodevelopmental condition such as autism or ADHD should include supportive actions relevant to the child's setting, but health promotion and awareness should also be made culturally relevant, in order to be understood. For example, definitions of disability may not relate to other countries within the African subcontinent as understanding of disability may differ. In the context of intersectionality in the UK there are also examples of different experiences of mental health services as a black male living with psychosis as described by David Harwood (2022) in his book Maybe I Don't Belong Here. Bisi Alimi, a Nigerian Gay rights activist also talks about his experiences of being black and gay in Nigeria and the issue of non-acceptance and criminalisation https://www.bisialimifoundation.org/ . Developing empathy for human diversity, greater cultural awareness and understanding should be part of the picture of learning.

Listening to diverse voices in the context of intersectionality

We need to reflect on the teaching and learning experiences of children who identify with a disability, or are perceived as having multiple identities in the classroom, multiple diagnoses or conditions or disabilities – as well as a unique and developing personal sense of identity. Promoting self-advocacy, getting children engaged by using arts-based approaches (Cologon et al,2019) which draws on critical pedagogy as an approach to enable children to express their experiences of disability could be a way forward. Listening to children has been shown to support upholding children's rights and deepen adult understandings of children's experiences, but also to enhance educational approaches and experiences and support greater child agency (Nutbrown and Clough, 2009; Paige-Smith and Rix, 2011). Children have a right to continue to communicate using diverse tools beyond the early years, where methods such as the MOSAIC approach (Clark and Moss, 2005) have been successfully used. Tuffrey-Wijne and Butler (2010) take voice to another level, claiming and proving the value and feasibility of co-researching with disabled people, as it would be unethical to exclude people who experience disability from research that may otherwise provide invaluable insight and facilitate understanding of lived experience (Lam et al (2021).

It is therefore   important to develop the discourse around disability early on to then follow

this up with more age-appropriate conversations as children develop. When thinking about how this translates to delivering a teaching session, it is important to find out what pupils already know and compare this to our understanding from literature and research as well as lived experience. Cologon et al (2019) explored how the perspectives of children can be facilitated through the use of arts-based approaches in research and found that creating a safe and supportive space for children to make meaning is a useful approach to share their feelings and thoughts about inclusion, exclusion, or any other life experience they choose to convey. Another way of managing provision before discussing sensitive subjects could be to use pre-teaching sessions or coaching to handle potentially sensitive topics that they feel are quite personal to them. Such topic discussion may trigger uncomfortable emotions that may be difficult to manage within the classroom and having a plan in place may reassure or reduce associated anxiety. This is something that will be further explored through education approaches presented below.

How to raise awareness of disability

Keeping all the above in mind, it would be worthwhile presenting some examples of how we work with different groups in terms of enabling this kind of awareness building. There are different responses to diversity by different age groups; younger children tend to be more accepting and responsive to difference and the longer they are in education and in institutionally constrained environments they begin to develop negative attitudes. As it has been mentioned several times in this chapter, in line with social constructivism, social phenomena, such as disability are not universal realities, but defined by societal attitudes, policies and practices (Blumer, 1969). And this is what we have to sometimes undo, as educators, as the children grow older.

As educators, we need to appreciate for ourselves and also make children aware that there are different contexts and themes in relation to learning environments, and particular limitations that actually make certain differences perform and look like what we call 'disability'. The socially constructed element of disability and institutional and contextual parameters that affect the way nuances around disability are communicated need to be taken into consideration in relation to the way we approach these issues with children and young people of different ages and developmental stages. This term is in many ways problematic as it can carry negative connotations and stigmatisation. Terms like diverse abilities, access needs and person-first language are key at challenging existing stereotypes and putting the person before their difference or disability. All the above needs to be considered within an intersectional lens, acknowledging that people who come from all walks of life, have different experiences and perceptions of their own identity and the identity of others.

How to promote social justice in the curriculum

'*Social justice describes a belief, action, or movement, that aims to address social inequalities by re-distribution or creation of resources, policies, opportunities, or privileges, to achieve fairer societies. This is because individual people and some groups may suffer systemic, attitudinal, and physical barriers to equality because of their personal circumstances and visible characteristics. In educational contexts, social justice could mean designing, developing, or delivering education so that teaching and learning has a positive impact on students, communities, and societies by reducing inequalities or disadvantage, or by improving outcomes for groups that have traditionally been excluded or undervalued*' (Paliokosta et al, 2022: p.14).

Although it is well-received that educational institutions nowadays tend to have a more inclusive agenda and make more explicit references to the reasonable adjustments duty (Equality Act, 2010) and the Convention for the rights of disabled children (2006), there are still gaps in the curriculum in terms of how we address particular issues connecting to the awareness of social issues, and particularly those related to disability. In line with Paulo Freire's (1993) stance, content, pedagogy and resources that address issues of equity, diversity and inclusion can counteract the aforementioned dominant, socially constructed narratives and power structures that can marginalise and oppress those who are more vulnerable and generate social change.

DAR lesson plans are based on the principle of connecting learning to real life issues and engaging with narratives coming from the community in relation to disability.

Several 'hands on' lesson plans are included in the resource, as shown on table one (p.3). For example, children are asked to define disability and to talk about what it means to be disabled and the impact, as a baseline to understanding. They then experience this in the lesson using a creative and sensory approach; this can be an effective way to engage learners in understanding the different contexts and themes in relation to learning environment limitations, while incorporating diverse perspectives. Another lesson plan is guiding children in enacting a campaign, helping them develop criticality, challenge dominant narratives and engage in debates. Another one is comparing approaches to mental health over time and asking children to understand what is happening now in relation to well-being and mental health? What were institutions of the past and of today and what kind of systemic inequalities existed and persist today? In another lesson plan, children are encouraged to create an accessible school blueprint, rather than having a specialist doing it, taking ownership of a real-world project that affects them and their peers.

So, opening all these discussions really practically is encouraging a good rapport, positive and trusting relationships and self-awareness because the children would bring their own narrative in, but also using this as a starting point, because we know how difficult it can be to talk about these things and have the appropriate language repertoire to do this. One way

to address this difficulty is by starting with the narratives of the others, those activists that are talking about their lives as a tool to open these discussions and approach the topics in a deeper way. And then this sharing of stories develops some knowledge and readiness for those in the receiving end to relate, enabling in turn an empathetic relational approach ref to be added. Children, young people, and teachers can reflect on how much things have moved on or see that at times some of the things remain the same, although you would have expected more progress.

How to capture the impact of such materials on different groups

It is important to consider the age group that teachers are working with for example, children or adolescents and within that group the developmental level they are operating under. Children and young people have access to information from various sources, and increasingly so through the internet and may access discriminatory material that includes hate-discourse towards vulnerable groups. Therefore, providing valid and accurate information and resources is important for achieving the learning outcomes that we have developed, for example using oral histories mentioned previously in this chapter will enable children and young people to hear first-hand about people's struggles, how they have experienced discrimination and how they have fought for their rights is invaluable. It is also important to help young people have some understanding of what they are hearing and interact with the resources. Using a co-production approach, we can enable children to deconstruct the narratives in an appropriate and relevant level to their age and development. This can be achieved by asking questions like 'what was your understanding of X's story, what difficulties do they have and what challenges did they face, what helped them overcome those challenges.' We also need to consider as mentioned earlier that some of these children and young people may identify with some of the challenges that are being discussed; it is therefore useful to think about how the child can be supported beforehand and following the lesson by suggesting some reasonable adjustments that can be put in place. An adaptation of the resources for children with severe and profound learning disabilities have been created and more material are under development.

The role of empathy in relational learning

Co-production operates successfully and meaningfully when you know who you're working with; in its context we are adapting a relational conceptualization of empathy that is essentially an other-oriented experience, rather than self-referential. 'It is through empathy that people connect with the other's experiential world and experience foreign consciousness' (Stein, 1964 in Van Dijke et al., 2020). Although empathy can be looked at through so many different lenses, here it refers to the understanding of the other person's positionality, the co-creation of some kind of collective narrative in the context of relational pedagogy. This links to Paolo Freire's (1998) development of critical awareness of social

reality through reflection and action. So, it is about understanding of where we stand, what are the subconscious processes operating, especially in younger groups. But it's important as a teacher to know why you're making certain choices. And again, aligned with Paolo Frere it is about this co-creation of knowledge by learners and teachers together in the context of their own lives and then in the context of the curriculum, and reflecting on other people's lives at different spaces and different times. It is pertinent to draw on social, political, gender and other personal perspectives that people develop while accessing those narratives. Exposure to activities that promote empathy has been found to help increase emotional awareness, while demonstrating signs of increased self-compassion and self-esteem. Children were more likely to find commonality with others and displayed a desire to care for and connect with others.' Resources can be found here during annual empathy week Empathy Week 2024 | Build the #EmpathyGeneration (empathy-week.com) NP, 2023). And then we are trying to use storytelling to connect the views with a learning process, in the context of critical pedagogy (Giroux, 2011). So there is a range of theories that teachers can be engaging in their journeys. Feminist pedagogy (Crawley, Lewis, & Mayberry, 2008; Shrewsbury, 1997) also represents the struggle, the people who did not traditionally have voice within certain environments and within institutions, or within schools. According to Althusser (1971**), s**chools are institutions of coercion and control and one needs to unpick these and see how they can become something more collective, more inclusive and encouraging via this interaction, promoting transformative learning experiences (Mezirow, Taylor & Associates, 2009) in the context of relational learning (Doane, Hartrick-Doane and Varcoe, 2020).

How can teachers enable children to understand and develop a narrative of activism?

Following on from the reference to a transformational dimension of educational experiences, it is important to frame and understand activism in the context of education.

Activism means the use of direct and public methods to try to bring about changes that a person or group wants, especially social and political changes. Different definitions and perspectives of activism exist, but in general it refers to: recognising a felt need or desire for change, or reversal or prevention of a change made by others, such as a change in the law, which motivates a person or group to take action; putting what people need or want into words and action; formulating ideas or a vision for change about how such change might be achieved; and taking action or engaging in activities to raise awareness and make change happen (Paliokosta et al, 2022).

In teaching and learning, it means that educators and learners engage with lived experiences or life stories from local people, or experienced communities, to understand social justice in action. Their engagement creates a shared or collective understanding about a particular story of activism in a particular context and can help teachers to become

activist professionals (Sachs, 2000 in Paliokosta et al, 2022). Through the development of teaching resources and learning spaces, a narrative of activism brings historical, political, theoretical, and personal experiences into education and training. Children can be supported to understand the concept by identifying issues they care about and reflect on the impact on individuals and communities. This engagement brings agency and motives into educational spaces so that teachers and pupils might activate change (Giddens, 2009 in Paliokosta et al, 2022). This is something that can expand beyond the walls of the school, into the family and community.

The resource discussed above tried to make social history relevant to now using transformational ideology for education in the context of these resources that refer to transformative events of the past, but people may not be aware of or may not choose to discuss. In that context, by using those narratives we hopefully create an emancipatory approach to disability and inclusion. Teachers and children are learning together about activism and can engage in various forms of peaceful activism. We acknowledge that the thought of causing disruption may be uncomfortable or seem inappropriate for someone who is in education. What needs to be explained in this context is that peaceful disruption may be necessary for challenging assumptions, questioning practices, questioning the status quo. Through other people's activism (found in the resource) one can gradually and safely engage with this approach and start reflecting on other possibilities and small things we can do to challenge the status quo, maybe in the school, in the class, in order to improve inclusivity for all.

At the same time, it is about looking at the person within their own social structures, but also beyond that and trying to create an environment that is going to perceive ways of change and apply them, taking into consideration intersectional perspectives of age, ethnicity, culture, because if you look at disability in its own right, it is just a characteristic that can feature in many people. In the context of this work, it is anticipated that the participant teacher is engaging with the resources, takes an abstract notion of concepts and co-creates resources for their children, and then they can modify them with them. And the outcome is to promote social change.

Promoting empathy through a multi-modal pedagogy

When we are thinking of an 'All means All' approach, multi-modality, namely using multiple modes of communication, is key in promoting a welcoming environment for all.

Storytelling and story making

Storytelling and story-making is an acknowledged tool used with children who have English as an additional language, where children are trying to make sense of the self. Storytelling can address social inclusion, cultural intelligence, and intersectionality in education

(Sinkfield-Morey, 2018) as it supports self-expression, creation, and imagination beyond institutions to engage traditionally excluded groups and communities in education (Paliokosta and Kostidakis, 2019). Storytelling and story making with children (co-production) really supports getting to an intersectional understanding of self and identity.

It is important to note that storytelling is looked at from a relational perspective in this context. A relational framework (Doane and Varcoe, 2007) can be used to approach the different types of such learning found in stories and the way we have been using them with children. There are three dimensions of relatedness: the story and characters; the processes of storytelling; other people participating in the storytelling.

So every child can look at a story from a different level and make connections with aspects of it, whether it is disability, ethnicity, other aspects of their identity they may be discovering and exploring. Some may be connecting to the process of storytelling, and they may be connecting with other participants in its context; this demonstrates the need for certain skills that are enabled for the child when they are becoming part of the story and then relating to the other people that are in this storytelling process and engage to their own level. There is no expectation, right or wrong, but it is a rather engaging process that hopefully enables children and their teachers to develop some empathy together within this relational process.

Story-telling and drama

Using storytelling and drama is a way to promote empathetic and relational pedagogies. It can be a powerful educational tool to promote diversity and foster inclusivity. 'Through storytelling you are able to open up and facilitate a space for navigating uncertainty' (Nash-Patel. 2022:4). However, storytelling remains a hidden part of the curriculum (Attenborough and Abbott, 2020) and there is a need to equip teachers and other professionals (like nurses) who meet children with effective techniques (Haigh and Hardy, 2011) that are relevant to their specific learning goals, but also enable better rapport with children (Eraut, 1994; 2004). Narrative enhanced pedagogy uses storytelling to motivate thinking, interpretation and learning (Diekelmann and Diekelmann, 2009 in Nash-Patel et al, 2022) and it is in line with Freire's (1988) critical pedagogy that intended to empower those who were marginalised. Narrative pedagogy focuses on sharing personal stories in the context of the learning process and seeks to co-create knowledge through a combination of voices in a collaborative learning environment (Daniels and Downes, 2016).

One such example is the inter-professional Heritage2Health pilot Virtual Arts and Drama Programme that addressed gaps in the curriculum for teaching and practice around disability of other professionals (nursing) who come into contact with children and is linked to barriers to healthcare for those with learning disabilities and student nurses' anxiety and fears of working with this client group. Students worked with young people with intellectual disabilities, parents and teachers using a 'Story Aid' approach which helped them self-

reflect as people and their social reality, examining their attitudes and belief systems while learning skills to work with those who have intellectual disabilities. *The storytelling space gives a place for active witnessing of self-identity formation of both the teacher and the child* (McAdams, 2008). Using a story called Ubuntu the Lion with the long, long mane (Nash-Patel, 2021), the Zulu Ubuntu philosophy comes to life, promoting an idea of humanity coming together. Using visual arts and sensory approaches to get the student nurses to work with the teachers, the young people and parents self-reflect on issues of identity; for example who am I as a human, the professional self and how that relates to me being a professional when working with those who have disabilities. (Nash-Patel et al 2022). 'I am because we are' is an underpinning concept in the Ubuntu philosophy.

Examples of visual communication in an accessible way

Journaling

The online and face-to-face drama sessions mentioned above were co-facilitated by a socially engaged artist; a socially engaged artist produces community and group representation through participatory activities with groups whose voice may not be heard (Cleveland, 2011) aiming at affecting the public sphere meaningfully (Helguera, 2011). They used visual representation through a journaling approach to depict learners' participation in the online sessions. In the context of the journaling process, both teacher educators, nursing educators and children and their parents would write notes about the experience, about the story, about the process, about the character or about each other. This was then represented visually in what looked like a powerful interactive piece of art. There are a lot of benefits in the journaling process, such as increased self-awareness, enhanced creativity and improvement of communication skills. In this context processing of difficult feelings towards the story were approached and attempted to be made sense of.

Visual Installation

This artist is also known for another type of visual representation entitled 'Refugees Crossing' http://www.bernodonoghue.com/refugees-crossing. Refugees Crossing is an interactive art project which invites members of the public to raise awareness of the real issues refugees face by placing fact filled paper boats in public places. It was started in August 2015. The messages have been translated into six languages and over 9,000 boats have been posted across the world. Since September 2015, the project has developed collaborative work with schools and colleges to encourage children and young adults to consider the plight of refugees and engage in an open discussion about migration.

Children have been engaged by creating a boat that they labelled with names or roles of people that had passed, such as son, daughter, sister, brother; such kinaesthetic methods can be applied to all sorts of different scenarios and ways of working with children to

make sense of topics that might otherwise be difficult to approach. The effect of saying 50,000 people died during crossing and actually visualising 50,000 boats representing them, is very different; there is an activism element in this process, as people who make them empathise with the dead during the process and then communicated this cognitively and emotionally by putting the boats on public spaces, such as the tube, a school door, on the pavement, etc. The children would do the same, put them in all sorts of different spaces so that people were becoming aware of this tragic and unacceptable issue that they may have otherwise heard without focusing on it. Similarly, this method can be used for a local issue, for example the exclusion of a friend because they are different or the bullying they may have been receiving by other children due to their difference. So hopefully that empathetic approach creates the ability to think through the other person's shoes and actually understand the story, understand their narrative and relate it to themselves.

Final words

We hope that this chapter gives trainee teachers and any teacher access to some historical representations around disabilities (visible and hidden) in the attempt to be informed when deconstructing old and new discourses. We have provided material and resources to support empathy development and a narrative of activism in the context of social justice that will hopefully support positive change in schools for those with disabilities and beyond. There is a wide range of opportunities for learning from FFR DAR to be used to enhance culturally-responsive learning and place-based learning through incorporating local voices and life experience narratives into curricula. If you are a teacher that would wish to develop these further, we would love to work together. In the meantime please find some reflection points and questions below with some resources to help you engage with the relevant sections of the chapter.

Local contexts

Closing questions to discuss or tasks

- **Reflection Point: Section Starting conversations with pupils about discourses surrounding disability and difference in a diverse classroom. Some background.**

  A definition of disability is useful here. Have you attempted to discuss this with your pupils? Is there a common understanding and language in relation to this?

  Resource: FFR1 Understanding Disability

  https://kcil.org.uk/wp-content/uploads/2023/01/FFR1_PSHE_Understanding-Disability-1.pdf

  invites children to understand different types of disabilities through experiential learning and create ways to include all disabilities.

- **Reflection point: Starting conversations with pupils about discourses surrounding disability and difference in a diverse classroom. Some background.**

  1. It is important as a teacher to not only use reflective practice but to support children and young people to do the same, therefore how do we:

  -reflect on our understanding of disability and how this impacts on our own perspectives and attitudes.

  -support children and young people to reflect on their own viewpoints of disability to engage in discussions that are inclusive and respectful of others.

  Resource:

  Look at the Gibbs Reflection Model (1988) as a framework to gain an understanding of your own experiences and attitudes towards disability in order to help children do the same. Here you can find models of reflection including the Gibbs Reflection Model. Reflective Writing – Models of Reflection and Reflective Practice | London (hee.nhs.uk

  2. What about children with lived experience of disabilities or being a carer for a family member with disabilities. How do we support them to offer valuable insights to their experience?

  Resource:

  FFR2 Developing Empathy Skills https://kcil.org.uk/wp-content/uploads/2023/01/FFR2_English_Developing-Empathy.pdf

  invites teachers and children to develop and demonstrate empathy skills, by creating a diary entry from the perspective of a pioneering disabled activist.

- **Reflection point: Some theoretical perspectives around disability.**Thinking about support for disabilities that currently exists could encourage a discussion about which

model this originates from. For example, is the school accessible for everyone with diverse physical abilities? Are there ramps etc in the building or lift access for those who can't easily access buildings of different floors?Resource:FFR 12 Demonstrating inclusion awareness through an accessible school blueprinthttps://kcil.org.uk/wp-content/uploads/2023/01/FFR12_Art_Demonstrating-Inclusion-Awareness.pdf invites children to demonstrate their awareness of inclusive approaches by creating a blueprint (e.g., a map drawing that shows an ideal layout) of the school, which is accessible to individuals with disabilities.2.Teachers can familiarise themselves with some background material on the social versus medical model of disability here: https://ukdhm.org/what-is-ukdhm/the-social-model/ in the Disability History Month resource:https://ukdhm.org/.

- **Reflection point: What about hidden disabilities?**Thinking about your own teaching environment, how do you as a teacher view those with hidden disabilities? What models of disability do you operate under?Resources:1.FFR11_History_Approaches-past-and-present.pdf invites children to compare approaches to mental health from the 18th century to now.2.Animation and teacher toolkit to start conversations about mental health in primary schools:Teacher resource for mental health Teacher resource for mental health .Here you can also find a mental health jargon buster approved by young people using this link jargon-buster to further understand terminology used in child and adolescent mental health.

- **Reflection point: Hidden disabilities now and in the past.** Do disabilities that are hidden (e.g., undisclosed, undiagnosed, not-visible) affect how you respond to behaviours when compared to those who have physical disabilities? Are your expectations different?Neurodiversity may have physical expressions but it may be categorised as 'hidden' if teachers lack the understanding to pick up on them e.g., subtle changes in behavioural responses or communication such as repetitive speech.Would this also apply to other children in the class in relation to how they respond to their peers?Resource:FFR10 Exploring the ethos of viewing mental healthhttps://kcil.org.uk/wp-content/uploads/2023/01/FFR10_English_Exploring-mental-health.pdf invites children to explore the ethos of viewing society's view of mental health and appropriate ways of responding to someone's life narrative with mental health difficulties.

- **Reflection point: Hidden disabilities now and in the past.** We need to consider who we have in the classroom in terms of diversity and the impact of discussing this subject matter.What is the preferred terminology around disabilities and what may be considered offensive to those with disabilities?Resource:FFR7 Disability in the Communityhttps://kcil.org.uk/wp-content/uploads/2023/01/FFR7_PSHE_Disability-in-the-Community.pdf invites children to understand the barriers families with disabilities face in everyday life.

- **Reflection Point: Story-telling and drama.** Resources: You can find more about the StoryAid project here: https://journals.healio.com/doi/epdf/10.3928/01484834-20220912-12 You can engage with ways of using the Ubuntu story here: https://kingstonuniversity.padlet.org/KU43435/ubuntu-the-lion-with-the-long-long-mane-by-theresa-nash-pate-maj1v9pcfl023yru

About the authors

Paty Paliokosta

Paty Paliokosta is an Associate Professor in Inclusive Education at Kingston University and a Senior Fellow of the Higher Education Academy. With over two decades of experience in the field of special and inclusive education, my journey has been dedicated to promoting social justice and empowering diverse learners, particularly those with special educational needs and disabilities (SEN/D). As an educator, inclusion manager, local authority advisor, researcher, and advocate she has actively contributed to shaping inclusive policies, leading innovative participatory research projects, and championing social justice within schools, local authority, higher education and the community. She leads the 'Inclusion and Social Justice' SIG and the 'Inclusivity, Anti-oppression and Underserved Communities' bidding network. Her full profile can be found here: https://www.kingston.ac.uk/staff/profile/dr-paty-paliokosta-730/

Nicola Ryan

Nicola Ryan, clinical nurse specialist in child & adolescent mental health, cognitive behavioural therapist, senior lecturer at Kingston University in the UK. Areas of interest and research include intersectionality, child and adolescent mental

health, neurodiversity, psychological and behavioural therapies, education of autism and ADHD for students and educators.

THE ROLE OF VALUES IN INCLUSIVE EDUCATION

Example Case

"Now I know that it is very important to me to make friends and to care for nature. Having friends is what counts in life. It is not important to me at all to be rich and powerful or to be like the others. If we are all equal, what kind of life would that be?" I stand about three metres in front of him trying to suppress the reflex to rub my eyes as well as the urgent need to ask the person next to me for a quick pinch. Instead, I just stand there, grinning from ear to ear and cannot believe it. The person next to me is an experienced middle-aged primary school teacher, also smiling broadly, perhaps not quite as exaggeratedly broadly as I do. Him – that is a nine-year-old fourth grader talking about what is important to him in life (cf. Auer, 2021, p. 1). And when we talk or think about what is important to us in life, we talk and think about values."

cf. Schwarz, 2012

Initial questions

In this chapter you will find the answers to the following questions:

1. What are values?
2. Why do values play a role in inclusion/inclusive education?
3. Where do I find values in the school context?
4. How can I work with values to foster inclusion?

Introduction to Topic

As the example case above illustrates, values reflect what matters to us, what we find important, and can also help answer the question of who we are. In this case, the fourth grader seems to place high value on friendship, caring for nature, and appreciating diversity. Based on this information, and drawing from a broad definition, (Ainscow, 1991; 1997; Ainscow et al., 2013; UNESCO, 1990, 1994) we could argue that inclusion is his cup of tea[1]. When it comes to inclusion and, more precisely, inclusive education, scholars have written more specifically about the concept of inclusive values (e.g., Ainscow et al., 2006; EADSNE, 2012; Booth & Ainscow, 2016; Väyrynen & Paksuniemi, 2018; Ianes et al., 2024). These scholars contend that values provide the foundation for developing inclusive education systems, and for successfully implementing inclusion from theory to practice. However, it is evident that, despite discussing values, these scholars often refer to different interpretations of the term. Therefore, in this chapter, we will explore in more detail why and how values play (and should play) a role in inclusive education, where they appear, and how we can work with them on a practical level. We will initially define what values are and propose a theoretical model, currently the most frequently cited across different research disciplines, but having its origin in social psychology. So, make yourself a cup of tea (or coffee) and let us venture into this topic …

Key aspects

What are values?

Values, as a central concept of social science, play an important role in many different

---

1. The idiom "(not) my cup of tea" means something that a person likes or dislikes. In its positive form it is often used to describe personal preferences, especially for activities, hobbies, or topics someone finds appealing. In its negative form it is a casual way to say something isn't to one's liking or interest, often used to politely show a lack of enthusiasm or to decline.

disciplines (e.g., sociology, psychology, anthropology) (Schwartz, 2006). However, since different academic fields have employed the concept of values, numerous understandings of the construct have co-existed over the last few decades. An agreement on what these values are, what constitutes them, what they contain and how they are structured, has been absent for some time (Schwartz, 2012). What do we mean when we talk about values? What do we refer to?

The Basic Human Values Theory

In 1992, the sociopsychologist and cross-cultural researcher Shalom H. Schwartz published an article introducing a theory of basic human values by identifying the common features from previous definitions and approaches (Davidov et al., 2008). In addition to other scholars, his theory was predominately based on the work of Milton Rokeach, whose work has mostly been shaped by the understanding of values in empirical science (Frey, 2016). Within his theory Schwartz (1992, 1994) defines values as "[…] trans-situational criteria or goals […], ordered by importance as guiding principles in life" (Schwartz, 1999, p. 25). To put it more simply, values give an answer to the questions "What is important to me? What goals do I strive for? What are the guiding principles of my life?" (Döring & Cieciuch, 2018, p. 17). As such, values are therefore part of the self-concept (Hitlin, 2003; Vecchione et al., 2016), in response to? who I am (Döring & Cieciuch, 2018).

Part of Schwartz's work consisted of the categorisation of values. But what did he do exactly? He collected countless words that people around the world, and in different languages, that were used to refer to values (i.e., specific values) and summarised them into 10 types of values based on their underlying motivational goals (see Table 1). These 10 value types are common to every human being all over the world, in other words, they are universal. Nevertheless, persons or groups of persons (i.e., cultures, societal groups, school classes) can prioritise them differently, which leads to contrasting value priorities or hierarchies (Schwartz, 2012). Hence, individuals share the same set of values within? a universal structure, but individuals or groups differ according to which values are more important to them and which ones are not.

Table 1: Value types, their underlying motivational goal and examples of specific values

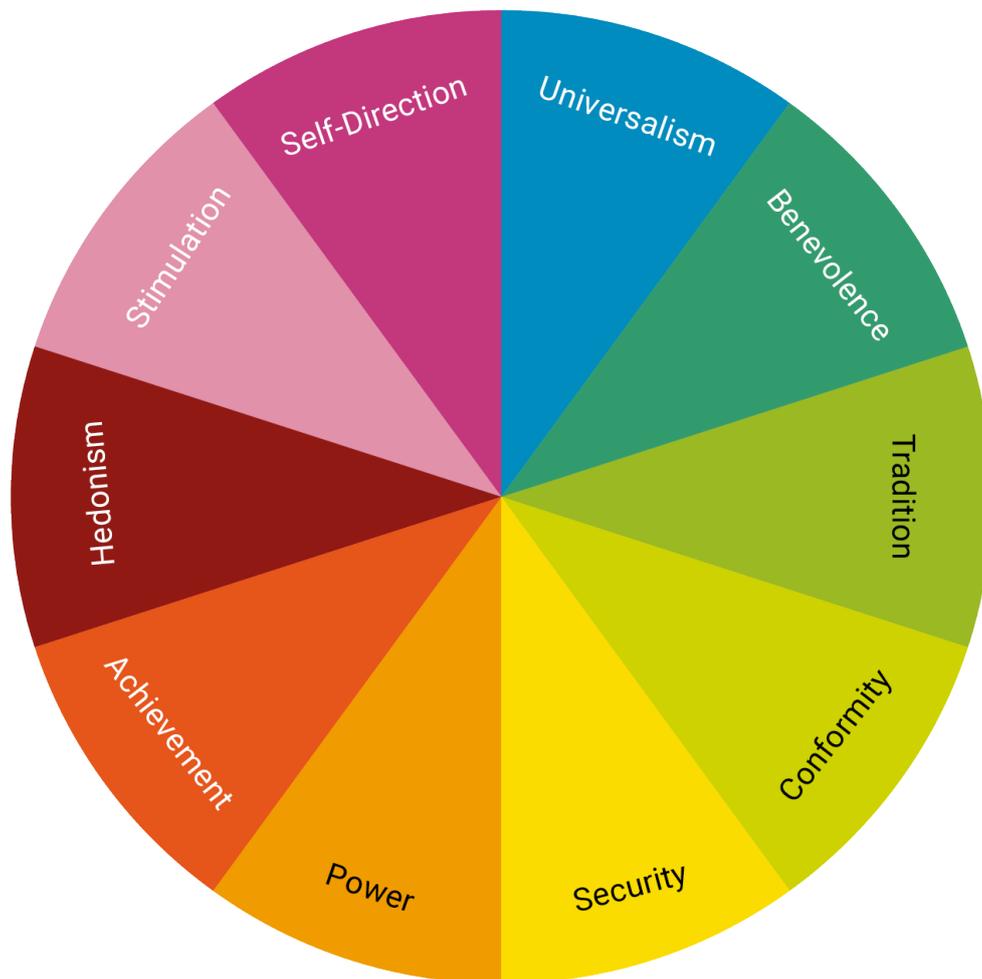
Value type	Motivational goal	Specific value
Power (PO)	Social status and prestige, control or dominance over people and resources	Social power, authority, wealth
Achievement (AC)	Personal success through demonstrating competence according to social standards	Successful, capable, ambitious
Hedonism (HE)	Pleasure and sensuous gratification for oneself	Pleasure, enjoying life
Stimulation (ST)	Excitement, novelty, and challenge in life	Daring, varied life, exciting life
Self-direction (SD)	Independent thought and action—choosing, creating, exploring	Creativity, curious, freedom
Universalism (UN)	Understanding, appreciation, tolerance, and protection for the welfare of all people and for nature	Broad-minded, social justice, equality, protecting the environment
Benevolence (BE)	Preservation and enhancement of the welfare of people with whom one is in frequent personal contact	Helpful, honest, forgiving
Tradition (TR)	Respect, commitment, and acceptance of the customs and ideas that traditional culture or religion provide for the self	Humble, devout, accepting my portion in life
Conformity (CO)	Restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms	Politeness, obedient, honoring parents and elders
Security (SE)	Safety, harmony, and stability of society, of relationships, and, of the self	National security, social order, clean

Source: Adapted from Schwartz, 1994, p. 22

Brief digression: Short digression: Power? Really? Power over others? Some readers may question the use of certain terms or feel that the perspectives presented seem one-sided. For example, in the chapter Participation of children and youth in learning and community development, alternative forms of power are discussed, one of which is "power with." This form of power is elsewhere defined as "having to do with finding common ground among different interests and building collective strength. Based on mutual support, solidarity, and collaboration, power with multiplies individual talents and knowledge. Power with can help build bridges across different interests to transform or reduce social conflict and promote equitable relations" (VeneKlasen & Miller, 2002, p. 45). According to Schwartz's systematisation of values – categorised by their underlying motivational goals – this concept of "power with" aligns more closely with the value type of universalism. This variation in the interpretation of "power" reflects how the meaning of certain terms can differ based on the theoretical framework in use. In their foundational work, Schwartz and Bilsky (1987), both psychologists, identified universal demands that all individuals and societies face: biological needs, requirements for social interaction, and group necessities for survival and welfare. They proposed that values are "cognitive representations" of these universal demands (Schwartz & Bilsky, 1987, p. 551). In contrast, VeneKlasen and Miller (2002) examine power from a political perspective, identifying various forms or expressions of power. Thus, while both groups discuss power, the concept differs depending on the underlying framework. This distinction can arise not only from disciplinary differences but also from the use of English as a lingua franca in research. In cross-cultural or international studies, terms translated into English can sometimes lose their original nuance, as D'Alessio and Cowan (2013) noted in their work on inclusion and special needs. So, if you find yourself wondering, "Power?" or perhaps even "Universalism?" or "Hedonism?" it may be because these terms have varying definitions. However, within Schwartz's framework, each value type is defined by its underlying motivational goal and the examples of specific values associated with it.

The Circular Structure of Values

The ten value types are related to one another in that they can harmonise or conflict with each other (Davidov et al., 2008). That is, the value of benevolence, for example, conflicts with the achievement of power values like social power, however, it is incompatible with universalism values like social justice. The dynamic relationships between all of the value types are portrayed graphically in the circular structure of Schwartz's value system (Schmidt et al., 2007) as shown in Figure 1. Values lying next to each other are in harmony, e.g., actions motivated by them are compatible with each other, whereas those on the opposite side are in conflict, e.g., actions based on these values are rarely combined.

Figure 1: Theoretical circular model of dynamic relations among the 10 value types


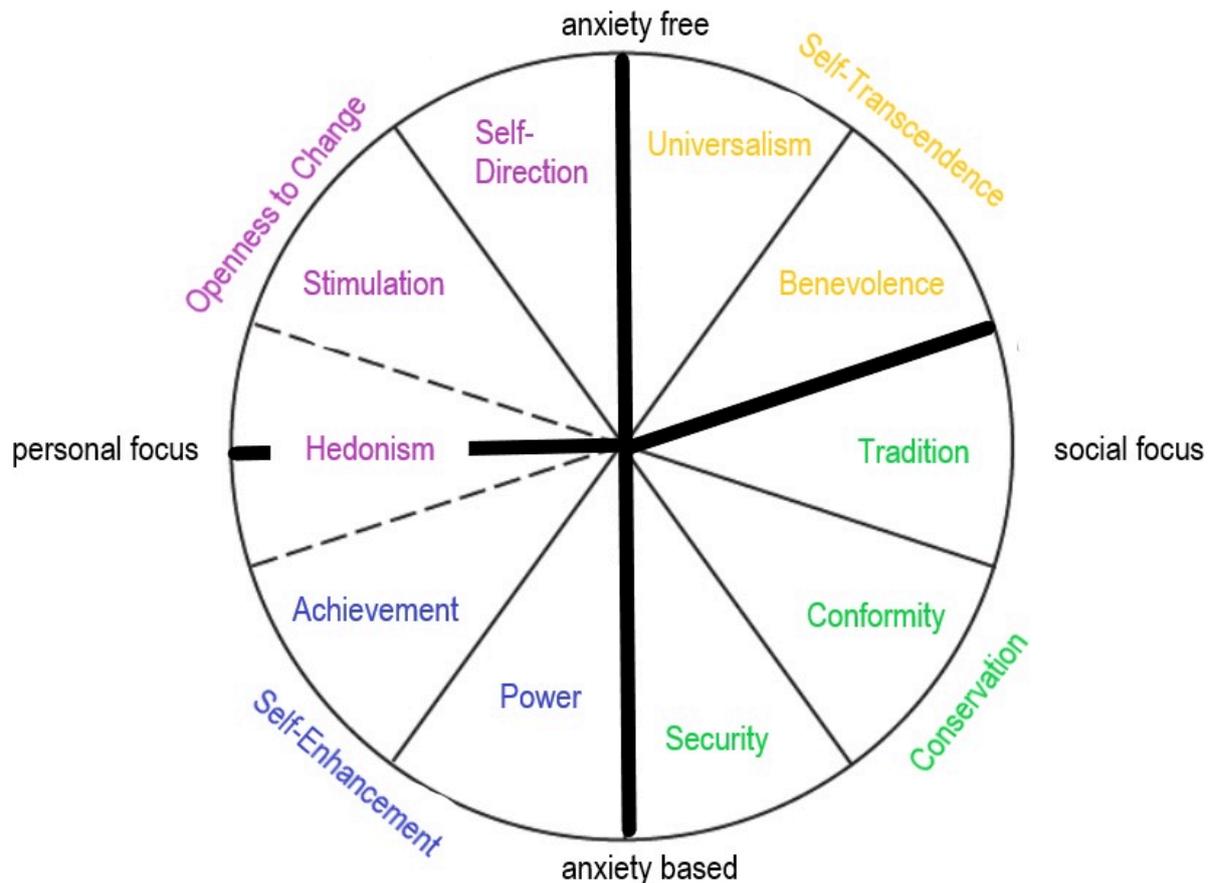
Source: Adapted from Döring & Knafo-Noam, 2019 and according to Schwartz, 1992, 1994

> **Example:** Let us try to make this more concrete. Imagine you are in a group hiking up a mountain together. You are walking uphill. One group member struggles, others are fine, and a small group almost runs up the hill. If it is important to you to take care of the people close to you, you will probably stay with the struggling person and try to help them get to the top of the mountain. This benevolence value would be compatible with universalism values, highlighting the importance of reaching the summit where no one is left behind. However, this conflicts with achievement values which may be important to you, and which showcase your capabilities. In this case, you would probably try to catch up with those who run up the hill, in order to demonstrate your ability to reach the top of the mountain. If you are a person who gives importance to both values, you might become aware of the competing nature and struggle to decide which action to take. Is it more important to me to stay with the slower group member or try to catch up with the others?

This situation is one of the rare occasions when the impact of values on decision taking

becomes conscious: in other words, there is a need to decide between two cherished, but equally, conflicting, values (Schwartz, 2012). For many, values unconsciously direct our everyday decisions and actions. The example above also reveals the importance of conflicting values. For instance, I can value benevolence, and at the same time, I can cherish achievement, i.e., being successful and ambitious. Furthermore, within a group, people may prioritise differing values, as the case above represents. Nevertheless, having different value priorities that guide us can be fruitful, and must not be a cause for conflict. A group can be more successful when there are explorers (self-direction), those who help others (benevolence) and also leaders (power) and those who take care of nature (universalism; cf. Döring & Noam-Knafo, 2019). As Schwartz (2012) argues, the pursuit of certain values can have negative consequences, such as when power values may be important for some, or when social relationships are harmed or someone is taken advantage of. On the other hand, inherent in power values is the motivation to work for the interest of a group. Consequently, values alone cannot be defined as "good" or "bad", but their meaning and value is crucial for the functioning of societies (cf. Döring & Noam-Knafo, 2019).

Adding complexity: Figure 1 shows a simplified version of the circular model. According to Schwartz (2012), values form a continuum of related motivations which gives rise to a circular structure. The ten value types (according to their competing nature) can be combined to four higher order values by organising them into two bipolar dimensions (see Figure 2). The value type hedonism cannot be related explicitly to one higher order value, but is attributed to two of them. The value types can further be classified based on the interest of attaining values (i.e., some value types focus on personal interests while others focus on social interests) or are dependent on the role of anxiety (i.e., some values are based on anxiety and others are free of anxiety) opening up a further two bipolar dimensions. All of these possible classifications are dynamic principles leading to the dynamic structure of value relations.

Figure 2. Dynamic principles of the structure of values


Source: Adapted from Schwartz, 2012, p. 13; Döring & Cieciuch, 2018, p. 27

The motivational continuum not only creates the circular structure but it also turns the value system into an integrated one, where all the values can be considered in relation to other concepts, such as behaviour or attitudes (Capanna et al., 2005). This organisation of values in a circular continuum highlights how a change in the importance of one value impacts the importance of both adjacent values and those lying next to the value in question (Bardi & Goodwin, 2011; Maio et al., 2009). The greater importance attributed to universalism values, the more important benevolence and self-direction values will be, and the least important the power value will be. Furthermore, what is important to me can vary considerably across groups and context?. In a study by Daniel et al., (2012), individuals were found to differ in their value differentiation ability whereby the latter (differentiation??) relies on the ability to compare contexts and the embodied values. Hence, the interplay of different factors in the importance of values and unimportance of others as well as the dynamic structure of the value system is as complex as real-life situations.

In summary, values play an important role in our lives and motivate our actions. Depending

on their underlying motivation, values can be summarised into value types which interrelate dynamically with each other either through harmony or conflict. In light of this value theory, the importance of values in everyday life seems almost logical. But how can this be used in inclusive education …

Why are values important when it comes to inclusion?

According to Booth and Ainscow (2016) values play a key role in the inclusive development of schools. In the Index of Inclusion, a resource for developing schools and society through participation towards inclusion, the authors argue that aligning actions with inclusive values can be a concrete step towards development. In line with Schwartz's (1992, 1994) definition, values are understood as action guiding principles, which guide cultures and define goals. Adapting? inclusive cultures next to inclusive policies and practices are positive steps towards achieving inclusive educational institutions and societies. Further, it can be assumed that values within the concept of cultures built the foundation. This arises also from their position on the basement within the triangle (see Figure 3).

Figure 3: Three dimensions of inclusive school development

Evolving inclusive cultures

Source: Booth & Ainscow, 2016, p.49

Even though all three dimensions highlighted in Figure 3 are essential for an institution

or society to become inclusive, if there is a lack of shared values it might be that changes in the other two dimensions risk a mere formal action (Demo, 2013). It is only through the activities of individuals that effective change can be sustained? Indeed, Booth and Ainscow (2016) also propose a set of inclusive values that schools can work with in a variety of ways (i.e., the Index for Inclusion is an instrument that can be used to work on the community level, the school level, the class level, or on the individual level). On the other hand, they also present a set of exclusive values, which might hinder schools in developing towards inclusion.

Brief digression: This might also lead to an understanding of "good" and "bad" values and, as argued above, such a categorisation does not do justice to the importance of the interplay of all values in a society (Döring & Noam-Knafo, 2019). Therefore, the definition of inclusive and exclusive values needs also to be understood from a critical perspective. Hinz and Boban (2013) propose combing them through a more dialectic approach like the so-called "value square". The foundational concept of the latter originates from Aristotle, was expanded upon by the German philosopher Nicolai Hartmann in 1926, adapted for psychology by Paul Helwig in 1936, for communication psychology by Schulz von Thun in 1989 (Schulz von Thun, 2015) and introduced into the inclusion discourse by Hans Wocken (2013; cf. Hinz & Boban, 2013). The key premise of the value square is that virtues, which are guided by underlying values, in their exaggerated form risk falling into something negative. Therefore, it is about finding an appropriate balance within one virtue to keep it compatible with its counterpart (Schulz von Thun, 2008). Relying on the concept of the value square could facilitate a shift from a values-recommending to a values-reflecting perspective (Hinz & Boban, 2013). In such an approach, the focus is not on what is right or wrong but rather on what is important to you, what is important to me, and what is important within the given situation or context. This allows for the discovery of a solution on a higher level – even, or especially, in cases of opposing or conflicting values – through the synthesis of both perspectives. In addition to the dynamic principle of values, the process of value reflection should also be dynamic, flexible and continuous.

Example: Bell is a 31-year-old primary school teacher working for the last two years in a new school along with a team of four other teachers. She cares about making educational contexts and the learning environment inclusive. For Bell, it is important to include all children in the learning, encourage collaboration, discuss different points of views and understand the perspectives of others and ensure that all children are content in school – though this sometimes can be time consuming. Unfortunately, she often has the feeling that her colleagues do not apply the same work principles, and there have been a number of conflicting situations recently. Bell realised that most of her colleagues did not recognise the benefits of the inclusive values. Rather they consider it more important that children learn all the content and topics, respect the rules, and ensure safety in the classroom. Bell understood that fostering more inclusion with her team could start a conversation on underlying values. Finding common ground could then facilitate a unifying objective that could guide daily classroom activities.

From this, a further aspect concerning "Why are values important when it comes to inclusive education?" arises. Bell initially used the Index and the indicated values individually, that is, she read through and reflected on the inclusive values. Following this, she will use this approach with her team colleagues. The Index for Inclusion can be used to work across many different levels: on the community level, the school level, the class level, or on the individual level (Booth & Ainscow, 2016) and values are inherent in each level? Let us dive into the next question, which, leaning on another theoretical model, will try to give an answer to the third initial question.

Where do I find values for Inclusive Education?

Considering how values can be defined in terms of content and features, it is important to understand the dimensions in which values lie (i.e., where) in order to work with them, and orient them, towards the promotion of inclusion across educational contexts. In this sense, values operate within multiple levels of human life particularly as they are maintained, negotiated or transformed across contexts and social groups. When it comes to education, learning environments constitute one of the most impactful dimensions in which values can be transmitted (Ristevska et al., 2019), as schooling encompasses socialisation and personal development.

The 'Where' section moves through deeply reflective and nuanced practical applications of case studies from both a national and international perspective. Other chapters have highlighted Bronfenbrenner's first edition of the Ecological Model (1979, see chapter Neuroinclusion: A school community approach). However, this chapter on inclusive educational contexts is discussed using an adaption of the Ecological Model, which describes movement within the Microsystem as linkage through the Mesosystem (Hayes et al., 2023; Sheldon, 2019). This movement brings with it possible conforming and conflicting values. Young children and adults are viewed as active participants with individual values, wants, needs and desires in their world (Bronfenbrenner & Morris, 2006). This occurs in an inclusive bi-directional way within families (Microsystem) and within communities (Exo- and Macro- Systems). Finally, this section points to the difficulties and successful application of individuals living close to their values in education and society.

The Process-Person-Context-Time Model

The next sections will frame the importance of values in education using Bronfenbrenner's and Morris' (2005) most up to date model Process, Person, Context over Time (PPCT) which highlights the potency of values in inclusive communities. Bronfenbrenner and Morris (2006) provided a detailed description of bi-directional actions using the PPCT model, which they defined as proximal processes. This model illustrates the relational engagement with others (including inanimate objects and symbols) in context over time. Bronfenbrenner and Morris (2006) called these engagements the engines of development. A person's engagement with their environment becomes more complex, causing the development to progress in a particular direction. Merçon-Vargas et al. (2020) considered Bronfenbrenner's perspective on the engines of development as slightly narrow as it only theorised child development from a positive perspective. Instead, they suggested that inverse proximal processes also produced dysfunction (either positive or negative), which are constantly evolving over time.

The active Person (P) is engaging in Proximal Processes with people, symbols and objects within a microsystem, interacting with other contexts, and involving both continuity and change over time (Tudge, 2008, p. 69). Bronfenbrenner maintained that the person is the active participant in their worlds; and includes a person's values and beliefs (Hayes et al., 2023). Relocating human development internally in relations and externally with the environment. Values and beliefs lay the foundation on which education is occurring. Bronfenbrenner's thoughts progressed from the previous dichotomous focus on the body separate from the mind or what had become nature versus nurture debate of attachment, to a more harmonious inclusive perspective of child development. Subsequently, Bronfenbrenner and Morris (2005) stressed the importance of reciprocal relationships within the social context on the development of the body? rather than just the brain (Bronfenbrenner, 2005; Osher et al., 2018). Nestled in these inclusive relational processes are the significance of both conscious and unconscious values, beliefs, traditions and cultures. Bronfenbrenner relied on the work of Kurt Lewin to position his thoughts on values. He viewed values as fundamental in the processes of human behaviour (Bronfenbrenner, 1979; Cartright, 1951). Lewin (1951) highlighted that the values among groups were likely to drive group engagements in both positive and possibly negative ways. Crucially, values, tradition and norms are culturally and contextually loaded.

Processes of Values

To begin applying the PPCT model, we will start by focusing on the first P for processes of inclusive relationships in education. A process is at the core of human engagement. Bronfenbrenner and Morris (2005) called these Proximal Processes, relations that are dynamic, active and consistent engagements with the environment. Previously, values were not prioritised as positive or negative but rather as beliefs driving behaviour. However, Wilkowski (2022) suggests that vices also need a voice within this framework. Vices can be understood as the counterpart of virtues, which, as stated earlier (see brief digression above), are guided by underlying values, as are vices. The vignette below highlights how an educator strives to uphold her values while addressing the contrasting values of the educational system.

The Processes of Values in Educational Inequity

Chris was a teacher in a German school. She was fascinated by how every classroom she walked into would have a list of the classroom rules supported by their teacher training. These sets of rules included her own classroom. The children all have rules to follow, still, she wondered about the inability of the rules to be followed. Chris taught her students to always question everything they were told, no matter how powerful or experienced the person they seemed with the information. Nonetheless, Chris began to reflect on this nested paradox from her teacher training instilling conformity whilst also trying to instil the children's wonder and curiosity. Upon reflection Chris thought 'how are these rules developing my children into flourishing human beings?' Chris brought her reflections to her class and after a discussion she realised the disparity between rules with intent to conform and values of universalism and social justice.

   Shortly after this reflection one of her children notified her of their deportation. Against the advice of the school Chris explained to the children what was happening. However, she prompted the idea there was nothing they could do to help their friend; this was German law and could not be changed. Chris then set an instruction and said, 'Rules cannot be changed we have to continue on with our work'. Yet the children's values of benevolence and universalism floated in the air. Chris heard the children whispering how they could get their friend back. Upon hearing this Chris reflected on her unconscious values. I am asking the children to question power but instilling conformity. I have emphasised the importance of these values I have to follow through. Chris enlisted the advice of a lawyer to see if the child and family could come back to Germany. She fought hard for the children's values to be upheld. Chris followed the lawyer's advice and made a plan against the school's wishes. Before proceeding, was there anything he wanted from Germany? The boy replied, 'my friend'. There were more hurdles for Chris to overcome but she did, and the teacher and the boy's friend travelled together to the child's hometown. On this 10hr journey Chris nurtured the children in Germany's sense of security and broadened the children's learning geographically, demographically, socially and culturally by bringing with them a little toy fox to tell the story of their trip. Chris brought their worlds closer together with letters from the children back in Germany awaiting his return. On return with the family a presentation was held for the family. Politicians were asked to join the celebration. Chris taught the children about the value of conformity from a different perspective of the community, noting if they tried to deport the family again everyone would know the family and they would have the backing of the community.
   Vignette from Chris Carstens (All means All participant)

Throughout this journey, Chris navigated the fear of losing her job while striving to improve her school system. From a values perspective, it is evident close connections between values, vices, rules and laws as well as emotions exist. Whilst both rule-led and values-led pedagogies are underpinned by values, perspective is often nuanced. This real-life complex scenario started with the children's values becoming more visible and Chris advocating

against her own teacher training, forcing her to question her own limitations regardless of a person's or system's status or power.

Next, we move from the process to the individual, the second P (Person) of Bronfenbrenner's and Morris's (2006) PPCT model. There is continuous overlap in the model, linkages are consistently made between P, P, C, T between the individuals and the processes over time.

Where are individual values framed inclusive educational practice?

Bronfenbrenner and Morris (2005) stressed the power of the individual acting? within a bi-directional education system (both young children and adults). Bronfenbrenner and Morris (2006) also viewed? individual traits as personal and resource characteristics which drive personal behaviour to either positive or negative interactions (Hayes et al., 2023). Crucially, we need to critically reflect upon the implications for labelling positive and negative characteristics, particularly as all behaviour is values-laden? Bronfenbrenner and Morris theorised how an individual perspective (or behaviour) had an effect on relational engagements, habits and norms. Simply stated, values can be guiding principles for individual or educational settings. In addition, habits also reinforce values, possibly by developing an evolving disposition that influences the acceptance or rejection of certain ethos. All values have their value (Sheldon, 2019), yet within these overarching categories, they are often driven by individual processes and complex relational values.

Explicitly stated, espoused values are claims of actions. The implications of individual behaviour patterns could result in? people seeking espoused values and values in use. Practices and norms that are possibly hierarchical and are prioritised to be upheld. Experiential work may result in an imbalance between the values-in-use narrative compared to the applied? practice to the espoused values and missions of the educational setting? These disparities can occur for several reasons. The case study below emphasises an individual's espoused values to the behaviour of the values-in-use. The actions, practices and virtues can include or exclude a person. Values can be viewed from the perspective of? conflicting or espoused values within the educational setting.

What's my Cup of Tea?

My own individual values lie heavily in relational pedagogy; they are focused on personalised care and education. I support the need for relational agency from birth. As educators we are a safe person the babies could trust and be free to explore also in times of need, they could seek comfort and responsive caregiving. Babies have the opportunity to make decisions about their learning and development to instil in them the right to decide and problem-solve. This did not come without challenges when we had to slow down and move at the baby's pace rather than outcome led agendas. Trying to enact my values in my day-to-day practice could be a real struggle. My values are conflicting with apparent inclusive child-led policies and regulations. Depending on the educator's temperament, values and dispositions, trying to work relationally in the presence of outcome-led processes can essentially de-skill the professional graduates' practices.
    Vignette from authors practice: Lydia Murphy

This vignette highlights the importance of instilling an ethical balance between espoused

values and the values in use in individual student teacher training. It is crucial to manage the balance of social power for voices which are often overlooked and unheard. Values can be a fruitful conversation, which can be linked with individual identity (Espedal, 2022). Bronfenbrenner (1979) advocated that all the human and nonhuman objects and symbols have agency in reciprocal relationships. From here it is fitting to transition to the third section of the PPCT model: the context.

Values in Context

Bronfenbrenner (1979) stated that social strengths and social struggles are not created in a vacuum. Indeed, humans do not evolve in isolation (O'Toole & Hayes, 2019). Bronfenbrenner (1979) advocated for the importance of context in neighbourhoods and communities, and how the environment shapes individuals' learning and development. This next section focuses on the additional influences of context adding to the analysis in the PPCT model (Bronfenbrenner & Morris, 2005). The chapter Neuroinclusion: A school community approach displays the full impact of the Ecological Model in communities. This chapter will use the mesosystem to highlight the importance of linking, relating, or unravelling of values that shape contexts in communities. To ensure clarity of the mesosystem, Figure 5 below has adapted Bronfenbrenner's Ecological System.

The Mesosystem is defined as the communications or interactions in contexts that happen between the microsystems (Hayes et al., 2023). This section focuses holistically on the child as an active participant moving forward and back through the Mesosystem. The orange triangle below represents the child connecting and relating within their home and community over time. The child's direct and indirect engagements, connections and influences with different community contexts are also said to impact and shape learning and development. Bronfenbrenner developed the term "linkages" for this process of movement.

The flourishing of the child is more likely to occur when the adults in the environment value the voices of the children, and communicate effectively with the linkages across microsystems in the form of a whole community approach (Hayes et al., 2023). An effective communication approach is to prioritise the child's? voice as a way of being in our relationships. Both arrows represent reciprocal relationships over time between the systems. When we support the plurality of values, this can be viewed as the beginning stages of love and care (Kaur, 2020). The vignette below represents Lilly' community context. Lilly is a capable, competent little learner. At one and a half years old, she carries her learning across context into a different environment. However, the difficulty arises when Lilly's competencies at home are valued but her knowledge is questioned within her community context, and viewed through the lens of a whole systems approach..

Learning across Contexts

Lilly is a one-and-a-half-year-old toddler, and values traditions possibly influenced by her family. The tradition she knows well is birthday parties that include having a cake and lighting candles on top of it. Lilly is competent that she knows that when candles are lighting, they usually get blown out. However, when Lilly and her family go to another traditional ceremony the customs change. Lilly is being christened in a church and during the ceremony the priest lights a candle. Lilly brings her learning and competencies across the Microsystem into a different context. However, in this environment candles do not get blown out. The behaviour that stems from the same value can sometimes vary depending on the context. Behaviour associated with the value type tradition, as shown in Table 1, is motivated by the commitment and the customs and ideas that traditional culture or religion provide for the self. However, in the microsystem of her family, Lilly had learned behaviour that did not align with the customs of the new context of the church.

Vignette from research relationship

These diverse value linkages between contexts possibly reshaped Lilly's self-assurance. Yet, Lilly did not do anything wrong because the candle will be eventually blown out. If customs and rules were prioritised over values in this situation, one could argue that she did not show the right behaviour. However, seeing it from a value perspective, at both times Lilly valued tradition. Finally, the chapter moves to the last section of the PPCT model: the influence of values, patterns and norms over Time.

Values over time

This section is the final in Bronfenbrenner's and Morris's Model (2006) which explores Time; past, present, and future. The important addition of time was later added to the ecological system and named the Chronosystem. Bronfenbrenner noted the significance of time and over time on all the layers of the ecological system micro-time, meso-time, exo-time and marco-time. Our values, actions and norms are ever evolving in the present time. Value research suggests that even though values are relatively stable, they often change over the life span, and during periods of transitions and major live events (Bardi & Goodwin, 2011; Döring et al., 2016). For instance, during COVID-19 in 2020, security was a value given high importance. People engaged with family and friends very differently to what we do now. However, some practices and learning could persist from this time. The lifespan can also prioritise different values (Döring et al., 2016). Individual value change over time can be and particularly at an organisational level?

This section develops a political agenda espousing values of universalism and security in organisational agendas over time at a macro level. However, espoused political values in practice highlight values of power and conformity. For example, Equal Start is a government funding model that supports early years services over time to support disadvantaged children's learning and development.

Strand 2 of Equal Start will provide child-targeted measures – measures that are available in all settings and that will focus additional supports on children from disadvantaged backgrounds and priority groups, including: Children living in a small area assigned as deprived under the Pobal HP Deprivation Index. Children from a Traveller or Roma ethnic background. Children availing of the National Childcare Scheme through a sponsor referral, children living in homeless accommodation, and children living in an International Protection Accommodation Centre or Emergency Orientation and Reception Centre' (DCEDIY, 2024).

Early start is premised on the United Nations Convention for the Rights of the Child (1989) which states that every child has a right to an education. Despite this, the gap in education for children in the most vulnerable areas is widening due to lack of funding and resources. In Ireland, early childhood care and education settings in deprived areas have been running at a loss for over half a decade (ref?), leading to carers and families filling the gap. Consequently, many children are unable to attend the setting for required number of hours, as families could not afford the fees. This situation threatens inclusive education, as

children are denied access if their family cannot afford the fees. In 2024, early childhood settings continue to see many children experiencing inequality as babies, toddlers and young children remain under-served in their communities. Bronfenbrenner's and Morris (2006) PPCT model supports the idea of the complex threading of shaping environments and human behaviour. This section presented Bronfenbrenner and Morris's (2006) PPCT model which emphasised the importance of values where reciprocal relationships are being created in environments and communities. We will now focus on physical environments ?

When designing values …

When investigating the different embodiments of values, we can distinguish many dimensions within which they are regularly shared, negotiated, reproduced or transformed. In educational systems, for instance, we can assess the presence of values within the international and national educational policies, institutional levels and the micro dimension of each teacher's professionalism (Prichard et al., 2018). As a consequence, values within educational systems could be viewed as the result of complex interactions between multiple agents of different natures and at different levels. This is particularly the case if we consider education as an "open system in which elements are interacting with themselves and their environment in emergent, adaptive, and self-reflexive ways" (Schuelka & Engsig, 2020, p. 6).

However, identifying the dynamics underlying this multitude of spaces in which values dwell, and are exchanged, can be complicated. On closer inspection, we might see how we can consider those levels as specific (but interconnected) contexts. The common thread that links? different contexts would be represented by human agency, which plays a primary role in defining them. In other words, people, through their actions and interactions, in their roles and positions, contribute to the shaping of the environments they inhabit. This act of defining or shaping could be considered – quite interestingly – as an act of design.

We can interpret designing as an activity of reflective and creative thinking that leads one to imagine what does not yet exist, whether we are talking about tools and products, services and processes, symbols or whole systems (Nelson & Stolterman, 2003). As we define design as an activity of envisioning and ideating something for a specific purpose (Redström, 2017), it also inevitably represents a device through which values are communicated and spread between people (Buchanan, 1985). Indeed, design could not unfold in a totally neutral way (Van Gorp & Adams, 2012; Norman, 2004), as "people engage in design in order to devise and implement a new system, based on their vision of what that system should be" (Banathy, 1992, p.41). In this sense, design represents a powerful channel through which we can communicate and spread specific values. We might notice how design does not only refer to domains such as architecture or engineering, as "almost everyone is designing most of the time – whether they are conscious of it, or not" (Nelson & Stolterman, 2003, p.1).

When establishing the rules of a community, sketching the layout of a physical space and planning how to conduct a lesson we are designing, and we are infusing our personal values into concrete actions and fixed structures, offering them for other people to experience in a variety of ways. Design, as an art of thought, would involve the vivid expression of values and ideas about social life (Buchanan, 1985).

Consequently, our actions as professionals of education can potentially contribute to the maintenance (or revolution) of a specific educational system, through the promotion of values and visions. In this regard, if education is crucial for social continuity and the transmission of ideals, hopes and standards for social life (Dewey, 1916), designing education means offering contexts in which knowledge, skills and experiences can be negotiated, renewed and co-created with learners for our future society. This is especially significant when considering that, in specific contexts, promoting inclusion requires contrasting social injustice through transformative processes. In these cases, designing education means co-creating opportunities for liberation and social change (Freire, 1970).

Given that humans can shape contexts through design, how can such designs communicate values that promote inclusion? Understanding design principles and practices is crucial to identify the relationship between each individual's values and the promotion of inclusion within the different contexts which we take part in, including the educational ones.

Design, values and frameworks

On a broader level, values can be found within the structural frameworks and policies that regulate specific systems. Indeed, values and laws are reciprocally connected, especially as juridical norms descend and draw inspiration from social norms and social values. Such values would be shared between members of a community, constituting their heritage of ideal references and orienting their behaviour. Consequently, social values, which are culture-related, determine social norms and, lastly, juridical norms (Pocar, 2010; Gulotta, 2002). The frameworks that regulate educational systems vary across societies, and are strictly connected to students? rights, designing how education is functional and to be promoted, and carried out, within each specific context and embodying values of different nature.

Enshrining the right to education in international laws and normative tools ensures the adoption of a shared vision on values that are functional, as a means to orient educational policies and practices across communities. From an international perspective, inclusion in education has been interpreted through a human rights-based approach, which is centred around the need to ensure basic human rights and fundamental freedoms to all people (Gordon, 2013). Article 26 of the UN's Universal Declaration of Human Rights (1948) outlines a number of primary values that should underline educational practices, such as equality in access, and promoting each student's personal development and potential. UNESCO's Convention against Discrimination in Education (1960) was designed to guide

the right to education, whilst also identifying standard-setting instruments in education (Gros-Espiell, 2005). Similarly, the 2030 Agenda for Sustainable Development (UN, 2015) aims at removing barriers to participation, ensuring quality education and learning opportunities for all people. The Index for Inclusion itself (Booth & Ainscow, 2016), as outlined earlier in this chapter, also proposes a set of values to support the promotion of inclusive processes within schools.

The aforementioned sources are just a few examples of how values, rights and regulations are intertwined and describe specific lines of action for the achievement of inclusion within educational contexts. However, it is important to note that, beyond universal and international values, countries and communities adopt specific norms, oriented towards the protection of individual and collective rights, and reflecting a specific set of values which are considered important. Accordingly, the idea of inclusion itself can be interpreted through specific rights and values, leading to a variety of ways which societies can advocate for. As educators, it is crucial to navigate the diversity of these scenarios and understand how intercultural dialogue is needed to reach a deeper understanding of inclusive values. In this way, international cooperation can foster empowerment, dignity and reciprocity among actors, identifying shared languages and envisioning shared advancements with the sensitivity of ensuring a true dialogue and not a subtle continuation of western dominance (Taddei, 2017).

Bigger picture frameworks act as boundaries within which smaller agents act. Accordingly, identifying the values which an educational system intends to promote, allows it to strengthen its cohesion through the contribution of all those concerned (for instance, aligning the actions of teachers and families). Conversely, it can also give space to change, and in doing so, overcome structural injustices and renew the societal purpose and meaning of its lines of action. These possibilities become feasible only when the values at the heart of system are recognised. What are these values and do they protect diversity and promote inclusion?

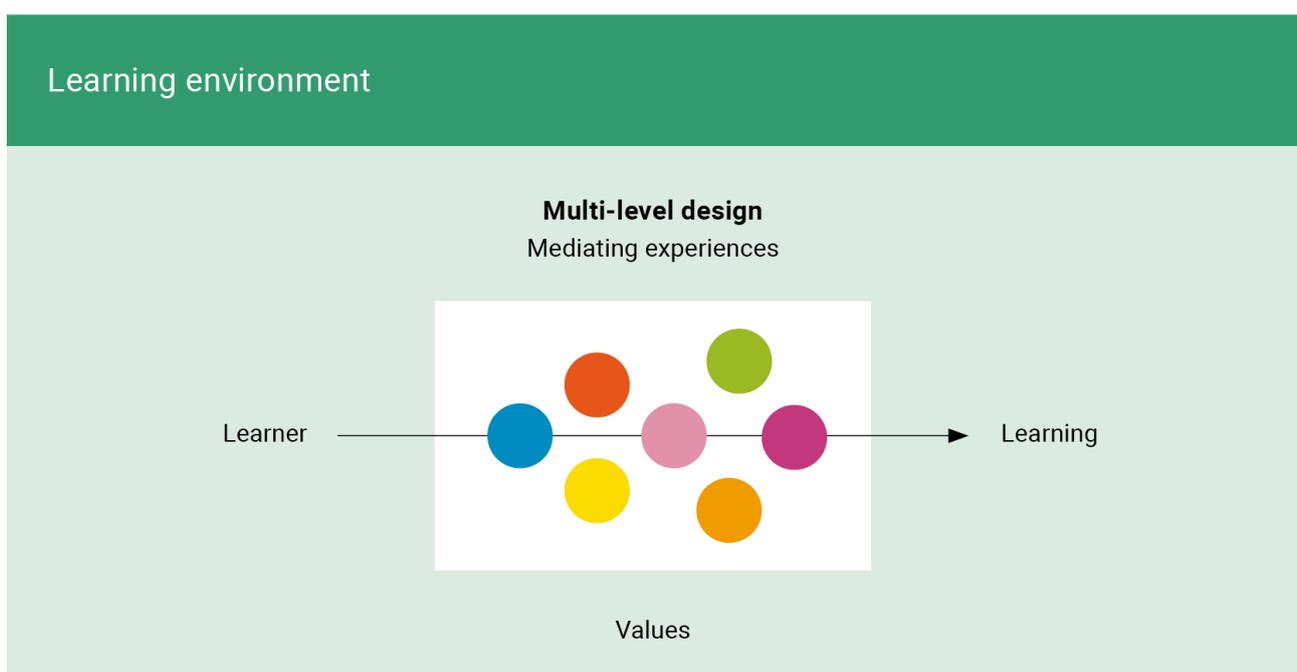
Such actions assume paramount importance when assessing the presence of multiple agents that, intentionally or unintentionally, communicate and spread a multitude of values based on specific interests and reasons. When considering contemporary scenarios, the plurality of non-formal educational agents and contexts (i.e., social media) may result in communities being exposed to conflicting or discriminative messages (Frabboni & Minerva, 2001). To ensure the development of more inclusive societies, formal educational agents should take part in a shared design based on an integrated educational system both on at an institutional and cultural level, thereby forming a "pedagogical alliance (…) practising neutral, ideal and democratic educational models" (Frabboni & Minerva, 2001, pp. 508–509). It is important to note that such actions, interpreted as "north stars" perspectives, might not be fully realisable, but do act as guidance for the promotion of virtuous processes. Once again, the definition and sharing of values lies at the core of the maintenance or transformation of educational systems, through the design of policies and

practices that should regularly be interrogated in order to assess their contribution to the promotion of inclusive education. As outlined at the beginning of this chapter, a dynamic, flexible, and continuous reflection on values is essential.

Design, values and practices

If educators' agency is guided by the trajectories drawn by bigger frameworks of values and regulations, individual responsibility in promoting values is still prominent at the school or classroom level. The creation of more inclusive learning environments emphasises the role of design as a practice that intervenes in the everyday life of people as an experiential mediator (Norman, 2013; Verbeek, 2008). If design is a reflective process of analysing a situation and defining solutions through continuous improvements and iterations (Schön, 1983), the profession of teaching cannot exclude it from its approach and everyday practices.

Design in learning means setting, defining or transforming the educational context, and influencing (but not determining) how learners will learn by providing opportunities, facilitators and barriers. At this level, design means structuring the learning environment and setting a variety of environmental factors that can facilitate or hinder learning, and embodying and conveying values. As the focus is centred around the role of educators in designing inclusive contexts, it is important to acknowledge how values within contexts are negotiated by all actors involved. In this sense, learners' values will be dynamically interacting among each other and also with the values promoted (consciously and unconsciously) by educators and institutions. Figure 6 illustrates the dynamic intersections that emerge when considering values in learning environments, highlighting the role of design in mediating learning experiences.

Fig. 6. Relationship between design practices, values and learning


When recognising the power of design in shaping contexts and potentially increasing or decreasing their level of inclusivity, it is essential that any approaches incorporate inclusive values, and embrace inclusive learning environments. In this sense, Universal Design (UD) represents a framework of action that aims to extend the inclusivity of products, services and contexts to all people beyond differences based on personal characteristics (with an intersectional understanding of inclusion) (Maisel & Steinfeld, 2012; Connell et al., 1997; Mace, 1985). As an extension of such an approach in the educational dimension, Universal Design for Learning (UDL) will be later presented as a context-specific approach. To further show the connection between design and values, UD itself is based on a set of principles that aims at ensuring its operability across multiple contexts, such as equity and flexibility in use, or simplicity and intuitiveness in use (Connell et al., 1997). Such principles can guide educators in promoting inclusion from the design of didactic materials or settings to the choice of which activities to be carried out can be offered during a lesson.

As contexts play a primary role in influencing our functioning (WHO, 2007, 2001), defining values as contextual factors is crucial in determining the Quality of Life of learners and their level of participation (Del Bianco, 2019; Giaconi, 2015; Schalock & Verdugo Alonso, 2012, 2002) and the meaningfulness of their experience in education (Ghirotto, 2018). Additionally, Universal Design approaches can play a significant role in contrasting discrimination and exclusion phenomena (Sanford, 2012; Imrie, 2000; Connell & Sanford, 1999). The dynamic relationship between design and values is even more central in learning when considering school as a multi-faceted place combining the provision of opportunities for learning transmission of knowledge as well as the provision of opportunities for social interaction, self-expression and growth (Corona & De Giuseppe, 2015) (see chapter "Participation of children and youth). Designing the learning environment requires an understanding of the multitude of variables that can contribute to inclusion (Cottini, 2019; Sibilio & Aiello, 2015).

Managing values in the design of educational contexts necessitates that equal opportunities and the protection of rights within the framework of Universal Design for Learning (UDL), embodies UD in education in order to support such actions (Rose et al., 2014; Izzo, 2012; Rose & Meyer, 2002). As the construct of inclusive education includes the affirmation of core principles as well as the organisation of contexts and procedures to promote inclusion, (Cottini, 2017), UDL can constitute a theoretical reference to orient such activities. As a construct, Universal Design for Learning encompasses three main trajectories (CAST, 2011):

- Offering multiple means of representation;
- Offering multiple means of expression;
- Offering multiple means of engagement.

When considering the design of multiple means of representation, educators should

recognise how the knowledge that is shared and co-created with learners can also be communicated through different sensory channels as a means to promote accessibility, personal significance and understanding. In the design of multiple means of expression, students can decide how to share what they learned and the knowledge they built, following their preferred approach. Lastly, the design of multiple means of engagement can increase learner's motivation (Cottini, 2019). Indeed, such strategies can embrace learners' diversity in participating in the learning environment (Meyer et al., 2014).

The design of the learning environment is further embedded in values which have a direct influence on active participation and protection of rights. In this sense, design principles and practices can represent key resources to implement inclusion-oriented values, which are essential to ensure meaningful learning and participation opportunities for all. Such a renewed sensitivity to values, agencies and contexts constitutes a conceptual and practical way to foster the promotion and renewal of inclusion.

In other words, if "we were created by the world we live in" (Gibson, 1979/1986, p.130), we may as well reflect upon what kind of world created us, and what kind of worlds we wish to co-create with our learners. The next section delves into the practical applications of such perspectives for our present and future worlds.

How can I work with values to foster inclusion?

Inclusive education means creating equitable opportunities for all students (DEI, 2016). The role of values is at the heart of this process (Espedal et al., 2022). Values as guiding principles underlying inclusive cultures (Booth & Ainscow, 2016) can ensure that the progress of this path is sustainable and ensures inclusive education is empowered and expanded at various levels. A recent study by Döring and her colleagues (2024) highlighted how teachers and educators instilled values using diverse methods across different aspects of the school environment. They further argued that the role of teachers extends beyond education to fostering democratic values, attitudes, and beliefs, contributing to a more inclusive and sustainable society. Values education is increasingly emphasised globally in Europe. For instance, some Teaching Standards focus on promoting respect, honesty and trust in children, aligning with professional ethics and integrity. Even without formal guidelines, schools are never devoid of values, and spaces exist where learning and experiences are shaped by a clear mandate, with every teacher, consciously or unconsciously, representing certain values (Schubarth, 2019).

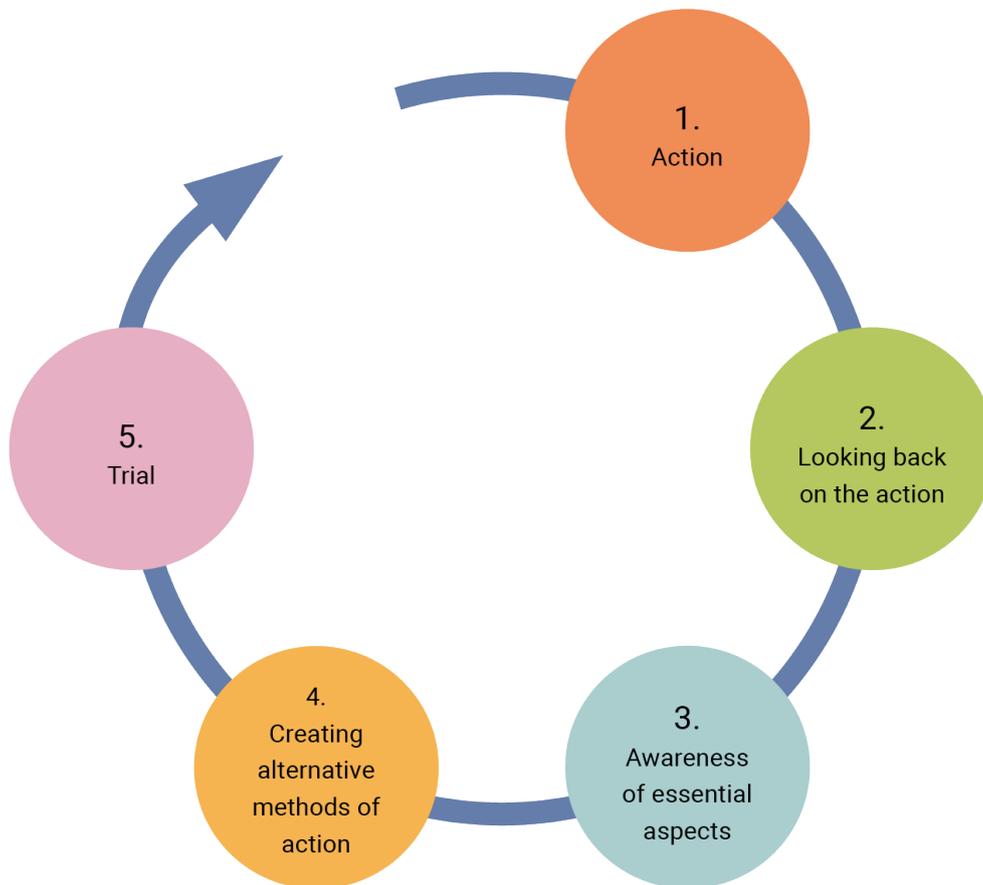
Educating children is not just about values or teaching them values, but it also concerns our own values and how teaching and learning embodies values? as has been stated above (Schulz von Thun, 2015; Wocken, 2013). How can we, as teachers, work with and on values in our classrooms on a daily basis? Within the following section we argue that four trajectories might be key value-based ways to foster inclusive education; reflection, resolution, negotiation and reinvention. These separate components are divided into

individual threads for knowledge application. However, in practice these trajectories are completely embedded in and braided through each other.

Reflection

One of the fundamental trajectories to supporting values is reflection, as this enables us as teachers and educators to continuously examine our own professional work and experiences, and to discern which perspectives are central, and which are peripheral, as well as clarifying and identifying the core values (Brookfield, 2018). By being more aware of our personal values and beliefs, and what is important to us, we can understand how values can help us to achieve reflection? (Schön,1983). Regular reflection can reveal how well we align with our values, but can also identify where potential conflict arises. We must also consider the extent to which these values are influenced by our experiences, background, and cultural context. As outlined at the beginning of this chapter, values are mostly unconscious but guide our behaviour (Schwartz, 2012). Therefore, it is crucial to reflect on what is important to us as part of our profession, both separately and when combining educational and political agendas (O'Toole & Hayes, 2019). The challenge lies in how we align our personal values with the values of the educational environment. We should review our reflections as messy, unorderly and if necessary, adjust again. Throughout this process, it is essential to seek feedback from our colleagues as critical friends, and assess how they observe us and our values in actions. The key point is that contemplation becomes constant practice (Brookfield, 2018).

In the early 1980s, teachers and educators recognised the difficulties arising between theory and practice, and reflection was identified as the missing link. Fred Korthagen (1985), a researcher in professional development of teachers and the pedagogy of teacher education, and the promotion of reflection in teacher education, defines reflection as "the mental process of structuring or restructuring an experience, a problem or existing knowledge or insights" (Korthagen, 1999). He elaborated a model, which describes the process of reflection which he described as ALACT (elaborated in Figure 7 below) (Korthagen, 2001).

Fig. 7. The ALACT model of reflection


Source: Adapted from Korthagen et al., 2001

ALACT is still regarded as lacking in profound knowledge and missing empirical evidence. A second model exists which suggests that different levels of reflection, the so-called Onion-model Korthagen, 2004; see Figure 8), provides content related information to ALACT. According to Korthagen & Nuijten (2022), this model differentiates various layers of an individual's identity resulting in (student) teachers engaging in deeper reflective processes. The process makes it possible to develop a more conscious understanding of personal qualities, and further involves identifying and addressing internal obstacles. The use of this onion model for critical reflection can help to uncover, and challenge, any personal biases related to different aspects of diversity. Therefore, as the authors argue, the approach can be a step towards reducing inequality, combating discrimination, and promoting social justice. Additionally, it may also become a more inclusive method when the student's voice is captured in the reflection process, Why not also reflecting together with the students (see also the chapter Person Centred Planning)? Both the ALACT model and the onion model can be a starting point for the reflection of values in the classroom.

Figure 8: The onion model

Core qualities

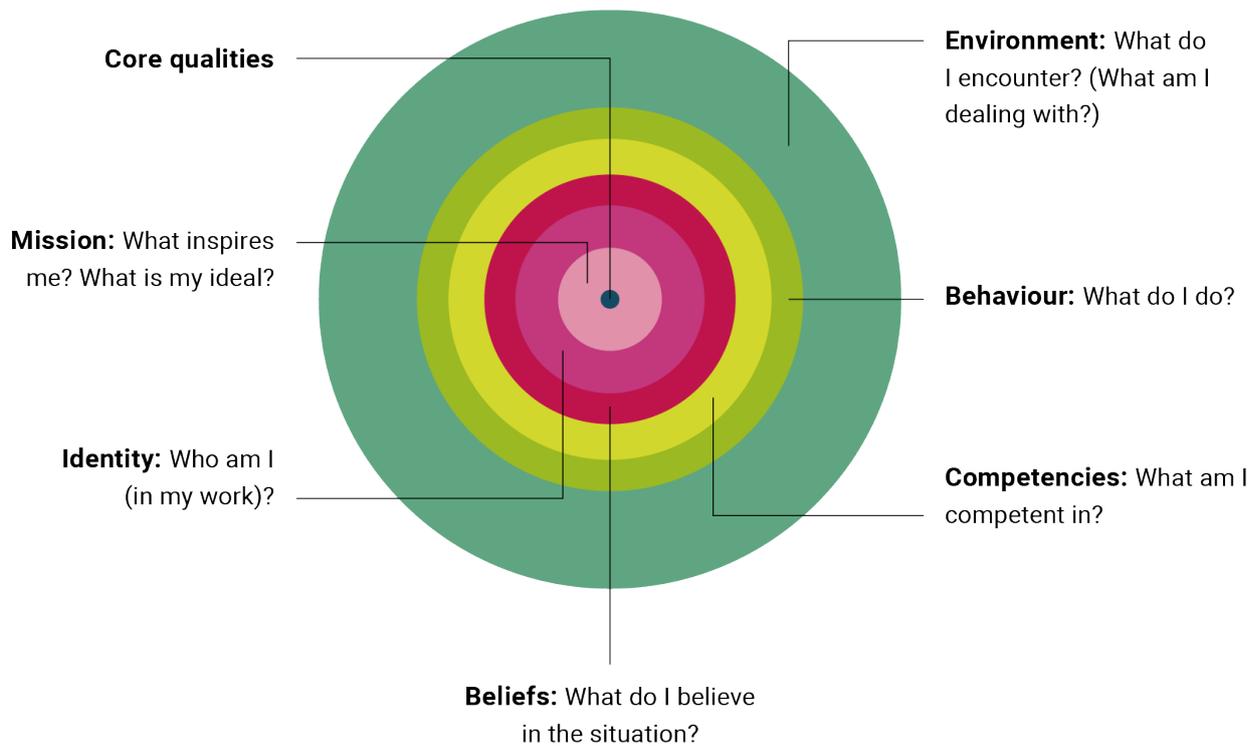
Environment: What do I encounter? (What am I dealing with?)

Mission: What inspires me? What is my ideal?

Behaviour: What do I do?

Identity: Who am I (in my work)?

Competencies: What am I competent in?

Beliefs: What do I believe in the situation?


Source: Korthagen et al., 2001

Some other practical suggestions are also recommended. Holding regular and ongoing teacher meetings are valuable for ensuring the sustainability of the process. These meetings should address the challenges in applying values, practice and feedback from colleagues, parents and children to improve the implementation of values, and, if necessary, to review them. When we reflect on the vignette of Chris' experience, the critical reflection approach in addition to the dialogue and dialectical method, could assist in finding a solution. How values are incorporated into student interactions, teaching methods, and curricula should be also discussed. New and more effective ways of applying values in inclusive education should also be explored (Palmer, 2017).

Teachers should also provide opportunities with students to discuss perspectives, values, experiences and needs. The classroom environment should be one where students feel secure and confident and where they will be heard without judgement. Giving voice, and influence, to students is vital as participatory action research with children has shown previously (Jörgensdóttir Rauterberg & Hinz, 2024). In this study, children collaborated with teachers? and spoke of their experiences of school and future development school services? Using such a democratic approach would be similarly beneficial for the values approach? (see also the chapter Democratic schools). Such an environment would also create a space for interaction for students who are introverted, ensuring they feel comfortable and have the courage to express their opinions. When students feel that their voice is heard and that they are valued, the reflective process becomes more meaningful. Students express their values, identity, assumptions, and experiences, and share their perspectives, not only as a standalone activity but also as part of? the curriculum. As

a result, we find that the active role of students leads to the creation and invention of new activities (Brookfield, 2018; Noddings, 2003). By instilling values, teachers create a more inclusive learning environment and foster the flourishing of students. Such a transformation, and approach, requires commitment, trust, creativity, and continuity, and lead to the fulfilment of the diverse needs of students.

Resolution

As you read at the very beginning of this chapter, values sometimes can also conflict with each other, in other words, you cannot combine actions motivated by two specific values such as benevolence and power (Schwartz, 2006). However, you can become aware of this competing nature when decisions must be made between both values which are equally important to you. It can also be the case that your values, and the values in the school system, come into conflict as illustrated in the vignette with Chris. Additionally, there may be students who value different values in daily situations of learning in your classroom. Common to all of these situations is the need to find a solution that involves both the teacher and students working together, often in the face of conflict. Resolution involves resolving disputes, achieving consensus, or solving challenges and problems in personal, social, or professional settings (Esptien, 2014). As outlined at the beginning of the Chapter, when it comes to values and inclusion, a dialectic approach such as that proposed by Wocken (2013), could do justice to the complexity of values and their dynamic relationships and help to find a solution on a higher level.

Problem-solving also involves translating ideas into actions. There are numerous ways to achieve a resolution in relation to values. Firstly, identifying core values by reflecting on the topic is a crucial first step. Focusing on our own values is more beneficial rather than expecting others to meet our standards of values, where the latter can result in a more dissatisfactory achievement. Instead of concentrating only on solving problems, teachers can make decisions to set some goals which improve some aspects of their students' lives (Kennelly & Oke, 2024). Teachers need to be aware that values are not easily changed. Hence teachers should concentrate on the long-term relationships in parallel with possible short-term goals. By focusing on resolution, they make a meaningful approach for growth and change (Kennelly & Oke, 2024).

Problem-solving also requires a commitment and responsibility to equity. This process involves placing values at the forefront of all partnerships. Through the process of persistence, respect and continuity, it can strengthen relationships and the determination of the teachers and students (Epstein, 2014). This process also involves identifying the conflict between personal values and the values of others, and finding possible solutions to these dilemmas. Recognising and understanding different perspectives and exploring common ground are among the solutions. Listening is a basic but profound way to direct

those to alternative and creative solutions, whilst also respecting individual's core values and paying attention to different perspectives.

Negotiation

Since dialogue and negotiation are important pillars of a participatory process in inclusive education, the existence of a dialogue space between students, teachers, administrators, and families is vital. Dialogues that are focused on finding a solution, listening to different perspectives and values of others and clarifying their opinions and experiences, leads to dialectical and peaceful negotiations and helps to identify alternative solutions for possible value conflict situations on a higher level. Strengthening dialogue requires the teacher to be open and receptive to creative ideas in expressing values, avoiding a win-lose approach, and seeking solutions that consider the diversity within classrooms and schools. The necessary skill of active and empathetic listening is useful and accelerates the path to finding a common ground (Espedal, 2022). In a safe environment, dialogue fosters and strengthens self-confidence in the educational environment and increases the transparency of perspectives and values (O'Toole & Hayes, 2019)

Reinvention

Maintaining an innovative spirit in the educational system is a key foundation for inclusive education. Teacher professional development is an ongoing process that benefits from remaining informed about current research findings and techniques on inclusive education. It also involves continuously adapting teaching methods to support students' development and recognising the diversity present in the classroom. An innovative mindset leads to the elimination of approaches that are no longer effective, which drives growth and improvement in the educational environment, thereby discarding perspectives which are no longer practical and do not advance the educational system (Palmer, 2017). The same approach applies to values. Although this approach may seem challenging and complex at times, it is ultimately an ethical and timely educational imperative that empowers teachers to develop inclusive learning environments. It is crucial to remain open to a changing environment, and to re-examine and re-construct teachers' responsibilities in inclusive education (Espedal et al., 2019). Consequently, the evolution of knowledge necessitates evolution and innovation. It is important to keep in mind that working with values is a constant process that requires self-awareness, flexibility, discussion skills, active listening, and innovation. An innovative mindset encourages a more flexible approach towards children and adolescents' diverse life stories, experiences and values, and opens up new perspectives for them.

This approach involving the four trajectories of reflection, resolution, negotiation and reinvention, can facilitate an engagement with values in a continuous and adaptable manner, ultimately promoting inclusive education.

Closing questions to discuss or tasks

1. What is your cup of tea? What is important to you?
2. What is important to you as a (future) teacher or professional?
3. Does the educational setting reflect its stated values, mission, or ethical practices?
4. Do you recall a specific situation where values played a significant role?
5. How do values, or how might they, influence your (future) classroom?
6. What tools do you have to design the educational environment you work in and how do you use them?
7. Are values in your (future) classroom discussed, negotiated, or reviewed over time?
8. Imagine a concrete way to reflect on values together with your students.
9. How might your practice adapt to accommodate diverse values?
10. Could you apply what you've learned in this chapter to a university context?

About the authors

Lydia Murphy

Lydia Murphy is a trained educator in Early Childhood Care and Education. Her special interests include relational pedagogy, love in education, empowering voices, and reflective practice. As an early years researcher she studies the role of the early years professionals supporting reciprocal relationships with themselves, babies /toddlers/children, their carers and educational environments/communities. Within this she explores potential deficit narratives that trickle into communities particularly those experiencing disadvantage.

Mahvand Sahranavard Espily

Mahvand is educated in English Literature. She is educated kids music teacher at Adamak institute (orff schulwerk association) in Iran. She is a vocal coach and kids music teacher around 21 years. She is teaching in an alternative school in Iran (kodakan Donya) from 2013 until now, also has experiences in working with kids 3-5 years old, Working with autistic children , low concentration children and hyperactive children. Managing many different kids event such as Pinocchio, Little black fish, Alice in wonderland, manage play week, nations celebration, manage many internal and external travels for kids, manage different visit for kids and invite many different musicians, manage many workshops for parents in different fields, member of literature work group,music work group, child friendly work group and report writer work group. She's got many certifications about vocal pedagogy, education and kids music in Iran and outside of Iran.

Petra Auer

Petra Auer is a trained primary school teacher qualified to teach children with special educational needs. She holds a PhD in General Pedagogy, Social Pedagogy, General Didactics and Disciplinary Didactics. Her main research interests are diversity and inclusion in education settings, children's values, value transmission, and socialization and acculturation in the school context.

Tommaso Santilli

Tommaso Santilli conducts research in the area of Didactic and Special Pedagogy and holds a Master's Degree in Communication and Digital Cultures. He is a trained WOSM educator and a visual designer. His main research interests concern inclusive processes in educational and recreational settings, educational technologies, inclusive design practices and accessibility of cultural contexts.

RELATIONSHIPS IN INCLUSIVE EDUCATION

Lina Render de Barros; Leah O'Toole; and Simon Klippert

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ama-2025-en/?p=371#oembed-1

Example Case

"One of the best experiences I had as a teacher was during the first days of the COVID-19-pandemic. As most of the students had to stay at home, I could use the time I normally spent with 25 people in one class to have long walks outside with individual students that seemed especially lost. These talks, this time dedicated to individuals, was not only helpful in the very special situation of a lockdown, but also paid off afterwards when lessons started once again in classrooms: deeper understanding, fitting settings, growing confidence led to a more relaxed atmosphere in class and provided better grounds for learning. Use the power in uncertain times to find new ways of communication."

Simon Klippert, Combined Primary and Secondary School on the Rütli Campus, Berlin, Germany

Initial questions

In this chapter you will find the answers to the following questions:

1. Why are relationships important in education?
2. What is a relationship?
3. What is special about a relationship in a pedagogical context?
4. What are the consequences of conceptualising the student-teacher relationship as structured by power?
5. How can critical self-reflection inform relational practice? What to do with the power?
6. What are the challenges and barriers to putting relationships at the centre of educational practice?

Introduction to Topic

Why do we have to talk about it?

A relational approach is central to inclusive education. One aspect of inclusive education is the focus on the individual and the individual's developmental needs. Another aspect is a focus on society and the social environment. How can the social environment be shaped in a form that is welcoming and hospitable for individuals? And how can each individual contribute to such an environment? A relational approach is the practical answer; the attempt to translate inclusive theory into relational practice.

This chapter starts by briefly summarising research showing the importance of relationships in human development and learning environments. It asks the question 'What is a relationship?' and investigates how power structures impact on relationships, particularly educational relationships. We then offer concrete ideas of how to apply this knowledge about relationships within the inclusive classroom. Depending on your individual questions and interests you might start your reading of the text in any of the subchapters. Start with the introduction if you want to get an impression of the current state of theory. If you prefer a more narrative introduction to the topic you might choose to start with 'Relationships as a dance between you and me'. If you are aware of the theory and its ethical implications, but are looking for ways to apply this in a classroom setting you can directly go to the section on 'Practical Application'.

Why are relationships important in education?

Often the social aspect of educational relationships is seen as an add-on; the role of the teacher might seem reduced to the organisation and delivery of content, while the relationship might seem less important. In fact, the reverse is true. There is increasing

evidence that a safe, trusting, caring and respectful relationship is a prerequisite for an atmosphere of well-being that in turn creates good conditions for profound learning and inclusive practice (O'Toole and Hayes, 2020).

The Centre for the Developing Child at Harvard University presents evidence that brains are built up over time through the power of interactions and relationships. The work of Patricia Kuhl (e. g. 2010) is particularly illustrative in this regard. She investigated the development of language and found that babies and toddlers who were presented with a second language by looking at video of people speaking it on screens did not develop the structures of that language in the same way as those who were engaging in direct interactions with human beings. In short, as human beings our brains are made to develop through social interactions, and this is just as true in educational settings as anywhere else.

The student-teacher relationship is shown to be of crucial importance for learning in a variety of theoretical models and empirical studies (Hattie 2015 / Cornelius-White 2007). Bronfenbrenner's work also foregrounds the importance of relationships that he sees as the culmination of a series of interactions occurring over time "with persons with whom [the child] has established a mutual and enduring emotional attachment" (Bronfenbrenner, 1973, p. 119; 1988; 2005). "In short, somebody has to be crazy about that kid" (ibid). Bronfenbrenner's theoretical model as well as these empirical studies show that a focus on intellectual approaches to learning and more emotional or relational approaches are not mutually exclusive. Lives are lived interdependently through a network of shared relationships, or 'linked lives' and the power of such relationships is so strong that they are referred to as the 'engines' of learning and development (Bronfenbrenner & Morris, 2006; Hayes, O'Toole and Halpenny, 2023; O'Toole, Hayes and Halpenny, 2020).

Equally, the central argument of Attachment theory (Bowlby, 1969) is that the bond or attachment formed by an infant with the primary care-giver forms the basis of all future relationships, and of psychological well-being for the rest of the individual's life. The theory states that this bond also has a highly significant influence on a child's current and future behaviour and ability to learn. A phrase that is often used in Attachment Theory is that secure attachment with a trustworthy adult who holds the child in mind, provides a secure base from which to explore the world. In research and practice in education, the teacher is increasingly being seen through this lens (Harlow, 2021). This is explored in more detail later in the chapter.

Relationships are also important in education because a child's academic self-image very much stems from the image that a teacher has of them (among other influences). For example, research based on the work of Albert Bandura on self-efficacy shows that if the adult puts forward to the child that they are capable and their learning is important, this trust becomes internalised into the child's self-image. This impacts learning because work on self-efficacy beliefs (Bandura, 1994) shows that if the child believes they can achieve a goal, they tend to work hard towards it, and through that hard work they are more likely to achieve the goal in reality. This achievement feeds back into the belief that they are capable

learners, further influencing future learning in a positive feedback cycle. In contrast, if the adult conveys the impression that a child is incapable of achieving an academic goal, either overtly or covertly, this also becomes internalised into self-efficacy beliefs. The internalised fear of failure might then become a self-fulfilling prophecy and lead to a lack of effort that in turn leads to the failure to achieve a goal – after all, why would I try if I know I will fail? These are just some of a multitude of theoretical perspectives that foreground the creation of supportive student-teacher relationships, and 'relational pedagogy' as a theoretical and philosophical underpinning to educational practice is increasingly gaining support (Sidorkin, 2023).

Research reinforces the fact that children learn through good relationships and this can lead to better academic outcomes. Hence, a focus on relationships and a focus on grades are not mutually exclusive (Bingham and Sidorkin, 2004; Reich 2014, 2018). Relationships are the basis for working in an educational environment as it is easier to access a topic when there is a positive relationship between the people involved. Connections between teachers and students are going to develop, no matter what. Teachers can influence their own approaches to students and how they create quality relationships. A relationship of some sort always exists and the only question is what will the quality of those connections be, and will they be nurturing or destructive for the people involved.

A child can learn in an environment where a teacher does not create a nurturing, relational atmosphere. Most people can give examples of things they have learned although they were afraid of or indifferent to a teacher. However, it is very, very difficult to learn deeply in an environment in which the child is afraid or the child is disengaged. As Siegel (2020) notes, "Experiences that involve little emotional intensity seem to do little to arouse focal attention, and have a higher likelihood of being registered as 'unimportant' and therefore of not being easily recalled later on. Events experienced with a moderate to high degree of emotional intensity seem to get labelled as 'important' and are more easily remembered in the future. If events are overwhelming and filled with fear, a number of factors may inhibit the hippocampal processing of explicit memory, and therefore may block explicit encoding and subsequent retrieval" (pp. 71-72). The most up-to-date understandings of the neuropsychological bases for learning show the impact of the stress hormone cortisol and the anti-stress hormones opioids and oxytocin on brain structures (Conkbayir, 2022; O'Connor, 2013); in other words, children's brains develop, and learning happens, in the context of relationships (Siegel, 2020). Explicitly and mindfully centering relationships in the classroom is a crucial aspect of the teachers job, since the teacher sets the emotional and relational tone of the classroom as a role model, as well as as an authority figure.

Attachment theorists have identified different 'attachment styles' that we develop based on our experiences of relationships in early childhood. These include secure, insecure-ambivalent, insecure-avoidant and disorganised (Ainsworth et al., 1978; Main and Solomon, 1986). Decades of research (see O'Toole and Hayes, 2020 for an overview) has shown that securely attached children expect the world to be comforting and supportive, and so

approach new relationships with this expectation. Therefore, securely attached children tend to behave prosocially in educational settings and invite future supportive relationships. On the other hand, insecurely attached children and those with disorganised attachment expect the world to be dangerous and unsupportive, and equally approach new relationships with this in mind. Their approach to interactions may therefore reduce the chances of forming positive relationships in educational settings the future. So we see that all students need positive relationships with their teachers. However, for students who are in insecure living situations or who only have loose relationships in their lives, relationships are especially important if we want them to have a successful learning experience at school. In more recent years we have come to understand that while early attachment experiences are highly influential, attachment style can be fluid across the life-course, depending on the availability of emotionally corrective experiences (Taylor, Rietschel, Danquah and Berry, 2015). Attachment theory assumes four different adult attachment styles: Anxious (or preoccupied), avoidant (or dismissive), disorganized (or fearful-avoidant) and Secure. The attachment styles are a result of early childhood experiences with primary caregivers, resilience and relational experiences in a life. Such experiences are those in which a person with an insecure or disorganised attachment is given the opportunity to discover that the world can in fact be comforting and supportive.They can thereby rewrite the expectations underpinning how they behave in the world – and so how the world responds to them. This gives hope to educators working with children who have experienced a less than ideal start in life that there is a lot of potential. Promising research avenues on children's resilience have developed in recent decades and the effect that one caring adult such as a warm, attuned, responsive educator can have on children's trajectories and life chances (e. g. Brohl, 2007). Teachers are well advised to reflect on their own upbringing and attachment styles in order to create a professional relationship and reactions towards students with a variety of different attachment styles.

Another strong argument for positioning relationships at the centre of educational processes might be that relationships continuously develop, whether we acknowledge their importance or not. Therefore, it is good advice to invest in these relationships and try to ensure that the student-teacher relationship is the most positive it can be.

Next to these insights from research and academia, there are also legal arguments which underline the importance of relationships: The United Nations Convention on the Rights of Persons with Disabilities has been ratified by 185 countries so far. This means that the states have the responsibility to ensure inclusion, accept diversity as the norm and adhere to individual's different needs in order to ensure equal opportunities for participation. Relational education can be one way to put this political, legal and ethical goal into practice. In order to ensure participation, we need to get to know the participants and their individual needs. We need to build relationships in order to get to know them.

The German word 'Beziehungsarbeit' means the work and effort involved in developing and sustaining a relationship. This does not have a direct translation in English, but it is

a powerful concept because it helps educators understand that while relationships are crucial to learning, they are not likely to develop to their full potential without significant and mindful effort. This means that the relational element of the profession needs to be valued to the same extent as other elements, such as the delivery of content. There needs to be an allocation of resources such as time, personnel, equipment, space and money for the creation of an accommodating atmosphere.

What is a relationship?

Having established that relationships are crucial for inclusive education, we now must ask what is actually meant by 'relationship'. The definition of 'relationship' in an educational context is a very complex task. There are very different related fields such as Psychology, Sociology, Philosophy, Education, Linguistics, Neuroscience, Political Sciences, activism and empirical everyday experiences of educators, teachers and students that shed light on different aspects of relationships. The challenge lies within combining very different systems of knowledge production and translating into a more holistic understanding of relationships.

There are many variables influencing "relationships" such as time, the number of parties involved, the social contexts, belief systems or experiences in early childhood and later, to name just a few. A relationship between two individuals is never isolated from the social environment (Nowak-Łojewska et al., 2019). It is influenced by the relationship one has to oneself, the primary caregivers, the environment and different social groups. It is influenced by belief systems of the group(s) an individual belongs to. It is also influenced by the beliefs an individual holds over what the counterpart in a relationship thinks of them and their actions; as well as what they believe others outside of this specific relationship think of them and their actions (Ryle and Kerr, 2022).

Although it is impossible to reduce a relationship to the actions, thoughts and beliefs of two people, we can benefit from looking at relationships from this perspective to better understand some of the dynamics underlying the process. The metaphor of a dance can help us to reduce the phenomenon of relationships to an understandable size (Ryle and Kerr, 2022). In the following paragraphs you can see some of the dance moves that would characterise our relationship. While reading, keep in mind that our dance will always also be influenced by the music, rhythm, our clothes, bodies, shoes, the floor, lighting, environment and so on. It is important that we both can more or less predict the other's moves so that we don't step on each others' feet; rituals help us with these predictions. We should both know whether we are dancing Halay, Waltz, Rock'n'Roll, Dabke, Step Dance or in Musical,… but we will come back to that later.

Relationship as a dance between you and me

In the following paragraphs you will find some dance moves in the way they might be carried

out in your classroom. You can put yourself in the position of student or teacher while reading. Enjoy.

Our relationship is influenced by what I think you think of me and by what you think I think of you. It is also influenced by what we think about what others think of us individually and of our relationship.

Our relationship is established over time.

Based on the roles ascribed to us and our accumulated experiences with other people in these roles, I make assumptions to predict how you will interact with me. I might assume that you as my teacher are on my side or that you are looking for a reason to catch me out.

Our relationship is a dynamic process, our attitudes and rituals are subject to change.

My previous relationships have shaped how I expect you to be with me, and thus how I react to you. Early in life, we learn how to "be" and what is expected of us in our relationships with our primary caregivers. These relationships form templates for my future relationships and influence how I interact with and react to you.

The way I see myself will influence the ways in which I can relate to you.

The culture of an organisation such as our school will influence how I am in our relationship. So if I feel that I am part of our school and my voice and behaviours are recognised and that they count, I will be more confident in our relationship.

The history of an institution will influence how I am in our relationship. For example, the fact that Roma children were deported directly out of classrooms in Nazi-Germany, has an effect on how families of survivors can be in relationships with schools and teachers.

I might try to form a relationship with you that mirrors the social templates ascribed to our roles and the expectations that come along with them. Relationships are structured by norms, conventions and (role) expectations that in turn are structured by narratives or societies' stories (Harari, 2018). As persons we never play just one role, our identities are complex, fluid and dynamic, and they entail a variety of different reference points, points for identification and might more often than not include aspects of contradictory beliefs and values.

Having experienced humiliation and degradation, I might react with fear, hurt, shame, anger, silence or violence if your behaviour reminds me of my past experience. I will see your behaviour and communication, not your intention. If you seem to repeat or reaffirm a stereotype other people hold against me or members of groups I identify with, I will protect myself and my group. If I trust you, because I have seen you deconstructing rather than reinforcing stereotypes, we might be able to criticise aspects of groups you and I identify with together.

My sense of self is as important to me as my sense of community and belonging. If you offer possibilities for identification and provide an atmosphere where I can develop a sense of belonging, I will be stronger and more relaxed.

To return to the metaphor of the dance, the movements in our relational dance can also

be understood in more general terms of symmetry and asymmetry as we can see in the following paragraphs.

Symmetrical and asymmetrical relationships

Drawing on communication theory (Watzlawick, 2000) we can distinguish between symmetrical and asymmetrical communication. We might as well distinguish relationships for analytical purposes in these terms of symmetry and asymmetry. A symmetrical relationship is characterised by the even distribution of the power to continue or discontinue the relationship. An asymmetrical relationship is defined by the unequal distribution of power. One party has more resources, more economic, cultural, social or identity capital available than the other. In other words: while, for economic or structural reasons, one party depends on the continuity of a relationship, the other party does not, or at least not to the same extent.

The role of power in relationships

The fact that we cannot think of a relationship outside of (social) roles and how these roles are ascribed to positions of power or the loss thereof leads us to reflect further on how power structures outside the classroom filter in. Therefore, it is important to notice that while we distinguished between symmetrical and asymmetrical relationships for analytical purposes, an asymmetry is seldom or never complete. Intersectionality studies (Crenshaw 1989) have shown that some aspects of one's identity might be associated with positions of power, while others are historically and presently marginalised. We need to realise that resources are unevenly distributed.

We have been talking about power in a rather simplifying way that helps us understand relationships. For the purpose of this chapter, we conceptualise power as the degree to which you can influence yourself and your environment. This in turn depends to a high degree on your different forms of capital (Bourdieu 1997). Relationships are structured by conventions and expectations that in turn are structured by a society's narratives on power. Capitalism, Colonialism, Patriarchy, Cis-Heteronormativity, Genderbinary, Ableism, Social-Darwinism, Nationalism are some of the narratives or stories that structure our belief systems and our access to resources.

Earlier on, we looked at symmetrical and asymmetrical relationships in terms of the power to continue or discontinue the relationship. Now we see that this is not the only power that structures our interactions.

Example Case 2 – Being Angela Merkel

This is one of my first experiences as a teacher, where the tension of social power relationships is almost tangible: After the terror attacks on the French newspaper "Charlie Hebdo", solidarity was wide all over Europe and also in Germany, as the famous slogan "Je suis Charlie" shows. So, I decided to have a special class with my students on this sensible topic. I thought about a decent way to address it, asking mostly questions: What do you know about what happened? How do you feel about it? How can we as a class react to it?

As most media and the Senate of Berlin were in mourning and shock and even initiated a minute of silence I expected to have a quite similar discussion in the classroom. To my surprise, in the class I was working with, most students had completely different emotions about it: A majority of my students identified as Muslim. They were angry, angry about the media representation and about the top-down decision of German politics to give this attack so much attention – while another terror attack in Lebanon only some days later didn't get any media coverage. That led to a discussion where I suddenly started to be seen mostly as a representative of the state and thereby became the target of my student's anger. Why do we talk about this and not about other terror attacks? Why do you ask us to hold a minute of silence?

That made me feel very uncomfortable and made me think. What could I – as the responsible person for this lesson – have done better? Which underlying needs were not sufficiently addressed? We had long discussions amongst colleagues – with the result that we now give more space and talking time to the students and the political events they are concerned about. We now define the classroom as a shared space where power structures become more visible, not only in times of crises.

Simon Klippert, Combined Primary and Secondary School on the Rütli Campus, Berlin, Germany

What is special about a relationship in a pedagogical context?

Similar to the relationship between a primary caregiver and a child, the relationship between teacher and student is always asymmetrical. This is mostly due to the social roles, age, developmental factors and the functions of school that include the socialisation and qualification of students as well as the allocation to social positions and job opportunities – the process of distribution of social positions and job opportunities (Fend 1980). However, there are some democratic schools that try to establish fundamentally different

distributions of roles and power. An example of this is the Sudbury Valley schools, where the learners have a say, for example, in the employment of the pedagogical staff, even though the realities on the ground may be more traditional than it seems (Filion Wilson, 2015).

The student-teacher relationship is characterised by the roles and the normative expectations attached to the roles of student and teacher. While these are changing over time and also differ in cultural contexts, we can identify some commonalities. Also individual interpretations of how a teacher should be, behave like and think might differ greatly across school forms, regions, legal frames and time, there is a common factor. In public and private education, a teacher is an adult who gets paid for what they are doing. Looking at teaching under the lens of paid labour offers the opportunity for the public, who ultimately pays teachers, to expect professionalisation and in turn it allows teachers and educators to limit the influence of these expectations to the sphere of work. Other than the relationship with primary caregivers, the educational relationship aims at its own abolition. So, the teacher's job includes supporting the student to become more and more independent and in the end not need them anymore.

To define a good pedagogical relationship, one lens is not enough. However, in a capitalist society, where a great deal of recognition is distributed monetarily, this cannot be ignored. In other words, where money and the flow of capital structure relationships, we need to look at their influence.

What are the consequences of conceptualising the student-teacher relationship as structured by power?

Recognising this is the first step to a better understanding of relationships and a possibility to deepen them. If we acknowledge that our relationships are not only influenced by good-will, intentions and personal (dis-)abilities, but rather a result of complex belief systems and narratives, we can start analysing our own position and positionality. Many activists and academics (Bourdieu 1997, Kilomba et al. 2005, Kilomba 2008, Essed 1990, Gomolla & Radtke 2000 / Ha 2007 / Palzkill, Pohl & Scheffel 2020, Mecheril 1997 u.a.) have analysed how these systems work in privileging some people while keeping others systematically away from power, or even the most basic resources (e.g., clean water, shelter). Drawing on these findings we can become aware of our own positionings within the social web. We can limit the influence dehumanising narratives and structures have on our relationships. We can get to know and become aware of our own and also our students' positionalities and traumas that might be associated with these. We can then in turn understand where a relationship is asymmetrical due to one narrative (e.g., racism, gender binary) that positions one person at the receiving end of discrimination and the other at the receiving end of privileges (e.g., one cis-gendered and one trans* person). Teachers and educators are professionals with a public responsibility. They also often have structural advantages as shown above. The structural advantage in a partially asymmetrical relationship should be used to increase the well-being of all. 'With great power comes great responsibility' or rather

with great privileges in a professional educational environment comes great responsibility. In the following paragraphs we will show how this might look like and summarise the practical applications with a brief overview on what to do with this power.

A relational classroom as part of a democratic school culture

The work of Biesta (2012; 2013; Biesta and Säfström, 2023) highlights the potential for education to become a location for democratic negotiation of a plurality of identities (Keupp, 2008). Within the classroom setting, a relationship that is based solely on the needs, wishes, power or dominance of one person (either teacher or student) in neglect of those of the other is unlikely to work positively; rather, educational environments offering both structure and support are most successful (O'Toole and Hayes, 2020). Traditional teaching approaches based on authoritarian ideas only focused on the teachers' and the schools' needs l to the neglect of those of the children and we are increasingly coming to recognise that this at best limits learning (Gregory et al., 2010) and at worst can create significant trauma and 'symbolic violence' for many people, particularly those who for whatever reason (ableism, racism, etc) struggle to fit the mold prescribed by the teacher or school (Bourdieu, 1990). Furthermore, children's learning is equally limited by chaotic settings where rules are unclear or non-existent, and no expectations are identified (Bronfenbrenner and Morris, 2006).

Ideally an educational relationship should be a democratic space where multiple identities, needs and strengths are negotiated (Biesta, 2012; 2013). In practice this can include sharing responsibilities for the shared spaces like cleaning together (Okihara 2006). Individual needs within the classroom will not always be in agreement with each other, and a good educational relationship does not mean that everyone is always happy. Sometimes it will mean negotiating conflict and the teacher will of course sometimes need to prod a student out of their comfort zone to promote the next stage of learning (Hayes et al., 2023) or reprimand students if their behaviour limits the development of themselves or others. In a truly democratic approach to education, conflict is negotiated not avoided (O'Toole, Dowling and McElheron, 2023). According to Biesta (2012; 2013), common action in education is not reliant on total agreement, total consensus, or total sameness since that would destroy the very plurality that is necessary for democracy. Relational inclusive education therefore must focus on the shared good of all in the classroom and not just the pursuit of individual agendas. However, a relational approach is also located within the potentially paradoxical position that individual needs do still matter, and meeting children's needs to facilitate inclusion is not only important but an ethical imperative.

Practical Application

You might be asking yourself "what now?" I understand what a relationship is, I understand

that relationships are crucial for inclusive education, I understand that I've got the power, now what should I do with it? In the following paragraphs you can find ideas on how the theory on relationships can be applied to a relational approach in the classroom in order to ensure inclusion.

Back to the dance:

Very often I am with you as you are with me, so the notion of a dance is a useful one because it helps us see that the steps I take impact on how you move in return. We hope that by now you have realised that this cannot be understood in an action-reaction pattern. You might think of societies' narratives as the music to our dance that does not determine our movements but seduces us to move with the rhythm and makes it harder to move smoothly in a different rhythm. The shoes, the wheelchair, the floor can be thought of as the economical frame-work. Ask yourself, do we both have equal means to engage in this dance? What can we do to get there?

Here our co-author Simon, a practising teacher in Germany, shares some experience, linking the theoretical background to his daily routine as a teacher:

See yourself & your role as a teacher

As a professional the starting point of professional acting always is oneself. Start thinking of how you've been raised and what you stand for. Also, consider the power structures (see above) that influence your role as a teacher in school: You have the power to support individuals if you use your power wisely. Or you have the power to deeply destroy somebody's self-esteem.

So, talking about myself – I am a white middle-class male – I was deeply shocked at first by just how different I was from most of my students and how much struggle this caused. To be clear: Not mainly to me, but to my students: I was someone fitting in the design – school settings are designed as white and middle class. But, for sure, I also have to admit, as a teacher, I am the one who has to work with the challenges my students might have.

Even if as a single person, impact is always limited, as a teacher you have an opportunity in your hands: the opportunity to make the lives of your students harder or to empower them. If you do not consider yourself as someone with power in the relationship – even if you do not want it – you will automatically reproduce injustice. So, define your role as a teacher and define establishing relationships with your students as part of your role as a teacher to use your power wisely.

Be humble & listen

If you want to listen to your students, you need to give space to their stories. These stories can be part of your German or Science class, or they can take room in informal situations such as breaks. They can be spread in the whole group or trustfully shared in a direct conversation between teacher and student.

As teachers, being the ones in a powerful position, we are used to people listening to what we say. If you want to create a constructive relationship, it is necessary to listen to your students, aiming at a better understanding of their living situations. Listen especially to their social environment – their families and friends – and recognise their daily challenges. If you know more about your students' lives, you will have many more opportunities to link your lesson to them. And you will have the chance to create a deeper understanding of what they need, both as a learner and a personality.

This, for sure, should impact not only the individual level, but also requires systemic change: Create new school subjects meeting your students' needs, establish supportive structures (e. g. anti-racist) in your schools.

Example Case – Talking about my son

On one of the first days I came back after my paternity leave, one of my colleagues asked if I had already heard one of my students talking about my new born son. My colleague told me the student was using a strong and hurtful swear word to refer to my son. That hurt me and I started doubting the quality of the relationship I had built with my students. So how to react? First, I took time to calm my nerves and made a plan to use the discussion about the word as a class subject. Later, as I entered the classroom, the students were not anticipating that I was about to write the swear word on the whiteboard in big letters. It felt somehow offensive, but I just let the students comment on what this word caused in them. We talked about their feelings and the origin of the word and of the impact it has been having. I did not mention that I knew that one of my students used the word for my son, but he knew that I knew. At the end of our common reflection, I told my class that I heard students at school calling my new born son in this way: many of the students felt sorry for me and voiced their aversion to this behaviour.

That same night, I got a message from the student: They deeply regretted their words and apologised for their behaviour. The next day we had a really good talk about it: The abstract use of an insulting word had become meaningful through our relationship. And this relationship made it possible for them to change the future use of this problematic term.

Simon Klippert, Combined Primary and Secondary School on the Rütli Campus, Berlin, Germany

Teacher as secure base: supporting positive behaviour in a relational

classroom

In order to avoid incoherence and chaos, classrooms must have a grounding point, and we argue that this should be rooted in a student-teacher relationship that offers some sense of stability in an otherwise seemingly very unstable world. Attachment theory (Bowlby, 1973) identifies the adult as the "secure base from which to explore the world", and in the educational setting this positions the teacher as providing the foundational relationship that helps 'contain' children's anxieties (Harlow, 2021; Riley, 2011), providing them with 'freedom to learn' (Rogers, 1969). As the adult and the professional in the relationship, this leaves the teacher with responsibilities that come with inherent tensions and contradictions; acknowledging the students' individuality and at the same time not being dissolved by different students' individualities; maintaining and developing one's own individuality but ensuring to uphold and stand up for others' individualities, pluralism and a sense of community; and respectful negotiation of the tensions that arise when any diverse group of people comes together (Treibel 2015).

Therefore, within educational approaches that centre on relationships, the teacher not only can but must establish clear boundaries for what is okay and not okay in the classroom. In relational classrooms, teachers hold children responsible for their own behaviour, and support them to make choices that foster a warm, empathetic relational environment (Gatongi, 2007). While rules can certainly be negotiated and agreed with the children, it is the teacher's responsibility to hold the line, call out behaviours that damage the relational environment of the classroom as a whole, and implement a clear, transparent system of consequences. In Simon's example above, addressing inappropriate behaviour in the context of the relationship allowed for the behaviour to be addressed without damaging the relationship – in fact the relationship may have even been strengthened by this experience. Ideas for holding the line in challenging situations can also be found in the concept of confrontational pedagogy (e.g., Weidner). The negotiation of rules is of similar importance. Boyer (2016) recommends a group or class mission statement, renegotiated regularly. In this regard, it is important, however, to keep in mind the differences between consequences and punishment. Consequences are about preservation of the relationship through restorative practice and reparations; punishment is about re-establishing power and dominance. Within a relational frame, intervention strategies should have a triple focus: 1) on the person that is being harmed by a behaviour, 2) on the person showing disruptive behaviour, and 3) on the group and the classroom discourse influencing the group. Approaches that focus on communication and support the relational classroom can be found in systemic pedagogy (e. g. "Authority without violence" Omer et al. 2002 or Lemme et al. 2019).

Stability is of central importance in a relational approach, but it is worth repeating that this does not mean avoiding conflict. In the attachment-based concept of 'rupture and repair', 'rupture' to a relationship can be both overt (i.e., direct hostility, sarcasm) and covert

(i.e., disengaged silences, eye rolling, physical withdrawal) (Maramosh, 2015). While rupture is likely to occur in settings where spaces and norms are negotiated (Treibel 2015), it does not have to be feared. Combined with 'repair' as an integral part, the concept of rupture and repair offers an orientation for the negotiation of needs and wishes in the classroom. Repair can happen in many different ways (Maramosh, 2015), and restorative practice is one of the practical tools to integrate this in an educational context. Concrete ideas can be found on the Website of the Department of Education Minnesota, e. g., the "Restorative Practices Trainer's Guide Training Activities" and the "Practices of a Restorative School" (ideas for German speakers can be found in Grabe 2014). The key point in a relational approach is that children need to know that even if a teacher needs to impose consequences for behaviour, this does not mean the end of the relationship, it can be repaired. Considering the power dynamics in the student-teacher relationship and the asymmetry, the responsibility for initiating the process of repair lies with the teacher.

Example Case – "By far the best teacher!"

One afternoon, a teacher sees a fight between two students in a school corridor, one threatening the other verbally and physically. The teacher tries to stop them with words, but doesn't seem to have an impact. He decides to intervene by shouting harshly at the aggressor to stop him, and this works. After the teacher had banned the aggressor from the school by sending him home for the day, he tries to help the student who got hurt. The next day, the teacher is out walking in the neighbourhood with a friend, when all of a sudden, he meets the aggressor in the street, also walking around with one of his friends. The student waves and shouts friendly from a distance: Hey teacher, how are you? Then proudly and unironically says, turning to his friend: "He really is by far the best teacher!"

Simon Klippert, Combined Primary and Secondary School on the Rütli Campus, Berlin, Germany

---

The concept of rupture and repair is also echoed in the person-centred concept of "unconditional positive regard" (Rogers, 1995). Regard for the person is non-negotiable. Therefore, awareness for condemning acts and never a person is central to the relationship. A teacher with a relation-centred approach should never threaten the loss of the relationship as this is recognised as an existential crisis for the child. Again, acceptance and unconditional regard for the child in an educational setting does not mean that all

behaviours are to be accepted – it is possible to identify behaviour as inappropriate or damaging while still retaining respect and regard for the child as a fellow human being with needs and feelings, strengths and challenges, just like adults (Gatongi, 2007; O'Toole and Hayes, 2020). Boyer (2016) reiterates this point: "We accept all students unconditionally, but not all behaviour is safe, kind, forgiving, or loving. The [teacher] must consider the mental health and physical safety of all students and set appropriate limits" (p. 344).

In the context of a book on inclusion, it is important to note that children with experiences of trauma and high-risk situations are particularly dependent on continuous and grounding relationships with their professional educators and other adults (Harlow, 2021). We stand in need of a critical debate on manipulative, exclusionary and labelling educational methods that appear to provide short-term success but attribute the reason for classroom disruptions to children and adolescents alone, while neglecting the role of adults and the broader social power structures in it. For example, O'Toole (2019) notes that current approaches to 'wellbeing' can lead to 'toxic positivity' when students are continually told to be happy, or when we demand resilience in the face of genuine challenges, rather than supporting students with the resources needed. Feeling anxious, upset, disengaged or even aggressive may be a meaningful or even life preserving response to the child's life circumstances and should not be pathologised but rather met with compassion within a boundaried and stable relationship.

Relational systems

Throughout this chapter we have touched on the idea that relationships in a school setting will be impacted by other relationships the participants have within and outside the school setting, but it is worth explicitly exploring this idea. There is a chain of activity that individuals drag with them across settings (Slesnick et al., 2007), and children in the modern world have an increasingly complex range of settings full of fluidities and disruptions to negotiate (Jackson and Barnett 2019; Bauman 2000). Different settings may operate under different religious, moral, ethical, and social norms and expectations so that a multitude of narratives is continually negotiated by learners. These are negotiations regarding who they are and who they are becoming within potentially contrasting roles, relationships, expectations and experiences (O'Toole et al. 2019; Keupp et al. 2008). Teachers are never only teachers, they are sisters, friends, football players, queers, are being (dis-)abled, migrantised, awarded privileges and discriminated against. In the same way as students are never only students, people's identities are complex processes in continuous (re-)construction. Bronfenbrenner and Morris (2006) maintain that learning and development is enhanced when there are linkages across the various settings in which children live their lives so that they can recognise and predict the behaviours of others, and their own strengths, skills, identities and understandings are transferable. In contrast, they proceed with caution, if movement between such settings (e. g. home and school) involves an

intolerable level of disjuncture; then their learning and development can be disrupted. For example, when there are differences between home culture and expected school culture in terms of beliefs and practices, such as the use of body language, clothing, greeting rituals, kisses, hugs, or waving hands or the use of derogatory language, there is a potential for misunderstanding. A child might be seen as misbehaving in one context, when her behaviour would be acceptable in a different context. Since culture is in many ways invisible when we are immersed within it, educators' attempts to support children to behave positively are often guided by biases and assumptions of which the educator is unconscious (O'Toole and Hayes, 2020).

Therefore, it is crucial to understand the student-teacher relationship within the context of systems of relationships. To clarify, the direct student-teacher relationship is highly influenced by all the other relationships in the lives of both the teacher and the child, particularly the relationships that can be observed, that is the other relationships occurring within the school. According to Bronfenbrenner and Morris (2006), one of the most crucial relationships from the child's perspective in this regard is that between the parent/guardian and the teacher as this provides a linkage and point of reference across the transitional boundary between home and school. The psychological concept of social referencing shows that children take their cues from adults on how they should feel and behave in uncertain situations (Berk, 2018). If parents and teachers seem to get on well and have mutual respect, this supports children to transition from home to school and feel safe.

In terms of inclusion, links and relationships between home and school are equally important for linguistic and cultural identity. Support structures for families are sometimes based on 'socialisation' (Hornby and Lafaele, 2011; O'Toole et al., 2019) whereby schools attempt to shape parental attitudes and practices so that they facilitate and meet the needs of the educational setting or of the broader society. This can create a jarring sense of disjuncture for children. As Derrington (2007) points out, the most successful inclusive schools do not force children to choose between multiple identities (e. g. the culture or language of the home and the dominant culture) but rather allow the child to be both or more. Relationships between children and teachers are rooted in the relationships both have with family and community. Sometimes values a school tries to convey might be opposed to the values a child is asked to adopt at home or in a particular community. We suggest to extend the distinction between the act and the person drawn before to a distinction between the values of a person and the person, when it comes to children in the formative years. Their values are still in development. As teacher: Try to say 'that is not okay' rather than 'you are not okay'. And even more importantly, try to amplify students' options for identification rather than limiting them, by creating positive frames for identification and providing possibilities for stable relationships with and amongst students (Render 2014); providing relationships in which conflict and disagreements don't threaten the continuation of the relationship (Treibel 2015). Behavioural norms have to be a negotiation between students and teachers and change with time and age. Upholding core

values such as equality and dignity is the teachers responsibility throughout and beyond these negotiations.

How can critical self-reflection inform relational practice?

In order to ensure that the relational culture within the classroom is not solely dominated by the personal and cultural background of the teacher, it is crucial for teachers to engage in regular critical self-reflection, studying their own positionality and what 'steps' they bring to the 'dance'. In doing so, we may realise that while we cannot control the steps danced by our students, we do have influence on our own steps and so in turn, within a dynamic relationship, we influence others. In engaging in critical self-reflection as a relational practice, it is important to realise that we are never outside of society, nor of power. Therefore, critical self-reflection is necessary for egalitarian inclusive education (Messerschmidt 2011). For some teachers, this could mean the need to relearn everything about the centrality of their own identity, and active, mindful work to ensure they are listening to the children not only in the classroom but also incorporating their background and their communities. Consideration of power differentials will need to be revisited and relearned repeatedly. As a teacher you must be open to listening to challenges the children are facing, and you must also be humble and recognise when things are strange to you and you are strange to them. Thinking about privilege is a starting point to thinking about establishing relationships that are supportive of learning, and it is important to mindfully move beyond simple reproduction of our own school experiences. Identities are more fluid than they once were – many traditional guiding structures of society (patriarchy, colonialism, nationalism) are increasingly being deconstructed, and a teacher is no longer supposed to tell a child what to be – 'be like this or you'll get in trouble'. Rather there are more negotiated spaces than ever before, and critical self-reflection allows the teacher to make explicit and break down the assumptions they bring to the relationship, as in example case 2. We also need to avoid thinking in terms of overgeneralised groups and genuinely get to know the individual child – a real relationship does not mean making a homogenous group out of your students but rather seeking the story of the individual person, their aspirations, thoughts, identities.

Another important stance to facilitate critical self-reflection is the understanding that I as the teacher may have needs of my own that I am seeking (attention, recognition, friendship…), perhaps inappropriately, to meet through the relationship with my students. Critically self-reflective teachers must ask themselves: Am I seeking a student's approval or proximity to satisfy my ego or strengthen my student's independence? Am I introducing myself as an irreplaceable part of the student's life and if so, reflecting on asymmetries, do I have the resources and am I willing to maintain the relationship, even when the student does not meet my expectations and confronts me with extreme violence or emotional needs? Do I or does my behaviour suggest a relationship (e. g. the relationship to a friend or

a primary caregiver) that I am not able or willing to follow up on? Will it be easier for me to distance myself from the relationship, because in the end I go on holidays with my friends or family and the child is left with theirs? The power of relationships means that we must be mindful of the boundaries of these relationships. It is never the responsibility of the child to manage the emotions of the adult teacher, and equally, there may be areas of the child's life in which the teacher does not have a central role to play.

The Principles of the Reckahn Reflections might be of use to support critical self-reflection. "1. Children and youth are addressed and treated with appreciation 2. Teachers and educational professionals listen to children and adolescents. […] 5. Teachers and educational specialists are aware of the interests, joys, needs, difficulties, pains and sorrows of children and adolescents. They consider their concerns and the subjective meaning of their behaviour."

What to do with the power?

Here are some ideas, feel free to add, change, comment and compliment!

- Become aware of our strengths and power and (re-)appropriate it for social change.
- Be an amplifier: make others' voices heard

- Be a filter on the way to an equal society without discrimination: help discriminatory language become a background noise rather than the dominant tone (classroom as discourse)
- Distinguish between intervention and prevention. The first aiming at protecting somebody or something during acts of violence, the second aiming at educating kids and reducing violent, harmful, discriminatory behaviour altogether.
- Don't use the discontinuity of a relationship as a threat
- Condone the act not the person
- Be a good example, use restorative practice as a form to restore relationships and rebuild trust. In comparison to forgiveness, restorative practice offers a way to keep the self-respect instead of instilling shame or guilt in a party
- Apologise, if you have harmed somebody
- Don't apologise for upholding pluralism and mutual respect as values
- Establish and maintain the relationship. It's your duty as teacher
- Keep in mind to be humble, you don't know everything
- Create appropriate and accessible communication channels with your students and their families
- Always see the individual person and treat different people differently
- Take into account the power structures in your wording and decision-making
- Be clear and transparent and have high expectations
- Care for your students, their stories and their development

• Believe in your students and show them that you want them to reach their goals

What are the challenges and barriers to putting relationships at the centre of educational practice?

While relationships are crucial to good inclusive practice in education, they are not always easy to put first, in part because of the inappropriate narrative, addressed above, that relationships exist somehow outside of the 'real' work of the teacher which is sometimes framed as content-delivery. Initial Teacher Education (ITE) at university (in Germany, Ireland, Italy and many other countries) often focuses on content: theories on literature or on science, theories on didactics or development. There is often one crucial missing point: student teachers in many jurisdictions are often not trained in how to interact on a personal level with a group of students. They do not learn how to create relationships as a basis for successful learning at schools. So, many teachers indicate that when they first start working at schools, they have to learn this while already on the job. And – for some teachers who may have been born and raised so differently from most of their students this can feel like an exhausting job. Because relationships are always individual, teacher education must provide general skills, and placement activities should focus on relationship building as well as specific instructional activities. Otherwise, early-career teachers can emerge from ITE with little sense of relationship-building as central to their role, and / or with inadequate skills to do the actual work of relationship-building.

These issues can become exacerbated as teachers progress through their careers. In many jurisdictions, teachers are under increasing pressure to meet academic outcomes and sometimes to disregard more holistic understandings of children's learning. Teacher working time often does not include time to invest in relationships. For example, in spite of the evidence in favour of home visits to support learning (Soule and Curtis, 2021; Soule, 2020) in many cases if a teacher visits a student's family at home to better understand their living situation and to provide appropriated learning settings at school, the teacher does this in their free time. We argue that relational work should be considered as part of the job description of teachers. Establishing a constructive relationship demands effort and time, and teachers must factor in the time to do the "Beziehungsarbeit" (work of building relationships) – to foster the students' reflections and to tutor them in the process as well as time to reflect on themselves as teachers and a professional self-concept, privileges and power-sharing. Of course, this has implications for policy, too, because teachers cannot simply manufacture more time, and workplace roles do not happen in a vacuum outside of considerations of pay and working conditions. For teachers, school leaders and policy-makers, it is vital to centralise relationships in education, and to see building relationships as a key role within the profession of being a teacher. The European Unions for Education

and Teachers play a vital role in shaping policies towards humane working conditions for teachers and educators that in turn make relational approaches an integral part of education.

Lastly, one of the biggest barriers to a relational approach in the classroom is the emotional labour involved for teachers and the potential for burnout. A teacher who invests in relationships can run the risk of caring so much for students, often with little structural support, that their self-care is neglected. This is unlikely to have positive outcomes for anyone involved and in order to be able to meet the needs of students, the needs of teachers must also be met: "Teachers are best able to serve students when they themselves have been adequately served" (Sergiovanni, 2005, p. 101). Therefore, we must emphasise that drawing personal boundaries is not in opposition to a relational approach; in fact, setting boundaries is a necessary pre-condition to being able to appropriately engage in relationships with students. There is no such thing as the 'perfect' teacher, and we draw on Winnicott's (1953) idea of the 'good enough' parent to advocate for the 'good enough teacher'; teachers who reflect on the impact of power structures within the classroom, who recognise the importance of relationships and do the work to build them, who understand their own needs and boundaries, who practice self-care and who perhaps do not always get things right, but are willing to work through 'rupture and repair'.

Conclusion: Making use of key concepts of relational approaches for developing inclusive educational practices

1. Often the social aspect is seen as an add-on in classroom-situation, while many studies show the opposite is true: the state of well-being is the basis for successful learning.

2. Relationships create a link between different people to create an atmosphere of well-being over many years. If I create opportunities to get to know each other that are grounded in the lifeworld of students, I create references that might be helpful to support them in their learning processes. When I know about the interests of a child, I can try to implement topics. That also applies to group dynamics. Just keep in mind not to appropriate their identities that also need protection. Learn something about their views, listen to them and invite local representatives of these (sub-)cultures to your classes.

3. Each relationship is part of a constellation of other relationships. The student-teacher relationship takes place in the context of the relationships between children and their family and community, teachers' relationships with the child's family and community, and teacher's relationships with their own family and community. Relationships are interactive, dynamic and multi-directional.

4. All students need to feel recognised as individuals, but the cultivation of good

pedagogical relations is especially important for students with unsecure living situations and looser relationships. They are particularly dependent on continuous and grounding relationships with their professional educators.

5. Creating relationships with your students does not only make you more knowledgable about their interests; knowing something about their lives means also knowing about their negative experiences, fears and trigger points. In crisis situations, you can rely on the relational bound to lift students up again to prevent conflicts.

6. Relationships are structured by power, and it is crucial for teachers to engage in critical self-reflection on their own role in the asymmetry of the student-teacher relationship.

7. Teachers establish the secure base from which students explore their learning. Behavioural norms in the classroom must be set by teachers, with clear boundaries and expectations, and consequences that address the behaviour but never threaten the removal of the relationship.

Closing questions to discuss or tasks

- Consider the approaches you currently use to leverage the power of relationships in your teaching. What can you actively do to more successfully build relationships with your students?
- Have you considered the impact of power on relationships in your classroom? Reflect on your own positionality and privilege / lack of privilege and think about what impact that might have on the relationships in your classroom.

About the authors

Lina Render de Barros

Lina Render de Barros is a queer of color activist from Pernambuco and Münsterland. She completed her first state examination (teaching degree) and her master's degree in bilingual European education at the University of Education in Karlsruhe and her master's degree in sociology at the Goethe University Frankfurt. She researches, lives and works in Cologne, always with the aim of taking a stand against group focused enmity and contributing to a more peaceful coexistence.

Leah O'Toole

Dr Leah O'Toole is Associate Professor of Early Childhood Education in the Froebel Department of Primary and Early Childhood Education in Maynooth University, Ireland. With an academic background in Psychology, her research interests include early childhood education, particularly accessing the voices of the youngest children from birth, relational pedagogy, bioecological theory and working with parents and communities. Inclusion across multiple dimensions is central to all elements of this work.

Simon Klippert

Simon Klippert is a Berlin-based teacher and teacher trainer. He has been working in various educational contexts: coordinating youth exchange

programs in France, teaching students at university in Colombia, giving classes for newcomer-students in Berlin. For the last 10 years, he has been working as a class teacher at a secondary school in Berlin-Neukölln, with a focus on language and political education, trying to empower less privileged students. Furthermore, he shares his experience as a teacher trainer in Berlin-Kreuzberg. Simon is a founding member of related (www.related-bildung.de), an initiative fighting injustices within the German school system.

INCLUSIVE EDUCATION AND THE CHALLENGE OF MENTORING THROUGH DIALOGUE - REACHING OUT TO ONE ANOTHER

Ines Boban; Dror Simri; and Linjie Zhang

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ama-2025-en/?p=434#oembed-1

Example Case

"Once when Dror was working with teachers who were trying to adopt dialogic mentoring as part of the school's educational work plan, a 43-year-old teacher asked him: "On what exactly do you expect me to talk to a 13-year-old girl about? What do we have in common besides the lessons? We have nothing in common." Dror asked her: "Were you once 13 years old? Are you both part of a family? Are you also a daughter? Do you also have relationships with your parents and siblings? Do you both experience fears, hopes, dreams, failures, successes? Are you both human? Dror also added: "Would you have been glad at the age of 13, that someone would be interested in all of these beyond being busy with classes and exams? There was a short silence and then the teacher said, "I never felt seen when I was 13 and for many years after. It caused me much pain and it left deep scars."

Dror Simri, education counsellor and family and couples therapist, Israel

In this chapter you will find the answers to the following questions:

- What is Dialogic Mentoring?
- In which way is Dialogic Mentoring a humanistic existential challenge?
- Why is mentoring important for schools and especially a key-element for inclusive settings?
- How does Dialogic Mentoring work?
- What are the benefits of Dialogic Mentoring?

There are also many more questions, connected to Dialogic Mentoring, that will be uncovered during this chapter.

Introduction to Topic

"Be yourself. No matter what they say" (Sting). When focused on inclusive education Stings words sound so right and obvious, but often they are very hard to fulfil. Especially in parts of a lifetime spent in institutions with rigid policies like many of the educational systems we know. Policies that lead to the phenomenon that teachers are driven to pay more attention to teaching subjects and inflicting discipline than to acknowledging children as whole and unique human beings. A situation that stacks obstacles that makes it hard to realise the inclusive goal.

Children and teenagers are busy in their everyday life with countless existential questions. Questions related to identity, values, morality, meaning. Addressing these questions means acknowledging children as whole human beings. Who addresses these issues in schools today? Who supports the students while they are engaged in the process of building their identity, consolidating values, dealing with moral dilemmas, and defining personal goals? This is where mentoring comes in. It is impossible to think that students can make the most of learning and developmental processes when such essential questions remain unnoticed and unanswered.

The idea that we can teach and educate children without being interested in their unique world, without paying attention to their mental, emotional, and social situation, without paying attention to relations, sounds impossible. At the heart of this chapter is the assumption that paying attention to relations is a critical aspect in achieving educational aims especially when dealing with inclusive education. Making room for attention to

relations is the way to focus on our students as whole human beings. We are suggesting that via professional mentoring this absence can be restored.

This chapter deals with mentoring; a term used in many fields but without a clear definition. You might have come across mentors in the education system in many forms. Students who volunteer to be mentors to younger ones in order to support them to settle in and adjust to school. Something like riding a tandem instead of riding the difficult "singles" of the school world alone. Sometimes mentors will be staff members who help students plan careers that are appropriate to the school's standards and expected by the institution. However, none of these focus on the student as a subject. Would it be nice, as a student, to be in a professional relationship with a staff member who is dedicated to helping you find and define yourself no matter where your dreams, ideas or goals may go? This could be a game changing role for adults in schools that intend to be inclusive places.

We chose to define mentoring as a collaborative relationship that is reciprocal and is aimed at supporting personal development and growth. In the chapter we introduce a mentoring model that follows this definition and was developed in Israel in the Hadera Democratic School (H.D.S.) – called "dialogic mentoring." Apart from being democratic, the H.D.S. is also inclusive. It has, among its students and staff, those with special educational needs, new immigrants and religious students and teachers Jewish and Muslim. We are introducing Dialogic Mentoring because it is a well-established model and has proven itself. The model was adopted in full or in part in many schools in Israel.

Dialogic Mentoring is a call for change in the relations between teachers and students as a new pedagogical approach. It focuses on relations because of the understanding that relations are the base for any kind of mutual learning process and the base for applying efficient and beneficial support processes. In order to do so, Dialogic Mentoring acknowledges the negative effect on school life and school culture of existing power relations between children and teachers and challenges them. It sees children of all ages as whole human beings and tries to put down the cultural "age barrier" that divides children and grownups. We introduce Dialogic Mentoring as a humanistic existential challenge, a new educational support role and a unique way to put human rights into action.

Key aspects

What is behind Dialogic Mentoring?

Dialogic Mentoring is structured on three levels. It is essential to understand and acknowledge them as a starting point.

- **A:** Recognition of **children as unique whole human beings.** That means accepting them as **unique, independent, autonomous, sovereign** beings that have a rich mental world, have views and understandings about life, have values, commitments, goals, fears, hopes and many unresolved questions.

- **B: Dialog** as a means of building relations. Dialog in the sense of an interpersonal engagement that encompasses the whole dimensions of human experience. That is driven by curiosity, humbleness and empathy, that acknowledges and accepts the otherness of every person. This involves not seeing the otherness as an obstacle, but rather as an advantage. Doing our best to engage each other with the whole of our being.
- **C:** The importance of allowing every person to **exercise their freedom** so they can fulfil and enjoy their full human potential.

If we take into account, the normative experience of most school lives this **ABC** of Dialogic Mentoring may seem like a big challenge. Nevertheless, as we go on with the details of the model it's necessity and its benefits will be clear. Figure 1 below shows that D.M. is at the heart of inclusive education and is part of reaching out to one another.

Dialogic Mentoring – A humanistic existential challenge?

To describe this challenge, imagine these 'simple' actions and attitudes in contexts of schools – they make clear what Dialogic Mentoring is about (see also Fig. 2) (Simri， 2020):

- Dialogic Mentoring is about **the will to see.** To see the people around us. To have the courage to see the whole of their existence.
- Dialogic Mentoring is about **the will to hear**. Hearing the words and hearing what is behind them, around them, hearing what is not said, but is implicit.
- Dialogic Mentoring is about **agreeing to be a witness** to what our students feel, experience and do. Witnessing without judgement or criticism.
- Dialogic Mentoring is about wanting, a real **deep wanting, to connect** to each other. To put into action our natural tendency for affinity, even though we understand that each one of us is different, completely unique and that we will never be able to experience and fully understand their way of seeing, understanding and experiencing the world.
- Dialogic Mentoring is about **accepting the complexity** of things. Understanding and knowing that behind what we see and hear there is always something more waiting to be seen, to be found, to be heard. Something waiting to be understood, to be recognised.

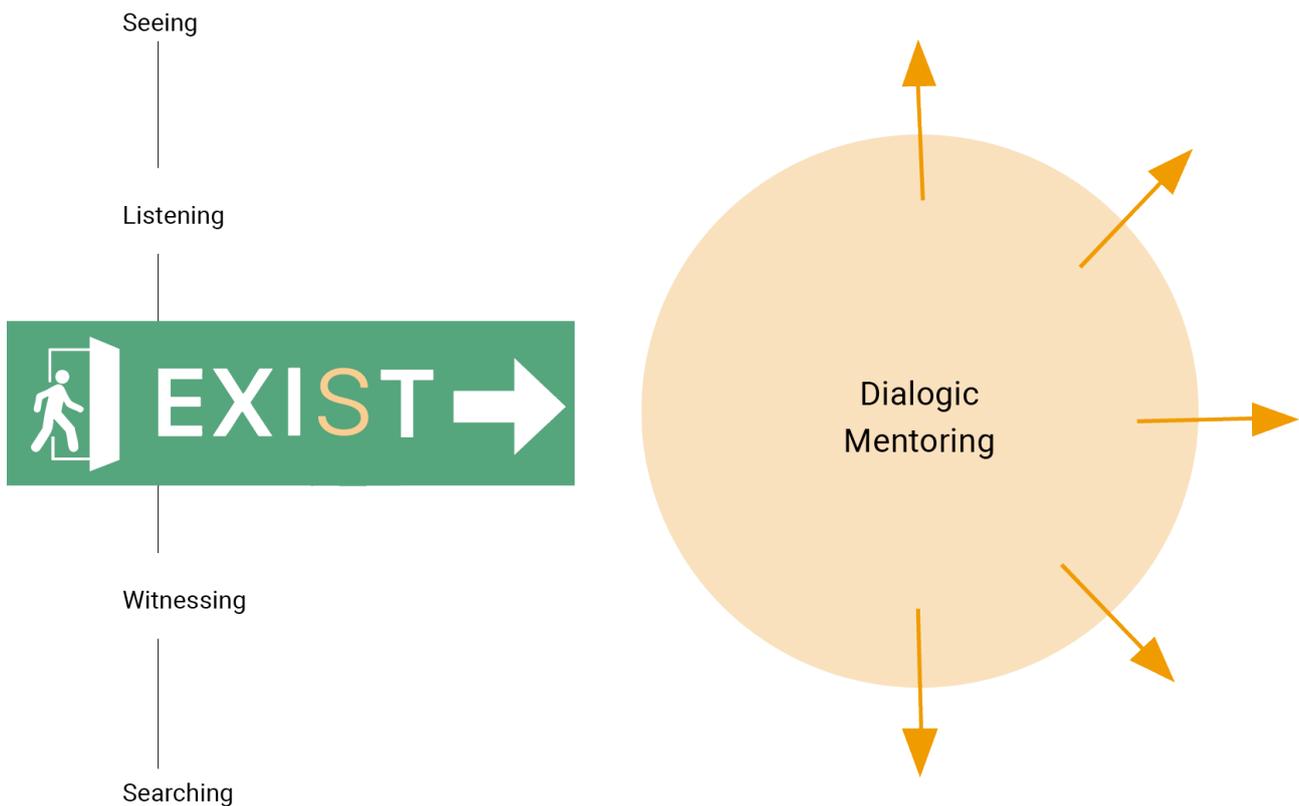
Dialogic Mentoring


Dialogic Mentoring is the understanding that it is our duty as grownups, who made the choice to work with children, to stand up to these challenges and try to see and hear what hides inside the inner world of students. What is hiding there that is important to them, whatever their age may be? Understanding that it is important to the student to be acknowledged and appreciated not only as a student but as a whole human being. Understanding that each person has a gift to give the world, but it will only be given if we make the effort to find it, if we assure them, they are safe.

This is why our curriculum, at least part of it, even a small part of it, should be dedicated to making the effort to find out what is there that our students want us to see, want us to hear. We should remember that what is hidden in their inner world is not all about pain, confusion and sorrow; it is also about new ideas, creations, special and unique points of view. It holds information, wonders, and knowledge that are important to be recognised not only for the benefit of the student but also for the benefit of all.

When we concentrate on seeing and hearing each other as whole human beings, as subjects that hold information that are very important to be heard, what usually emerges are **acceptance, closeness, empathy, altruism and love**. This is the important piece, the magic of dialogic mentoring.

When this kind of relationship exists, normally creativity appears, the ability to learn new things, find new interests and a greater understanding. We feel seen and safe. We build confidence in the possibility to shape our reality. We find that we can clearly determine what is important for us, and we find it is easier to achieve. In this state of being we

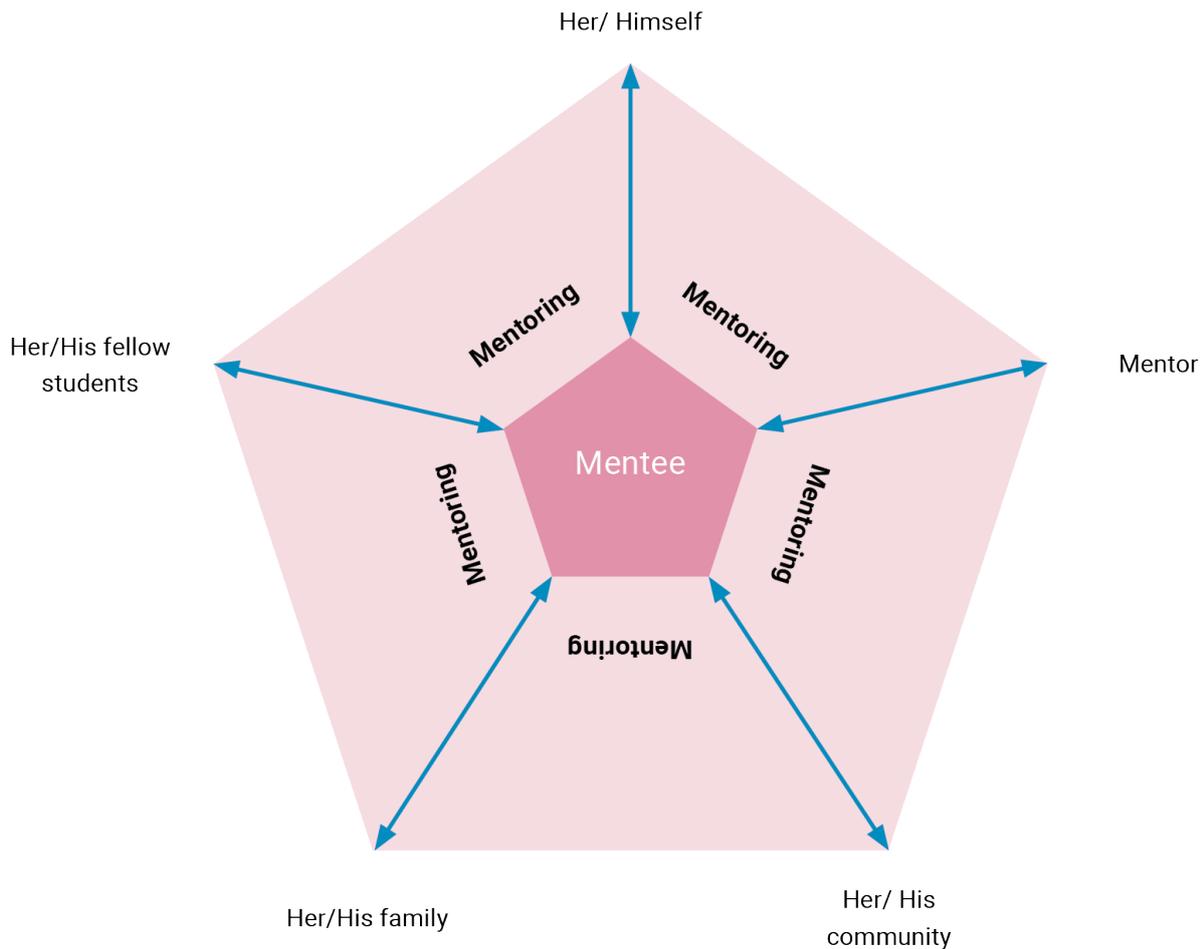
most commonly feel moments of joy, connection and **a deep and meaningful feeling of existence.**

The main tool that enables us to achieve such relations is the dialog as it is presented in the philosophy of Martin Buber. In his view, dialog is understood as a space of existence formed by the relations between the "I" and the world around it. From this point of view the "I" does not exist as a separate entity. His existence is the outcome of the affiliation between him and what surrounds him. The way we perceive and relate to whatever is around us defines our state of being. It will determine what kind of "I" will be present at that moment. An "I" that encompasses our whole being or just a part of it.

If we relate to a person in front of us in a superficial way, the "I" that we shall experience at that moment will also be a partial and superficial one. On the other hand, if we relate to it as a whole human being, the "I" we will experience will be a whole one. For example, if a teacher is trying to teach a young student addition, the teacher will see her/him just to that extent – a young student to teach addition to. The teacher will perceive the student in a shallow way and be partially aware of her/his whole existence as noted above. In this case the teacher will also experience herself/himself in a very shallow way. She/he will experience her/his being partially – she/he reduces her/his being only to a teacher that wants to teach a student addition. However, if she/he perceives the student as a whole human being, she/he will pay attention to how she/he behaves and reacts. She/he will pay attention to her/his words, expressions, and body language. She/he will really care about what is going on inside her/him. What are her/his thoughts? Is she/he happy? Is she/he afraid? Is she/he open to learning or bothered about something? If she/he will remember that she/he is a unique miracle of nature – one of her/his kind, she/he will experience the student for the whole of her/his existence and so she/he will experience her/his own whole being. All of her/his mental, emotional, physical abilities will awaken and be present.

When this happens a very **special experience of existence** appears. An experience that brings forth what was described above. This is the experience we are looking for when we talk about Dialogic Mentoring. This state of being is not easy to achieve and is hard to maintain for a long time. In order to create it we have to make an effort. We need to be focused on remembering our aim and to be aware of our mental and emotional state during the interaction. When we succeed in creating and maintaining these moments, they will yield what was described above.

If in our school, all through the day, all the mentors and teachers aspire to create such moments the whole school becomes a **dialogic sphere.** It will become a space of existence that will allow deep listening, an experience of connection and an awakening of creativity, involvement, and responsibility.

Figure 2: What influences a mentee? (own figure)


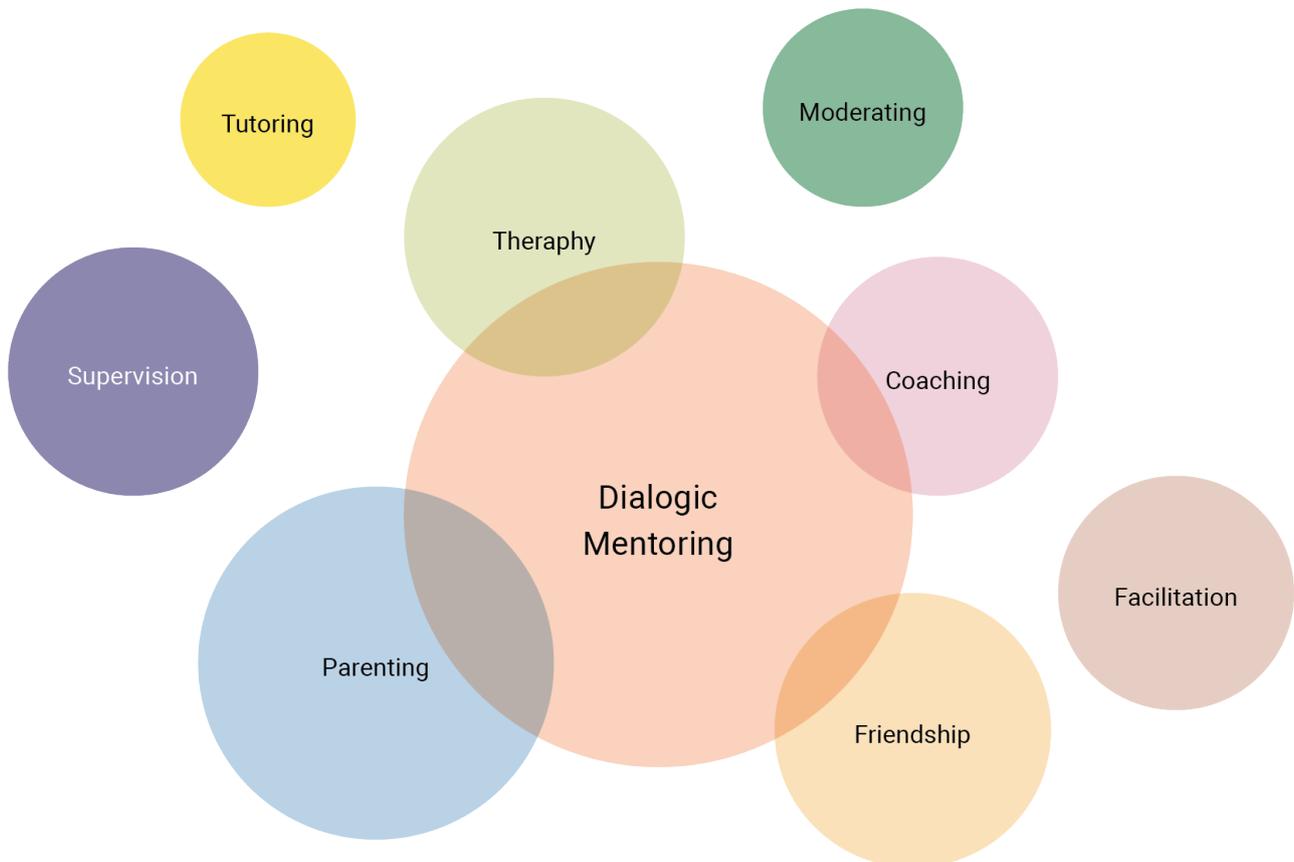
What does this new educational support role look like?

Dialogic Mentoring compiled parts of existing support roles and put them together to form a new educational support role that is based on the three principles **ABC** described above.

The mentor creates for the mentee and herself/himself an **intimate and safe space.** She/he is there to help in any situation. These components are found in parenthood and friendship. The mentor creates relations based on **equality and mutuality** like in a friendship. She/he has **experience and maturity** like their parents. She/he acts from an **empathic standpoint**, uses **mentalisation,** and frequently **reflects** like therapists would do. She/he supports **self-realisation** and **inner growth** processes, **goal setting** and finding a way to fulfil them – in a way therapists and coaches do.

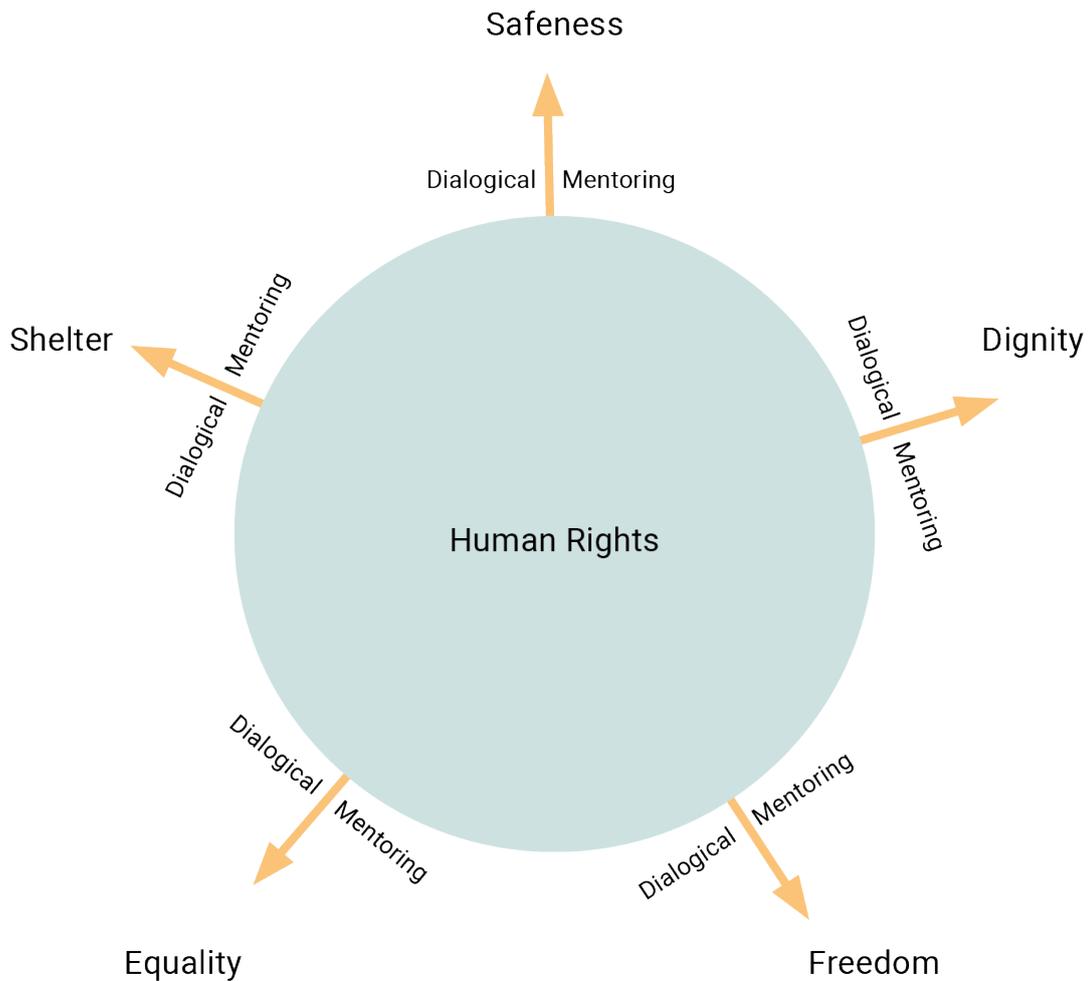
However a Dialogic Mentor is not the parent of the mentee, or a friend. She/he is not a therapist or a coach. She/he does not hold the responsibility of parents and does not substitute them. She/he is not entangled emotionally with the mentee like very often family relations are. She/he is not in competition with the mentee like friends often are and she/he does not take part in the mentees adventures of growing up. She/he does not diagnose the mentee, or meet her/him in a strict setting detached from life, but is a witness helping the mentee reflect and act in everyday life. A Dialogic Mentor helps the mentee determine

their own goals and acquire tools to fulfil them – and she/he concentrates on the process and not the potential results as Figure 3 clusters:

Figure 3: Aspects of Dialogic Mentoring (own figure)


How is Dialogic Mentoring connected to Human Rights?

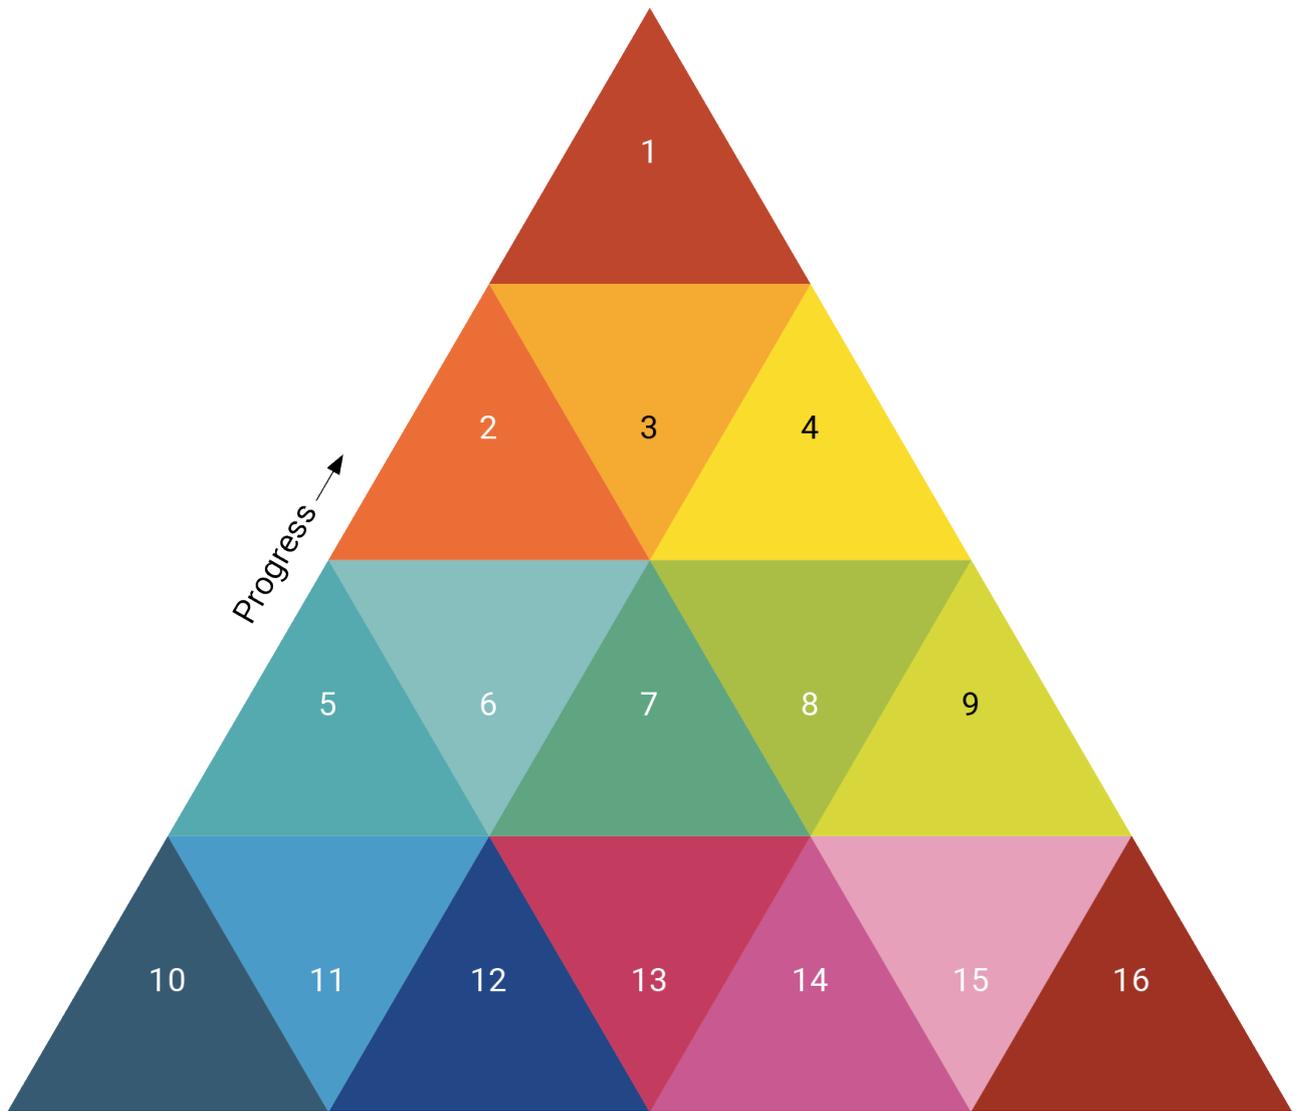
When the relations between all that attend school are open and equal (but not symmetric), when personal freedom is guarded, when everybody is acknowledged and can feel safe, dignity is being realised to its full extent and human rights are put into action.

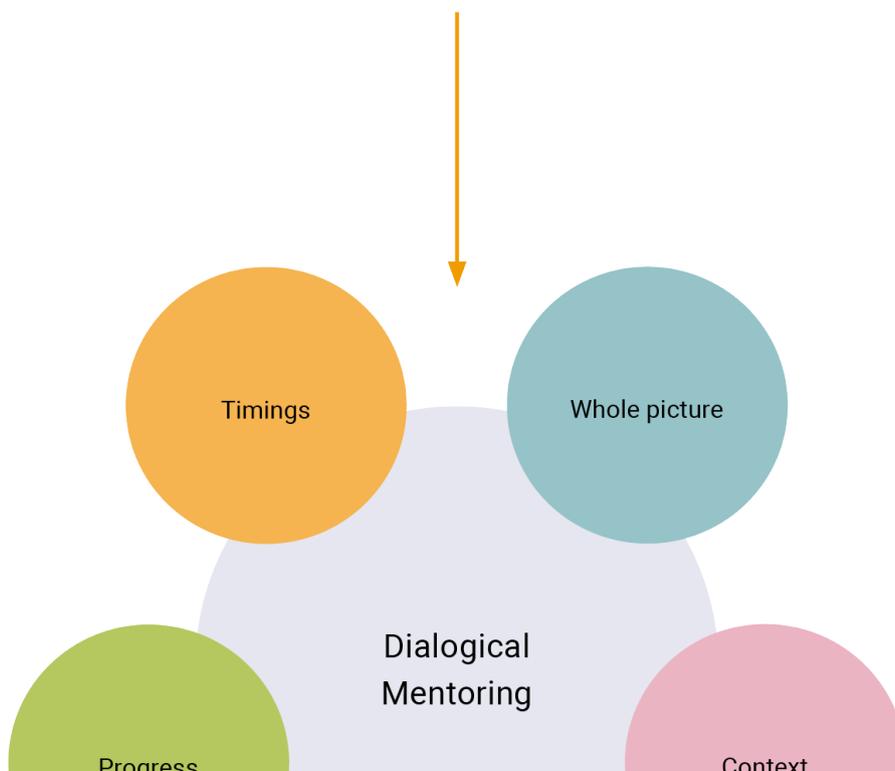
Figure 4: Human Rights – a frame for Dialogic Mentoring (own figure)


Human rights, constantly evolving, serve has been an enduring guiding principle. From time to time, this statement is specifically updated and made more concrete by various agreements and treaties, such as the Convention on the Rights of the Child (1990).The goals of Dialogic Mentoring are shaped by the children's rights framework.

Why is Dialogic Mentoring important for a democratic transformation of schools?

Most societies are following a pyramidal logic as if there were always levels to reach, higher steps to long for and linear climbing to get somewhere in a top position. Riane Eisler (Eisler, 2015, 2017; Eisler & Fry, 2019) calls this the ideology of a "domination culture." Figure 5 presents this logic on the left side and shows some elements it consists off – all serving structural violence:

Figure 5: The transforming shape of Dialogic Mentoring from pyramids to circles (own figure)


1. Different levels
2. Curriculum
3. Certificate
4. Standards
5. Tests
6. Categories
7. Cohorts
8. Groups
9. Competition
10. Rankings
11. Segregation
12. Separation
13. Behaviourism
14. Adult leading
15. Materialism
16. ...ism


Constructing different levels and certificates as if everyone has to follow a 'holy' curriculum and fulfil certain standardised efforts to climb up and reach high levels by overcoming tests by being categorised and compared to a set-up cohort. To set up groups is seen as reducing the complexity and helps to define a frame for competition, so rankings can be used for segregation and separation. To keep this system working, it needs judgements, including rewards and awards. In the tradition of 'old authority' (Omer, 2016) they use not only tokens and punishments but all kinds of 'motivating' stories to challenge children and focus their will towards materialistic success. One daily materialistic story told while pushing through the pyramid says, 'Time is money!' All kinds of '…isms' (adultism, fascism, sexism, racism, …) are nurtured by this up-climbing vision. Here teachers are valued for having their class in their grip … and push or pull their students to the highest level reachable in this certificate dominated logic – to reach their full 'human capital', this is also used later for the labour market. As all societies are patterned on a dominator model, in which human hierarchies are ultimately backed up by force or the threat of force. We see that spaces of education and how they are structured and filled play an essential role.

In a hierarchical context 'mentoring' will always be a tool to optimise human resources but never Dialogic Mentoring. In a structure like this 'inclusion' is just a term that must be added without disturbing the dominant patterns.

What if the story is changed in "Time is life; life is time" (Korten, 2015; 83)? What if there is no pyramid to climb to the top by being 'excellent' and leave all other competitors as 'mediocre' or 'weak' ones behind? What if the narrative of progress in the domination model with fear and suppression is replaced by a partnership model with empathy and respect (Eisler, 2000, 2003, 2004, 2015, 2017)?

Instead of simplifying the educational process by cutting off the complexity, it's important to see the beauty of being different and equal like Dialogic Mentoring does.

To really practise an inclusive life in schools Dialogic Mentoring would be the core element to find transformation steps towards a common philosophy as shown on the right side of Figure 5: If all agree that there is no pyramid to fit into but we can all stay on the ground in different fields. This is displayed in Figure 5 above as the round circles.

Students labelled as having special educational needs confront many challenges apart from their academic duties. This can harm the studying process and hurt their achievements and development academically, socially, mentally and emotionally.

Thus, it is very important to find an opportunity for them to receive support and assistance so they will be relieved and encouraged. Dialogic Mentoring enables us to deal with that. In order to make that happen, Dialogic Mentoring in education has to widen the scope of subjects brought to the mentoring relations.

Commonly, we talk with our students about their formal learning issues, their grades, and their behaviour in class and school. However, they have a full life that many times is more challenging, interesting and intensive than school. The mentoring process will benefit if it is possible for the mentee to bring his whole self into the mentoring.

As stated before, children have a rich mental world. Very often, they experience pain, confusion and emotions they do not completely understand. All of these influence their everyday life and there is no way of supporting them without bringing them into consideration. Society delivers the message that achievements in school are important, so what happens when a student is challenged by everyday life in a way that disturbs his schooling. How does it influence him? Who is there to assist him aside from his peers? That task can be dealt with by mentoring. So let us decide to change the story (Korten, 2015) and move away from the norms that led to hurt and crisis to a story that carries into a welcoming future. According to David Korten (2023): "Humans are Earth's ultimate choice-making species. Our decisions have defining consequences for the whole of Earth's community of life."

His description of the necessity of awareness about the stories we use underlines what Riane Eisler analyses as serving either a domination system or heading for a partnerist context – and it connects with all intentions to decolonise education. So, there is no doubt where Dialogic Mentoring belongs when David Korten (2023) writes under the chapter title "Sharing an Authentic Narrative":

"We fail to recognise the tyranny for what it is because we live in a trance state induced by a Sacred Money and Markets cultural narrative that shapes our collective understanding of our world and our choices as a species. It is based on two foundational assumptions:

1. Because we humans are by nature self-centred, materialistic, and inherently competitive, the wealth of the society is best maximised by channelling these natural instincts to beneficial ends through unrestrained market competition.

2. There is no limit to the total wealth of a society. The affluence of the winners is their just reward for their contribution to the well-being of all. If the needs of some are not being met, simply accelerate growth to bring up the bottom.

Both assumptions are critically flawed. An authentic narrative is emerging grounded in three truths essential to our time:

1. As living beings, we are by nature dependent on our ability to organise as healthy communities that create and maintain the conditions essential to our well-being.

2. We humans shape our behaviour by cultural and institutional choices. These can support individualism, gluttony, violence, and competition. They can support communitarianism, frugality, peace, and cooperation. And almost everything in between.

3. We depend on the generative capacity of a finite living Earth and must learn to meet our needs within these limits. Wealth distribution is an essential concern.

For thousands of years the institutions of Imperial Civilisation pit us one against another in a competition for the positions of privilege that favour the few at the expense of the many. The dominator hierarchy of corporate rule and its legitimating cultural narrative are extensions of Imperial Civilisation and the sociopathic behaviour the Sacred Money and Markets story would have us believe defines our inherent nature."

How is Dialogic Mentoring connected to Inclusive Education?

So, Dialogic Mentoring can become a heart element of finding more inclusive steps to change the rules of 'the games' people play and to reorganise procedures, policies, rituals and structures. If the individuals and their topics are heard and become stronger within their settings the groups, communities – any WE – become stronger too. If, as Marsha Forest (O'Brien & Forest, 1989: 3) once said, the only prerequisite for inclusion is "breathing, life itself" – if necessary with a respirator -, Dialogic Mentoring is a condition to a free breath: THE ultimate basis for learning – and living – anyhow.

Similarly, when Jean Liedloff (1986) shows with her "continuum concept" and the "search of happiness lost," that it is the main longing of every person to feel welcomed, worthy and 'right' then it is a way to look at the purpose of inclusion:

- Feeling to be welcomed
- worthy and
- in the right moment at the right place.

Obviously Dialogic Mentoring opens up the space for the awareness of this longing and to express it in a sheltered constellation (the matrix), and then to define steps (the patterns) to create more fulfilling situations. Inclusive education starts with this attitude – it is the basis for following decisions. In a way one could call it 'inclusive diagnostic.' If beliefs are formed in a child's mind by the words of the people who live their daily life with, especially those expressed as absolute truths rather than as opinions, while repetition aggravates the effect, Dialogic Mentoring offers consciousness about these processes and helps to relieve from wrongness to welcome feelings.

To find a common clearness about the matrix first and then agree about patterns on this ground can also be seen in initiating future planning in circles of support.

To deepen and underline Jean Liedloff's point of view here follows a longer quote as a source for persons involved in Dialogic Mentoring and in that sense inclusive processes of uncovering damaging beliefs, something she calls "our western malady" (1991, 2023):

"I noticed something curious about normal, neurotic adults: what we were experiencing was not a variety of 'problems' at all, but rather the very same difficulty. Although the details and degrees of damage differed, the malady was the same. It manifested as a deep sense of being wrong — of being not good enough, not lovable, disappointing, incompetent, insignificant, undeserving, inadequate, evil, bad, or in some other way not 'right'. What's more, this feeling of wrongness had come about almost always through early interactions with parental authority figures. And it had evoked powerful unconscious beliefs that have informed our views of both self and self-in-relation-to-others.

Upon coming to this realisation, I searched for words to describe how human beings would have to feel about themselves in order to live optimally, to feel at home in their own skins and represent themselves accurately to others. I thought of the Yequana people, and arrived at the

words worthy and welcome. People need to feel worthy and welcome, not bent out of shape, angry, or apologetic about their existence" (Liedloff, 1991; 2023).

Who is involved in Dialogic Mentoring?

The mentoring process involves two main entities: the mentor and the mentee. Each of these participants plays a distinct and crucial role in the mentoring relationship and processes.

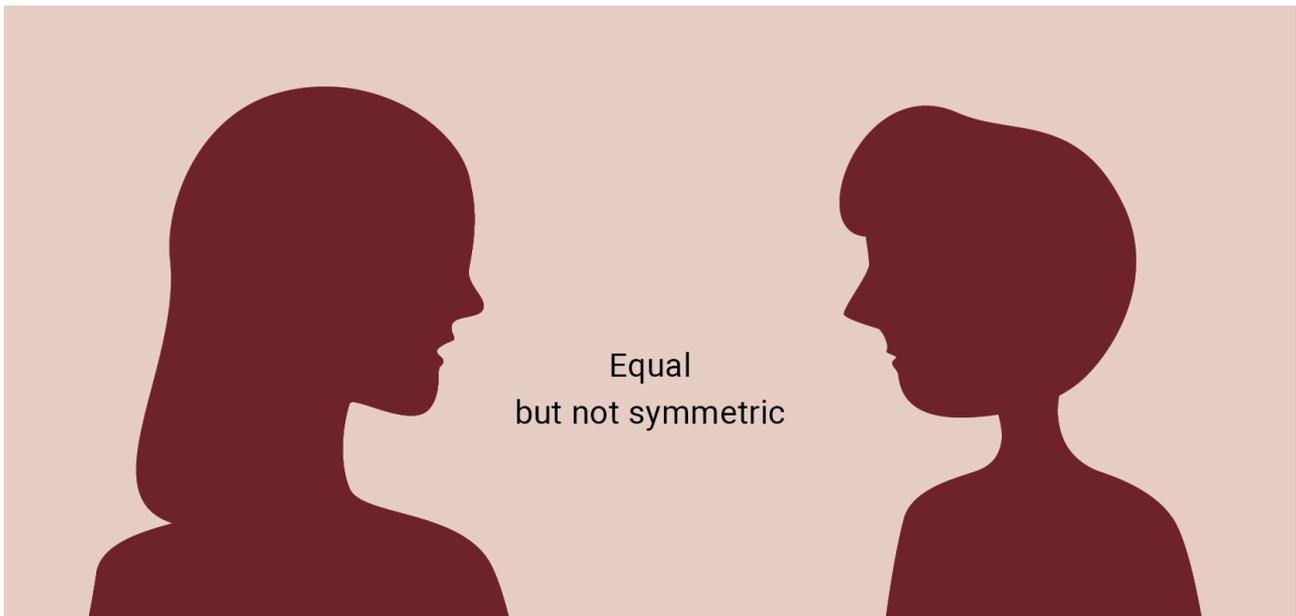
What is the role of the mentee?

The concept of a "mentee" can be understood through the lens of personal growth, guidance, and the interplay of knowledge between individuals. A mentee is someone who seeks to learn and develop themselves under the guidance and support of a mentor. The mentee is never identified with the problem that challenges them. As Michael White stated in his well-known quote: "The person is not the problem, the problem is the problem."

The role of the mentee is not one of passivity but rather an active engagement with the mentor's facilitation. The mentee is a whole human being holding points of view, having values and knowledge, having plans and goals, and enjoying their dignity. Mentee is the most authorised expert about themselves, who is encouraged to reflect, question, and internalise the lessons imparted by the mentor. Through this process, the mentee is not merely acquiring knowledge but also undergoing a transformative journey, honing their character, and developing a deeper understanding of themselves and the world around them.

In some philosophical traditions, the relationship between the mentor and the mentee can be seen as symbiosis, where both parties benefit from the exchange of knowledge and experience. The mentor gains satisfaction and fulfilment from passing on their wisdom, while the mentee gains valuable insights and growth opportunities.

Overall, the concept of a mentee is rooted in the recognition of the inherent interconnectedness between individuals and the belief in the potential for personal and intellectual development through learning from others.

Figure 6: The Relationship of mentee and mentor in Dialogic Mentoring (own figure)


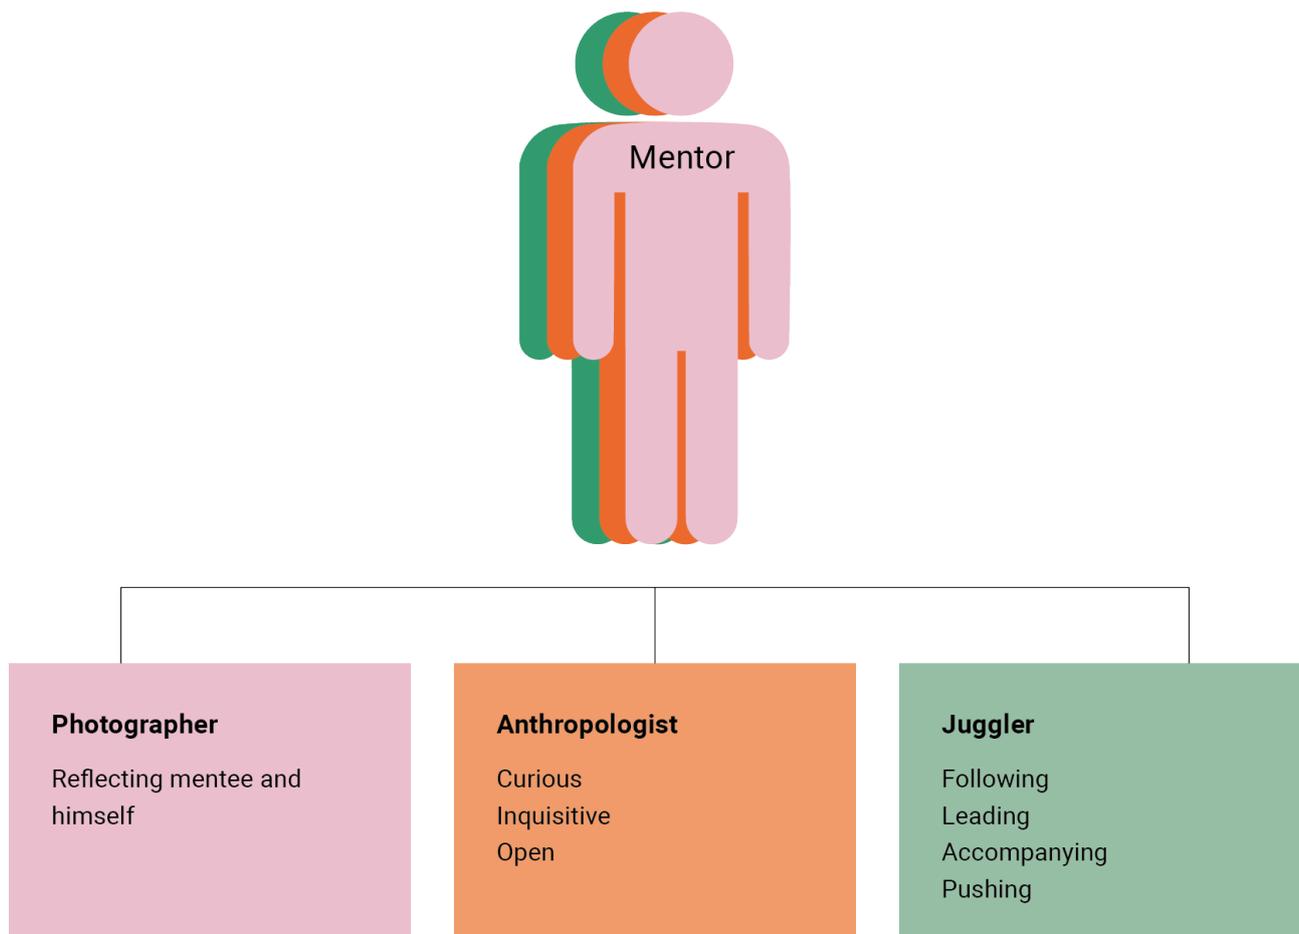
What role is the part of the Dialogic Mentor?

Mentor is a concept deeply rooted in ancient Greek literature and mythology, specifically in Homer's epic poem, "The Odyssey". In this work, Mentor is portrayed as a wise and trusted advisor and friend to Odysseus, the protagonist. However, it is essential to recognise that the concept of Mentor has transcended its initial literary context and has become a symbol of guidance, wisdom, and mentorship in broader philosophical discussions (Slatkin, 2005).

A mentor embodies the archetype of a knowledgeable and experienced individual who imparts valuable insights and teachings to a less-experienced person, known as a mentee. The role of a Mentor extends beyond simple instruction; it involves nurturing the mentee's personal and intellectual growth, providing support, and assisting them in navigating life's challenges. This relationship is often characterised by mutual respect, trust, and empathy – the Dialogic Mentoring mentioned above.

Figure 7: Roles of a Dialogic Mentor (own figure)

Mentor

Photographer	Anthropologist	Juggler
Reflecting mentee and himself	Curious Inquisitive Open	Following Leading Accompanying Pushing


If metaphors are used to describe the multiple identities of mentors, then mentors can be likened to anthropologists, photographers, and jungle explorers. The anthropologist embodies an insatiable thirst for knowledge, an unyielding curiosity, and an open-mindedness that propels them to explore the intricacies of diverse cultures and societies. The photographer, in turn, assumes the role of both a reflective mentee and a self-aware artist, skilfully capturing moments that hold a mirror to both the subject and the photographer's own inner world. Jungle explorer, adept at seamlessly transitioning between roles, alternating between being a companion, a follower, a trailblazer, and an inspirer.

The concept of Mentorship highlights the interconnectivity of human experience and emphasises the value of passing knowledge from one generation to another. The Mentor's role is not to dictate or impose beliefs but to encourage critical thinking, self-reflection, and individual growth. This aspect aligns with broader philosophical ideas on education, personal development, and the pursuit of wisdom.

In conclusion, Mentor is a philosophical representation of a wise and guiding figure who fosters learning, growth, and self-discovery in the mentee. It symbolises the transformative power of mentorship, wherein knowledge and wisdom are transmitted, contributing to the continuous evolution of individuals and society as a whole (Daloz, 2012; Allen & Eby, 2007).

What qualities does a person need for Dialogic Mentoring?

Dialogic Mentoring requires several key qualities in a Mentor to be effective in the process. These qualities include (Fig. 8):

Figure 8: Attributes for Dialogic Mentoring (own figure, adopted from this project)

- Interest in the process: A person engaged in Dialogic Mentoring has a genuine interest in the process itself, valuing the exploration and exchange of ideas with the mentee. This curiosity fosters an open and dynamic learning environment.
- Willing to witness: The mentor should be willing to listen actively and be fully present during the dialogues with the mentee. Being a witness means being attentive and supportive, allowing the mentee to express themselves freely.
- Accepting subjectivity: Dialogic Mentoring acknowledges that different perspectives

and experiences shape individuals' understanding of the world. The mentor must be open to accepting the subjective viewpoints of the mentee and avoid imposing their own beliefs or biases.

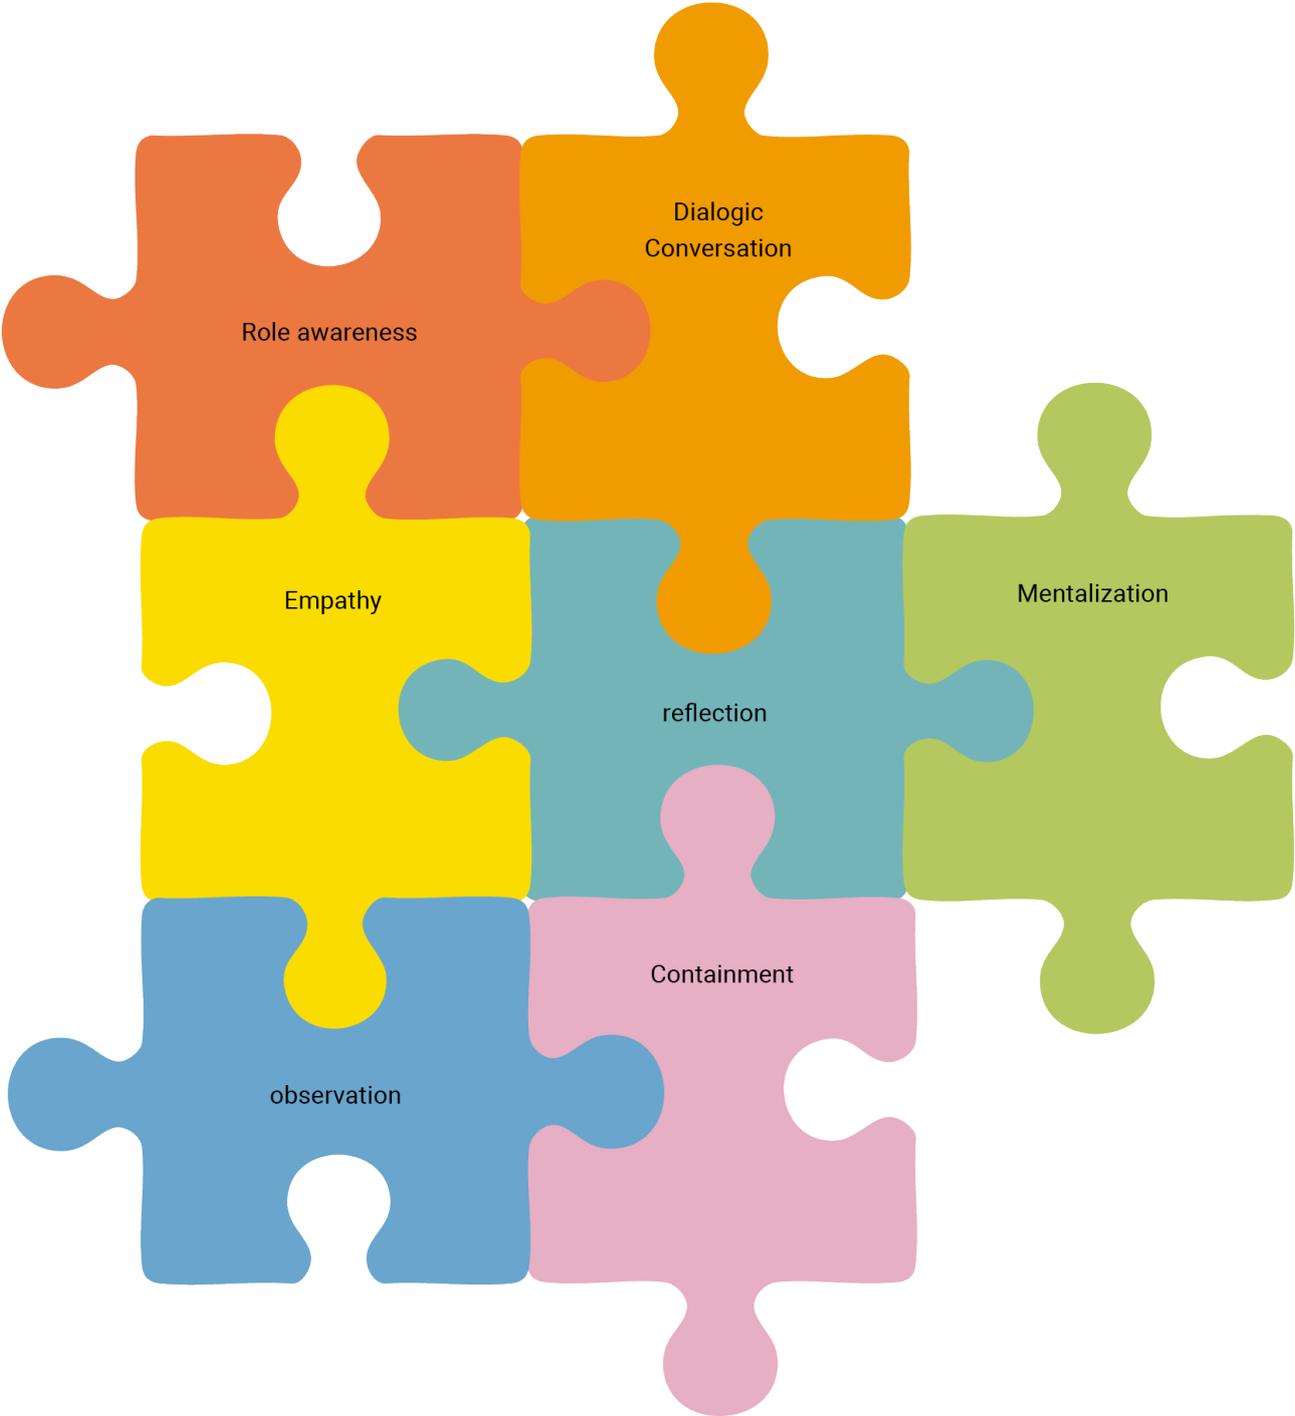
- Awareness of the backstage: This quality refers to recognising the personal and emotional aspects that might influence the mentee's thoughts and actions. Understanding what happens "behind the scenes" helps the mentor provide more empathetic and insightful guidance.
- Reading the hidden message: Dialogic Mentoring goes beyond surface-level discussions. The mentor should be skilled at understanding underlying messages, unspoken emotions, and non-verbal cues to gain a deeper understanding of the mentee's needs.
- Asking inspiring questions: A mentor must possess the ability to ask thought-provoking and inspiring questions that encourage the mentee to reflect, explore new ideas, and develop their critical thinking skills.
- Enjoying contacts: Being able to establish a positive and meaningful connection with the mentee is crucial. Enjoying interpersonal interactions and being approachable can create a comfortable and trusting atmosphere for open dialogue.
- Containing: The mentor should be emotionally mature and capable of holding space for the mentee's emotional expression without being overwhelmed by it. Providing a safe and non-judgmental environment helps the mentee feel supported and heard.
- Partneristic: Dialogic Mentoring is a collaborative partnership between the mentor and mentee. The mentor should view the mentee as a partner in the learning journey, rather than adopting a hierarchical approach.
- 'Good enough' mentality: Recognising that perfection is not the goal, the mentor should embrace the idea of being 'good enough' and focus on progress and growth rather than expecting flawless outcomes.
- Open to various developments: The mentor should be flexible and open-minded, willing to explore different paths and adapt their approach based on the mentee's unique needs and learning style.
- Authenticity: Being genuine and transparent is crucial in building trust and rapport with the mentee. An authentic mentor creates a safe space for open and honest conversations.
- Curiosity: Curiosity drives continuous learning and encourages the mentor to stay receptive to new ideas, experiences, and perspectives. It also helps the mentor maintain a growth mindset and model a commitment to learning for the mentee.

In summary, this part introduced some key qualities that could help mentors to achieve Dialogic Mentoring, which requires a mentor who is genuinely interested in the process, empathetic, non-judgmental, open to diverse perspectives, and committed to creating a

collaborative and inspiring learning environment for the mentee. This leads to the question: How to develop and improve Dialogic Mentoring?

Which attitudes belong to Dialogic Mentoring?

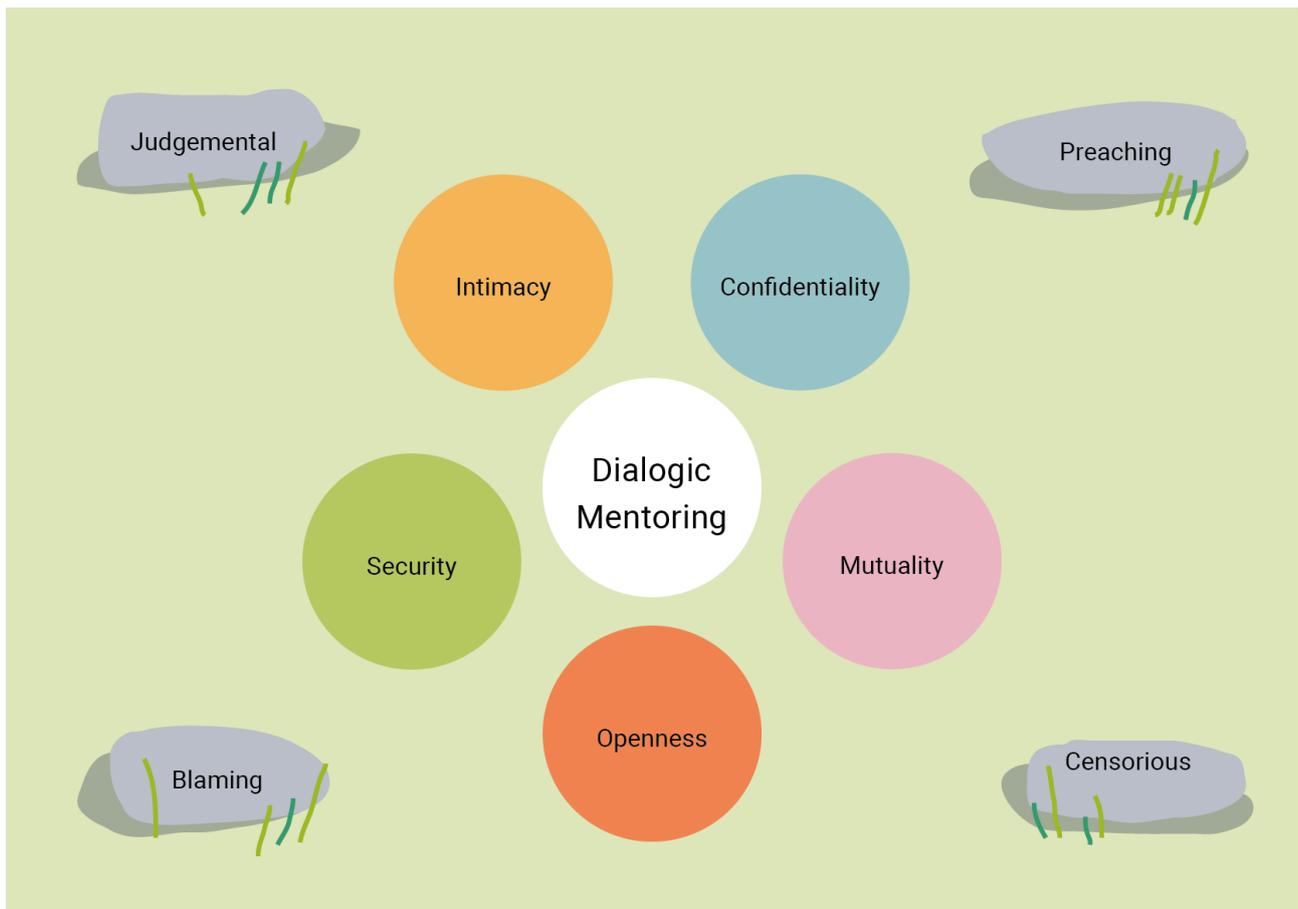
The competences of clear role awareness, partnerism in a dialogic conversation with empathy, willing to reflect, differentiate, and to practise mentalisation, observation and containment, as Figure 9 puzzles together – with space for more:

Figure 9: Attitudes in Dialogic Mentoring (own figure)


Connected to all pieces of the puzzle, there is the importance of an attitude that sees the relevance of a balance between the presence and the future. Does the future already exist? Is it like a train station waiting for us down the line? Is this where we are heading and there is nothing to do but prepare for what we think we saw? Or is it an uncertainty which is formulating in the present? If the first is correct, we have to stretch our necks as high as possible to try to see the next station so we can prepare for it. If the second option is correct, maybe we should be concerned with the present, with our relations today, with evoking our responsibility and understanding how we wish to shape our **existence today** and not the future.

What do children need us for? Do they need us to install 'programs' in them that will enable them to function or are all the 'programs' **already there** and all they need us for is to enable them to run and develop freely?

If we accept the uncertainty of the future and accept that our children have all the programs already installed, then the understanding of **concentrating on the presence** arises … always also aware of the stones that lay on the way (see Fig. 10):

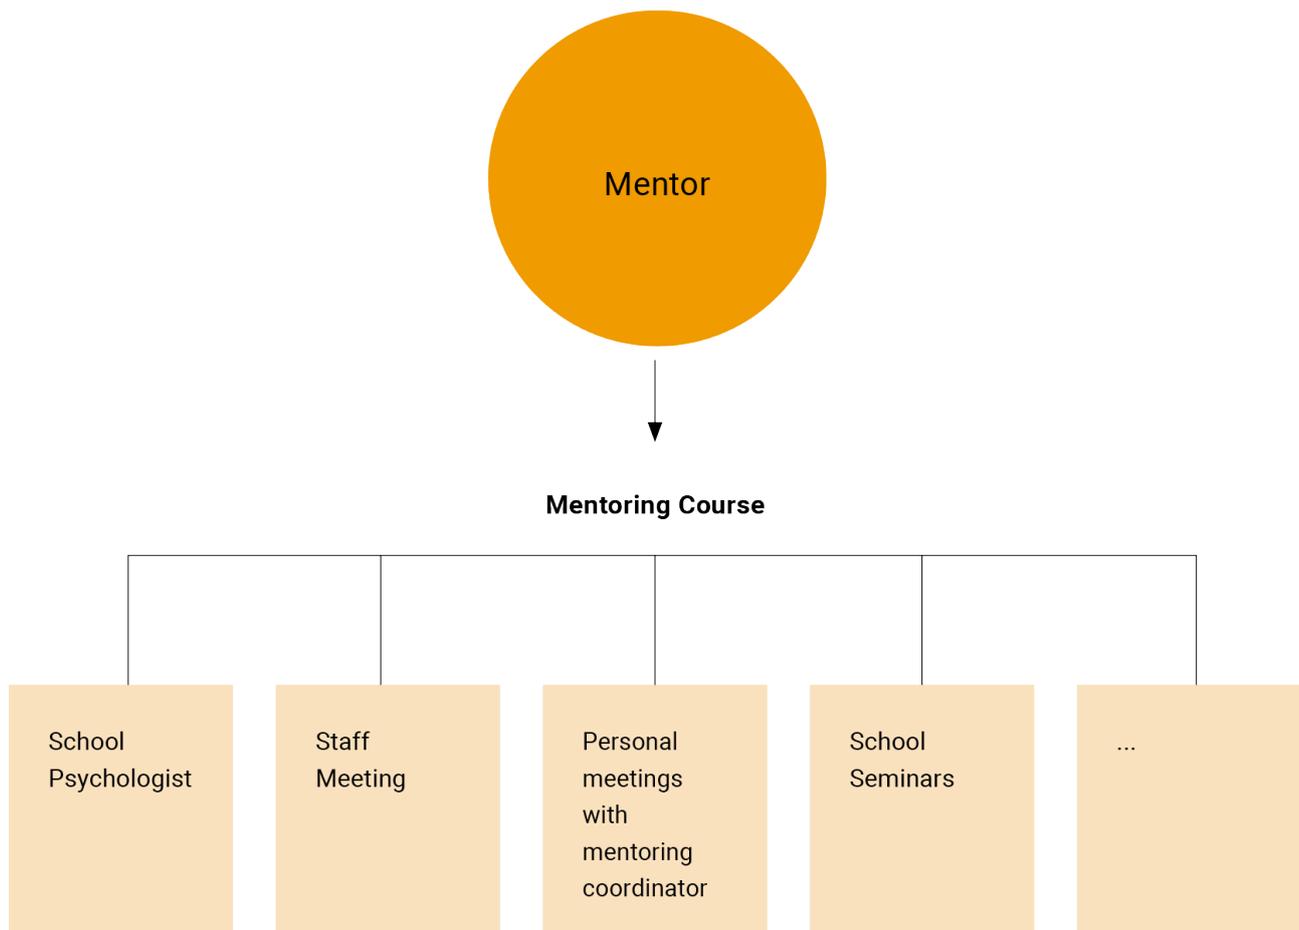
Figure 10: What Dialogic Mentoring can let grow in its presence (own figure)


If we no longer 'prepare' for an uncertain 'futurum II' (perfect future) by preaching, censoring, blaming, judging, 'encouraging and challenging' – openness, security, intimacy, confidence

and mutuality can grow; and these are the plants for a bunch of learning everyone needs – right NOW!

How to support Dialogic Mentoring?

Understanding mentoring as a profession that needs to be learned, practised and constant support, it makes sense to create spaces where dialogues are of central meaning.

Figure 11: What Dialogic Mentoring needs (own figure)


As Figure 11 shows, beneath a certain course for Dialogic Mentoring the exchange with a school psychologist or with other mentors in the staff meeting can be a continuous support. Very helpful are personal meetings with the coordinator for Dialogic Mentoring processes and of course seminars in the school are a huge support for all mentors to establish the attitude of Dialogic Mentoring in their field of action (Simri, 2020).

What supports mentors intending Dialogic Mentoring?

Beneath the above an ongoing training would be an appropriate support for mentors in the field of Dialogic Mentoring to reflect on their own attitude and to widen their competences of Dialogic Mentoring processes. This 'crimson'-side is urgent, as shown in Figure 12:

Figure 12: Dialogic Mentoring is to be supported (own figure)

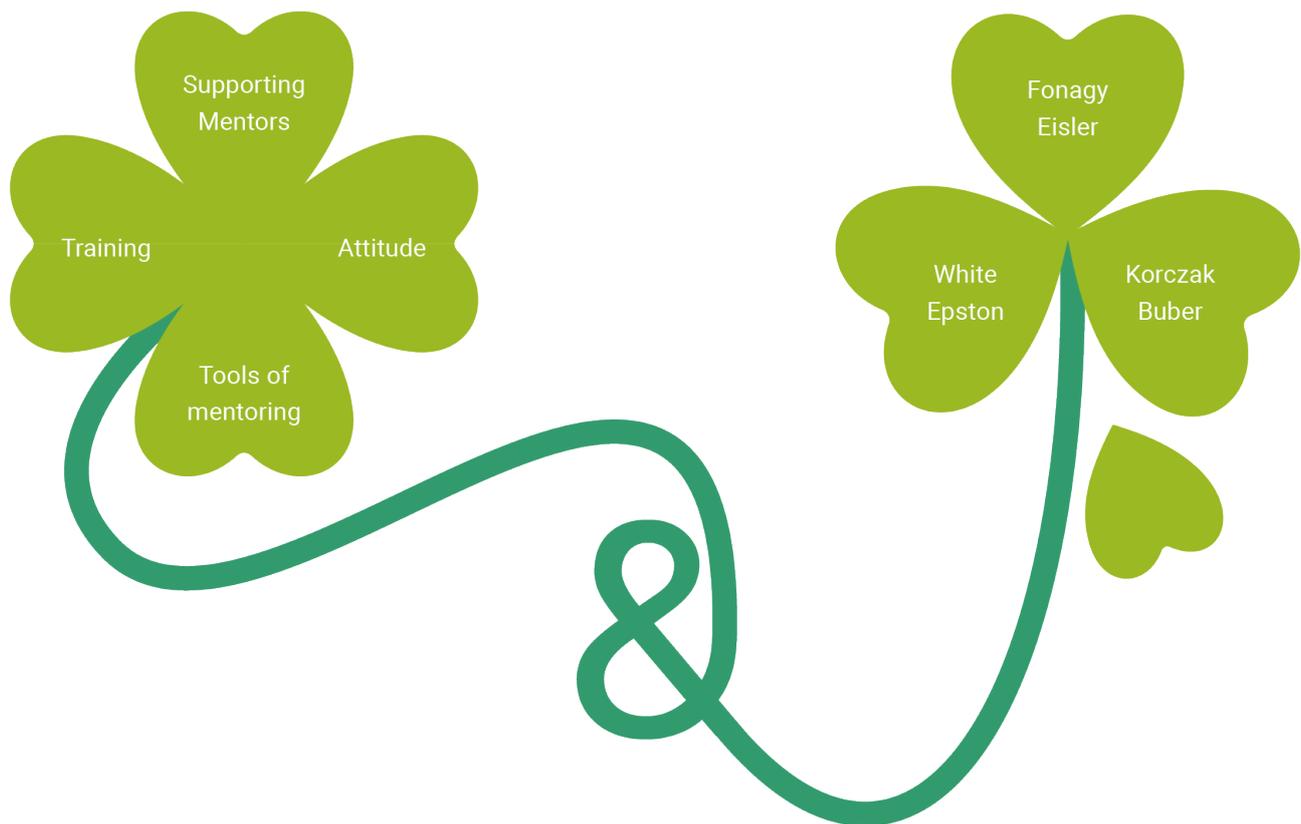
Supporting Mentors

Training

Attitude

Tools of mentoring

Fonagy Eisler

White Epston


Korczak Buber

And there is an additional 'clover', proving that nothing is new about the ideas of dialog and mentorship; here the names of Martin Buber (1937, 1966) Janusz Korczak (1919, 1929, 1939), David Epston (Epston & White, 1992; Epston, Freeman & Lobovits, 1997),, Michael White (1995, 2004, 2007), Riane Eisler (2000, 2003, 2004, 2015, 2017, Eisler & Loye, 1990, Eisler & Fry, 2019) and Peter Fonagy (Fonagy et al. 2000) are arising – and the fourth leave symbolises, that there are a lot more witnessing authors supporting all that is needed for Dialogic Mentoring. Some examples of such sources will follow in our last chapter to encourage all for all readers to deepen and to nourish their attitudes to existential human needs, not only in school-life: Dialogic Mentoring.

Closing questions to discuss or tasks

What are further questions about Dialogic Mentoring?

If it is true, that the more we find out, the less we know – then let us collect some new arising questions that occur from the circle we created around Dialogic Mentoring (see Fig. 13).

Figure 13: More questions than answers? (own figure)

Three people with three extremely different backgrounds sit together in a circle and focus on a centred topic: Dialogic Mentoring. And still there is an empty space in the middle with questions.

Still crazy after all these words? A final thankful thought: The week of our common teamwork took place in Ireland while in Israel people demonstrated for the continuity of democracy. When we said *"Farewell"* this summer we could not even imagine the horror of the 7th of October and all that followed. Sinead O'Connor (08.12.1966 in Dublin – 26.07.2023 in London)– famous for *"Nothing Compares 2 U"*, a message fitting to the intention of Dialogic Mentoring has a gift of words for us now: "Thank you" stays for what we all are longing for – always:

"Thank you for hearing me … Thank you for loving me… Thank you for seeing me … And for not leaving me….Thank you for staying with me… Thanks for not hurting me … You are gentle with me …Thanks for silence with me… Thank you for holding me …Thank you for helping me…"

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it

online here:
https://book.all-means-all.education/ama-2025-en/?p=434#h5p-14

Closing questions to discuss or tasks

There may be a lot of different questions and tasks around Dialogic Mentoring depending on their background and contexts.

- How does a Dialogic Mentor deal with mentees of different ages?
- What is the relation like between the mentee and the parents during the process of Dialogic Mentoring?
- Is Dialogic Mentoring only working in a bubble of 'milieu' where Democratic Schools are working well? What about socially disadvantaged areas and state schools?
- How could you implement dialogic mentoring into your future school practice? Does it only work if the whole school commits to dialogic mentoring or how could it be implemented in your classroom or grade?

About the authors

Ines Boban

Once teacher in so called Integration-Classes at a comprehensive school (Reformschule Hamburg Winterhude), from 2002 until 2017 researcher and lecturer for Inclusive Education at the Martin-Luther-University Halle-Wittenberg.

Dror Simri

MA, education counsellor and family and couples therapist, working from 1992 until 2018 at Hadera Democratic School as a teacher, mentor and mentoring supervisor.

Linjie Zhang

Linjie Zhang is a researcher at the University of Vienna. Her primary research interests encompass structural inequality within the educational system, the development and management of international schools, elite education, neoliberalism and globalization, educational policy, and the application of capital theory in education.

CONTINUOUS PROFESSIONAL DEVELOPMENT FOR STAFF FOR DIVERSITY SENSITIVITY

Example Case

"Imagine that you are a middle school teacher. Alex, a pupil in your middle school, identifies as a young black man with a physical disability. Alex also comes from a low-income family. Alex encounters multiple obstacles as a result of the intersection of his identities. He faces obstacles associated with racial prejudice, ableism, and socioeconomic disparities in the school. You also realise that there is not much support allocated to help students like Alex. You are part of a group of teachers willing to learn more about diversity sensitivity, intersectionality and develop your practices for creating a more inclusive school culture. You also know that there is a group of teachers who avoid talking about these issues and who are reluctant to take part in professional development activities on topics outside their subject areas (e.g., teaching maths or science). Throughout the chapter, we will help you examine this case and reflect on what you have read."

Initial questions

1. In this chapter you will find the answers to the following questions:

   - **What are the different styles/types of CPD?**
   - **What impact can CPD have on the students, the teachers, and the learning environment?**
   - **How does ethos and culture affect CPD within a school?**
   - **How can you avoid the learning from CPD from moving away from the school when the teacher leaves?**
   - **What is the importance of CPD within the school environment?**

Introduction to Topic

In many European countries diversity is increasing, creating *super-diverse* classrooms. Super-diversity (Vertovec, 2007, 2010) refers to the fact that diversity is a far too complex concept to be defined by single characteristics/differences, such as gender, learning abilities or cultural background. These characteristics interact with one another, creating rich personalities and unique experiences of people. Unfortunately, not all experiences are equally positive. Numerous studies show that diversity characteristics are related to disadvantages and inequalities. Looking at the school context, we for instance see that there are unequal (learning) opportunities for girls, children with disabilities, children with darker skin tones, children from cultural or religious minorities, and so on. Because the identity of children consists of an interplay of diversity characteristics, this also means that some children experience disadvantages and inequalities at more than one level (for instance when you are a black girl with a learning disability). This is called *intersectionality*(Bešić, 2020).

Think about your student, Alex.
- How do his different identities intersect?
- How does this intersectionality result in more disadvantages for him at school?
- Think about the other students in the school. What might be similar cases?

Inclusive education is meant to tackle all students' diversities (and their interplay) in order to reduce all forms of exclusion, marginalisation and inequalities and to guarantee quality education for all (see Goal 4 of the UN 2030 Agenda; UNESCO, 2015). To fulfil this role, schools should be a place where all students are equally supported in their well-being and development. This means we should unequally invest in students, because of their different experiences. Students should receive the best possible support adapted to their needs (*equity*), rather than giving every student the same treatment (*equality*). In order to achieve this, we need teachers who are sensitive to the diversity of the class. *Diversity sensitivity* is

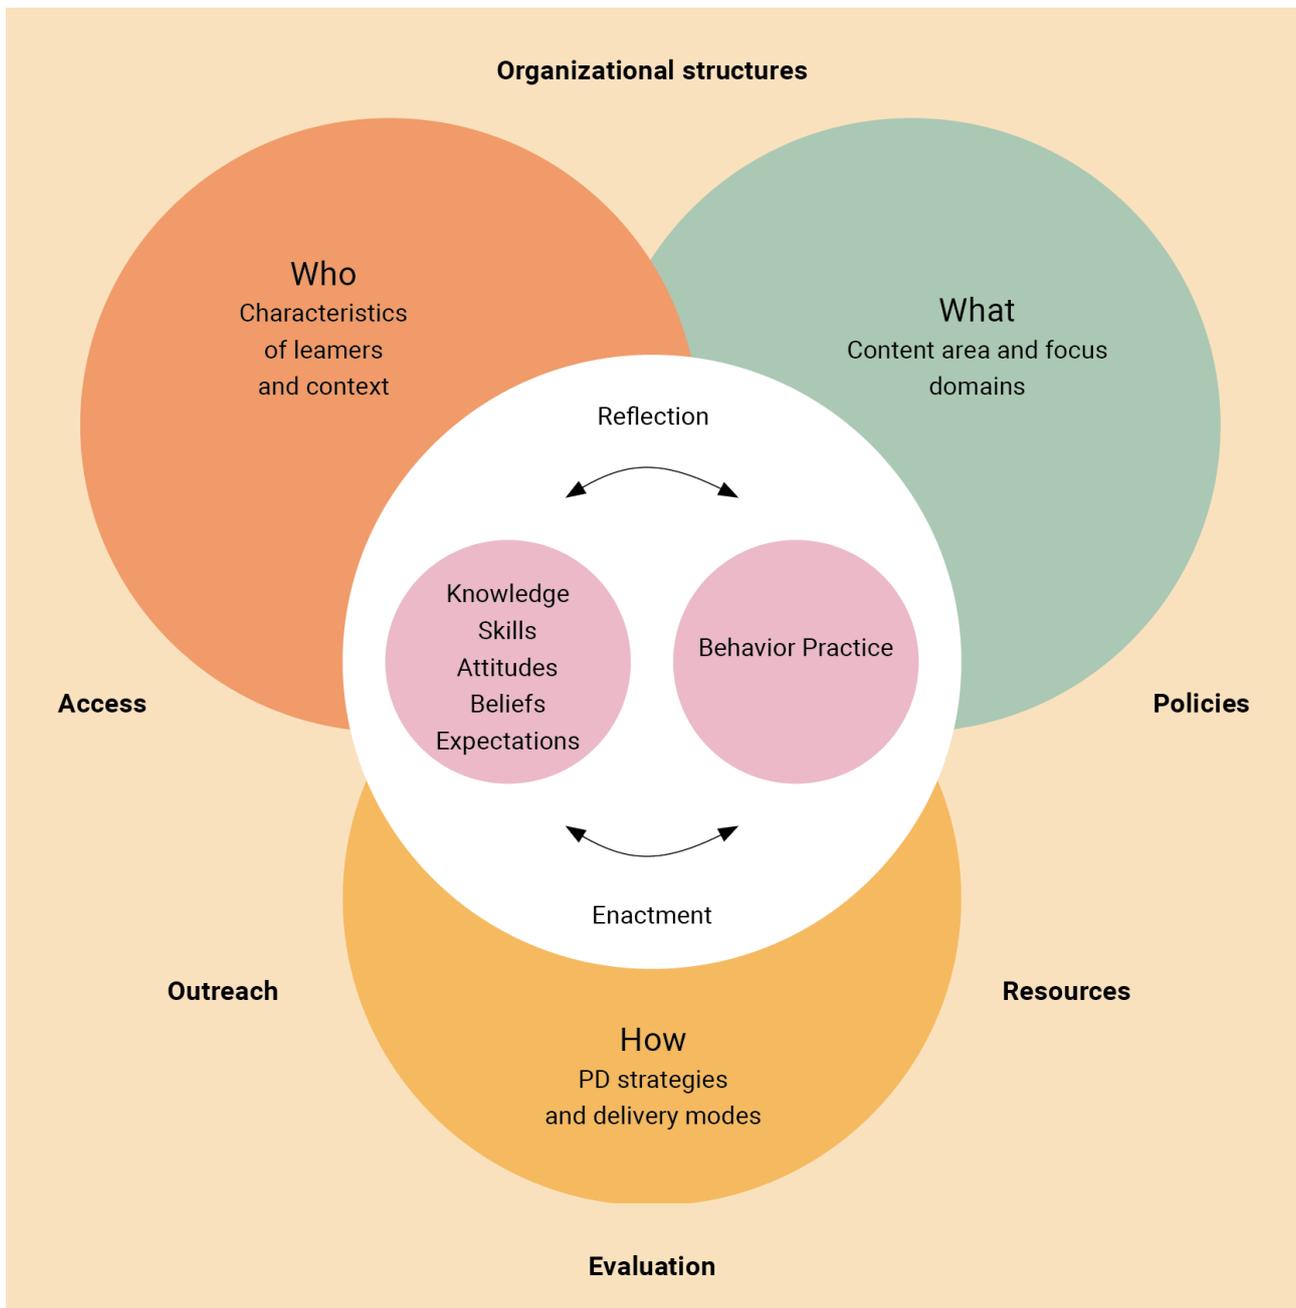
about the ability to acknowledge, accept and value diversity. These are important steps in creating an inclusive environment that supports students' well-being (Pastori et al., 2019, 2020).

Many teachers indicate that they lack this diversity sensitivity and that they feel ill-prepared for teaching the super-diverse classroom (e.g., Banjeree & Luckner, 2014; Slot & Nata, 2019). This chapter describes how continuous professional development can be used to further support teachers in working in diverse classrooms.

Continuous Professional Development

Professional development refers to all the actions and activities focused on education, training and development opportunities for teachers with the ultimate goal of improving students' developmental or educational outcomes (Sheridan et al., 2009). In other words, professional development is not about becoming a better teacher, but about becoming a better teacher for your students. Continuous professional development (CPD) emphasises that this learning should be a continuous and ongoing process. Teachers are learners themselves, and their initial teacher training is just a first step in the process, but they continue to develop as teachers long after that. With respect to diversity sensitivity, we should be aware that our understanding of "diversity" is evolving over time too, making it necessary to continuously develop on the topic.

CPD can take on a lot of different forms, ranging from short workshops to extensive multi-year curricula. However, not all forms of CPD are equally effective (Civitillo et al., 2018; Parkhouse et al., 2019). CPD is most likely to be effective and sustainable if it follows an embedded and contextual approach (Romijn et al., 2021). Using the following model (see Figure 1), we will explain what this means.

Figure 1: Conceptual framework of professional development


Source: Slot et al., 2017 as presented in Romijn et al., 2021

Key components of CPD

When choosing or designing a CPD activity, it is important to think about its key characteristics: *who* is it for, *what* is it about, and *how* is it delivered (Buysse et al., 2009).

   Who. CPD is always for someone, so we should consider the characteristics of the learners and their context. For instance, a teacher who has a lot of experience with students with visual impairments, might need a different approach from a teacher who has never worked with such students before. A teacher with a minority background can make use of other strategies when trying to bond with students with a minority background, than a

teacher with a majority background can. A teacher who is resistant to change will probably need a different strategy than a teacher who has an internal motivation to make a change because they want to solve a certain problem in their classroom. Thus, CPD is most likely to be effective when it is adapted to who the learner is.

What. CPD is always about a certain topic or targets a specific domain such as knowledge, skills, beliefs or behaviour. Depending on what your focus is, different strategies might be useful. For instance, if there is a need to learn new knowledge, reading a book (like you are doing now) can be a useful strategy. However, if teachers wish to improve their skills in communicating with children from different backgrounds, merely reading a book will not necessarily work. Thus, an important step in choosing or designing an effective CPD activity is to properly define what needs to be learned (*learning goals*).

How. A wide range of strategies and delivery modes exist, such as workshops, immersion experience (i.e., doing an internship), coaching, video-feedback, critical friendships, learning communities, online self-ratings. When learning goals are more complex, a combination of strategies and delivery modes is recommended. In general, research shows that strategies that are more intensive (in duration and dose) and have a collaborative component are more likely to be effective (Siraj et al., 2019). Later in this chapter, we will elaborate on what strategies and delivery modes are most common and how they can be effectively used.

Individual teachers in a wider context

Figure 1 also shows that while development happens within an individual teacher (intra-individual level), this individual teacher is always part of a wider context. To understand how development occurs, we must first investigate the underlying mechanisms within the individual. Teachers all have their own unique set of characteristics, related to their personal background and beliefs, previous experiences, knowledge and skills. This informs how they behave in classrooms and what practices they are likely to use with their students. However, this relationship between what one knows, feels or believes on the one hand and what one actually does on the other hand is not as straightforward as one might believe. Studies for instance show that teachers' explicit attitudes towards diversity are not always in line with their implicit beliefs and actual behaviour (Álvarez Valdivia & González Montoto, 2018). By using the mechanisms of *reflection* and *enactment* teachers can develop their knowledge, skills and beliefs as well as their behaviour and practice. In the next section we will elaborate on these internal mechanisms.

Though CPD is a process that primarily happens within the individual teacher, we cannot think of the teacher as a sole entity that is completely separated from their context. Teachers are always part of a classroom, part of a team of teachers and support staff and part of a school within a local community. Moreover, CPD has the ultimate goal to impact the students' well-being and development. Therefore, it is necessary that CPD also has a

sustainable impact that moves beyond the individual teacher. In the last part of this chapter, we will further discuss what needs to be done to make CPD more sustainable by properly embedding it within the wider context.

Read this sentence one more time: "Teachers all have their own unique set of characteristics, related to their personal background and beliefs, previous experiences, knowledge and skills".

● Think about your colleagues in your school. What do you know about their personal background?
● What do you know about their beliefs, previous experience, knowledge and skills about working with a diverse group of learners?
● With your group, what can you do to learn about the needs of all teachers so that you can have a starting point to build on in your professional development attempt?

Key aspects

Individual processes in learning and development

At the core, learning and development is an individual process. When engaging in CPD, teachers contribute a unique combination of characteristics encompassing their cultural background, upbringing, personal experiences, beliefs, as well as their existing knowledge, skills and competences. These individual variations impact how teachers approach their role as learners during CPD, their motivation and engagement, and the process outcomes. In this section, we will discuss the importance of individual belief systems for developing diversity sensitivity and elaborate on the mechanisms of *reflection* and *enactment*.

Teachers' belief systems

All teachers have a belief system, which is a set of developed assumptions, beliefs, attitudes and values (Spies et al., 2017). Though these terms are related, they cannot be used interchangeably, and a relevant distinction can be made especially between beliefs and attitudes. Teachers' ideas, beliefs and values encompassing the different factors involved in education, have been referred to as teachers' *beliefs* (Pajares, 1992). When beliefs towards a specific object, for example, diversity inclusive education, are organised and predisposed to action, this cluster of beliefs becomes an *attitude* (Eagly & Chaiken, 1993).

The main components of attitude are cognitive, affective, and behavioural, indicating that attitudes concern the individual's knowledge, feelings, and predispositions to (re)act toward a specific object (de Boer et al., 2011). When considered in relation to diversity in education, the cognitive component refers, for instance, to the teacher's beliefs regarding the adequacy of their school to embrace diversity (for example, "I hold the belief that students with special needs should be included in mainstream schools"), the affective component to teacher's emotions (for example, "I am worried that students with

behavioural issues may disrupt the classroom environment"), whereas the behavioural component pertains to how the teacher is inclined to behave in relation to a specific scenario (for example, "I can offer afternoon activities to support non-native speaking students"). According to the Theory of Planned Behaviour (Ajzen, 2001), teachers' attitudes play a role in determining their actual behaviour, insofar as attitudes are one of the factors influencing the intentions to perform it (for example, positive attitudes are likely to result in more open and welcoming behaviours, while negative attitudes are more likely to lead to avoiding and/or rejecting behaviours; see the box below for examples related to Alex's case). Attitudes towards diversity inclusive education have been found to be influenced by a wide range of factors (Avramidis & Norwich, 2002), including years of teaching experience and higher perceived self-efficacy, which you will learn more about in Section 2.5 (Kunz et al., 2021).

Think about Alex's case and possible teacher reactions in your school. Do they reflect the cognitive, the affective, or the behavioural component of attitudes?

"I believe that students with disabilities can be better supported in other schools"
"I'm afraid students coming from low SES backgrounds can disturb the order and change our pace because they tend to be slow learners"
"I'm not sure if I have enough time to learn about the case of every student. They are all different. I don't have enough resources to support all of them so I can't do anything".

Another distinction worth mentioning here is between explicit and implicit attitudes. Explicit attitudes are conscious and generally overtly reported. However, especially in relation to sensitive issues, such as diversity inclusive education, people might have opinions diverging from mainstream social norms. In this case, individuals might be more reluctant to overtly express what they think. For instance, a teacher might think "Dealing with diversity is so stressful that I would prefer to work in a special educational provision system rather than in an inclusive one," but might feel that this would not be well received by colleagues and supervisors. In contrast, implicit attitudes are automatic reactions to an object, which can be observed even in absence of the individual's awareness (Glock et al., 2019). We will see in Section 2.4 an example of how implicit attitudes affect teachers' practice.

The individuals' existing attitudes can influence the way they perceive and interpret new information. Indeed, to simplify information and make rapid decisions, individuals often activate cognitive patterns that align with their pre-existing beliefs and attitudes. These systematic patterns of thinking are known as *biases* (Tversky & Kahneman, 1974). Although biases allow people to handle the high amount and complexity of information in a time and resource efficient way, they can nevertheless lead to oversimplification and generalisation and thus open the doors to stereotypes and prejudices (Haselton et al., 2005).

Teachers, just as everybody else, may apply their generalised knowledge or stereotypical beliefs to their students, often without being fully aware of that (Glock et al., 2019; Turetsky et al., 2021). Examples include the assumption that students in culturally diverse schools are more prone to disruptive behaviours, that students with low socioeconomic background

are less likely to be high achievers, that girls are more likely to excel in verbal tasks and boys in STEM subjects, or that all students have a canonical family. Teachers' misconceptions about their students can significantly influence their interaction with them, the assessments and evaluations, as well as achievement expectations. Research shows that teachers' biases have a profound impact on students' actual learning outcomes and can contribute to the perpetuation of educational disparities (Pit-ten & Glock, 2019). However, while teachers' attitudes towards diversity typically have a lasting impact on their behaviour, it is crucial to recognise that these attitudes can nevertheless be modified through targeted CPD activities (Kunz et al., 2021).

Think about your school again and think about the different teachers who are teaching Alex.

- Do you think he has the same experience with every teacher?
- What are the different attitudes among teachers towards inclusive practices in your school?
- How do these attitudes differ and based on what?
- What might be the ways to understand the reasons for different attitudes so that you can start working on developing more inclusive and diversity sensitive practices?

The relation between belief systems and CPD engagement

Teachers' beliefs towards diversity influence their motivation to take part and commit to CPD initiatives (Liu et al., 2019). Additionally, any CPD approach, by employing specific practices, establishes particular ways of knowing as more significant than others (Musanti & Pence, 2010). Hence, it is unsurprising to witness resistance among teachers when it comes to engaging in CPD initiatives (Musanti & Pence, 2010). The sources of resistance are usually classified as individual resistance and political resistance (Musanti & Pence, 2010). Individual resistance reflects the conflict stemming from a discrepancy between the expectations or requirements placed on the teachers and how those align with the teachers' needs and evaluations. For example, teachers may perceive ad-hoc training on certain topics as relevant to only a subset of the category, leading them to implicitly question its relevance (for example "It is not my thing", "Why should I be involved? This doesn't apply to me"). Political resistance instead refers to the resilient act of reclaiming a sense of agency ("I didn't choose this, what isn't my voice heard when it comes to planning and designing such initiatives?").

What you can do in the professional development initiative that you start with fellow teachers in your community is:

- Gain an understanding of the existing stereotypes, prejudices and misconceptions teachers might have towards intersecting identities students?
- Create a safe and supportive space for all teachers to talk about what they know and what they want to know?
- Devise a plan on how you want to empower your school community in becoming more knowledgeable and skillful toward diversity sensitive practices?

Teachers' questioning implicitly challenges the perceived necessity of such training, which, in addition to pre-existing attitudes toward diversity inclusive education, might undermine the initiative as a whole. Resistance can nonetheless offer an opportunity of reflection on the scopes and aims of CPD initiatives (Walter et al., 2023). Even individuals who are "on board" may still have questions or concerns about CPD initiatives (for example, "Do I have the necessary skills to embark on this?", "What am I going to be exposed to?" "What am I supposed to learn?"). Some good practices help to promote resisting teachers' compliance with the proposed activities. For instance, establishing a psychologically safe environment, where group members feel safe to share and contribute, without any fear of being judged, is of crucial importance (Edmonson & Lei, 2014).

Your teacher learning community is working slowly but steadily. You have started getting together regularly with other teachers, organising meetings, doing readings and inviting experts. Not all of these events are initiated or followed by all the teachers in the school but most of the teachers care to join in at least a few of them and contribute to the community. However, you observe that there is a group of teachers who are hesitant, sometimes critical/judgemental of what you do.

- Why do you think they demonstrate resistance?
- What are their reasons for not joining?
- What can you do to create a channel for dialogue and communication to understand each other?
- What can you do to make them wonder about your community's activities?

Transformative learning

Given the sensitive nature of the topics involved, it is highly recommended to adopt a comprehensive approach when designing and delivering CPD activities aimed at fostering diversity within the educational environment. Two methods have been demonstrated to robustly mediate professional practice improvement (Cole et al., 2022):

- Critical reflection: refers to the practice of applying critical thinking to personal experiences, while at the same time taking some distance from them. When teachers engage in critical reflection, they ask themselves questions to extract meaning from the experienced events (Cole et al., 2022).
- Reflective practice: it arises from the recognition of a disparity between a new experience and the existing beliefs and knowledge one holds. This awareness prompts teachers to reframe their implicit assumptions about practice, in search of a new and more promising course of action, eventually bridging the gap between theory and practice (Russell, 2018).

How are critical reflection and reflective practices implemented in CPD? How can CPD make the best use of them? According to some authors, the learning potentials of critical reflection and reflective practices in CPD can be fully realised within a transformative learning experience framework. This framework promotes a profound structural shift in

thinking, as opposed to a superficial additive learning approach, where most existing beliefs remain unchanged (Wall, 2018). What does this mean in practical terms? This will be addressed in the following section.

Cognitive dissonance as a trigger of behavioural change

When considering the cases of two of Alex's teachers; one, in an attempt to compliment him, might exclaim "If someone had made me guess where you live, I wouldn't have bet on *that* neighbourhood!" Another one tends to constantly monitor him with the corner of her eye while in class. Both teachers might perceive themselves as treating Alex and the other students equally. However, with their behaviours, they are acting on their implicit attitudes, covertly denying or misvaluing Alex's background, or implicitly making assumptions about his trustworthiness and compliance to the norms. Behaviours like these qualify as microaggressions, acts that subtly communicate disrespect, degradation, and/or hostility that are directed against people in marginalised groups, either intentionally or unintentionally (Lilienfeld, 2017; Steketee et al., 2021). If questioned about their action, these teachers might say that they are genuinely complimenting him or devoting the same amount of attention to all pupils. This might nevertheless induce a conflict, a cognitive dissonance (Festinger, 1957), between their overt egalitarian attitudes and covert biassed intentions.

According to cognitive dissonance theory, the inconsistency between what people know or think and new pieces of information makes them experience a state of psychological tension. In the attempt at alleviating the emerging psychological discomfort, they aim to make their beliefs and new information align, by either modifying their existing beliefs or by assimilating the new information, so that the discrepancy can be reduced (McFalls & Cobb-Roberts, 2001). Remember we mentioned the concept of a transformative learning experience process early on? CPD activities that foster a sense of cognitive dissonance in the teachers, just like the one experienced by Alex's teachers, facilitate transformative learning (Thompson & Zeuli, 1999). To make the transformative learning experience more likely to be effective, other elements should be incorporated:

- Creating a structured environment that allows teachers enough time, the appropriate contexts and support, to allow teachers to reflect on and reconcile the conflict they experience.
- Incorporating activities that both stimulate and resolve this cognitive dissonance directly within teachers' daily teaching situations and practices, ensuring they are not isolated from their classroom work.
- Empowering teachers to cultivate a fresh set of teaching approaches that align with their newly acquired understanding. This will enable them to effectively implement their newfound knowledge in the classroom, thus developing a repertoire of practices that

are in harmony with their revised perspectives.
- Engaging and supporting teachers in an ongoing, continuous cycle of improvement and growth, providing them with the necessary guidance.

When we refer back to Alex's teachers' example, becoming aware of the biases being held and that some behaviours can be perceived as microaggressions act as the starting point to enable a progressive behavioural change. This, in turn, stimulates Alex's teachers to monitor their behaviour, so that potential microaggressive acts can be detected before being enacted, and thus be progressively avoided. In more general terms, practices that are implemented within the educational settings feedback and become a matter of further reflection and, in turn, nourish further reflection, so that they are constantly improved and made more effective. Through this circular process, teachers become more responsible to their own learning, and more accountable as professionals (Walter et al., 2023; Yost, 2006), and eventually develop a higher perceived self-efficacy, a concept you will learn more about in the following section.

Teachers' self-efficacy

The term "teachers' self-efficacy" defines the complex set of beliefs teachers have about their capabilities to effectively handle the tasks, obligations, and challenges related to their profession (Lazarides & Warner, 2020). According to Tschannen-Moran and collaborators (1998), two cognitive processes contribute to the emergence and development of teachers' self-efficacy. The first process involves examining the task and its context, identifying the challenges of teaching and weighing them against the resources at hand. The second process involves evaluating one's own skills and acknowledging any areas where they fall short in relation to the task. Different sources of information contribute to these processes (Bandura, 1977):

- Mastery experiences: outcomes of direct personal action (for example, successes enforce self-efficacy, failures weaken it).
- Vicarious experiences: observation of others and comparison with one's own experience. Useful when novel and challenging situations are faced, where personal accomplishments are still lacking or not yet mastered.
- Verbal persuasion: performance feedback from a supervisor or a colleague.
- Somatic/affective states: emotional or physiological reactions.

Interestingly, there is a reciprocal relationship between the information sources of self-efficacy, their interpretation by the individual, and the resulting self-efficacy itself (Bandura, 1977). This means that, if teachers believe that their performance is being successful, this belief will likely result in the enhancement of their self-efficacy perception and, in turn, contribute to their expectation of future success, thus establishing a sort of virtuous

self-fulfilling prophecy (Ulbricht et al., 2022). The cyclical nature of teachers' self-efficacy implies that, whenever a task is successfully completed, the positive outcome contributes to reinforce one's self-efficacy beliefs and, in turn, good practice (Gutentag et al., 2018; Saglam et al., 2023). CPD can play a vital role in addressing the challenges of diversity while simultaneously enhancing teachers' self-efficacy. By improving teachers' self-beliefs and confidence, significant progress can be made in effectively managing diverse classrooms and overcoming the associated challenges (Lazarides & Warner, 2020). The methods used to achieve this goal will be the topic of the next section.

Useful Strategies for Effective CPD for Diversity Sensitivity for Teachers

Teaching requires continuous learning and adaptation to new methodologies, concepts, and topics (Desimone, 2009; Kyndt et al., 2016). To adapt to societal and educational changes toward diversity, instructors must increase their knowledge, question their beliefs, develop their skills, and reflect on their instructional practices (Brookfield, 2002). This necessitates the creation of professional learning environments for instructors that incorporate reflection, interaction, and collaboration as essential CPD strategies. These methods – the "How" and "What" components of the model presented in Section 1.1 – will be described in detail within this section.

The Role of Reflection

Reflection is a metacognitive action that helps us to think about our thinking, beliefs, or behaviours. It allows us to be critically aware of what we do, how we do, and this self-realisation allows us to understand the influence of our thinking and beliefs on our actions (Dewey, 1933; Habermas, 1971; Lempert-Shepell, 1995). Reflection is a valuable tool for teacher professional development, particularly when it comes to cultivating sensitivity to diversity among educators. Therefore, a reflective approach needs to be the key element of all teacher-learning environments (Postholm, 2008).

Through self-reflection, teachers can evaluate their own biases, prejudices, assumptions, and deeply rooted beliefs about differences. They can consider how their own cultural backgrounds and personal experiences shape their perceptions of and interactions with students from diverse backgrounds (Fiedler et al., 2008). CPD activities to foster diversity sensitivity need to present opportunities for teachers in which they can be reflective on their instructional practices, the type of classroom and school culture they cultivate, and the level of inclusive practices they embrace (Gay, 2010; Sensoy & DiAngelo, 2017). Through the medium of self-reflective practices, teachers can be more aware of how their actions influence their students, which can open space for further discussion and room for improvement of more inclusive practices (Acquah et al., 2016; Ragoonaden et al., 2015).

Teachers can establish inclusive and supportive learning environments that celebrate

and embrace diversity through the ongoing professional development of these knowledge, skills, and competencies. They can effectively meet the diverse requirements of children, promote social justice, and promote effective learning for all students (Gay, 2013; Leeman & Ledoux, 2003). It is important to note here that being self-reflective is a skill that needs to be practiced and refined over time. Reflecting on your knowledge and practices is an ongoing, cyclical process which requires practice, time and dedication. Also, it is not enough to be self-reflective. In professional development activities, teachers need to co-reflect with their colleagues on their teaching practices and challenges they have to address diversity issues in their school community.

Practical Suggestions:

At this point, it might be useful to provide some concrete examples of reflective questions teachers can make use of in CPD. If teachers want to be critical of their professional practices, they might consider asking such questions:

- Am I aware of the different backgrounds of my students? What do I do to learn more about it?
- Am I aware of my own biases and how they influence my students?
- Am I creating an inclusive classroom environment in which my students feel valued and respected?

As well as these questions, continuous professional development programs can use methods such as reflective journaling, structured reflection exercises, peer analysis of classroom scenarios on inclusivity, and feedback from peers (Arrastia et al., 2014). The incorporation of feedback and evaluation processes into professional development activities enables teachers to receive input from peers, administrators, and outside experts. These feedback mechanisms can focus specifically on diversity sensitivity, providing teachers with constructive feedback on their practices, identifying areas for development, and providing suggestions for enhancing their approach to diversity in the classroom. Teachers are motivated to refine their strategies and implement more inclusive practices as a result of the feedback and evaluation they receive, gaining an outside perspective and evaluation from other teachers.

With your teacher learning community, you have read and learned about the importance of being self-reflective and also reflecting with your fellow colleagues. In your learning journey toward creating a more inclusive school environment:

- What kind of reflective questions can you ask?
- What kind of teaching practices do you think you should reflect on together?
- Can you reflect on any assumptions or biases that could affect your perception and interactions with the students of the community. How would you combat these biases and ensure that all students are treated fairly?

The Role of Interaction

As learners of all ages and backgrounds, teachers are also social learners (Wardford, 2011). They learn and develop through interacting with their fellow teachers, exchanging ideas, engaging in valuable discussions, and listening to different perspectives within their teacher community (Kyndt et al., 2016). Therefore, integrating elements of interaction in all forms of teacher professional development matters for their effective learning (Postholm, 2012).

Interaction plays an essential role in CPD for teachers in becoming more diversity sensitive. Interaction provides teachers with opportunities to engage with diverse backgrounds, allowing them to deepen their understanding of diversity, the intersectionality of differences, and ways to make classrooms more inclusive and safer learning environments for their students. Interaction enables instructors to engage in experiential learning in which they actively participate in discussions and simulations that promote understanding and empathy for diverse perspectives. By interacting with individuals from diverse backgrounds, cultures, and identities, instructors can acquire first-hand experiences and insights that heighten their sensitivity to diversity. This could be done by first learning about the teacher community's diversity (Postholm, 2012).

Practical Suggestions:

In CPD, to promote diversity sensitivity, interaction can be used as a tool to encourage open dialogue and reflection among teachers. Teachers can challenge stereotypes and broaden their perspectives about the complexities through meaningful dialogues and discussions that they engage in with their colleagues.

Interaction can also be used as a way of engaging with diverse communities, including students, families, and larger communities. This can be done by inviting speakers from various backgrounds, organising cultural activities, participating in community initiatives, or forming partnerships with local organisations working on the intersection of diversity.

You, as a group of teachers, came together to learn more about Alex's case and to empower yourself to address all students in your school community. Most of the focus of your discussions was about diversity among your students. However, have you looked at the diversity within the teacher learning community you have formed? You can ask these questions in your meetings to deepen your understanding of each other and then you can talk about what you think of the group's answers:

- How aware am I of the diversity of our teacher-learning community? Do I comprehend the unique experiences, origins, and points of view of my fellow educators?
- Have I taken the time to learn about my colleagues' cultural, linguistic, and social identities? What have I learned? What didn't I know?
- Are our teacher-learning community discussions and activities inclusive and available to all members of the teaching staff?
- In our conversations, do we actively search out and value diverse perspectives?
- Are there opportunities for instructors of varying backgrounds to share their knowledge and experiences?

The Role of Collaboration

In contrast to interaction, where teachers primarily engage in communication and learning from one another, collaboration in CPD involves actively working together, making joint decisions, engaging in collaborative tasks, and fostering communities of learners (Opfer & Pedder, 2011). Collaborative professional development allows teachers to learn from their colleagues and share their knowledge and expertise in the areas they feel competent (Garet et al., 2001). Teachers can contribute to a collective body of knowledge by exchanging ideas, strategies, and resources through collaborative interactions (Levine & Marcus, 2010). Teachers can observe and learn from one another's instructional practices and approaches to creating a supportive and inclusive school climate when they collaborate. Peer support and feedback can help teachers in gaining new perspectives, refine their abilities, and overcome obstacles more effectively (Darling-Hammond et al., 2017). Collaboration also fosters the development of teacher-professional learning communities and networks within educational settings.

Collaborating becomes much more important when it comes to designing CPD on diversity sensitivity and inclusivity. It is an important element of teacher learning of diversity sensitivity because it offers opportunities for teachers to learn about the diversity within their groups, to work on cases and scenarios, and to find solutions for common problems based on classroom practices on diversity and inclusivity (Szelei et al., 2020). Collaborative learning brings together teachers with diverse experiences, backgrounds, and expertise. This diversity enriches the learning environment by providing a variety of perspectives, encouraging critical thought, and nurturing a broader understanding of complex and challenging issues (Pijl, 2010).

Practical Suggestions:

In CPD programs, collaborative interactions can take the form of group discussions, case studies, workshops, and joint reflective exercises, giving teachers the opportunity to learn from one another and increase their collective understanding of diversity and inclusivity. Regardless of their experience, teachers can form or join the existing professional learning communities within and outside their school community in which they can collaborate on broader projects, develop materials, resources and increase their understanding of diversity-sensitive educational practices.

Case studies and simulations can also be tools to work with as they provide teachers with realistic and classroom-based scenarios in which they must apply their knowledge of diversity sensitivity. By engaging in group discussions and problem-solving activities based on these cases, teachers can analyse the complexities of diverse student needs and develop strategies for creating inclusive and equitable learning environments for everyone.

Working together with colleagues may not be as easy as it seems, especially when it comes to sensitive or challenging issues like diversity sensitivity. Here are some questions you can use to reflect on the collaborative practices of your teacher group:

● How well am I able to communicate and work efficiently with other teachers who come from a variety of backgrounds?
● How can we make our collaborative efforts to enhance diversity awareness in an environment that encourages sharing of ideas and information?
● How can we learn best from the perspectives of other teachers?
● How can we support one another in addressing biases and creating learning opportunities for all students that are equitable?

Delivery Modes

CPD programs vary in their forms depending on the available resources, the needs of the learners, the context, and the learning culture in the schools. Based on their needs and available options, teachers may enrol in one or more formats to continue their learning and development on any subject including diversity sensitivity and inclusive educational practices. These modes of delivery can be listed under four main categories: short training programs, mentoring, team-based learning, and professional learning communities (PLC).

Short training programs. Short training programs include formats like seminars, webinars, one-shot presentations, and courses (Waitoller & Artiles, 2013). The content is designed and prepared by experts for the teachers. They are the most common forms of professional development activities for teachers as they are practical and easily organised. They provide structured and focused learning opportunities for CPD on diversity. They are ideal for introducing new ideas, concepts, or topics on diversity sensitivity. However, they are mostly short in duration and there is not much room for interaction and collaboration among teachers in such formats (Darling-Hammond et al., 2017).

Mentoring . Another mode of delivery is mentoring, in which teachers work with more experienced colleagues or academics from the field (Hudson, 2013; Kennedy, 2005). Through mentoring, experienced educators provide individualised support and feedback to less experienced teachers to improve their practices (Anderson & Shannon, 1988). Teachers have opportunities to make individual plans, practice what they learn, and reflect on it with their mentors. It allows critical thinking and reflecting on the knowledge, beliefs, attitude and practices of the teachers on diversity sensitivity and inclusive practices (Darling-Hammond et al., 2017; Santoro & Forghani-Arani, 2015).

Team-based learning. In team-based learning, some teachers from the same school work in small teams on new concepts, skills, and practices (Coolahan, 2002). These are usually organised by the professional development units of the schools and experts present the newly introduced content. Team-based learning makes use of collaborative learning experiences, by encouraging active participation, self- and co-reflection, and cooperation of teachers (Thompson & McKelvy, 2007).

Professional Learning Communities. Lastly, Professional Learning Communities (PLCs) are collaborative structures that are designed for and by teachers of the school community (Keung, 2009). They are often built around a real need or a challenge that teachers have been experiencing; therefore, allowing them to get together, devise a plan to meet their own needs, and collaborate on reaching and sharing knowledge (Hord, 2009). Through PLCs, teachers take collective responsibility for their own learning along with their colleagues' learning, work on problems they bring from practice, and take on new approaches to transform themselves and the classroom culture they create for their students (Antinluoma et al., 2021; Ohi et al., 2019). PLCs can be formed by teachers within and outside the school community, making use of available resources, and inviting experts and other teachers who are willing to work on the same topic (Opfer & Pedder, 2011). As they are initiated by teachers and allow space for the agency, contribution, and needs of the participating teachers, PLCs represent a sustainable model for CPD (Borko, 2004; King & Newmann, 2000). We will deal more specifically with CPD sustainability in the next section.

Lea or Frank, could you connect this part with the Mentoring chapter?

> The formats and design of teacher professional development activities change and the effectiveness of these depends on your needs and expectations, in addition to how well the CPD activities are designed and delivered. Based on the needs and expectations of your teacher group:
>
> - How can you learn about the available CPD activities that you might be interested in?
> - What are the existing communities and networks you can reach out and join to learn more about diversity sensitive practices?
> - How can you contribute to the development of a learning community among the teachers in your school?
> - Which forms of delivery may serve the needs of your contexts the best at the given moment?

How can we make continuous professional development sustainable?

Research shows that many CPD activities have a positive impact on teachers (Bottiani et al., 2018; Parkhouse et al., 2019). However, effectiveness is usually measured using self-reported data of teachers. In other words, asking teachers if they feel like they developed in a positive way after a CPD activity (Romijn et al., 2021). Though it is great that teachers feel CPD has an impact, it is also necessary to measure this impact with more objective measures, such as classroom observations or student development measures (like test scores). Ultimately, we want CPD to change teachers' behaviour and practices to have an impact on students' development and well-being. As discussed earlier, the relationship between what teachers think or feel and what they actually do is not that straightforward. Therefore, just investigating if teachers think they changed is not enough.

Unfortunately, regarding the topic of diversity sensitivity, there is less research on what CPD activities have a positive impact on students' development and what activities are effective in the long run (Romijn et al., 2021). However, the consensus seems to be that

short training, which has a rather individual and passive character, is not the most effective form for sustainable change. The impact of this training is likely to be very limited (one teacher, one classroom) and often fades over time, with teachers going back to their old habits. What is even worse, is that teachers and schools seem to invest most of their time and resources in short training CPD (Lumpe, 2007). Therefore, the school system needs a shift towards more sustainable forms of CPD. To achieve this sustainable change, we should ensure that CPD is *embedded* within the wider context.

Embedded continuous professional development

Embedded means that CPD should not stand on its own in terms of time, people and context. If CPD is properly embedded, the impact is generally bigger and less likely to fade over time.

Time. CPD activities that have a higher intensity are more likely to be effective. The impact of a single workshop in one afternoon generally has a smaller impact than a multi-week training program. Thus, teachers should preferably engage in CPD activities that ask for a bigger time investment or should search for opportunities to intensify short CPD activities. For instance, after following a single workshop, one could schedule monthly moments to take the time to discuss the content of the workshops with colleagues, to reflect on how well newly implemented practices work, or to refresh the acquired knowledge.

People. CPD activities that target individual teachers, or the individual learning process are less likely to yield a big impact. Individual CPD can take many forms, from reading a book by yourself to reflecting on a video of your practice. Even if CPD is facilitated in groups, for instance when you complete training with fellow professionals from other schools, the focus of the activity is often still on the development of the individual teacher. Individual CPD activities can be very effective, especially when they are intensive and well-adjusted to the teachers' context (like coaching-on-the-job). However, a change in one teacher will only affect a small group of students within the school. Once that teacher leaves their position at that particular school, the impact on these students is lost. Therefore, it is important that CPD activities are team-based. In other words, multiple members of the same school team should be engaged. These could be other teachers but also support staff. By sharing knowledge and good practices within a team, the impact of the CPD is likely to be more sustainable.

Context. There is no such thing as the perfect 'one size fits all' CPD activity. That is because the context in which teachers work are very different. If one training was very effective for one teacher, this does not mean that the exact same training will work equally well for another teacher. Properly embedded CPD considers who the teachers are, what their context looks like, and how the CPD outcome can be implemented in their classroom.

This calls for a *needs assessment*. Several studies show that when there is a mismatch

between the CPD activity and what the teachers within their context need, CPD is more likely to fail (Spies et al., 2017). A needs assessment can take on several forms. Teachers could formulate their own learning goals or write down what problems they encounter. Also, other stakeholders in the school, like support staff, students or parents can provide useful information on what CPD is needed in the school. Besides such subjective measures of needs, information could also be gathered by more objective standards. For instance, by using observation tools or questionnaires to measure teachers' diversity sensitivity, self-efficacy, or prejudice.

> Suppose that you have decided to engage in a long-term CPD process with all the teachers in your school community.
>
>
> - What can you do to conduct a needs assessment before your CPD?
> - How can you understand the needs of your context?
> - How can you learn about the expectations, goals and preferences of your teacher learning community?

Important conditions to create embeddedness

Creating embedded CPD in schools is easier said than done. Only if the conditions are right, teachers can engage in embedded CPD. This comes down to four important considerations: the school's resources, structure, culture and policies.

School resources. Teachers need sufficient resources to develop their school resources. The most important resource they need is time. In many countries, the school system is under pressure leaving teachers little time to engage in CPD activities. Teachers need time inside and outside of the classroom. CPD is not well embedded if the school cannot facilitate teachers with sufficient hours to learn new knowledge, prepare activities, discuss practices and perspectives with colleagues, observe each other, and reflect on your development. CPD is not properly embedded if the school curriculum is so full that it leaves teachers with no room to try out new training within the classroom.

Besides time, other important resources are materials and external expertise. Imagine a teacher who wishes to improve their skills in supporting neurodivergent learners. On a teacher forum they read about these special Pictionary boards that can help teachers to better communicate with their students. If the school cannot provide the necessary materials for this, the teacher is hindered in their professional development (Biasutti et al., 2019). The use of external expertise has a similar story. We cannot expect teachers to be knowledgeable and skilled for every form of diversity as soon as they finish their initial teacher training. To support their development, they might need external expertise. If the school does not have funds to hire expert coaches or to send teachers to specific training programs, CPD stagnates.

After you have completed the needs assessment for the CPD for your community, it is time to look at the other factors that will affect the progress of your learning journey such as:

- What are the available resources that your school provides to sustain your CPD?
- How much time are teachers willing to allocate for the CPD activities?
- What can you do if the available resources are not enough, and you need more support?

School structure. As discussed earlier, CPD is preferably team-based on a regular basis. This is easier to achieve when there are structures within the school context that support regular evaluation, communication and collaboration within the team. Useful structures are for instance school wide study days in which the whole team takes the time to evaluate the schools' performance and to decide on shared development goals. Another example is to assign buddies that can observe and feedback each other every now and then or to create smaller sub teams within the school that can meet up on a regular basis to reflect together on a specific topic. Or (in)formal boards of teachers, parents and students (either combined or in separate boards) with the explicit task to evaluate the schools' quality every year. Furthermore, we should not forget that the staff in a school is more than a collection of teachers. It is important that support staff, such as special needs educators, care coordinators and those with managerial positions (like the school director) are included in these structures as well (Romijn et al., 2021).

School culture. Not just the formal structure, but also the more informal school culture is worth considering. As CPD should have a continuous character, teachers would benefit from a school culture that supports learning and development. Teachers should be supported by managers and colleagues to engage in CPD activities. Moreover, the school should be a safe environment in which teachers feel comfortable to reflect on themselves, to give feedback to others and to invent and try out new ways of working. A school culture where there is strong leadership but also a shared responsibility for development has a positive impact on the school quality (De Jong, 2022). This means that teachers try to motivate each other to develop continuously and that they collectively combat resistance to change. Moreover, it is about every teacher feeling like they can learn something from their colleagues, but also that they bring something to the table themselves. For instance, teachers with more experience are usually more skilled, while newly trained teachers tend to have more up to date pedagogical knowledge (Alkharusi et al., 2011).

> After reading about the importance of thinking of the school structure and culture in CPD for diversity sensitivity, it is important to reflect on your own school and then make some plans.
>
> - How would you describe your school culture?
> - Do you believe that there is enough administrative support for teachers' CPD?
> - How would you describe the cooperation between the teachers?
> - How would you describe the existing CPD teams in your school?
> - What are the areas to be improved?
> - How can you and your teacher group contribute to this improvement?

School policies. Finally, a school is not without limits and all teachers must navigate their work and development within certain boundaries. There are regulations and policies they need to abide by. These policies can be created by the school or school board, but also by local or even national entities. CPD activities are ineffective if they are not aligned with these policies and teachers lack empowerment to implement new ways of working (Brown et al, 2016; Daniel & Pray, 2017).

Imagine a teacher that notices their multilingual students struggle with their literacy skills. This teacher is looking for ways to support their students and they find an online seminar that gives the teacher new knowledge on how literacy skills develop in multilingual students. The teacher learns that encouraging them to make use of all their language knowledge (not just their knowledge of the majority language) is beneficial for these students. If the school has a policy to actively ban the use of minority languages in the classroom, the teacher will not be able to enact on their newly gained knowledge, hindering the teacher's (and students') development. Thus, CPD should take these boundaries into account if we want change to be sustainable. Again, including key persons (like school directors) is crucial here as they often have the necessary power to push boundaries.

> Let's go back to Alex's case where the intersectionality of his identities makes his education experience more challenging for him and puts you in a more advantaged position. You are a group of teachers trying to improve the school culture and make it a more inclusive place so that you can support Alex and all students. So, think about the school policies now:
>
> - Consider your role as an educator in influencing and shaping school policies. How can you effectively convey to administrators and other decision-makers the needs and benefits of inclusive policies for students with intersecting identities, such as Alex?
> - How can you work with colleagues and school administrators to identify and address policies that may impede the development and well-being of students with intersecting identities? How can a shared comprehension and commitment to inclusiveness be fostered?
> - Regarding policies, consider the significance of ongoing professional development. How can you ensure that CPD activities align with existing policies while simultaneously challenging and transforming policies that inhibit inclusive practices?
> - What steps can you take to cultivate a culture of continuous improvement and learning in your school's community?

Creating optimal conditions bottom-up and top-down

As a final remark, the described conditions above are created by both top-down as well as bottom-up processes. For instance, school leaders should take the responsibility to provide sufficient resources and create a school structure and culture that supports CPD. Simultaneously, teachers play a major role in the school culture and can take agency in shaping the organisation structure as well. Moreover, they can search for creative ways to engage in CPD, even when resources are limited. This combination of top-down and bottom up even applies at policy level. Policies that heavily support the development of diversity sensitivity have a strong top-down impact on teachers' CPD (DeJaeghere & Cao, 2009). CPD can be hindered when the policies themselves are not inclusive or (implicitly) create inequalities (Leeman & Van Koeven, 2019). In that case teachers should try to include key persons in the schools to find ways to push the boundaries and create a new reality from the bottom up.

Conclusion

As detailed in the previous sections, diversity sensitivity is crucial for creating inclusive school environments . Many teachers, probably including yourself, need a higher sensitivity towards diversity in the classroom. CPD plays an important role in achieving this. This chapter has shown how your behaviour in the classroom is shaped by your belief system and what activities you can undertake to change both your beliefs and behaviour. Moreover, you have read that CPD can take on many forms, but not all forms are equally effective. What matters most is that you engage in CPD activities that are contextualised and well embedded. This means that the activity should fit with who you are, where you work, what you already know and what you want to achieve. In addition to engaging in individual CPD activities that align with your personal goals and context, it is essential to involve your school and colleagues in the process. By actively collaborating with your school community, you can create a significant and sustainable impact on student outcomes. Remember, CPD is not solely an individual endeavour but a collective effort that extends beyond the confines of your classroom. By embracing collaboration and leveraging the support and expertise of your colleagues, you can foster a truly inclusive educational environment. This way you create the biggest and most sustainable impact on student outcomes.

Closing questions to discuss or tasks

After reading about the importance of Continuous professional development, it is important to reflect on your own school, your culture, your reflective journey and your CPD needs

- How would you identify your CPD needs after reflecting on this chapter?
- How would you embed CPD learnings into your practice?
- How would you build an ethos and culture of group CPD learning within your classroom or school?

You have been on this reading and reflection journey together with your colleagues in your school. Thank you for noticing the reality and needs of your students along with your professional development needs as teachers. We hope that the examples and questions have helped you relate the information with your experience and practices.

Your CPD journey only begins here. There is so much to learn about diversity in our schools. Your CPD journey with your community is going to be an enriching, ongoing process as long as you follow the essential strategies for teacher learning, pay attention to the contextual factors in your school and community, continuously reflect on your thinking and acting and be committed to become sensitive to diversity in educational settings.

About the authors

Fetiye Erbil

Dr. Fetiye Erbil is a researcher and a lecturer at Bogazici University. She completed her PhD at the Learning Sciences Program of Bogazici University. Her research interests include social-emotional learning, teacher professional development, children's rights and participation and educational policies.

Valeria Occelli

Valeria Occelli is a lecturer in psychology at Edge Hill University. Her work focuses on human sensory and cognitive processes, and how they are affected by individual variability in personality traits, beliefs, as well as neurodevelopmental

conditions. She is interested in the promotion of inclusive practices in higher education and scientific research environments.

Bodine Romijn

Bodine Romijn is a researcher and lecturer at Utrecht University. Her work focuses on equality, diversity and inclusion in early childhood and primary education. She studies professionals' intercultural competences and the role organisations play in supporting and facilitating their staff in implementing culturally sensitive and inclusive practices.

UNDERSTANDING YOURSELF AS AN INCLUSIVE TEACHER – TEACHER PROFESSIONAL IDENTITY DEVELOPMENT

Ann-Kathrin Arndt; Beausetha Juhetha Bruwer; Sarah Volknant; and Zhicheng Huang

Example Case

"I am a teacher who, as a learner, experienced difficulties in school. I left primary school unable to read and write properly due to dyslexia and my disadvantaged background. In secondary school, I was placed in intervention groups, which restricted my access to the mainstream curriculum. To pass my exams, I had to study at the local library because I did not have internet access at home. I chose to become a teacher to gain a better understanding of the decisions my teachers made about my educational path."

Rhianna Murphy

Initial questions

In this chapter, you will find the answers to the following questions:

- What is Teacher Professional Identity Development (TPID)?
- Why do we need it to promote more inclusive education?
- How to develop and support TPID in times of change?
- How can intersectional perspectives contribute to TPID?

Introduction to Topic

Teacher Professional Identity Development (TPID) is a multifaceted concept that varies across countries and subject areas. To discuss TPID, it is essential to clarify several key terms. Teacher Professional Identity (TPI) refers to the recognition of teachers as professionals, similar to other fields such as medicine or engineering. Teacher Professional Development (TPD) involves continuously enhancing a teacher's subject knowledge and teaching skills. Going beyond TPD, TPID focuses on the broader development of a teacher's identity including their roles, values, and social influence.

TPID involves the ongoing construction of a teacher's professional self-image and role within the educational environment (Pishghadam et al., 2022). This process includes continuous learning, research, and collaboration, emphasising the teacher's potential for growth and development. It requires teachers to be lifelong learners, researchers, and collaborators who are deeply invested in maintaining their professional image (European Agency for Development in Special Needs Education, 2012). TPID enhances a teacher's professional knowledge and skills and fosters an understanding of educational philosophies, pedagogical approaches, and societal expectations. Through ongoing practice and reflection, teachers refine their professional identities, roles, and educational philosophies.

While TPD focuses on the enhancement of professional knowledge and skills, TPID is centred on the development of professional identity and self-awareness. Both concepts are interconnected, complementing each other to support a teacher's professional growth. TPD typically follows a series of stages, from novice to expert, as teachers gain experience and expertise. TPID, however, is a continuous and dynamic process, influenced by personal experiences, educational backgrounds, and social contexts. Teachers can develop their professional identity through reflective practice, participation in professional learning communities, and mentorship. In relation to being an inclusive teacher, TPID plays a vital role in fostering a deep sense of self-awareness, empathy, and commitment to diversity, which enhances a teacher's ability to create an inclusive and supportive learning environment for all learners.

This chapter will explore TPID by providing key theoretical concepts and offering multiple opportunities for reflection on your own journey, your personal educational and national context, and your identity as a teacher. It will delve into questions such as: What influences our perception of a good teacher and why? How is TPID shaped during times of change, and how does it vary across countries due to cultural, social, and historical factors? By looking at the educational approaches of China, Namibia, and Germany, the chapter will provide insights into how each of these countries addresses inclusion. Additionally, the chapter will encourage reflection on how privileges and disadvantages impact educational journeys and teacher identities. Finally, it will examine how we can cultivate sensitivity to the intersectional experiences of learners, fostering a more inclusive and equitable approach to teaching.

Key aspects

Teacher Professional Identity Development as a Constant Process and Multidimensional Concept

Teacher professional identity is regarded "as dynamic, multifaceted, negotiated, and co-constructed, the processes of identity negotiation being highly individual, but also shaped by teachers' socio-professional institutional environments" (Edwards & Burns, 2016: 735). The professional identity is of key importance for teaching (Martínez-de-la-Hidalga & Villardón-Gallego, 2019). According to Sachs (2005) teacher professional identity provides a framework for teachers to help them formulate ideas on how to be, act and understand their work, as well as construct their own ideas on their place in society.

When focusing on the development of teacher professional identity, you can either look at the individual level or refer to the collective ('teachers'). Based on previous research and ongoing discussions, both developing *individual* and *collective* teacher professional identity is considered as relevant (Suarez & McGrath, 2022). Collective teacher identity refers to a "shared understanding of professional communities" (Suarez & McGarth, 2022: 10) and encompasses a feeling of belonging (Davey, 2013). Teacher professional identity (development) has received increased attention in the last decades. Nevertheless, important questions, especially on collective teacher professional identity (development), remain (Suarez & McGrath, 2022: 10). Regarding the individual and collective level, teacher professional identity (development) is of great importance for pre-service and in-service teacher education (Martínez-de-la-Hidalga & Villardón-Gallego, 2019).

How can we understand individual and collective teacher professional identity *development*? Looking at professional standards or education policy documents might suggest that there is only one way to develop teacher professional identity. However, Mockler (2020: 323f.) emphasises that there are *multiple* ways to develop teacher professional identity. How can we define the development of teacher professional identity

to capture this? According to Mockler (2020: 324), developing teacher professional identity is "in a nutshell, (…) about understanding your own orientation to education, to schooling, to your learners, and to your subject area, and connecting and aligning these to your practice." Therefore, "a robust teacher professional identity can help you align 'who I am' with 'what I do'" (ibid.).

Let us pause and reflect.

Think about Mockler's (2020) 'in a nutshell' definition: What is important for your understanding of education, schooling, your (future) learners, and your subject area? If you have already had practical experiences within schools: How did this understanding align to your teaching practice?

Take some time to reflect on aligning 'who I am' with 'what I do' from your perspective: What comes to your mind? You could create a MindMap or visualisation of your choice to further reflect on this.

Earlier notions, for example, by Huberman (1989), referred to several consecutive "stages of the 'life cycle' of the teacher" (Mockler, 2020: 324). However, Mockler (2011: 324) emphasises that teacher professional identity development is "less linear and more complex" (Mockler, 2011: 324). At the same time, different understandings based on different theoretical frameworks of teacher professional identity (development) prevail. In this context, Akkerman and Meijer (2011: 308) draw on the theory of dialogical self in psychology to understand teacher professional identity "as both unitary and multiple, both continuous and discontinuous, and both individual and social."

While, by way of example, this gives you a glimpse into ongoing discussions on how to understand and conceptualise teacher professional identity, different understandings and models converge in the understanding of teacher professional identity as a multifaceted or multidimensional concept. Based on previous work (Mockler, 2011), Mockler (2020: 325) refers to the "confluence of personal, professional and political dimensions."

As Reeves (2018: 98) highlights with regard to teacher identity work in neoliberal contexts, (re)negotiating teacher professional identity is situated within the "multiple, differentially-powered voices that conflict and converge around what makes for 'good' teaching and teachers." Looking at teacher professional identity in the era of accountability, Buchanan (2014: 700) notes that "20 years of standardisation, tight coupling, and ubiquitous testing practices have begun reshaping the nature of many teachers' professional identities." This is of particular importance as tensions between inclusive education and standardisation and accountability may arise, for instance concerning the understanding of student

achievement. At the same time, Ainscow et al. (2006) indicate that, on school level, the standards agenda and inclusive education are intertwined. Based on their research, they underline the need to "support teachers to take greater control over their own development" (Ainscow et al., 2006: 306).

Let us pause and reflect.

What are – conflicting as well as converging – ideas about 'good' teaching and teachers? How could these ideas, as well as the broader political situation, influence teacher professional identity? What tensions may arise regarding understanding yourself as an inclusive teacher?

Overall, it becomes clear that teacher professional identity is not a static concept. This is of particular importance when looking at teacher professional identity development in times of change.

Teacher Professional Identity Development in Times of Change

The professional profile of teachers has always been dynamic, adapting to meet the needs of educational systems influenced by societal shifts and advancements in learning processes (Martínez-de-la-Hidalga & Villardón-Gallego, 2019). Given teachers' significant impact on learner outcomes, society and educational systems place high and varied expectations on their roles, particularly during periods of transformation. In a world marked by instability and uncertainty, the complexities within educational systems are amplified, necessitating strategic and policy approaches that emphasise innovation and flexibility over traditional methods (Suarez & McGrath, 2022).

Teachers are responsible for fostering children's intellectual development and preparing future generations to face new challenges (Martínez-de-la-Hidalga & Villardón-Gallego, 2019). In this capacity they play a pivotal role in the modernisation of society. Therefore, the goals and outcomes of education must align with societal changes. School and system reforms, whether focused on national or global objectives, must adapt to these shifts by redefining teachers' roles and competencies. This requires ongoing professional development (see chapter on Professional Development) and lifelong learning programs, allowing teachers to keep their knowledge and skills up to date in response to evolving

societal demands, demands integral to the development and sustainability of teacher identity (Thomas, 2019).

As the professional landscape for teachers continues to evolve, a strong professional identity becomes increasingly important. This identity, which includes teachers' beliefs and perceptions of their roles, is vital for navigating these rising expectations and ensuring the delivery of high-quality education (Suarez & McGrath, 2022). To gain a clearer understanding of the contextual shifts that can challenge the role of a teacher and influence the development of their professional identity, this chapter will explore examples of changes that may be unexpected within the teaching profession.

The implementation of Inclusive Education

The role of teachers is dynamic in that it constantly adapts to the changing demands of education systems as it responds to societal shifts and developments in learning methods (Martínez-de-la-Hidalga & Villardón-Gallego, 2019). A pivotal transformation in educational science occurred in the 1970's when the focus moved from a segregated education system to one that promotes inclusive education, welcoming every child. The importance of inclusive education for all learners, both with and without special needs, has been well established. It represents a worldview where fundamental education is accessible to everyone, ensuring full participation, membership, and civic rights. Integrating learners with diverse abilities and cultural backgrounds into the same classrooms symbolises societal cohesion and integration, highlighting the broader societal value of heterogeneity in education beyond just academic outcomes (Galkienė, 2014).

UNESCO (2005) defines inclusive education by highlighting four key principles: Inclusion is an ongoing process aimed at continuously improving responses to diversity within the learning environment, it involves the continuous identification and removal of barriers to learning, it focuses on the participation and achievement of all learners in educational settings, and it places particular emphasis on groups of learners who may be at risk of marginalisation, exclusion, or underachievement. These principles highlight that educational systems constantly change, necessitating ongoing efforts to provide effective education for every learner (Zimba, Möwes & Victor, 2018).

A study done by Galkienė (2014) exploring the socio-educational characteristics that define the professional identity of teachers in the context of inclusive education shows that both learners and teachers highlight the significance of establishing a supportive and individualised learning environment that encourages participation from all learners. Learners appreciate teachers who exhibit empathy, understanding, and the ability to connect personally, valuing those who maintain a balance between being both demanding and caring (Galkienė, 2014). Teachers reflect on the need to build strong personal relationships with learners, recognising the importance of understanding each learner's uniqueness and interpersonal differences. They also highlight the necessity of continuous

professional development, creativity in organising the educational process, and the ability to motivate and support learners to achieve success (Galkienė, 2014). Thus, developing a teacher's professional identity in the context of inclusive education requires ongoing adaptation to the multiplicity of learners, shaped by the teacher's capacity to understand and embrace these differences. Teachers cultivate their professional identity through continuous reflection on their practices and by striving to enhance their skills and knowledge to ensure the success of every learner in an inclusive environment.

Unforeseen social change

As the teaching profession continues to evolve, marked by significant disruptions like the COVID-19 pandemic, the importance of cultivating a strong professional identity has become increasingly apparent (Suarez & McGrath, 2022). The pandemic posed unprecedented challenges, requiring teachers to rapidly adapt to new demands and environments. This adaptation included developing innovative teaching methods and utilisingnew online communication strategies with learners and colleagues. Balancing the pastoral care of their learners with their own professional and personal challenges profoundly impacted teachers' self-perception, emotions, and overall performance (Bacova & Turner, 2023).

The sudden closure of schools worldwide due to COVID-19 forced teachers to swiftly transition to virtual instruction to meet the needs of learners and families. Teachers adapted to new teaching modalities overnight, often working harder than before while managing their own children's education at home. They faced difficulties in ensuring learner engagement, particularly for those without reliable internet access. The pandemic underscored the essential role of teachers and their significant impact on learners' lives (Jones & Kessler, 2020). Before the pandemic, there was already a strong emphasis on the crucial role of teachers in supporting the academic, social, and emotional well-being of learners. Teachers build their professional identities around these discourses, which emphasise care and impact as central to their roles (Jones & Kessler, 2020).

Bacova and Turner (2023) emphasise the importance of open vulnerability in shaping teachers' professional identity. During the COVID-19 pandemic, teachers navigated an emotional journey from anxiety and self-doubt to a reaffirmation of their roles as caring professionals, often driven by positive feedback from learners, colleagues, and communities. Despite sometimes opposing institutional rules, teachers found pride in their autonomous decisions, reinforcing their self-image as compassionate educators (Bacova & Turner, 2023). Their vulnerability encompassed empathy, accountability, and a commitment to helping learners through the social and economic challenges. This approach also extended to supporting colleagues' well-being and professional growth. Reflecting on these experiences was found to be cathartic, helping teachers gain a deeper understanding of themselves and the future challenges they may face.

The Era of Technology

In the digital age, the role of teachers has expanded significantly, with their responsibilities constantly changing. Teachers are no longer just sources of information, they also serve as role models and mentors, shaping a society that is in constant flux (Avidov-Ungar & Forkosh-Baruch, 2018; Martínez-de-la-Hidalga & Villardón-Gallego, 2019). Traditionally, teacher identity was defined by the necessary competencies and knowledge, such as pedagogical skills and subject expertise. This traditional view underscores the importance of evaluation and ongoing professional development (Martínez-de-la-Hidalga & Villardón-Gallego, 2019). As educational needs and scientific advancements have progressed, teachers' roles have shifted from simply delivering knowledge to facilitating learning, providing guidance, support, and values education. This evolution calls for training that covers not just teaching skills but also interpersonal, communicative, and Information Communication Technology (ICT) competencies. Thus, teachers' professional identity involves understanding changing roles and acquiring relevant skills and knowledge (Martínez-de-la-Hidalga & Villardón-Gallego, 2019).

Such a role change occurred with the COVID-19 outbreak that forced educational institutions to implement extensive changes within weeks, shifting teaching to various online platforms that were unfamiliar to many teachers. Online teaching that goes beyond merely supplementing traditional methods requires teachers to re-evaluate their core beliefs about teaching and learning, as well as their roles. Many teachers were left unsupported and untrained to manage the transition to a fully technology-mediated environment, where policies and practices differ significantly from face-to-face settings. Consequently, teachers' professional identities can be impacted, as teachers can feel vulnerable when long-standing principles and practices are challenged by new policies or expectations (El-Soussi, 2022).

The COVID-19 outbreak enforced giant steps to adapting education to the 21st-century requirements, essential for adopting innovative pedagogy. This involves implementing new educational approaches to prepare learners better for modern challenges. Innovative pedagogy consists of planned educational activities, introducing new ideas to enhance learning through interaction, ideally using project-based learning focused on real-life problems (Avidov-Ungar & Forkosh-Baruch, 2018). Curricula then needs to be developed by teachers who have 21st-century skills, focusing on learners' interests and future skills. This includes integrating ICT to support knowledge-based teaching, active learning, and diverse resources. The concept of "quality pedagogy in an innovative environment" according to Avidov-Ungar and Forkosh-Baruch (2018), highlights the dynamic relationship between pedagogy and evolving learning contexts. Innovation in pedagogy may not always involve radical changes but can be seen as a gradual and relative process.

According to Steel (2009), as cited by El-Soussi (2022), teacher beliefs are often implicit and complex, potentially serving as either an obstacle to change or facilitator of effective

practices. Integrating technology into daily teaching is challenging, as even technologically proficient teachers may not recognise its pedagogical value. Teachers whose pedagogical beliefs do not align with technology use are likely to avoid it or use it in ways that do not fit their teaching philosophy. Conversely, teachers whose beliefs align with technology tend to be more successful in adopting it in their teaching (El-Soussi, 2022). Thus, positive attitudes and beliefs about the value and utility of technology, with proficiency in ICT, encourage the acceptance and use of innovative technology-based teaching methods. Consequently, how teachers develop their professional identity effects the advancement of pedagogical changes and reforms (Avidov-Ungar & Forkosh-Baruch, 2018).

Teacher Professional Identity Development in Times of Change involves teachers adapting and evolving their professional selves in response to shifts in the educational landscape. This process includes reflecting on their roles, values, and practices, particularly during significant changes like introducing new inclusive practices, adopting new technologies, adjusting to educational policy shifts, or facing unexpected challenges like the COVID-19 pandemic. Teachers continually redefine their professional identity to meet new demands and to ensure they can effectively support their learners' learning and well-being.

Let us pause and reflect.

In what ways can teachers proactively adapt their professional identities to navigate the challenges posed by societal changes while ensuring they continue to meet the diverse needs of their learners?

Changing teacher professional identity within inclusive education in different international contexts

Inclusive education is a global priority, but its implementation varies widely across countries and is influenced by cultural, social, and historical contexts. By examining the approaches of China, Namibia, and Germany, you can develop a deeper understanding of how diverse systems address inclusion. This highlights the successes, challenges, and opportunities in creating educational environments that cater to all learners, particularly those with special needs. The goal is for you to critically reflect on how professional development, teacher preparation, and societal attitudes shape inclusive practices. Grasping these dynamics can be significant for Teacher Professional Identity Development, as it enables educators to consider and adapt strategies from different contexts to effectively address local challenges.

Let us pause and reflect.

By exploring the strategies employed in China, Namibia, and Germany, you can ask yourself the following questions:

- What are the key challenges and successes in implementing inclusive education in each context?
- How does professional development differ across these countries?
- What elements do you recognise in your own country or context, and how do those elements help or hinder inclusive education?
- How do cultural and societal contexts influence the perception and practice of inclusion?

Inclusive Education in China

In China, there is a strong tradition of emphasising Teacher Professional Development (TPD) in teacher education, with future teachers studying their main subject for four years, encompassing both educational theory and practical teaching experience. After graduation, subject specialisation is a key part of a teacher's identity, particularly in primary and secondary schools, where teachers focus on a single subject such as mathematics, Chinese, or English. This contrasts with some other countries, where primary school teachers may handle multiple subjects.

TPD in China is an ongoing process that helps new teachers quickly develop their subject-specific teaching skills. Various strategies support this growth, including mentoring by experienced teachers, participation in instructional and research groups, observing other teachers, and receiving feedback on teaching effectiveness. Teacher promotion in China follows a structured hierarchy linked to both professional development and salary increases, ranging from new teachers to expert master teachers.

However, when it comes to inclusive education, TPD alone is not enough. Teachers also need to engage in Teacher Professional Identity Development (TPID) to fully understand and implement inclusive education. While inclusive education is still in its early stages in many parts of China, cities like Shanghai have begun integrating learners with special needs into mainstream classrooms. Despite these efforts, challenges remain as learners

with special needs are often exempt from academic exams, leading to a focus on learners without special needs due to teacher evaluations being based on learner performance.

Inclusive education in China is deeply connected to the reform of special education, which for over a century has segregated learners with special needs into special schools. By the late 1980's, China began transitioning to a more integrated system, moving learners with special needs from special schools into regular classrooms. By 2003, the majority of special education learners were learning in regular schools, though this shift has been met with mixed success. Many regular school teachers lack the training to effectively manage classrooms that include learners with special needs, and some reforms have been superficial, without a true change in mindset.

In recent years, the Chinese government has shown a commitment to inclusive education. Following the 2015 UNESCO Education Forum and the Education 2030 agenda, China has introduced policies to promote inclusive and equitable quality education. Scholars and experts in China have been instrumental in advancing research and practices in inclusive education, establishing centres for studies, and developing experimental projects in several provinces.

While progress has been made, significant challenges remain, particularly in fostering an inclusive culture within schools and society, reforming curricula, and adequately preparing teachers. Despite the Chinese definition of inclusive education emphasising the inclusion of all learners and opposing discrimination (Huang Zhicheng, 2004), many teachers continue to overlook the needs of learners with disabilities. As the country moves forward in both TPD and TPID, achieving true inclusive education remains a long-term goal, though the path towards it is becoming clearer.

Inclusive Education in Namibia

Inclusive education in Namibia continues to evolve. After ratifying key commitments that support the inclusion of learners with special needs in general education and, ultimately, their integration into society (such as the UN Convention on the Rights of Persons with Disabilities of 2006, the Salamanca Declaration of 1994, and the National Policy on Disability Revised Draft of 2011), Namibia has made significant strides by establishing an Education Sector Policy for Inclusive Education in 2013 (Chitiyo et al., 2016).

With this policy, teachers have received in-service training to better support learners with special needs in inclusive classrooms. Existing special schools, now referred to as resource schools under the Sector Policy on Inclusive Education, continue to play a vital role in equipping other teachers with specific strategies for teaching and supporting learners with special needs. However, more efforts are required to effectively address needs and allocate resources (Chitiyo et al., 2016).

Inclusive teaching requires teachers to recognise and value the diverse experiences and abilities of all learners, understanding that every learner's potential is unlimited and

embracing diversity. Although teachers generally show a commitment to inclusive education, their attitudes are often influenced by concerns about their readiness and the adequacy of the education system's support. Effective inclusive teaching necessitates thorough training, adequate support, suitable working conditions, and the freedom to adapt teaching methods. Teachers must be responsible for offering diverse learning opportunities to all learners and continuously reflect on their practices to combat social biases and stereotypes (UNESCO, 2020).

High-quality training is crucial for inclusive teaching, addressing gaps in teachers' knowledge about inclusive pedagogies, instructional techniques, classroom management, and multi-professional collaboration. This training must be practical, comprehensive, and include follow-up support to help teachers integrate new skills into their classroom practices. The challenge lies in moving beyond the traditional approach of preparing different teachers for different types of learners that can suppress diversity issues in teacher education and hinder effective inclusive teaching (UNESCO, 2020).

In Namibia, the Ministry of Education has raised concerns about the adequacy of pre-service training for inclusive and special education. According to Chitiyo et al. (2016), a 2013 educational needs assessment report identified a shortage of skilled professionals, particularly in special education, where specific training is lacking. While some inclusive education training is provided, it is insufficient to meet the needs of learners with special needs. Therefore, specialised training and ongoing professional development are essential to better equip teachers and enhance education quality for these learners.

A study by Mokaleng and Möwes (2020) indicates that teachers in a particular region in Namibia view supportive leadership as crucial for the success of inclusive education, emphasising the vital role school leaders play in providing necessary support. Without this support, inclusive policies are at risk of failing. The study further highlights the need for inclusive leadership to implement effective educational policies and programs. Many teachers feel unsupported, leading to negative attitudes towards inclusive education, often linked to insufficient knowledge, skills, training, and support. In addition, the study points out that large class sizes are perceived as a significant challenge to inclusive education in Namibia, with many teachers feeling overwhelmed and unable to meet the needs of all learners effectively. Teachers acknowledge that their attitudes are critical to the success of inclusive education, and negative attitudes are often associated with inadequate training and skills. Many also believe that inclusive education places excessive demands on them, likely due to a lack of knowledge and support, contributing to feelings of being overwhelmed. Thus, negative attitudes that often arise from a lack of support are identified as a major barrier to successfully implementing inclusive education (Mokaleng & Möwes, 2020).

The majority of teachers in a study by Chitiyo et al. (2016) emphasised the importance of professional development for teaching learners with special needs. This indicates that teachers in Namibia see the need for further training, suggesting that current pre-service

education, which includes only a few courses on inclusive education, may not be enough to prepare them for supporting learners with special needs. However, the positive attitude toward professional development presents a valuable opportunity for Namibia to develop and implement robust special education training programs (Chitiyo et al., 2016). Research highlights a strong link between teacher professional development and overall education quality, particularly in relation to teachers' beliefs, practices, and learner education. Effective professional development includes workshops, in-class coaching, team planning, action research, peer observation, and study groups. Namibia's teacher development programs incorporate many of these elements, aligning with international best practices to enhance education quality (USAID/EQUIP1, 2006). However, significant work remains to be done in Namibia to ensure positive outcomes for all individuals with special needs.

Inclusive Education in Germany

In Germany, developments of inclusive education vary highly between the different federal states (Steinmetz et al., 2021), also regarding the persistence of special schools. As Powell et al. (2016: 244) conclude: "The German case, despite the legitimacy crisis of special schooling since ratification of the UN-CRPD, also reveals the remarkable path-dependent persistence of segregated and stratified schooling." With great variance between the federal states, the extensive network of special schools largely remains (Bildungsbericht, 2024). This parallel system of special schooling limits learners' opportunities for educational success by obtaining higher education qualifications (Bildungsbericht, 2024), as Goldan and Kemper (2020) have shown regarding learners with special educational needs in the field of learning difficulties.

In the last years, there have been increased links between inclusion and diversity in the German speaking discourses (Resch et al., 2020) and an increased emphasis on intersectional perspectives (Haas & Penkwitt, 2023). However, notions of inclusive education that focus on special educational needs or disabilities prevail (Löser & Werning, 2015). This leads to a missing link to migration pedagogy (Paraschou & Soremski, 2022) and disregards, for instance, intersections of language and disability (Mecheril & Natarajan, 2022). A narrow understanding of inclusive education as focused on special educational needs is reflected in a study on pre-service teachers' understandings by Schaumburg et al. (2019).

With regard to the ways in which inclusive education is embedded in German teacher education programs, Blasse et al. (2023) emphasise that teacher education should enable pre-service teachers to perceive relations of power and domination and reflect on their own positioning within them. This would entail questioning their own beliefs, learning about the deconstruction of normative images and concepts of education as a core component of teacher education, and fostering critical reflection on power dynamics, differences, and inequalities as an essential part of developing a professional identity as a teacher.

Paraschou and Soremski (2022) call for a broader understanding of inclusive education within educational science to ensure participation for everyone. The joint recommendations by the German Rectors' Conference and the Standing Conference of the Ministers of Education and Cultural Affairs of the States in the Federal Republic of Germany (2015) on "Educating teachers to embrace diversity" state: "degree programs which lead to a teaching position in any type of school and at any level of schooling should prepare prospective teachers cooperatively to take a constructive and professional approach to diversity" (HRK & KMK, 2015: 2).

However, several challenges for teachers' professional development and teacher education remain. The prevalence of a narrow understanding of inclusive education remains challenging regarding broader notions of diversity. For instance, Schreiter's (2021: 72) analysis of module descriptions in initial teacher education for primary education indicates a lack of reference to sexual and gender diversity in teacher education programs. Furthermore, the strong tradition of special schooling in Germany is also reflected in teacher education programs, which mostly rely on a distinct model with separate programs for general and special education (Heinrich et al., 2013). At the same time, there are differences concerning the federal states and their respective guidelines and frameworks for teacher education. Hence, there are also examples for more integrated approaches to teacher education on the university level (Bielefeld University: Kottmann & Miller, 2022) or there have been changes on the federal state level following the UN-CRPD, for instance in the federal state of Berlin. Within separate tracks for special education, Junge's (2020: 6) study on pre-service special education teachers reflects insecurities in the contexts of different situations in inclusive or special schools as well as the "need for students to be recognised as a 'real' teacher." By way of example, this reflects the crucial role of teacher professional identity development in the context of changes as well as persistence in schools.

In recent years, professionalisation and teacher professional development regarding inclusive education and diversity have been the focus of several initiatives on both the federal and state level. Especially within the Quality Initiative for Teacher Education (Qualitätsoffensive Lehrerbildung) funded by the German Federal Ministry of Education and Research (BMBF) together with the federal states between 2015-2023. This initiative had the overall aim to improve the quality of teacher education, one major focus was placed on heterogeneity and inclusion. The projects included cross-sectional topics that considered curricula, methods, and teaching and learning arrangements in teacher education for all programs (BMBF, 2024). However, the end of funding places several challenges, for instance with regard to focusing on multidisciplinary collaboration as one important aspect for inclusive education (=> cross ref All means all chapters "Working within multidisciplinary teams" and "teacher agency"here) within teacher education programs (BMBF, 2023: 25).

By way of example, we reviewed teacher professional identity development in three contexts. At the same time, it is also important to engage with intersectional perspectives

on teacher professional identity development, which will be addressed in the following section.

Teacher Professional Identity Development and Intersectionality

Intersectionality is a framework that examines how various aspects of social identities – for example, race, gender, disability, language, religious beliefs, or socioeconomic background – interconnect to create unique life experiences and overlapping systems of discrimination and disadvantage. In educational practice, an intersectional perspective raises awareness about the diverse realities and discriminations faced by individuals, highlighting the impact of power dynamics (for example, racism, ableism, sexism, etc.) in schools. The framework of intersectionality helps to analyse how different social categories and power structures interact, focusing on their inclusive and exclusive effects as well as the reproduction of inequalities (Budde 2018, Riegel 2016). The goal of intersectionality is to deconstruct power hierarchies and promote social justice by examining and challenging relations of difference and dominance, thus holding significant transformative potential (Lawrence and Nagashima 2020; Riegel 2016).

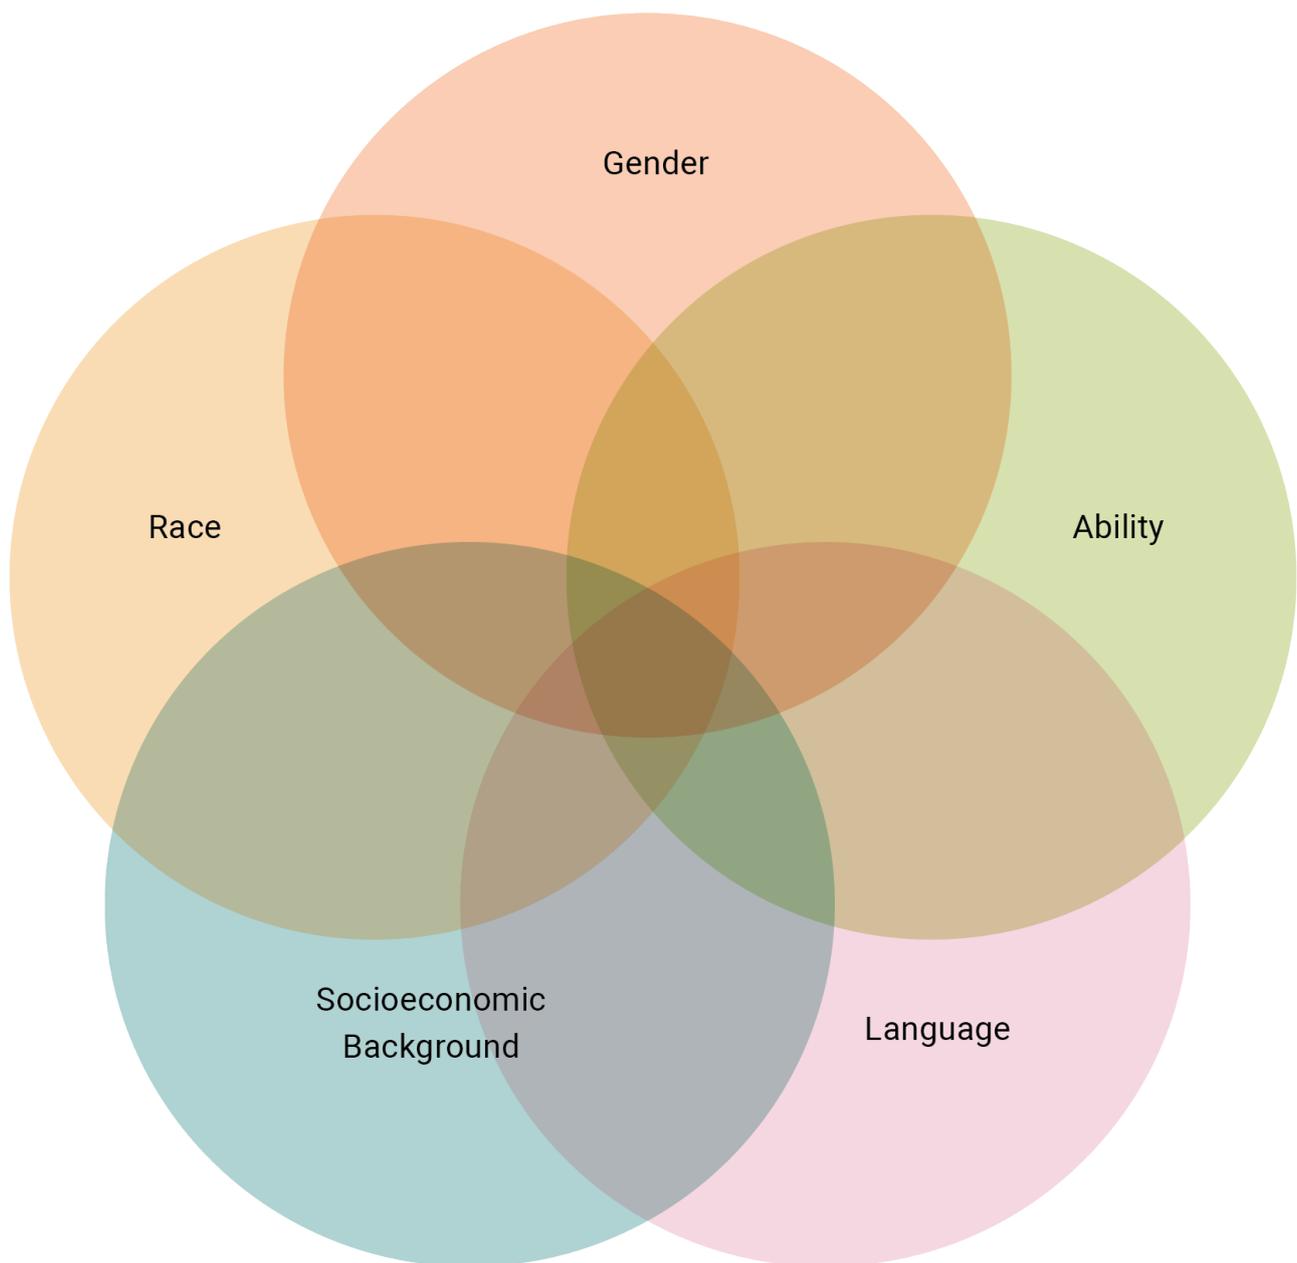
Figure 2: Intersecting Aspects of Identity


Figure 2 demonstrates how a selection of aspects of social identity might intersect with each other. It should be noted that this graphic includes only a selection; there are numerous other aspects that influence identity, such as religion, sexual identity, immigration status, and many more.

For pre-service and for in-service teachers, understanding intersectionality is crucial not only for appreciating the diverse identities of learners but also for recognising the importance of their own identities as educators (Pugach et al., 2019). An intersectional perspective allows pre-service teachers to reflect on their social positioning and on how it influences their teaching. It further helps to address and tackle inequalities that occur in every classroom (Boveda & Aronson, 2019). Pugach et al. (2019) undermine the need for an intersectional perspective on identity in teacher education:

"Probing the complexity of multiple identities not only can help [teacher] candidates

understand how risk is amplified based on multiple jeopardies; doing so can also surface the multiple assets students bring − across identity markers − that can be marshalled toward learning" (Pugach et al., 2019: 214).

By adopting an intersectional perspective, an asset-based approach can be taken, which is central to inclusive teaching as it focuses on the strengths and potentials of learners rather than on their assumed deficits. Another aspect that underscores the need for an intersectional perspective when addressing teacher professional identity development is the often-encountered demographic mismatch between teachers and learners' backgrounds. This mismatch can lead to problems in understanding learners, as well as prejudices and potential biases against them, which can hinder their educational experiences (Gershenson et al., 2016).

This section will closely examine these aspects, aiming to encourage self-reflection on intersectionality and the development of one's identity as a teacher. After providing a brief historical context of intersectionality, we will explore the meaning of disadvantages and privileges in education as they relate to intersectionality. The section will also offer examples of intersecting teacher identities and include biographical insights.

Historic context of intersectionality

The idea of intersectionality originated to a significant extent in Black feminism. Particularly within the Combahee River Collective, a Black feminist lesbian organisation that was active in Boston from 1974 to 1980. In their 1977 statement, they highlighted intersecting systems of oppression affecting Black women, however, without directly referring to the term "intersectionality." The statement called for social change by addressing interconnected systems of oppression like race, gender, sexual orientation and class, and it greatly influenced feminist theories and activism. In 1989, legal scholar Kimberlé Crenshaw introduced the term "intersectionality" to emphasise the unique experiences of individuals facing multiple forms of discrimination. The idea has since travelled through numerous disciplines (for example, law, philosophy, sociology), being referred to as a "traveling theory" (Salem, 2018) and a "traveling concept" (Lindmeier, 2023), and has long made its way into educational sciences.

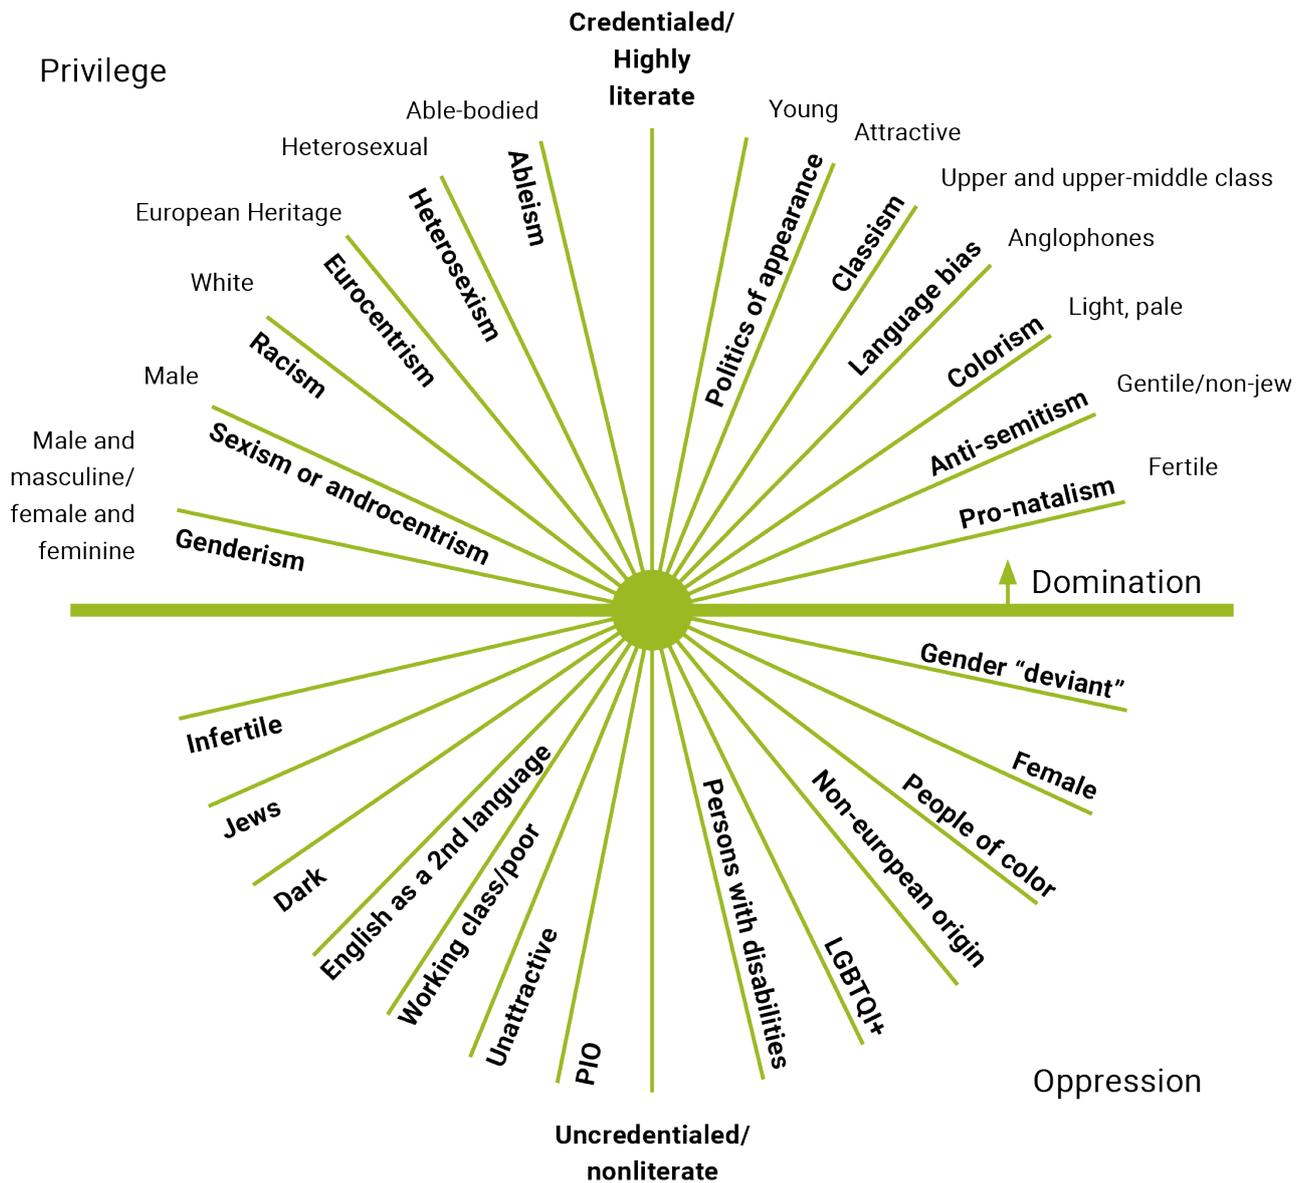
Disadvantages and Privileges in Education

When applying an intersectional perspective to TPID, it is crucial to consider issues of power and oppression, as they are inseparably linked to different aspects of identity. Questions of privilege and disadvantage are particularly useful when reflecting on both

teacher and learner identities. While the term "privilege" may carry different meanings depending on the context, many people have an intuitive understanding of it as a common term. Black & Stone (2005) define privilege in relation to oppression, introducing the concept of social privilege. In this understanding, privilege is a special advantage that is context-dependent rather than universal. It is typically unearned and tied to a preferred social status or rank, benefiting those who possess it, often at the expense of others. Many times, individuals or groups holding privileges are unaware of them (ibid.). Since identities are shaped by multiple factors that intersect with privilege and disadvantage in different ways, it is essential to examine them through an intersectional lens. Black & Stone (2005) highlight this by discussing privilege within the context of socially constructed categories such as sexual orientation, socioeconomic status (SES), age, differing degrees of ability, and religious affiliation (ibid.). This list is not exhaustive; however, it underscores how multiple variables influence privilege. The challenges or possibilities that learners encounter due to being (de)privileged significantly shape their educational experiences.

For instance, Antoninis et al. (2020) took a closer look at the UNESCO 2020 Global Education Monitoring Report with a focus on inclusion and pointed out how disadvantages often intersect. It was observed that those most at risk of being excluded from education frequently face intersecting disadvantages related to "language, geographic location, gender, and ethnicity" (Antoninis et al., 2020: 105). Specifically, in at least 20 countries with available data, very few rural young women that live in poverty finish upper secondary school (ibid.). This example demonstrates the intersectional interaction of multiple factors, showing how limited access to resources – because of living in a rural area, having a low socioeconomic background, or living in poverty – interacts with linguistic background, age, and gender. In this way, an individual's educational participation is hindered by multiple structural disadvantages, which can be traced back to various relations of power and domination, such as linguicism, adultism and sexism, as well as patriarchal and capitalist structures.

Another example of how privilege influences educational opportunities becomes evident when examining learners' socioeconomic backgrounds. In Germany, only 32% of children from socioeconomically disadvantaged families receive recommendation for higher-level academic tracks, compared to 78% of children from privileged families (Autor:innengruppe Bildungsberichterstattung, 2024). Even when learners have the same academic performance and grades, still 59% of children from privileged families and only 51% of children from lower socioeconomic backgrounds receive such a recommendation (Autor:innengruppe Bildungsberichterstattung, 2024).

Figure 3: Intersecting axes of privilege, domination, and oppression


Source: Henr/iques et al., 2023, adapted from Morgan, 1996: 107

Figure 3 above illustrates how different social categories can be linked to privilege, oppression, and disadvantages. Each line represents a social category or aspect of identity, with one end associated with privilege and the other with oppression or domination. This representation wants to highlight how various aspects of identity can place individuals at different points on the privilege-oppression spectrum. It includes the concept of intersectionality by showing that these categories are interconnected and collectively shape a person's overall experience in society. For example, a Black woman with disabilities experiences life not just as a woman, a Black person, or a person with disabilities, but as a combination of all these aspects, creating a unique experience that may simultaneously be influenced by power dynamics such as sexism, racism, and ableism (AWIS, 2018). However, it should be noted that aspects of privilege and oppression are context dependent. For example, Figure 3 views speakers of English as a second language as disadvantaged

because it focuses on a U.S. context; however, the (de)privileging of languages depends on the specific context in which it occurs.

Let us pause and reflect.

Take a closer look at Figure 3. Try to think of three aspects of your identity that are especially important to you. Those aspects may or may not be represented in the figure. Write them down and reflect on how they have been connected to privileges, disadvantages, and oppression that you have experienced in your life.

Intersectional Teacher Identity

A teacher's identity is essential not only for their development as educators but also in how they address inequalities and differences in educational settings. "Teacher identity can be broadly defined by how teachers make sense of themselves as professionals, by how they present themselves to others, and by the roles that they play in response to their disciplinary, social, cultural, and political contexts" (Maddamsetti, 2023: 2540). This implies that in the process of developing their professional teacher identity, teachers should be reflecting on the interplay between their self-concept and the external expectations and societal contexts they navigate.

An example of how experiences with self-concepts and external expectations may play out in a classroom is provided by Lawrence & Nagashima (2020). The authors explored the connections between identity, teaching practice, and university classroom interactions from an intersectional perspective by analysing personal written narratives through duo ethnography. They found that the intersection of gender, sexuality, race, and native-speaker status significantly impacted their professional identities as language teachers. For instance, one author reported that, as a bisexual Japanese woman living and working in the U.S., she experienced both sexualisation and fetishisation. While already facing fetishisation as an Asian woman, she chose to conceal her bisexuality to avoid further hyper sexualisation, given the false perceptions of sexuality often associated with bisexual women. The author further expresses that despite her desire to incorporate LGBTQ+ topics into her classroom, she hesitates because she fears learners might react with homophobia or indifference, which could negatively affect her personally (Lawrence & Nagashima, 2020). This example highlights how heteronormativity, sexism, and racism influence

teachers' decisions, in this particular case leading to the exclusion of certain topics from the curriculum.

Let us pause and reflect.

Can you think of a moment in your teaching practice where you felt a conflict between your self-concept as a teacher and the external expectations of your teaching environment? How did you navigate this tension, and what insights did you gain about your evolving professional identity?

Reflecting on one's personal history is essential for understanding how individual experiences form professional identity. A teacher's biography profoundly influences their beliefs and practices as an educator, with early experiences profoundly shaping their perception of what it means to be a teacher (Pajrares, 1992). Such reflection helps teachers link their personal histories to their teaching practices, offering valuable insights into their professional development. For example, Leckie & De Buser (2020) conducted a study that explored teachers' autobiographies to investigate how intersectionality can act as a framework for professional growth. Their findings indicated that, through an intersectional perspective on their autobiographies, the participants were able to connect critical content with their own experiences in society and education. The study also revealed that even within a seemingly homogeneous group, teachers have encountered a variety of privileges and disadvantages in their biographies. By applying an intersectional lens to their own lives, teachers were able to better understand the experiences of diverse learners, despite differences in identity or social categories.

Let us pause and reflect.

With the above in mind, we would like to revisit the example case at the beginning of this chapter, which contains biographical narratives from a teacher named Rhianna. Please read

through the example case once more before continuing with the following section.

Referring back to our example case, we can see that Rhianna's self-understanding is deeply connected to and motivated by her own experiences at school. Reflecting on this from an intersectional perspective, considering the effective power structures and the privileged or deprived aspects of identity, we observe that her personal background resulted in hindrances on multiple levels. Her dyslexia, socioeconomic background, and limited access to resources intersected to shape her educational journey and created unique barriers and challenges. These challenges included being placed in intervention groups, which restricted Rhianna's access to the mainstream curriculum and, consequently, to education in the same way as her peers. The decision to place her in a separate program was likely made by educators and administrators, significantly impacting her educational path and highlighting how power dynamics can influence the quality and direction of a learner's education. These experiences inspired her to become a teacher, equipping her with the ability to empathise with learners facing similar challenges and informing her approach to teaching.

Let us pause and reflect.

Reflect on your own educational experiences and how they might have shaped your professional identity as a teacher.

- What aspects of your identity have led to advantages or disadvantages during your time at school?
- What barriers did you encounter (or not encounter) in your educational journey?
- Have these experiences influenced how you want to be as a teacher? If so, how?

Developing Intersectional Sensitivity

As demonstrated by Leckie & De Buser (2020), identifying and exploring various aspects of privilege and oppression and their interconnectedness can profoundly influence teaching practices. The authors further argue that reflecting on one's own experiences is essential for understanding and shaping one's role as a teacher (ibid.). Additionally, the adoption of an intersectional framework reveals that everyone, often unconsciously, internalises traits

from oppressive ideologies. This realisation underscores the importance of understanding how oppression shapes our society and therefore influences institutions, including schools and other educational facilities. To effectively incorporate these insights into teaching, the concept of "intersectional sensitivity" can serve as a reference point. According to Volknant et al. (in press), intersectional sensitivity in pedagogical practice encompasses several key aspects. Primarily, it involves teachers developing the ability to identify the individual circumstances their learners are in and also to recognise the privileges and disadvantages accompanying them. This approach requires more than just knowledge and diagnostic skills; it demands a mindset and practical approach that prioritises an empathetic understanding of the challenges that learners face in their everyday lives. Furthermore, it calls for responsive actions that address these challenges, considering each learner's individual biographical experiences (ibid.). To develop an identity as an intersectional sensitive teacher, the following points should be considered:

Knowing: Understanding the history and mechanisms of power and dominance, as well as inclusion and exclusion, particularly within the relevant context (for example, national, cultural, political, etc.).

Identifying: The ability to identify learners' individual needs in relation to their intersecting aspects of identity, as well as the power structures, privileges, and disadvantages at play and how they manifest in the classroom. An intersectional framework (Boveda & Aronson 2019; Leckie & De Buser, 2020; Riegel, 2016) can assist in this identification process.

Acting: Taking responsive actions that address learners' individual needs, continuously reflecting on one's practices, beliefs, methods, and materials. This involves addressing critical or discriminatory actions that occur within the classroom, among staff, or in school organisational structures. It also encompasses engaging in ongoing professional development, for instance, by continuously participating in teacher education.

Intersectional sensitivity is central when considering TPID because it emphasises the ongoing reflective process educators must undergo to understand their roles and responsibilities within a diverse and complex society, thereby enabling meaningful inclusive teaching.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=669#h5p-40

Closing questions to discuss or tasks

- Reflect on the context of teacher professional identity in your country or context. What is the role of a teacher?
- What role do cultural and structural differences play in shaping teacher attitudes and professional development towards inclusive education, and how can these insights help create more effective training programs?
- Think about how you want to be as a teacher. Reflect on why including intersectional perspectives is crucial for your professional identity as a teacher and how it connects to your own identity, your learners' identities, and societal power structures. Try to visualise those connections through a drawing, diagram, or a written reflection that helps you express these relationships.

About the authors

Ann-Kathrin Arndt

Ann-Kathrin Arndt, research, teaching and developing teacher education in the field of inclusive education. PhD on collaboration between general and special education teachers (Leibniz University Hannover). Main research areas: Multidisciplinary teamwork, constructions of difference in inclusive classrooms, inclusive, diversity-sensitive teacher education.

Beausetha Juhetha Bruwer

Beausetha Bruwer, instructor of inclusive education, deaf education, and sign language. Experiences as a teacher of deaf children and as a teacher and sign language interpreter trainer at college and university level. Her key areas of research interest include, among other things: language education, early literacy and language acquisition/ development for deaf learners, sign language linguistics and practices, Deaf culture, mother tongue education, multilingual education, early childhood inclusive practices, play pedagogy, outdoor pedagogy, and teacher preparation for inclusive practices.

Sarah Volknant

Sarah Volknant is an educator and researcher from Germany with a passion for the topics of inclusion, multilingualism, and intersectionality with a focus on teacher education. Her work delves into prejudiced perceptions of language within

educational contexts, aiming to uncover the underlying beliefs and socially constructed norms. Sarah's approach involves critically reflecting on and deconstructing biases by employing intersectional perspectives.

Zhicheng Huang

Zhicheng Huang, is professor of Institute of International and Comparative Education in East China Normal University, Shanghai, China. His research interests include comparative education, international education theories, curriculum and instruction, teacher education, inclusive education, educational administration, Latin America education, Paulo Freire education theory, etc. In 2004 he published the first book in China on *Inclusive Education——All means all*. He was visiting scholar in Chile, Mexico, Spain, USA, UK, Germany and Japan. He has managed several national and international cooperative research projects on inclusive education and others topics. He was vice-dean of Faculty of Education, director of Department of Curriculum and Instruction, director of Institute of International and Comparative Education in East China Normal University. He was vice president of China Association of Comparative Education.

REFLECTING ON TEACHER HABITUS - THE POTENTIAL TO SUPPORT INCLUSION IN THE CLASSROOM

Nico Leonhardt; Rose Ryan; and Valerio Ferrero

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ama-2025-en/?p=369#oembed-1

Example Case 1

"I was born and raised in western Germany in a Catholic, white, middle-class family without any academic background…and then I went to Berlin and I'm teaching at a school where most of my students have a completely different background, let's say. When I was first teaching there, I had to relearn many things because entering with my habitus, the way I was socialised, didn't work out very well because there were lots of misunderstandings, lots of biases from my side. And so, I was trying to better understand how I was raised and how my students were raised…and also, they have different families and different backgrounds, but it was very, very obvious to me that I couldn't just put my own beliefs and habitus on them because theirs was very different. […] As a teacher, you're always aware of the powerful side of that. So, I asked myself, how can I use that power in a positive way for my students? And how do I talk about my students, because this is a kind of reproduction of how I see them. So, first of all, how I talk about them with my colleagues. I just asked myself very concretely when I come out of class, when I finish a class and I go into the teacher's (staff) room, how do I talk? What do I say? Even if I'm frustrated, what kind of behaviour do I display when I talk about them in a biased way… if we think about teacher habitus and how we talk about students it is not only how we talk inside school, but also how we talk outside of school. So how do I talk to my own parents, to my own family about how I work, what I see and how I see my students? And this is also something that really changed during my working experience over the last ten years. If you change your perspective and you take on

board the student's perspective and their family's perspective, you see that it's not a school in a socially deprived or marginalised area, it's not a school facing lots of problems, it's also not in paradise. But for them, it's just a school, a normal school. So, if you change your perspective on these schools and the discourse, then you can also see the bias that you have, because it's a very normative way to look at these schools and these students. For me, trying to change my perspective and beginning with myself has helped me."

Simon Klippert, secondary school teacher, Germany

Initial questions

1. What does teacher habitus mean?
2. Why is it important for me as a teacher to consider teacher habitus?
3. How diverse is the teaching profession in Ireland, Italy, and Germany? What needs to change to achieve inclusion?
4. What is the impact of teacher habitus on students?
5. What are the challenges of engaging with your own teacher habitus?
6. How can I reflect on my own habitus as a teacher?
7. Through a better awareness of teacher habitus, what is the potential for me to support inclusion in the classroom and impact inclusive school culture?

Introduction to Topic

We know that teacher habitus is contextualised within one's own knowledge, behaviour, and social influences. Teacher habitus is also increasingly becoming the focus of a reflexive examination of pedagogical discourse. Habitus, as a person's overall appearance and internalisation of social and cultural norms of one's social class (Bourdieu and Passeron 1977), is significantly shaped by a person's background and biographical (and school) development. In this regard, the discourse on teacher habitus is also linked to the issue of educational inequality, because schools play an important role in producing and (re)producing class inequalities (Bourdieu & Passeron, 1979). Our expectations, assumptions, relationships, and interactions are closely linked to our beliefs (and biases) about what is considered 'normal' and 'capable'. Habitus significantly determines and

influences teacher action and thus student development (Helsper, 2015; Lange-Vester, 2015). Discrimination, stigmatisation, and the (re)production of social inequality can play a significant role in this.

In relation to teacher habitus, different types can be distinguished (Lange-Vester 2015). Concepts of the normality of teachers are closely linked to the respective (ability) expectations. In the context of teacher habitus, questions for consideration include to what extent my own habitus influences my everyday pedagogical work and/or which prejudices influence me as a teacher? Also, which experiences and habitual patterns remain invisible in everyday school life and are excluded in the sense of a hegemonic effect?

Knowing that power is immanent in the context of schooling, inclusive pedagogy, or inclusive teacher education faces the challenge of revealing and questioning habitus patterns in a power-critical way. This chapter explores the meaning and importance of teacher habitus, how it is affected, and considers the implications of the lack of diversity in the teaching profession in Ireland, Italy, and Germany (the authors' countries of origin). The chapter outlines the possibilities there are for confronting one's own habitus as a teacher in an inclusive pedagogical everyday environment.

Considerations for developing habitus sensitivity are used as potential for change. As a result, implications on two levels for self-reflective engagement are highlighted. On the one hand, on the level of the teacher and, on the other hand, on the level of the students or the school culture.

Key aspects

The meaning of teacher habitus

The term 'habitus' refers to the dominant norms and practices of particular social classes or groups (Bourdieu and Passeron, 1977). Central to Bourdieu's notion of habitus is that in society certain classes use their social, cultural, and economic capital, to reproduce themselves and secure their dominance in society (Thomas, 2002). Thomas (2002) argues that habitus refers to more than norms or values because it is so embedded, often subconsciously, in everyday life and interactions (Thomas, 2002). In Bourdieu's sense, habitus can be described as "schemata or relations of perceptions, sense-making, and actions and their social conditions" (Höhne, 2013:261, Author's translation) and is essentially shaped by one's own experiences and social structures. It is thereby something "internalised, something that demarcates me and my world from another world" (Thümmler, 2022:220, Author's translation) and is not cognitively caught up, but finds expression in a person's practices (cf. te Poel 2022:142 after Kramer, 2019, Author's translation).

The meaning of social class, for example, plays an all-encompassing role in our contemporary society (Hooks, 2020). Nevertheless, reflection on social processes critical of classism, is only hesitantly moving into the focus of public discourses (ibid.). In the field

of education, however, the question of origin and its effects in the context of educational (in)justice is increasingly discussed (e.g., El-Mafaalani, 2020 or Behrmann, 2013). The topic discussed in this chapter, therefore, focuses on the concept of habitus and its impact on (inclusive) educational processes. The habitus of the elite are well suited to thrive in formal educational environments that are (deliberately) structured to meet their needs while the needs of other groups are far more likely to be divorced from the habitus of formal educational institutions. These can be summarised as structural barriers in education, particularly financial barriers, a disconnection between the students' habitus (values, norms, and culture) and the 'middle-class' habitus of schools, universities, and elite institutions, where students can experience education as a 'struggle' with a strong sense of 'not fitting in' or 'not being good en   ough'.

Habitus is of great importance, especially in the context of school: as Perrenoud (2001) states, it is the generative grammar of all practices. Teachers come to school with their "habitual orientations that have developed in their social environment" (Thümmler, 2022: 221, author's translation). The so-called teacher habitus is therefore an important part of current educational debates. In this context, Helsper (2018) differentiates the concept of habitus into four parts of an overall habitus of teachers, which are interconnected in terms of processes. First, Helsper identifies the primary habitus of origin. This is based on the cultural practices of the family and one's own social environment. It forms the basis of the overall habitus. From this, an individual habitus (second) develops, which is reciprocally strongly influenced by one's own life path and shaped by experiences in environments and spaces outside the family (ibid. & te Poel 2022). Depending on the contact with other environments, this can also lead to habitus transformations, in relation to the primary habitus. In addition, teacher habitus (third) and student habitus (fourth) are still essential field-specific formations of the overall habitus of a teacher, which in turn strongly influence each other. Thus, "teachers design student images equivalent to their own teacher habitus, which tend to remain concealed" (te Poel 2022: 142, Author's translation). Thus, the question is what learned behaviours, perceptions, and experiences determine teachers' behaviour? What notions of normality or difference influence teachers' concrete practices? What forms of 'othering', discrimination or stigmatisation are associated with habitual imprints? Lange-Vester (2015), for example, distinguishes three different habitus types among teachers (personal responsibility and inclusion, integration and equal opportunities, and order and discipline), which in turn are each linked to specific expectations of students and can lead to different patterns of action. Thus, the view of social inequalities differs across patterns, and expectations of students are linked to them. For example, who receives recognition for which skills, or who is expected to succeed in school and who is not?

Considering your own habitus as a teacher: why is it important?

Example Case 2

"I am a primary school teacher in Ireland. Recently, a child from Serbia arrived in my classroom: she did not speak English and felt lost. Observing her, I noticed that she loves to draw and doodle during playtime. So, I decided to include drawing in my lessons as a strategy for communicating and approaching different topics: she started to feel at ease within the class. Feeling welcome, she started to use drawings as a map to speak in English. It was crucial for me to consider my habitus and perceive myself as a change agent for this child: she should have every opportunity to succeed."

Dean Vaughan, primary school teacher, Ireland

Much has been written in pedagogy books on what it means to be a good teacher, on how to welcome and value diversity from an intersectional perspective, on how to implement inclusion (Azer, 2005; Biesta, 2017; Ida, 2017). However, every teacher, even the one with the most refined and precise academic preparation, knows the feeling when certainties break down in front of a group of students who are decidedly different from the typical cases presented in university textbooks. No two students are the same and there is no single way to be a good teacher. However, reflection on habitus is useful in this perspective and is connoted in terms of equity and social justice (Bell, 2016; Carlisle et al., 2006; David et al., 2001; Hackman, 2005). The issue is to ensure excellent educational opportunities for all, and it can be achieved mainly through teachers.

Teachers can be agents of change by exerting transformative and ameliorative potential for their students' school paths and lives (Brown et al., 2021; Cooper et al., 2015; Pantić et al., 2022), but they can also reproduce and produce inequalities because of their stereotypes and prejudices and their idea of schooling that may not match that of some students and families. (Collins, 2009; Ferrero, 2023; Reichelt et al., 2019; Behrmann 2013). This is certainly not a new dynamic (Bourdieu, 1966; Mickelson, 1987), but in the context of current emergencies (the pandemic, the geopolitical crisis, energy, and food autonomy), it becomes essential to affirm the crucial role of schools and teachers in supporting equal opportunities and social inclusion for all.

As we have outlined earlier in this chapter, each teacher is a person with their own ideas, values, beliefs, history, and culture. Everyone reads and understands reality with their own interpretative schemes, not being free from stereotypes or prejudices that have an influence

on their educational relationships with students (Inan-Kaya & Rubie-Davies, 2022; Mason et al., 2014; Sabarwal et al., 2022) and on evaluative practices (Beg et al., 2021; Triventi, 2019). In this context, not all teachers will value diversity in all its forms: there are some more likely to accommodate cultural diversity than sexual orientation, others more comfortable with disability than religious difference, still others more likely to appreciate socioeconomic diversity than family composition (Granata, 2016).

Considering one's own positionality is critical to fully analysing reality, tracing unknown stimuli back to known categories, counteracting false and inflexible processes (Allport, 1979) that risk producing and reproducing inequalities. This is why it is essential for each teacher to consider their own habitus and to reflect on their own modes of professional action. Considering one's own habitus as a teacher and consciously working on one's own way of constructing educational relationships, of communicating with students and families, means valuing the ethical and deontological dimension of educational professionalism (Damiano, 2007; Milani et al., 2021; Morin, 2004), i.e. on their own educational role and on how their actions convey meanings and have consequences on students' educational pathways.

Habitus is a central aspect of teaching professionalism because actions and practices must change to respond to the diversity of the classroom: there is no one size fits all, but it is necessary to understand which strategies will meet the needs of the students. It is imperative for every teacher to consider their habitus and perceive themselves as agents of change for each individual student. Both in the choice of materials to be adopted and in the operations to create an open and inclusive environment, one's own view of the world comes into play; being aware of this means paying attention to the effects that one's ideas about education may have on the students and on the (lack of) appreciation of everyone's uniqueness.

Understanding habitus is first and foremost a reflection on oneself, which connotes professional action for which creativity, empathy, and emotional intelligence are required to increase their view of the world (Feucht et al., 2017; Zembylas, 2014). In this perspective, attention to the teacher's habitus is indispensable in order to let its transformative potential emerge, not only regarding the individual, but also for the school culture in which one is immersed (Balkar, 2015; Feldman, 2016). Asking questions about the organisation we are in and questioning it (Cansoy & Parlar, 2017; Mincu & Granata, 2021; Yusof et al., 2016) can change what produces inequalities.

The teacher can be an agent of change not only for students, but also for school life. Equity and inclusion are systemic issues for everyone; schools, teachers, and students. From the teacher's perspective, considering one's own habitus and taking a reflective posture is important because it supports professional growth, change, inclusion, and equity.

Talking to all, representing all: How diverse is the teaching profession in Ireland, Italy, and Germany? What needs to change to achieve inclusion?

Based on the importance of teachers reflecting on their own habitus, the diversity of the teaching profession in Ireland, Italy, and Germany (the authors' countries of origin) is described in the following section.

In all three countries, various similarities emerge in the composition of the teaching profession. Regarding the availability of data on the characteristics of teachers, differences also emerge. In Germany, for example, it has not yet been comprehensively researched "how heterogeneous or homogeneous the habitus patterns are within a teaching staff" (Thümmler, 2022: 222, author's translation). However, it can be observed that teachers mainly come from upper and middle social milieus (ibid.) and that there are still discriminatory barriers to entry when it comes to accessing the teaching profession. In Ireland, teachers are predominantly white, Irish, female, settled, Catholic, and middle class (Heinz & Keane, 2018). In Italy, the situation is quite similar, although there is a lack of specific studies on the composition of the teacher and student population in teacher education. Cultural and religious diversity is poorly represented (Colucci & Gallo, 2017) and there are few teachers with disabilities or other special needs (Bellacicco et al., 2022). Data on sexual orientation and family composition are lacking. In Italy, more than 90% of kindergarten and primary school teachers are female, and this gender also predominates in the other school types, albeit to a lesser extent (OECD, 2017; 2018).

Access to teacher training programmes in all three countries is only possible through access to higher education. In Germany for example you need a Master's degree, state examination or university part-time training as a lateral entrant to work as a teacher. This means that access to be a teacher isn't yet very inclusive because universities or university colleges of teacher education are strongly characterised by an "aura of exclusivity" (Alheit, 2014), so that access to this form of knowledge (re)production cannot be thought of independently of privileges and marginalisations (cf. Leonhardt, Schuppener, Goldbach, 2022 & Goldbach et al., 2022). Thus, teacher education is already affected by the fact that it only recognises certain habitual patterns and denies different groups of people access to the university system. Even though there are now opportunities for lateral entry into the profession, this too is tied to university training (exemplified by Leonhardt, 2020). In Germany, the issue of class affiliation is still very much reflected in educational success, which is well illustrated by the recurring PISA results, among other things. This means that access to the teaching profession requires successful passage through the school system (see Helsper 2018 & El-Mafaalani, 2020).

Regarding access to teacher education in Italy, for kindergarten, and elementary school teachers there is a qualifying master's program. For middle and high schools there are disciplinary master's programs that must be accompanied by qualifying courses that are subject to constant reforms (Mortari & Silva, 2020). In general, access to the profession is

difficult and, in many cases, expensive due to the high cost of teacher education courses. Students from low or middle socioeconomic and sociocultural backgrounds acquire fewer linguistic and logical-mathematical skills than their peers (INVALSI, 2022) and less affluent students choose high schools at the age of 14 that restrict their opportunities to pursue professional programmes of study (Benadusi & Giancola, 2021), resulting in a homogeneous teacher population.

In Ireland, while there has been significant investment in widening participation in higher education and some reduction in inequality, access to higher education remains highly stratified (Higher Education Authority, 2015:14). National policy has focused on increasing the number of higher education entrants from lower socioeconomic groups, first-time entrants, mature entrants, students with disabilities, part-time and flexible learners, continuing education degree holders, and Irish Travelers (HEA, 2015: 34). Inequality in education is reflected in inequity in access to high-status professions, such as law, teaching, and medicine (Keane & Heinz, 2016) resulting in a homogenous teacher population (Heinz & Keane, 2018) Ireland's National Plans for Equal Access to Higher Education (2015-2019 and 2022-2028) (Higher Education Authority 2015 and 2022) include a focus on diversifying initial teacher education as a key national strategic priority stimulating the development of projects nationally that focus specifically on broadening the diversity of teachers in Ireland.

The diversity (lack of diversity) of the teaching profession in all three countries described above highlights the possible disconnection between the habitus (predominantly 'middle-class' values, norms, and culture) of many teachers and the habitus of many students (working class, students with disabilities, students from different ethnic minorities for example).

The impact of teacher habitus on students

Example Case 3

"I grew up as a child in a position where I was gendered differently from what I felt. Myself and my teachers always asked the question: what do you want to be when you grow up and my answer was always, I want to be a boy. I want to be a guy. I want to be a police MAN. […] and teachers always told me, that's funny. What do you really want to be? And so, I kept saying, I want to be a boy. I want to be a guy. I want to be a man. But it became almost like a weird joke because that was the way they translated my words all the time and I still remember that meeting ending with me having no clear path of what I want to do and not really feeling

acknowledged. Even when I contacted those professionals, I went into that room laughing and joking and trying to use humour as a way of talking about my position because the only way I've learned to talk about it was with people laughing at me. And then when I went through transitioning and went into trans groups, I felt very alienated because I wasn't sure I was supposed to be there. I still had memories coming back to me of the teachers telling me that I was a joke. They didn't want to harm me. They just didn't really see that that was even possible. I don't think there was intent. It was not because they were cruel or were politically involved in anything. Their mind view was just this couldn't happen. So, it was just a joke."

Sebastian Nemeth – Expert and Researcher/adjunct

As Sebastian Nemeth's words make clear, norms associated with the teacher habitus can lead to discriminatory actions, which in turn have a strong influence on students' biographies. Helsper (2018: 118, Author's translation) also points out that the "conflation of habitus and teacher orientation" can contain a "potential for problems", for example, when teachers have little or no understanding of life situations or lifeworld's due to their own habitus. In turn, unconscious teacher behaviour develops from their own learned ideas, as can be seen in the previous example. In this regard, te Poel (2022) also shows that these habitual student images can be linked to recognition orientations. This means that recognition or lack of recognition towards pupils can arise from learnt beliefs. As described earlier, internalised norms and prejudices relate to habitus, which can have an influence on who we recognise and value.

Following this thought and knowing that habitus also guides action, a direct connection between the habitus of the teacher and the possible recognition behaviour towards the students becomes apparent. Accordingly, the development of a sense of belonging is strongly tied to teacher orientations or beliefs. Empathy can be a great challenge if there is no habitual ability to fit in with the students (ibid.), so that there is no access to their lifeworld. One's own prejudices and conceptions of norms can therefore have a great influence on the development of pedagogical relationships (cf. Chapter Pedagogical Relationships in this   book).

Teacher habitus has a major impact on students' orientations, their sense of belonging, of being valued, of being heard (Helsper, 2018; Thümmler, 2022). The question of who I expect to be successful or which student do I trust with which skills can therefore strongly influence students in their learning and in their educational biography. These habitual teacher orientations can thus contribute to the stabilisation and further development of educational trajectories or (re)produce (educational) inequalities.

The confrontation with your self – challenges of engaging with your own

teacher habitus

The influence of the teacher habitus is extensive and remains mostly unconscious. It is therefore very complex and difficult to break through these internalised norms. Looking at one's own status and confronting one's own privileges is often emotional and painful, especially since these are biographically rooted. Studies and biographical descriptions have shown that challenging one's own habitus is complex and can also lead to tensions (e.g., with one's own family environment or milieu of origin). Furthermore, self-reflection from one's own point of view will always be limited, as this is done from a restricted position influenced by one's own norms and prejudices. Certain perspectives on discrimination are thus denied through pure self-reflection. Perspective on the subject matter may also be limited because many teachers themselves have been successful in (and therefore value) established systems. They value the system, and the definitions of success, which has advantaged them. Self-reflection in the context of school cannot replace a 'pluraliaation of perspectives' as exemplified by Emcke (2019).

In addition, school is always subject to and characterised by powerful structures and cultures (cf. Leonhardt et al., i.p.). Breaking through this 'grammar of school' (cf. Feichter, 2020) as a teacher is associated with strong limitations, so that confronting one's own habitus and its effects can lead to feelings of powerlessness in challenging norms. Efforts to change habitual effects cannot be viewed in isolation from societal (norm) ideas and structures. For example, schools play a significant role "in ableist subject formation" (Buchner, 2022: 207, author's translation) in that students are "confronted with specific ability-related imperatives and norms and forced to relate to them." This makes it clear that even when teachers are highly motivated, socially produced "patterns of perception, thought, and action […] are not simply suspended" (ibid., 211, author's translation). Furthermore, such a reflexive examination requires time, which is too often not available in everyday pedagogical life since it can also only be considered as a process.

Developing empathy for students and their lifeworld can be challenging when mutual (learnt) beliefs do not match. In addition, it cannot be the goal to create a complete habitual fit between teachers and all students. Students are characterised by high diversity, and it seems impossible that all lifeworlds are reflected in one's own experiences and conceptions of norms (cf. Helsper, 2018). Rather, it should be about the formation of empathy that enables the development of relationships with students. In this regard, concrete strategies will be described in the following sections.

The teacher reflecting on their own habitus: a systemic task

Reflecting on your own teacher habitus requires the ability to stay in ambiguous and even contradictory situations without letting yourself be overwhelmed and turning mistakes, or critical episodes, into opportunities. Schön's (1987) well-known image of the teacher as a reflective operator is fundamental. Questions that you can ask yourself might include, for

example, what does it mean for me to be a teacher? How does my value system influence my educational practice? How can I be a good teacher and an agent of change for equity and social justice? Asking these questions is not an exercise in style, but an indispensable operation to illuminate teaching as a socially and politically strategic profession that promotes empowerment and conscious development in the people of today's and tomorrow's society (Biesta, 2017).

Dewey (1910; 1929) talks about reflexive action, which develops from a situation of cognitive unease, doubt, perplexity, hesitation, to evolve into an act of investigation and research that can overcome the initial uncertainty. Faced with the complexity present in a school classroom, each teacher has no choice but to abandon one's certainties and explore new possibilities for action. Reflection on your own habitus, on the cultural aspects of teaching, on the students' responses to the curriculum, on the school culture and its effect on the students, is essential to connote teaching in terms of inclusion and equity (Beck & Kosnik, 2001; Jaeger, 2013; Umutlu & Kim, 2020).

A starting point to work in this direction, beyond rhetoric, is collegiality (Khourey-Bowers et al., 2004; Shah, 2012): a person discovers more about themselves through dialogue with others, so it is desirable to imagine opportunities for dialogue between teachers to discuss issues that raise questions, ethical dilemmas, and may produce inequalities in students' everyday school life (Thomas et al., 1998). Examining experiences together, confronting one's own personal beliefs, and understanding how one's own values, ideas and stereotypes influence one's actions serves to become aware of one's habitus as a teacher.

There is an opportunity for shared reflection at the individual school level. By holding focus groups during the school year, teachers from the same school can confront each other on issues felt to be urgent and relevant, building a professional community capable of self-analysis and having a transformative potential on everyone's professional self, school culture and students' learning paths (Choi Fung Tam, 2013; Hadar & Brody, 2010). Of course, it is work that can never be considered finished, because no acquisition is valid forever and one must always be prepared to increase one's degree of equity as a professional community, as a school, and as individual teachers. All means All, but the word all can acquire different meanings every day, welcoming new uniqueness's that must be valued.

Serious and constant work on your own habitus as a teacher, therefore, serves to be open to diversity, to welcome it without homologating it, and to be an agent of change and equity.

Through a better awareness of teacher habitus, what is the potential to support inclusion in the classroom?

As outlined earlier in this chapter, the term 'habitus' refers to the dominant norms and practices of particular social classes or groups (Bourdieu and Passeron, 1977). In reference to Lange-Vester & Teiwes-Kügler (2014: 177, author's translation) we "understand habitus sensitivity as a kind of distinct feeling for the counterpart, as a key competence, and

prerequisite in the everyday pedagogical work of teachers, which comes very close to 'understanding' in Bourdieu's (1997) sense. What is meant is the ability and willingness to put oneself mentally in the social place that a student occupies. This chapter has explored the disconnection between the habitus (values, norms, and culture) of some students (for example, those working class students, students with disabilities, students from different ethnic minorities) and the predominantly 'middle-class' habitus of schools, universities, and elite institutions. In these spaces, some students can feel a "kind of habitus dislocation," a disconnection between their own background and culture and the habitus of educational institutions where they experience education as a 'struggle' with a keen sense of being different, of 'not fitting in' or 'not being good enough' (Lehmann, 2009: 638).

As educators there are a range of practical strategies that you can consciously adopt to address this 'habitus dislocation' and to support inclusion in the classroom (Zoletto, 2010).

- ## Awareness of one's own habitus

The most powerful tool is to have a better awareness of your own habitus, to empower and challenge yourself by considering your own social background, your own values, norms, and culture. Consider your own positionality, your own biases, privilege, and prejudice. Exploring these issues at times specifically structured for this purpose is a key dimension of each teacher's professional action, both as an individual and within the network of collegial relations. You are then better placed to recognise and address inequality (and privilege) in the classroom, school, as well as in broader societal systems and structures.

- ## How I understand 'difference'

Consider how 'difference' is positioned in society and mirrored in the education system. Historically 'difference' has long been associated with 'deficits.' Disability, for example, has been conceptualised as an inherently negative, pathologised, individual, and undesirable state of difference and deficit, assuming dependency and necessitating charity (Abberley ,1987; Braddock and Parish, 2001; Barnes, 1991; Cottini, 2017; Finkelstein, 1980; Oliver, 1990; Pavone, 2014; 2015). These conceptualisations and historical contexts continue to influence the lives of people with disabilities today, where to have a disability is to have 'something wrong with you' (Oliver, 1996: 30). The medical model of disability has relevance as it has been the dominant perspective in education, suggesting that the deficit lies within the child rather than in the education system. Thus, it is desirable to move to a biopsychosocial model that enhances the strengths of individuals and their abilities: the question is to imagine interventions not on the individual, but on life contexts so that they become capacitating and not limiting.

Similarly, in society the "negativity associated with the working class is ubiquitous" (Skeggs, 1997: 75). In Ireland, being 'working class is widely represented and stereotyped

as 'an underclass', associated with drugs, criminal gangs, crime, and welfare dependency (Finnegan, 2012). Also, in Germany classist advantages are very powerful in society (ct. Kemper & Weinbach, 2009) and in the pedagogic field (ct. El-Mafaalani, 2020). Thus, many teachers' "own middle-class affiliation […] conditions their preference for the education-motivated and upwardly mobile middle class-similarity is preferred and their own culture is reproduced" (Behrmann, 2013: 262 with reference to Lütkens, 1959; Bernstein, 1977; Schumacher,2002 & Birkelbach, 2011). In Italy, too, there is a very strong socio-cultural reproduction dynamic, with students from low or lower-middle status families achieving lower test results, dropping out of school, and not accessing higher and university education (Benadusi & Giancola, 2021; Giancola & Salmieri, 2020). These conceptualisations of social class underpinned by assumptions of deficit, difference, and inferiority, continue to influence the lives of working-class students in education today. Like the stigma associated with disability, there was and continues to be a strong belief that to be 'working-class' is negative, that to be working-class is an individual deficit and that it "is to get things wrong, to fail, to be lesser" (Fleming et al., 2017:155), a label that signifies "all that is dirty, dangerous and without value" (Skeggs, 1997: 74). Many of these themes, of difference, deficit, segregation, and individual failure, are common to the experiences of many marginalised groups.

As an educator, consider how the construction of social identities, and the assumption of homogeneity within these identities, has created common hierarchies of inferiority, and privilege, and positioned individuals within these hierarchies as polar opposites, the 'ideal' and 'normal' versus the 'undesirable' and 'abnormal', the 'able' versus the 'disabled', the 'working class' versus the 'middle class', with a clear distinction between those that are valued and those that are not. As an educator, you can champion change by challenging these deficit models, challenging the individualisation of difference, positioning difference as 'a problem,' and locating that problem within the individual. Consider instead how structures and systems produce and reproduce inequality in education and in society. Think how powerful the institution of school is (Leonhardt et al., i.p.; Pescarmona, 2012), the influence of institutional discrimination (Gomolla & Radtke,2009) and how this effects your own professional actions.

- **How 'difference' is constructed in my school**

Consider how difference is constructed (and operationalised) in your classroom or school. Negative assumptions around disability, sexuality, social class, and ethnicity for example, can be endemic among students and teachers. Consider carefully how children and young people negatively experience being 'different'. In Ireland, the sense of social class, for example, for students is pervasive and impactful and had a bearing on each individual's sense of self as well as on student experiences, trajectories, and outcomes across the education system (Fleming et al., 2017). Lynch and O'Riordan (1998) suggested that the

experience of working-class students in education in Ireland is one where working-class culture and background is positioned as inherently inferior in schools and that low expectations and the perception of being an 'outsider' in a dominant middle-class culture had a pervasive impact on students. In Ireland, there is evidence that teachers had lower academic expectations of students with disabilities even when this was not consistent with ability (Shevlin et al., 2002; O'Donnell, 2003; Rose and Shevlin, 2004; Rose et al., 2010). With reference to Dederich (2007), it is also clear that these low expectations can lead to what is called learned helplessness, as is particularly common among students with disabilities (see also Schuppener, 2021). Buchner (2022) also shows that differences are produced by ableist notions of norms and notions of ability. He shows the importance of dealing with one's own (school) biography and the 'work on the self'.

- ### The power of language

As part of a more inclusive classroom and practice, consider the power of language and how language can reinforce negative stereotypes. The language of disability for example can be highly medicalised with reference to 'chronic disease', 'illness', 'malfunction', 'malformation', 'disease' and 'conditions.' The language used to portray disability and the images used to represent disability continue to label and to portray people with disabilities as "…deficient, pitiable, wicked or malign, dangerous or valueless" (Hosking 2008: 14). Powerful professionals diagnose some students with learning difficulties, syndromes, issues, impairments, problems, and disorders. This is the negative language of disability that all students internalise and navigate in education and society. Social class operates just as powerfully on an individual and on a collective level as "class is deeply embedded in everyday interventions, in institutional processes, in struggles over identity, validity, self-worth and integrity" (Reay, 2005: 924). Reflect on the language that you use, and the language used in the classroom and the school. Consider how powerful and impactful language is and use inclusive language in all environments.

- ### Universal Design for Learning (UDL)

How you teach also matters! 'Universal Design for Learning' has been defined in US legislation as 'A scientifically valid framework for guiding educational practice that provides flexibility in the way information is provided, in the way students respond or demonstrate knowledge and skills, and in the way students are (Higher Education Opportunity Act, Sec. 103, Additional Definitions). In Ireland, there is a recognition that 'Providing a fully inclusive learning environment is complex and creating a culture of engagement and inclusion that works for all students requires a shift in thinking and a change of behaviour at an institutional level… Universal Design for Learning (UDL) provides an effective framework to improve the learning experience of all students within the mainstream teaching

environment' (AHEAD, 2017). Adopting UDL teaching practices in your classroom means challenging the status quo of the traditionally advantaged learner, recognising that students have different ways of experiencing the education system and learning (Cottini, 2019; Savia, 2016).

As an educator, think about your own practice and how you can respond in an innovative way to diversity in the student population. Think about redesigning your own educational practice with diversity in mind, to create an inclusive, accessible, and welcoming learning environment for all students. Think about multiple means of presenting materials, multiple means of action and representation and multiple means of engagement. If you do this, it will reduce the need for individual adaptation, while likely increasing the motivation of all learners. It also means critically considering the curriculum where many students do not see themselves reflected in the text or the images.

For many children and young people being different has a negative connotation and is often highly stigmatised (Banks et al., 2015; McCoy et al., 2016). Students suggest that inclusive teachers who provide support in an inclusive way are important and that students do not want to be singled out or to be treated or labelled as being different, which was seen to be implicitly negative (Squires et al., 2016; Barnes-Holmes et al., 2013). As an educator, consider how you can create a culture in your classroom, and in your school, where there are high expectations for all students and where diversity is celebrated, and all students are equally valued. Ultimately, a better awareness of teacher habitus can empower you to better understand your own habitus and to consciously act to improve your educational practice. As a teacher, you can be an agent of transformation and change consciously fostering a sense of belonging for everyone in your school community, supporting inclusion, transforming student opportunities, experiences, and outcomes.

Conclusions

Reflection on the teacher's habitus is crucial for individuals and schools that want to promote equity, inclusion, and social justice. It is about a production of empathy through reflection that allows for an openness to the other.

The generative grammar of all practices, as habitus is defined by Perrenoud (2001), should be the subject of a reflection that examines biographical experiences, their interpretations, and the implicit habitual orientations that accompany them. In summary, biographical work (Miethe, 2011) and habitus sensitivity work (Sander, 2014) is critical for the formation of a professional habitus, because it allows for the confrontation of "intuitive beliefs" (Helsper, 2018: 133, author's translation).

The issue is intimately connected with the reduced human capacity to form an adequate image of other people (Emcke, 2019).

Sensitivity to habitus can support the development of a good working alliance between teacher and student (Helsper, 2018), who get to know each other, recognise each other,

and establish an authentic educational relationship. The teacher is the one who has the professional responsibility to open a dialogue with all their students, ensuring no one is excluded (Mbembe, 2000; Burgio, 2022; Milani et al., 2021; Zoletto, 2010) and understanding that individual action can create opportunities for equity. Reflection on one's habitus is fundamental to being agents of change and having transformative potential in terms of inclusion and equity.

From the point of view of educational action in the classroom, the focus is on how to ensure that all students have what they need to learn. Mincu (2012) "inclusive pedagogy stands for a school in which differentiated empowerment should take place, but which does not produce differences." Thus "traditional performance orientations and related orientation patterns are challenged and adapted from the perspective of recognition theory and democracy" (Buchner, 2022: 210, author's translation), so that everyone has the same opportunities to learn and realise their aspirations.

Understanding habitus reflection as collegial work to bend school culture in a direction of inclusion and equity is the consequence of the reflections elaborated so far: teachers are nodes within a larger system, which has its own culture and rules of operation. Being agents of change means venturing into unexplored avenues not only in one's own classroom, but also and above all, in imagining alternative organisational modes that can foster effective inclusion of all diversities.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

1. How do I interpret my role as a teacher in a specific school as a space for co-construction of a community and the freedom to teach?
2. How can I better understand the lifeworld and meet the specific needs of my students?
3. Does the organisation of my school risk putting some students and families at a disadvantage, creating inequality? How?
4. As a teacher, how could I change the organisational structure of my school?

5. Through a better awareness of teacher habitus, what is the potential for me to support inclusion in the classroom and impact school culture?
6. Do I perceive myself as an agent of change for my students and my school? Why?

About the authors

Nico Leonhardt

Nico Leonhardt is research assistant at the Leipzig University (Institute of Special Education). His work and research focuses are inclusive school development and social space orientation, inclusion-sensitive higher education development, accessible language, participatory research and teaching.

Rose Ryan

Dr Rose Ryan is Director of Access at Maynooth University with responsibility for leading strategic change in relation to widening participation in higher education in Ireland. Dr Ryan leads the Maynooth University Access Programme (MAP) which works in partnership across the University and alongside under-represented learners, schools, and communities to increase equity of access and support student success.

Valerio Ferrero

Valerio Ferrero does research in the field of intercultural education, focusing on equity and inequality in schools. He is also interested in community philosophical practices, on which he also carries out training activities. Before starting his research work, he was a primary school teacher.

BECOMING AN INCLUSIVE TEACHER

Example Case

Mr. Malik recently joined a high school in an urban area with a diverse student population. Growing up as a first-generation college graduate from a low-income immigrant family, Mr. Malik vividly remembers the challenges he faced navigating an educational system that often didn't acknowledge or support his unique needs.

In his first week, he noticed several students in his classroom who reminded him of his younger self—students who seemed hesitant to speak up, struggled with a sense of belonging, or carried the weight of balancing school with family responsibilities. Among them was Aisha, who often stayed quiet in group discussions, and Mateo, who worked part-time after school to support his family.

Drawing from his own experiences, Mr. Malik shared parts of his journey with the class: how he learned to navigate structural barriers, overcome self-doubt, and embrace his identity as a strength rather than a barrier. His openness resonated deeply with students like Aisha, who later confided that hearing his story gave her hope that she could succeed despite her challenges.

To connect further, Mr. Malik implemented strategies that mirrored the support he wished he had received as a student. He created after-school mentorship hours to help students with study skills and applications for scholarships or internships. He also designed project-based learning assignments where students could share aspects of their cultural backgrounds,

struggles, and dreams, which gave Mateo an opportunity to reflect on his family's migration story and feel pride in his contributions.

By modeling resilience and providing a safe space for open conversations, Mr. Malik cultivated a classroom environment where students felt seen, heard, and empowered. Over time, he noticed a shift in his students: Aisha began participating more actively in discussions, and Mateo became a peer mentor for younger students. Many of his students later expressed that having a teacher who truly understood their challenges made them feel capable of overcoming barriers they had once thought insurmountable.

Initial questions

In this chapter you will find the answers to the following questions:

1. What do we mean by inclusive teaching and learning?
2. Why inclusive teaching and learning is important?
3. How can we put inclusive teaching and learning into practice?
4.

A teacher's perspective;

I realise that being a great teacher isn't just about subject knowledge or classroom management—it's about meeting the needs of all students, embracing their diversity, and creating an inclusive environment where every learner feels valued. So, what needs to change? How do I grow to become the kind of teacher who can serve and inspire every student I encounter?

For us, becoming an inclusive teacher entails the following…

Learn from students experience

Build positive relationships

Create safe learning spaces

Emotionally and culturally compentent

Be patient and flexible

Respectful interactions

Put your words into practice

Create a joy of life-long learning

Model good practice

Encourage the use of multiple sources of information

Actively listen

Guided learning to create critical thinker

Your journey to becoming an inclusive and diverse teacher

Authenticity and open mindedness

Innovate, don't imitate

Failure is okay, it is part of learning

Learn from mistakes

Actively commit to inclusivity, diversity and equality in education

Counter story-telling

Decolonisation

Telling our stories

Encouraging multi-cultralism

Attend conference and talks to fill gaps in knowledge

Engage community groups

Introduction to Topic

Teaching is a profoundly impactful profession, and teachers hold a unique position of influence in their schools and communities. However, as the example case demonstrates, teachers who share lived experiences with their students can build deep connections and serve as powerful role models. Yet, globally, teachers are disproportionately drawn from dominant social, racial, cultural, and linguistic groups. For instance, in the United States, 79% of public school teachers are white, compared to a student population that is only 53% white (National Center for Education Statistics, 2020). Similar trends are evident in Europe (OECD, 2020) and Australia (Santoro, 2013), highlighting the need for systems that better reflect the diversity of the communities they serve.

While programmes like Turn to Teaching in Ireland and Pathways2Teaching in the United States are instrumental in fostering a more diverse teaching workforce, they are only part of the solution. Pathways2Teaching introduces high school students from underrepresented backgrounds to teaching as a career path, while Turn to Teaching provides alternative pathways for disadvantaged or underrepresented individuals to enter the profession. Such initiatives are critical in diversifying the profession, however, we must also focus on empowering the existing teacher workforce to develop more inclusive and culturally responsive practices.

Even teachers who share some commonalities with their students' backgrounds may not fully grasp how their own position as educators comes with inherent privilege. As McIntosh (1989) reflects, "I have come to see white privilege as an invisible package of unearned assets which I can count on cashing in each day, but about which I was 'meant' to remain oblivious". (McIntosh, 1989, p. 74)

Acknowledging privilege requires recognising these invisible advantages and understanding how they shape one's experiences, perceptions, and teaching practices. Such reflection helps bridge the gap between teachers' and students' experiences, fostering empathy and inclusivity.

All teachers have the potential to be role models, not only teachers from diverse backgrounds. For us, being an inclusive teacher, no matter what your background, can make you a positive role model for your students and your school community. So, when we say All Means All!, in relation to inclusive teaching, we mean that ALL teachers need to become inclusive teachers, enriched by the diversity of the students and teachers they work with, and the communities they work in.

The following text will offer an insight into what we believe being an inclusive teacher is all about. We will do this by sharing some inspiring stories of teachers applying inclusive teaching and embracing diversity in their teaching practice and learning environments. These stories involve members of our group directly, or what we have learned about through our interactions with the people involved. We hope these stories will provide readers with

an understanding that, in becoming an inclusive teacher, you are embarking on a journey of discovery and transformation for you, your students and your school community.

Beginning the journey towards inclusive teaching

The authors of this chapter recommend reading Dr Lilian Nwanze's Anti-Racist Manifesto for Adult Education in Ireland, which appears in her PHD thesis Un-silencing the silenced: Using Black Migrant Women's experiences of racism to propose a critical anti-racist pedagogy for Irish Adult Education (2024). Dr Nwanze's manifesto connects with many of the topics explored in this chapter. Although the manifesto is aimed at adult educators, the All Means All authors of this chapter believe it is applicable to all teachers and educators. Dr Nwanze's manifesto can be accessed here:

Un-silencing the silenced: Using Black Migrant Women's experiences of racism to propose a critical anti-racist pedagogy for Irish Adult Education. – MURAL – Maynooth University Research Archive Library

Part 1 – Self Reflection: what you can do in any given situation

Acknowledge privilege and the impact it can have- a reflective beginning

Acknowledging privilege and understanding its impact is an essential step for any teacher committed to creating an inclusive and equitable learning environment. Checking privilege is a way for teachers and prospective teachers to begin to be more inclusive in their teaching, as it allows us to raise awareness of our own biases, acknowledge social inequalities and promote equitable educational practices. To begin with, it is necessary to learn about privilege and investigate its various forms, such as racial, gender, socio-economic, and educational privilege. This will give you an insight into the potential difficulties some of your students, your colleagues and the wider school community could be facing on a daily basis.

Privilege checking does require us to reflect our own social identities and recognise the advantages we possess due to factors such as race, gender, socioeconomic status, or ability (McIntosh, 1988). This self-reflection and awareness enables teachers to understand how their experiences may differ from those of their students and how their privilege can influence their teaching practices and interactions in the classroom. Acknowledging your own privilege can allow you to begin to put yourself in another person's shoes and increase the level of empathy you can work with in your career.

In this section we will focus on two stories that show the way different teachers have increased inclusivity, diversity, and equality in their teaching practice, their students and

their classrooms. These stories are brief examples of how small actions can have huge impacts.

Story 1 – The power of apology

We sometimes have expectations of young people in education; they may need to behave and act a certain way even when it may not suit their character or personality. We as educators may at times act in contradiction to these expectations, and this can be damaging to students' learning and unravel any positive relationships that we have built with them. The following story relates to a school in Inner City Dublin, which is part of the DEIS (Delivering Equality of Opportunity in Schools) programme. DEIS is aimed at addressing the educational needs of students in communities that are characterised by poverty. It provides additional resources to promote student engagement, and academic achievement, in communities at risk of disadvantage and social exclusion (source). In these contexts, socio-economic issues and generational trauma related to education can have a significant impact on students, shaping the challenges they face and the support they require.

In this situation I was responsible for a poor reaction to behaviours that I normally dealt with in a consistent and controlled manner. This experience involves my interaction with a student I knew well. I had not slept the night before due to one of my children being sick and upon arriving at school I encountered the student in my class who was clearly distressed and was disrupting the class. I was aware that they had very little support at home and they had been working with professional support services to help with anger management issues. However, maybe due to my tiredness, my reaction to the situation was one of annoyance.

I was refusing to take any of the student's perspectives on board. It was a poor way to react to a vulnerable young person, but I could not see past my tiredness and irritation. After our interaction, the student went to their next class and I learned that they had another bad experience, possibly due of our earlier interaction. Hearing about this I went to find the student, but I was informed that they had left the school early and gone home.

The following morning, I waited for the student and the first thing I asked for was a chat with them. I immediately apologised to the student for how I had behaved. I did not offer any excuse for my behaviour, I simply apologised. I told the student I would explain the background behind my reaction if they wished, whilst explaining it was not an excuse for my behaviour. The student wanted to know and so I explained about my tiredness and we finished our conversation. I did not ask for or expect any apology in return.

Our relationship in class was back to normal and it began to improve, and nothing was said

about the interaction again. That was until the student graduated from school, when they brought the incident up and talked about the impact that it had. The student explained that it was the first time ever that an adult had taken responsibility and apologised to them. The student shared with me that they had always been blamed for any negative interactions that went poorly between them and any adults. This student explained that it was shocking, but good, to see adults taking responsibility for a mistake, whilst having the power to learn from the mistake and resolve the issues. It gave this student an insight and understanding of their own behaviours. This student realised it was okay to make a mistake, once you accept it, face it and learn from it.

What can be learned?

Safe space for learning: The teacher in this situation gave the student an insight into their life and the effect that personal experiences can have on their interactions with others. The teacher acknowledges their poor behaviour and the need to make amends, thus showing the student that learning from mistakes can have a real benefit in building positive relationships. Taking responsibility for the behaviour created a safe space for learning where an adult had shown that failure, or poor decisions, can be used in a constructive way.

Emotionally competent: The teacher showed an understanding of their own behaviour and the effect it can have on others. This situation allowed the teacher to explain to the student that they understood the impact that they can have and how making mistakes is part of education. The acceptance of responsibility allowed this student to understand and experience empathy from a person in power.

Story 2 – A Language Exchange

An Italian teacher was trying to teach immigrant students her native language. The students were learning Italian in an effort to improve their ability in school. However, the learning was taking much longer than the teacher expected and she had tried several different tactics and teaching tools, but none had worked. The teacher came up with the idea that she would learn alongside her students. So, while the students were learning Italian the teacher would learn the students native language too. An exchange of learning was agreed upon between the teacher and the students. This shift in the relationships between the teacher and the students (the teacher was now also a student and the students were now also teachers) had

a dramatic impact on the learning environment and the relationships. So much so that the students began to learn Italian at a much quicker rate than the teacher expected. This created an equity in the educational transaction, a shared ownership that fostered a positive relationship, ultimately creating a safe space for these students.

What can be learned:

Building positive relationships: A positive relationship was built between the teacher and students as she shared the learning journey with them. Her involvement in the process changed from being a teacher to that of being a student as well. In this instance the teacher was sharing the difficult experiences of the students learning a new language. This ability to empathise and immerse herself with her students created a safe space for all to learn.

Challenging Dominant Norms: Instead of framing the students as linguistically deficient for not knowing the dominant language, the teacher treated all languages as equally valuable. This shift disrupted the traditional power dynamics in the classroom and highlighted the potential for a multilingual, inclusive approach. The teacher's strategy reframed the students as competent and knowledgeable, emphasising the value of their languages and cultural backgrounds rather than positioning them as lacking.

Models good practice: The teacher showed a willingness to learn something new alongside her students. There was no requirement or expectation for her to do this, but by engaging in learning something new, she modelled the good practice that she wanted to see from the students themselves.

Emotionally and culturally competent: This teacher has shown a willingness to learn from another culture. The ability to speak the same language as the students from a different ethnicity can support the learning journey. It demonstrates an openness and willingness to take into account the students' experience, which in turn can increase the engagement of these students in education and make the learning environment an inclusive space.

Cultivating a joy of life-long learning

Developing a life-long approach to learning can have dramatic effects for teachers and students alike. Lifelong learning is a vital tool to be used for personal development and self-fulfilment. Through engaging in this, teachers can enrich the lives of the wider school community as they continue to adapt to changing circumstances, acquire new competencies, and maintain a sense of intellectual and personal growth (Jarvis, 2007).

Who Am I?

The role of personal and critical reflection is increasing in importance across education, as it provides practitioners with an opportunity for continuous improvement in their craft. By

engaging in reflection, we allow ourselves to keep abreast of the current intellectual, social, emotional, and physical environments our students operate in.

We would encourage all members of the school community to engage in deep self-reflection to identify their own privileges, and what privileges (or lack thereof) have helped you get to where you are today. Reflecting on these factors helps you to understand how they may have influenced your own experiences, opportunities and assumptions of the world around you, whilst also enhancing the level of empathy you can use towards your students in class. The use of your personal understanding of privilege can lead to the development of authentic and safe spaces for students, colleagues and parents/guardians to continue their journey through education.

Recognising and leveraging the funds of knowledge that students bring into the classroom can empower learners and foster truly inclusive educational practices.

Part 2 – Inter-relational: Engaging + Being emotionally + Culturally competent

The Israeli context[1]

Palestinians in Israel are a national ethnic group and an indigenous minority, totaling 20% of the population; of these, 85% are Muslims, 6% Druze, and 7.5% Christians (Israel's Central Bureau of Statistics, 2017). Indigenous minority (Palestinian minority in our case) refers to the remaining minority of a group that resides in its own homeland, considers themselves distinct from other sectors, and develops and transmits their ethnic identity and cultural heritage to the next generation (Jamal, 2005, 2011). This Palestinian minority aims to retain its unique characteristics while becoming integrated within the majority culture.

In the Palestinian society in Israel, there is an excess of teachers, while in the Jewish society, there is a shortage of teachers. Therefore, some of the Palestinian teachers choose to teach in secular Jewish public schools (Jayusi & Bekeman, 2019a, 2019b). Teaching in such diverse cultural contexts presents complexities, as it involves navigating themes such as cultural competence, teacher identity, and the challenges faced by educators in multicultural environments (Gutman et al., 2023). The Palestinian teachers have positive relationships with students, parents, and colleagues. They believe that their work helps reduce prejudice and increases mutual understanding among the groups in conflict through successful acculturation, despite some difficulties (Jayusi & Bekerman, 2019a, 2019b).

---

1. This chapter was created during the summer of 2023, over a year before the outbreak of the conflict initiated by the October 7th attack on Israel and the subsequent war. Readers are encouraged to consider that the content reflects perspectives, discussions, and priorities prior to the event. Hence, interpretations or references to the region or related topics are not shaped by the developments and global reactions that followed.

They see in their work the potential to be effective agents of social change by helping their students (parents and colleagues) combat racism and prejudice.

Furthermore, Palestinian teachers promote and sustain direct and indirect contact with the parents, which results in a generalising effect, reducing prejudice and changing attitudes even when the contact is indirect (Asbrock et al., 2014). Although lacking in intercultural training, the teachers seem to recognise that reducing prejudice implies working on the social-cognitive development of their students through the promotion of sustained contact (Allport, 1954), offering anti-bias information (Bigler & Liben, 2006), empowering students to construct new knowledge (Peucker & Reiter, 2008), and widening the socio-psychological repertoire (Bar-Tal, 2013).

Story 3 – A Remembrance Day with Two Meanings

This story focuses on Palestinian Israeli teachers' involvement in the celebration of Israel's Independence Day. For Arab teachers, this day holds a different meaning, as it marks the Nakba catastrophe, a time of remembrance for the expulsion and loss suffered by Palestinians in 1948. This day of remembrance is one of sorrow and loss and is a discomforting experience for the Arab teachers. Conversely, for Israeli students and colleagues, the day represents one of celebration. Despite this, all teachers, driven by inclusivity and respect, participate in this day despite their personal pain. Their ability to adapt, show compassion and patience, and remain flexible allows them to accommodate their students' needs, even if it requires participating in activities that may contradict their own narratives.

"It is too hard for me on Independence Day. I used to stand with them, but it was very hard. I cried several times and other teachers hugged me. I explained to them that it hurts me to stand because I think about my people who were killed… I don't mention the word "Nakba" but I don't see how I can stand in a good way on this day. I'm not disparaging it, but it is hard."

What can be learned:

1. Building positive relationships: The teacher empathises with her student's and colleagues' feelings. She recognises the student's personal connection to the day and

the teacher creates a safe and supportive environment, showing respect and a willingness, above all else, to continue to build positive student-teacher relationships.

2. Authentic and open-minded: Although faced with such a challenging situation every year the teacher remains true to herself and yet still open-minded to appreciate the significance of the experience for her students in terms of their needs and well-being. This demonstrates the teacher's commitment to supporting the student's emotional well-being and understanding their unique circumstances.

3. Respectful approach: Despite the teacher's personal difficulties and discomfort, she participated in the event. This respectful approach highlights the teacher's ability to empathise with others' experiences while still acknowledging their own emotions and perspectives. Palestinian teachers respect, and embrace, their Jewish students and colleagues, fostering a sense of belonging within the school. This is especially evident when the principal and Jewish teachers show respect and inclusivity towards the Palestinian teachers throughout the year. If the school administration were not inclusive, Palestinian teachers would not feel comfortable and might even seek to leave. In other words, a supportive and inclusive school environment strengthens the sense of belonging for minority teachers. As a result, they are more willing to respect and embrace their students and fellow teachers.

Story 4 – Not the Right Doctor

This story highlights the positive impact the teachers from diverse backgrounds can have on their students and the wider community. It shows how diversity can play a pivotal role in reducing prejudices and stereotypes against culturally diverse societies, particularly in the Palestinian culture.

Before encountering his Arab teacher, a Jewish student admitted being indifferent to the plight of Arabs in Israel. He recounted a time when he fell ill, and his mother took him to the hospital where an Arab doctor attended to him. His mother expressed discomfort and insisted on a Jewish doctor, showing a discriminatory attitude toward the Arab doctor. Although the student did not react to this when it occurred, he informed the teacher that after reflecting on the incident, the student expressed his anger towards his mother's behaviour and regretted his own complicity in allowing racism to prevail. He revealed that, thanks to his Arab teacher, he realised a valuable lesson in that we must embrace equality and treat people fairly, regardless of their ethnicity. He now advocates for respect towards Arabs and acknowledges the importance of treating everyone with dignity.

What can be learned:

1. The power of personal experiences: Building a relationship with the Palestinian teacher had a profound impact on the Jewish student. It challenged his preconceived notions and opened his eyes to the reality of discrimination and inequality. This highlights the importance of personal experiences in shaping our perspectives and beliefs.

2. The impact of diverse education: The Palestinian teacher played a crucial role in the student's transformation. Through education and dialogue, the teacher helped the student understand the importance of equality and treating all people with dignity and fairness. This underscores the power of education in fostering empathy, understanding, and breaking down stereotypes.

3. Advocacy for respect and equality: The student's transformation led him to become an advocate for respect towards others and a proponent of equal treatment for all individuals, regardless of their ethnicity. This highlights the potential for personal growth and the positive impact individuals can have when they actively work towards creating a more inclusive and just society.

Story 5 – My students and I

This story centres on a Palestinian teacher who taught a diverse class of Jewish students, comprising individuals from various groups of the Jewish society. Within the classroom it was clear to the teacher that the students themselves, although of the same ethnicity, still held prejudices and stereotypical beliefs about each other because of their different backgrounds.

"[…] my presence in the Jewish school makes a difference. My students learned that it is important to know about the "other", not to judge, [but rather] to accept the "other.." […] I send a message to the students that the fact that the other is different doesn't make him or her worth less."

This teacher shared that through her guidance, inclusive teaching methods, and diverse classroom discussions, the students gradually learned to appreciate and respect one another's differences – whether they were Russian, Ethiopian, Eastern, or Arab. She implemented interactive activities, such as group discussions on identity and cultural backgrounds, storytelling exercises where students shared their personal histories, and role-playing activities to challenge biases. Creating a safe and respectful learning environment

empowered students to ask questions, engage in open dialogue, and develop a more empathetic and nuanced understanding of their peers.

Through these experiences, the teacher was able to enhance her students' awareness, compassion, and ability to see beyond stereotypes, fostering not only respect within the classroom but also a broader sense of inclusivity within their wider community and society.

What can be learned:

1. The significance of representation and diversity in educational settings: When students have the opportunity to interact with individuals from different backgrounds, it broadens their perspectives, promotes understanding, and challenges stereotypes.
2. The value of knowledge and understanding: The teacher emphasises the importance of knowing about the "other" and not judging them. Education and awareness play a crucial role in fostering empathy and acceptance. By learning about different cultures, religions, and perspectives, students can develop a more nuanced understanding of the world and appreciate the diversity that exists.
3. Embracing and accepting differences: The story emphasises the need to accept the "other" despite their differences. It encourages students to recognise that the worth of an individual is not determined by their differences but by their inherent value as a human being. This promotes inclusivity, tolerance, and respect for diversity.
4. Challenging prejudice and discrimination: By sending a message to the students that the fact that someone is different does not make them worth less, the quote addresses and challenges prejudice and discrimination. It encourages students to question their biases and preconceived notions, promoting an environment of equality and fairness.
5. The impact of individual actions: The speaker's presence and their message to the students indicate the potential impact of individual actions. By modelling acceptance and respect, they are able to influence and shape the attitudes and behaviours of the students. This underscores the power of individuals to make a positive difference in their communities and foster a more inclusive society.

In conclusion, being a diverse teacher goes beyond the mere transmission of knowledge. It fosters understanding, empathy, and building shared humanity. Diverse teachers create a positive change, inspiring their students to embrace diversity, stand against prejudice, and have respect for all people.

Part 3 – Societal Relations: To actively commit to inclusivity, diversity and equality in education

What does decolonising mean?

Broadly speaking, decolonising the curriculum explores the ongoing impact of legacies of colonialism and imperialism on perceived knowledge, learning and society. It seeks to recognise and challenge this legacy in re-balancing dominant Eurocentric processes within curricula by including and integrating a much wider range of perspectives. Rather than seeking a neat definition of this, it is more instructive to see decolonising the curriculum as an approach and as an ongoing journey. In fact, what is often referred to as decolonising the curriculum simply amounts to diversifying the curriculum, as, realistically, a process of decolonising the curriculum would require a momentous overhaul of the system of education rather than modifications to course content (Tuck & Yang, 2012; Bhanot, 2015)

While the ethical and moral rationale for diversifying our curriculum is self-evident, there are practical benefits for taking this undertaking on, for example:

- Highly diverse student cohorts often do not see themselves reflected in mainstream teaching methods and content, which are predominantly shaped by white, middle-class perspectives. This misalignment challenges the principles of authentic student-centred pedagogy, which should acknowledge and incorporate the lived experiences of all students.
- Rich opportunities to co-create knowledge production from the Global South and non-Western sources.
- Both staff and students are enabled to deeply reflect on their own positionality and privilege in social, economic and political contexts.
- Decolonising work is a necessary extension of inclusivity in its shared aim for all students to experience positive well-being and belonging (Tran, 2021).

Potted history timeline

The concept emerged from the Rhodes Must Fall campaign in 2015 where students in Cape Town, South Africa, demanded the removal of a statue of Cecil Rhodes, the imperialist, racist business magnate, from their campus. Their battle cry, #RhodesMustFall, sparked an international movement calling for the decolonisation of universities all over the world. Following similar calls by students in Cape Town, students at Oxford University called for a statue of Cecil Rhodes to be removed. This was not simply about tearing down an outward symbol of British imperialism – a monument glorifying a colonial conqueror – but highlighted the need to confront the toxic inheritance of the past and challenge the continued underrepresentation of Black and Global Majority people at universities. This went to the very heart of the pernicious influence of colonialism in education today.

Why do we need to do this work?

The curriculum provides a way of identifying the knowledge we value, and structures the ways in which we are taught to think and talk about the world. By amplifying the voices of those currently underrepresented in the curriculum, for instance from Black and Global Majority, LGBTQ+, disabled, Gypsy, Roma and Traveller groups, this is just one mechanism that can go some way to creating a safe learning environment and generate lasting impactful change. Similarly, critical race theorists adopt counter-storytelling as a way to speak back to dominant and mainstream narratives in its reframing and rearticulating the experiences of minority groups. There is no universal template to decolonising, but it is helpful to consider this in stages. One starting point is diversifying reading lists to ensure the inclusion of a wide range of voices. Below, is one example of how a primary school in North East London began their journey into decolonising through this route.

Story 6 – Counter-stories in action

The power of authentic representation

I was working with a headteacher on a project on the use of comics and graphic novels as a tool to develop racial literacies. Her initial concerns were centred around how her positioning as a white, British woman in a leadership role, would bear on her participation in the work of decolonising and diversifying. She quickly came to realise that it was actually the work of everyone to be inclusive and diverse, regardless of background or position. Her main aim was to address the lack of relevant materials to engage the pupils. We worked together on creating a book box for 9-10 year olds that drew on as wide a range of perspectives as possible and which reflected her student population. We sought titles that are not typically found in school curricula and which would, hopefully, connect with the readers. The school librarian disseminated the book box to some of the teachers to implement in their lesson plans. I can honestly say that it had a significant impact. A few days later a 10 year old Sikh boy knocked on the headteacher's door with a graphic novel in his hand – Fauja Singh Keeps Going. This book was based on the true story of a 100 year old Sikh man who broke world records to become the oldest man to run the British marathon. The boy said: "Miss, I just wanted to say thank you so much for this book. I've never seen myself in a book – ever". He was visibly emotional, which in turn, made both of us emotional! It was such a heartfelt moment of gratitude that said so much about the power of authentic representation, and

how this approach, when undertaken with thought and consideration, rather than a form of 'cancel culture' can enrich the learning for both staff and students. It highlightly how an educator really can make a difference – and it is up to you what difference you want to make.

From recognition to action

I guest lectured on an undergraduate module called Decolonising Politics for a colleague. The month that I delivered the module happened to coincide with South Asian Heritage Month which takes place every year across Britain from mid-July to mid-August. In the session, I spoke about racial capitalism and how capitalism and colonialism are historically intertwined with the theft by colonial powers funding the emergence of capitalist enterprises in Europe. Slavery, in this context presented as an economic category, became racialised over time and is a well-known aspect of global history (even if not taught correctly), I added a section on Indian indenture in the Caribbean: a lesser-known and an even lesser-taught underrepresented aspect of British and South Asian history. After the lecture, a small group of students questioned me about the system and operationalisation of indenture, following the Slavery Abolition Act of 1833, and how the British Empire recruited workers from India (as a cheap source of labour), for their sugar plantations in the Caribbean. I went on to underscore how the descendants of Indian indenture embarked on another wave of labour migration, in the form of the 1949–71 Windrush migrations to the United Kingdom. The Windrush generation had a high number of Indo-Caribbean and Chinese-Caribbean migrants that made this journey, but their stories rarely get told in the wider Windrush narrative. The 'minority within a minority' as they are described by scholars, consequently occupy a marginal positionality.

This session resonated deeply with one of the students who had distant Indo-Caribbean heritage, as she reflected about her own positioning and disidentification as part of her identity particularly as these experiences were not discussed amongst her family or relatives. She also spoke about how her racialised identity negated, if not disallowed, any notion of Indianness simply because of how she was perceived. Following this session and our conversation, she embarked on a project with her two peers to learn more about this part of British, Indian and Caribbean history and developed a proposal to host a small community event in South London as part of a wider museums' engagement project. The group identified and invited people of Indo-Caribbean heritage to a roundtable to share their memories, stories and family histories with the goal being to support and recognise the legacies of the Windrush generation and specifically how the Indo-Caribbean community continued to struggle to find a place in the Windrush story which is so often overlooked. The roundtable event was a considerable undertaking by students who took it upon themselves

to embark on a 'decolonial activity' in an attempt to provide a corrective to this oft-ignored part of our migration and social history.

These two examples speak to so many factors in our opening diagram, but in particular they emphasise the power of counter-story telling, and the practice of diversifying colonial narratives that can connect and inspire our students who often feel no real connection to course content. Opportunities to integrate and embed counter-stories that diversify curriculums are available to all educators and can be incorporated into learning environments. By doing so, educators can ensure that they are embracing processes of guided learning to create critical thinking and widen opportunities for learning.

The stories remind us that….

Unpacking privilege and challenging systemic inequalities can be uncomfortable and challenging at first. It can be a difficult process to engage with initially, but in doing so, can create numerous opportunities to create inclusive and diverse education. Embrace feedback and guidance using your own reflective tasks, colleagues, mentors, students, and all other stakeholders in your school community.

Your vibrant and active school community offers an excellent opportunity to learn, ask questions and actively listen. Actively seek out and listen to the experiences and perspectives of individuals from all communities that are represented, or linked to your school or community. Attend workshops, conferences, or events that promote dialogue and understanding around privilege and social justice, or failing this, invite speakers to come to your school to speak to staff, students, and parents/guardians. In a safe space, engage in conversations with colleagues, students, and community members who have different backgrounds and life experiences. Or even act as an instrument of change and work with your students to create an event that explores topics such as as decolonisation or counter-stories. Working with your students, and giving them the autonomy to represent themselves and perspectives that have value and meaning, will create a space of inspiration and empowerment in your school.

In Conclusion

Our message to initial teacher trainees is that anyone can be an inclusive and diverse teacher and, in fact, every teacher needs to be inclusive and embrace diversity in their teaching practice.

Sometimes when a new teacher joins the school, and is different from the majority, there may be a perception that this new teacher will oversee the diversity work in the school. As we have heard from Wurud's story (story no.5), teachers who have a different life or different lived experience from the majority of students or school staff, can have a transformative impact on peoples' understanding and perspective of the world they know. However, it is not only the responsibility of diverse teachers to be inclusive and embrace diversity in their teaching (to ensure all students feel respected and valued), every teacher must adopt strategies and approaches to ensure they are being an inclusive and diverse teacher. Just like in Kavyta's example (story no.6), the school principal can change the reading lists to ensure students lived experience and culture was reflected in the school's curriculum.

For educators, such examples make teaching an exciting and an inspiring career move. In trying to become an inclusive and diverse teacher, you are embarking on a journey of continuous discovery and transformation for everyone connected to you and your school. Therefore, when we say All Means All in relation to inclusive and diverse teaching, we mean that all teachers need to become inclusive teachers, and be enriched by the diversity of students and teachers they work with.

As a final thought, consider the timeless wisdom of a phrase often attributed to Plutarch:
"The mind is not a vessel that needs filling, but wood that needs igniting."

While the exact authorship of this quote is debated[2], the message is universal and deeply relevant to inclusive teaching. Education is not about simply transferring information but about sparking curiosity, critical thinking, and a passion for lifelong learning. By embracing inclusivity and diversity, teachers can light the fire within each student, encouraging them to realise their potential and make meaningful contributions to their communities.

Local contexts

Closing questions to discuss or tasks

- How can we ensure that all students can be heard and encouraged to participate?
- What is the importance of incorporating global perspectives into inclusive teaching?
- Think about strategies to involve students actively in decision-making processes and inclusive practices.
- Consider a specific challenge in your own teaching or educational context. What inclusive strategies from this chapter could you adapt to address it?
-

About the authors

Wurud Jayusi

Dr. Wurud Jayusi is a senior lecturer, researcher, and the head of the Arab Academic Institute at Beit Berl College. Being a member of the Palestinian minority in Israel, Wurud Jayusi is passionate about fostering greater understanding and acceptance among diverse cultural groups. Through Wuruds research and academic work, wurud has published articles, presented at conferences, and co-edited two books on diversity, including topics such as integrating Palestinian teachers into Jewish schools, peace education, and creating a shared society.

Wurud strongly believes in the power of diversity in teaching. A diverse teacher embodies various facets, such as being an ethnic minority educator in a predominantly different cultural setting in my case, or simply a teacher with cultural competence who fosters multiculturalism, equality, and respect for others who are different from them.

As a researcher Wurud has had the privilege of interviewing Palestinian teachers as part

of the research on their integration into Jewish schools. Their stories are both enlightening and inspiring. The stories reflect Engaging, Being emotionally and culturally competent.

Declan Markey

Declan Markey works on a programme called Turn to Teaching, which provides an alternative pathway to becoming a teacher for students who have experienced educational disadvantage or are from communities who are under-represented in the teaching profession in Ireland. Turn to Teaching's objective is to diversify the teaching profession and support teachers and schools in becoming more inclusive teaching and learning environments. Through his work he constantly encounters the impact and legacy that teachers have on their students – be that teachers who inspire students to break-through societies preconceptions or judgements and reach their full potential or those teachers that uphold these prejudices and stereotypical beliefs, which then impact negatively on their students. All teachers have the opportunity and, it could be said, the responsibility to ensure that they become the former – the teacher that can inspire.

Kavyta Raghunandan

Kavyta is a course leader for the MA in Race, Education and Decolonial Thought and Senior Lecturer in Race and Education at Leeds Beckett University. Her teaching cuts across undergraduate and postgraduate levels and she teaches on Education Studies degrees, as well as contributing to undergraduate, masters, and doctoral degree supervision. Her teaching, writing and research interests lie in intersectional ways of thinking through race, gender and identity across multiple platforms namely education, popular culture, graphic novels and more recently nature spaces. Her work, so far, has also been influenced by anti-racist pedagogies and decoloniality as a theoretical framework to examine South Asian representation.

Graham Maher

Graham Maher is a teacher in a secondary school in Dublin, Ireland. He has been working in secondary schools around Dublin, ranging from private schools to DEIS (Delivering Equality of Opportunity in Schools) band 1. The reason he became involved in All Means All is to increase the diversity of teaching in Ireland. Graham is a white, middle class, highly educated, Irish national; and this is mirrored across most of the education sector in Ireland. The representation of diverse teachers must increase to better reflect the multi-cultural development of Ireland. This increase of diversity, he believes, will increase the inclusivity, diversity, and equality in Irish education.

TEACHER AGENCY AND INCLUSION

- What is teacher agency?
- Why does teacher agency matter for inclusion?
- What are the elements of teacher agency?
- How can teacher agency be supported in a professional context?
- How can teacher agency be achieved?

Introduction to Topic

With continuous social changes and increased globalization, the education system is experiencing pressure to adapt and prepare children and students to face related challenges. Teachers around the world are called upon to drive this transformation, and become? "agents of change". Yet to study the concept effectively, it is crucial to clarify the objectives and scope of this change (Pantić, 2015; Pantić & Florian, 2015). Furthermore, there is a need for a better understanding of what this role involves and thus, what *teacher agency* means.

In this chapter, teachers are seen as crucial actors capable of making significant strides towards *inclusion* and *social justice* (Pantić & Florian, 2015). Recalling the legacy of the *Education for All* Movement (UNESCO, 1990; 2005), the *Salamanca Declaration*(UNESCO, 1994), the *SDG4-Education 2030* and the *Incheon Declaration* agreed at the World Forum on Education in May 2015 (UNESCO, 2015) that *inclusion* and *equity* should be considered the essential foundation for quality education (Ainscow, 2020). Within this framework every learner matters and therefore it is necessary to recognise the disparities and barriers that some learners may encounter in the access to a good quality education, enhancing their possibilities of learning and participation (*ibidem*). *Equity*refers to the principle of *fairness* that every educational system should encompass, developing strategies and plans for promoting lifelong opportunities for all (UNESCO, 2015; Ainscow, 2020), and going beyond merely achieving high measurable standardised performance (Seitz et al., 2023). Accordingly, adopting a *social justice* approach means ensuring everyone has the conditions necessary to develop their *capabilities* and participate as equal citizens within society (Nussbaum, 2006). Policies should therefore aim to create environments that support the growth of each person's capabilities and promote inclusivity, reflecting a commitment to participatory justice and equal citizenship.

In some countries inclusive education is generally associated with integrating children with disability into general school settings, however, a more broader perspective of inclusion is adopted here. Conceptual difficulties exist when defining inclusive education, particularly since the meaning is often highly contextual. Ainscow and Booth (2002) describe inclusive education as the process of increasing participation and decreasing exclusion. On this basis, it is important that teachers learn how to recognise exclusion and actively intervene – in other words, being agentic – in order to "mitigate the external causes of educational inequality" (Pantić & Florian, 2015, p. 334). Hence teachers themselves cannot remove structural inequalities, but instead, through their awareness, act by preventing their reinforcement? High quality teacher training that develops "reflective practitioners" (Schön, 1993) who can recognise and implement inclusive practice that values participation, can thus help every learner to foster his/her potential (Seitz, 2024).

For this reason, we will explore, in this chapter, the individual and contextual factors relating to teacher agency, and specifically adopt an ecological perspective. Initially we

must define teacher agency (Section 1), and why teacher agency matters for inclusion (Section 2). We the describe elements of teacher agency using a case study example from the research experience of one of the authors (Section 3). In paragraph 4, we describe how professional development can support teacher agency, and finally, in Section 5, we provide a more practice-oriented section in attempting to explain how teachers can achieve their agency.

Key aspects

What is teacher agency?

 Teacher agency can be a challenging concept to define and may be interpreted differently in various contexts. For instance, agency might refer to a company, or in some countries, a supply teacher. A common understanding, especially amongst sociologists, is that agency is an innate human capacity or capability (Giddens, 1984; Bandura, 2001; Bandura, 2006; Barker & Jane, 2005; Emirbayer & Mische, 1998): something which the individual either possesses or not. A potential difficulty with these approaches is that agency is viewed as individual responsibility. This may disregard social or organisational pressures that an individual has little control over.

Recently, there has been a move towards a more ecological approach to agency (Priestley et al., 2015; Li & Ruppar, 2020). This perspective views agency as the capacity of teachers to make choices and take purposeful action in their professional contexts. It emphasises that agency is not a fixed trait or a personal attribute, but instead is situational, emerging from the interplay between individuals and their environments (Priestley et al. 2015). One reason why teacher agency can be hard to define is that it is not always visible. For example, when a teacher decides to teach about Ancient Egypt, this choice may be a result of their intention to relate to their students' backgrounds and needs, or it may be a result of working within a restrictive method that prescribes this topic. Therefore, what we see the teacher do might be a result of teacher agency, but it is not the agency itself. In other words, the process behind how teachers make these decisions is often not apparent.

Teacher agency refers to "action with intentionality, the capacity to formulate possibilities for action, active consideration of such possibilities and exercise of choice" (Priestley 2016, p. 23). Rather than focusing on whether a teacher has or doesn't have agency, the focus is on "how teachers may achieve agency in their everyday settings and what might help or hinder in this" (ibidem, p.14). This perspective places teacher agency as something emergent, something achieved by individuals in their present contexts (Emirbayer & Mische, 1988). In other words, teacher agency is not only the capacity for an individual to act, but also the interplay of the environment the individual is in, their background, knowledge and experiences, the resources and relationships, and aspirations for their future self and their learners (Priestley, 2016).

Why does teacher agency matter for inclusion?

The social justice agenda of inclusive education is a response to the segregation of children based on their ability and disability. The *Salamanca Statement and Framework for Action on Special Needs Education* (UNESCO, 1994) were among the key developments which shifted the focus from special education to inclusive education in terms of the education of children with disabilities. Today, the concept of inclusive education has expanded to incorporate all forms of marginalisation.

The work of inclusion (in a school) may be classified as access, participation, engagement and achievement of all students where process, roles and structures are developed towards the intention of inclusion. Within this agenda, teachers are called upon to highlight the process of inclusion and are often referred to as *agents of change* (Fullan, 1993 ; Pantić, 2015). Teachers play a vital role in realising inclusion since access or entry into a 'regular' school does not guarantee inclusion into the classroom.

As classrooms across the world become more diverse (due to geo-political reasons and as we embrace a more disability-inclusive policy) teachers will need to reflect on their practices and ensure every learner feels included (Florian & Spratt, 2014). When teachers deepen their understanding of their context (students' backgrounds), they are more likely to feel equipped to create an inclusive environment. However, an important prerequisite to enable this is to create an environment that encourages teacher agency to thrive.

If teachers are best placed to raise awareness about social justice, we must consider how best they can be supported. It is widely recognised that motivation for work depends on whether people feel that they can act on their values and competencies (Ryan & Deci, 2000). They also need to feel supported and competent in their endeavours, which therefore requires a supportive network to help them achieve agency (Chirkov et al., 2003). The achievement of agency can also lead to greater job satisfaction. Job satisfaction is important because teachers are under increased pressure due to multiple teaching demands. For instance, teachers face a range of issues such as ongoing staff shortages, high turnover rates, and an increasingly diverse student population. Consequently, the workload of teachers has increased while their well-being is declining (Sandmeier et al., 2022). Teachers may feel overwhelmed, nevertheless tapping into agency might help to regain a sense of control and thus promote well-being (Burger et al., 2021). In this sense, agency is also related to the concept of resilience (see **Box A**). When supporting teachers, it is important to understand that agency is not viewed as another teacher activity, but rather as a way to empower teachers.

Resilience and agency

Resilience and agency are often used interchangeably? and even though they are interconnected they should be defined separately. Defining *resilience* is not an easy task, given the growing recent number of studies and research paradigms. The psychological definition understands resilience as the process and the outcome of successfully adapting to difficult or challenging life experiences (APA, 2018). However, this perspective carries the risk of reducing teacher resilience to an individual's behavioural adjustment to external and internal demands, overlooking the critical roles of contextual factors and the potential for "being agents of change". In contrast, we adopt an ecological perspective, as articulated by Ungar (2012). In this regard, when people face significant challenges, resilience refers to their ability to find and use resources that support their well-being, working individually or together to ensure these resources are used according to their culture (Ungar, 2012). This broader perspective highlights the interplay between individual and environmental factors in fostering resilience.

Despite the limited research on teacher resilience within inclusive learning environments, a recent sociological structural model sheds light on the complexity of this phenomenon. This model, developed by Mu et al. (2024), frames resilience as a dynamic process encompassing individual capacities, structural constraints, and *teacher agency*. Notably, even under the pressures of emotional exhaustion, neoliberal challenges, and the risk of teacher de-professionalisation, teacher agency plays a pivotal role. By harnessing agency, teachers can foster positive outcomes, mitigate negative consequences, and sustain their resilience over time (ibidem).

We understand this model to imply that teacher agency, as well as resilience, are best understood from an ecological perspective. Hence, this short reflection highlights the importance of looking for definitions of concepts that do not reduce complexity but show the multidimensional character of the terms used.

Box A. Relationship with the concept of resilience.

In conclusion, teacher agency plays a critical role in creating an inclusive classroom, particularly as teachers are in the best position to identify the needs of the students and raise awareness about diversity issues. It is also crucial for job satisfaction and well-being, in order that teachers feel competent in addressing inclusivity issues. Changes towards a more inclusive educational approach is a way to both engage in professional development and shape teacher agency. Florian and Pantić (2017) highlight the importance of teacher education in fostering critical thinking and situating professional autonomy **(see Box B)** within the broader work context. This perspective underscores the need for systems and

structures that enable individuals to recognise and act upon the possibilities for making a difference. In the next section, the discussion will explore the elements of teacher agency, emphasising how they are shaped by and interact with the ecological context, including institutional, cultural, and policy-related factors.

Autonomy

Teacher autonomy is the ability of teachers to make key decisions about their work. It is defined as the "capacity of teachers to make key decisions that affect the content and conditions of their work within a frame of regulations and resources" (Lennert da Silva & Mølstad, 2020, p. 118). Autonomy can be seen as a resource for agency, giving teachers the freedom to act (Oolbekkink-Marchand et al., 2022). On the other hand, agency may also be achieved in contexts with limited autonomy, such as within prescriptive schemes of work. The main difference between autonomy and agency is that teacher autonomy refers to the amount of freedom (from restrictions) that a teacher perceives while teacher agency highlights how a teacher can make use of this, e.g. the dynamic interplay between the teacher and the conditions of his/her environment.

Box B. Difference between autonomy and agency.

What are the elements of teacher agency?

Teacher agency can be conceptualised in multiple ways. This chapter adapted an ecological model of teacher agency first introduced by Priestley, Biesta and Robinson (2016). This model claims that teacher agency is built up of three elements: iterational, practical-evaluative and projective. Whilst this model splits agency into three elements, an interplay exists between the three elements (see Figure 1).

Figure 1: Model of elements in achieving teacher agency

Iterational	Practical-evaluative	Projective
Personal histories • Biographical histories (background) • Identity **Professional histories** • Teacher education • Professional development • Teacher experience and experience with children with SEN	**Structural** • Social Structures (relationships, roles, power and trust) **Cultural** • Societal views and beliefs • Performativity and accountability • Ideas, values, beliefs, discourse and language **Material** • Resources (curriculum, physical resources • Physical environment/ space • Teaching assistants • Technology	• Short term • Long term • Vision for students • Vision for professional • Transformative agency

Teacher Agency

Source: Adaptation of Priestley's (2016) Model of elements in achieving teacher agency.

The figure shows three boxes next to each other, the first 'iterational', the second 'practical evaluative' and the third 'projective'. The boxes have arrows between them to show that they interact with each other. The arrow underneath the three boxes points towards 'teacher agency'.

Initially, the model is briefly explained. Subsequently, an example is used to dive deeper into the different factors within the model.

The iterative dimension of agency is the element of teacher agency which has a past orientation. For example, this would include a person's experiences, both professional and personal, and their knowledge and skills as well as professional learning and childhood educational experiences.

The practical-evaluative element has a present orientation and is the only element where agency can be acted out. This element focuses on the context within which a teacher works

such as materials (resources and physical environment), social structures (relationships with staff and children, and school level and national policy) and culture (school and societal views).

Finally, there is the projective element which has a future orientation. This includes long-term and short-term goals. In other words, it focuses on visions and aspirations that a teacher has for themselves and also for their learners.

Building upon Priestley and colleagues model, our understanding of agency, and the elements shaping it, underscores the interconnectedness and interactions between factors. By using Freire's definition of praxis, it can be argued that action and reflection employed by educators may have an intention to change the world (Freire, 1970). Therefore action can contribute to projective visions and as an iterative process, reflection can further improve teaching practices (Kemmis & Smith, 2008). Therefore, we identify bidirectional interactions between the factors, each affecting the other. The ecological model allows us to conceptualise the different elements that constitute teacher agency, whilst at the same time viewing the interplay across other elements. For example, if a teacher has past experiences of feeling excluded in their classroom as a child (iterational), this has the potential to influence their aspirations for the future (projective). For instance, ensuring that her own learners do not feel this way and aspire to achieve an inclusive classroom. This then could influence the decisions she makes today in the classroom (practical-evaluative). In the next section, a case study example is shown, which is used to further illustrate the terms of this ecological model of agency.

Rebecca's story of inclusion and agency – a case study

Rebecca* works as a teacher within a special needs department at St. Augustine High School* in India, a school that has a hundred-year-old legacy. The school, like many private schools in India, segregates students in three ways: the 'average' and 'above average' achieving students who go to the mainstream school, the 'low' achieving students (many of whom may have learning difficulties) who go to a separate section at the same school. This section has more flexibility in the curriculum, learning processes and a different school-board called National Institute of Open Schooling (NIOS). The third section, known as the special unit, is for children with disabilities. Before Rebecca took on the role of a teacher within the special unit, she worked as parent-volunteer in the school for three years, during which time she also gained a diploma in inclusive education. She says: "*I would have preferred to work in a role which acts as a bridge between the different [segregated] sections… but I was given this role*". Within two years of taking up the role, Rebecca has enacted inclusion in three distinct ways.

First, she ensures her classroom activities engage every child (no one must be left behind). There are alternatives for every task as well as alternatives to how it can be done. There is room for children to sit together at a community table or sit separately if they

want to work independently. Rebecca sometimes finds that it difficult to reach children with her instructions, so she also uses visual aids and drawings to communicate. She invites her colleagues from other departments of the school to visit her classroom to seek their feedback.

Second, she uses her time on the school bus to ask her peers about their methods of working with children with disabilities or difficulties in their classrooms. She enjoys this daily commute with her peers as it allows them to talk freely about various school issues and she finds her colleagues more receptive to her ideas while on the bus. Though teachers are not open to a system where children with disabilities are integrated into the 'mainstream' classroom, they are still curious about how Rebecca works with children with disabilities.

Third, she nudges the school management to consider making the school more inclusive. Through her diploma, Rebecca learnt to look at her school from a theoretical lens and was able to analyse the different functions of the school. During her diploma, she also developed a few long-term goals and her own vision for her school. With the support of the management, she recently conducted a school-wide survey about teachers' awareness of inclusive education which led to important discussions in the staff rooms and faculty meetings and further resulted in the management seeking guest lectures on the subject of inclusive education. Rebecca now has her eyes set on making school events (such as sports day) inclusive. She hopes to continue to take such steps to make gradual shifts in the school culture and practice.

Figure 2: Description of Rebecca's agency in terms of the model of teacher agency.

Code:

Iterative   Practical-evaluative   Projective

In the middle of this figure stands a black-and-white woman, representing Rebecca. Around her are small boxes in three different shapes and colours, referring to the different elements of teacher agency. Blue circles refer to Iterative, orange hexagons to Practical-Evaluative and purple squares refer to Projective.

Implications of the teacher agency model for Rebecca's case

Iterational

Iterational

Personal histories

- Biographical histories (background)
- Identity

Professional histories

- Teacher education
- Professional development
- Teacher experience and experience with children with SEN

Personal Histories

Rebecca's personal experiences include being a parent of a child with a disability. This role provides her with first-hand experience in understanding and working with children with disabilities. This could also enable her to empathise with other parents who have children with disabilities. These personal experiences equip her with valuable insights and knowledge that can shape her agency fostering inclusivity.

Professional Histories

Rebecca's professional experiences are equally significant. She has spent several years working as a teacher with children with disabilities, during which time she has interacted with a diverse range of students. Her role as a teacher gives her a comprehensive understanding of the existing structures within her school. Additionally, Rebecca has pursued professional development in inclusive education, enhancing her knowledge and leading to greater competence in this area. These professional experiences contribute to her overall ability to support and implement inclusive practices in her classroom and school. In the case study of Rebecca, both her professional and personal experiences may impact the achievement of agency when it comes to developing an inclusive classroom and school environment.

In sum, the model highlights that the achievement of agency is always informed by past experience, and in this particular case, this concerns both professional and personal experience (Priestley, Biesta and Robinson, 2016).

Projective

Projective

- Short term
- Long term
- Vision for students
- Vision for professional
- Transformative agency

The projective element encompasses both long-term and short-term aspirations and visions. In the case study, Rebecca's proactive efforts to promote inclusion are closely tied to her long-term vision of creating a more inclusive school system. This alignment between her day-to-day practices and her broader goals helps explain her strong commitment to inclusion. Supporting this perspective, wider literature also illustrates how long-term goals can shape a teacher's agency. For instance, Gu, Liang, and Wang (2020) conducted research on English as a Foreign Language (EFL) teachers in China, revealing that these educators had long-term goals focused on ensuring student progress. These ambitions motivated them to take actions aimed at elevating the status of English in their local communities, thereby supporting the achievement of their long-term goals. Whilst the iterational element is discussed separately in this chapter, it is important to recognise its interconnectedness with other dimensions. For instance, Rebecca's personal experience as a mother of a child with a disability and experience as a teacher may partly explain and motivate her vision to create a more inclusive educational environment. In other words, her personal journey could be providing the foundation for her aspirations (projective).

Practical-evaluative

Practical-evaluative

Structural

- Social Structures (relationships, roles, power and trust)

Cultural

- Societal views and beliefs
- Performativity and accountability
- Ideas, values, beliefs, discourse and language

Material

- Resources (curriculum, physical resources
- Physical environment/ space
- Teaching assistants
- Technology

Considering the practical-evaluative element of teacher agency, which encompasses structural, cultural, and material factors, we can analyse the factors affecting Rebecca's agency.

Structural

In Rebecca's case, certain policies and school structures might be hindering her agency. For example, school policy segregates children according to those with, and without, disabilities. This may restrict Rebecca's agency as she is unable to make the decision to mix the classes.

The second structure which possibly could hinder Rebecca's agency is that the prescribed, compulsory curriculum requires her special needs unit to take a more vocational approach to education, providing children with practical skills over disciplinary knowledge – resulting in restrictions on the curriculum content. According to Leijen, Pedaste and Lepp (2020) "educational policies that emphasise testing, accountability and efficiency have been heavily criticised for restricting teacher agency" (p. 296).

The case study also indicates that Rebecca's agency could be influenced by teachers and senior management in her setting. For example, she exchanges ideas with other teachers and feels able to discuss inclusive education with them. This could positively influence the achievement of agency in the school and classroom environment as she may feel supported by others.

Cultural

Rebecca's school, having a hundred-year-old legacy of serving the community it resides in, is moderate in making progressive decisions even when national policies encourage certain changes such as adopting inclusive education. It relies on the consensus among parents and staff opinion when considering changes. For instance, Rebecca's approach to gently persuade the school management and her peers towards inclusive practices is based on her deep understanding of the school and its beliefs. Her agency comes from the cultural knowledge she possesses of the school from having been a parent, a parent volunteer, and now a teacher at the same school. Rebecca belongs to a city (societal context) where there are only a handful of 'mainstream' schools that include children with disabilities. Those who do include children with disabilities follow a similar model of segregation as her school. This is unsurprising, as noted by Singal (2019), teachers in India feel unprepared to teach children with disabilities alongside children without disabilities.

Rebecca's school, which is built on Christian values, feels obligated to serve the community and all children (including those with disabilities). It also views children with disabilities in a charitable manner, which, in the short term, has aided Rebecca's goal of inclusion and has given her agency to be a disability advocate, and to mobilise her peers towards inclusive practices.

Resources

Access to resources can significantly impact a teacher's agency. For instance, Priestley, and colleagues (2016) claim that agency is partly shaped by the availability of physical

resources and the nature of physical constraints. In Rebecca's case, her classroom is spacious and specifically designed for children with disabilities. It includes numerous visual resources and calm areas for the children to use, setting it apart from traditional classrooms. These resources, and the ample physical space, allow Rebecca to select from a variety of visual materials and activities, creating options which may enable her to tailor her teaching to the needs of her students, and ultimately therefore creating the potential to lead to a more inclusive classroom.

To conclude, the analysis of Rebecca's case identifies that there are many elements which hinder, and support, the goal of agency in her setting. Whilst this section has discussed the iterative, practical-evaluative and projective examples from Rebecca's case study, it is important to note that there may be many more relevant examples and factors influencing the achievement of agency.

How can teacher agency be supported in a professional context?

To move towards more inclusive education, changes in the way of working in the school and in the classroom are required. To ensure that such transformations are successful, teachers must feel that changes are in line with their beliefs, and that they have the competencies or resources to contribute to this change (Palmer et al., 2017). This alignment can be shaped by reflection and discussion. School reform also relies on the professionalism of the teachers. During this process, teachers may have opportunities to explore their values and learn new professional skills (Imants & van der Wal, 2020). Such an exploration can help to further shape their values and competencies. As a professional (in training) it is important to recognise how your professional context can support you to achieve teacher agency.

In this paragraph, different professional contexts and how they can shape teacher agency will be further discussed, through the contexts of teacher education, early career teaching, and communities of practice. Finally, the role of reflexivity, as an overarching premise for professional development, is highlighted in the last section of this paragraph.

Teacher education

In teacher education, teachers can practise the achievement of agency in their settings. An overlap with student agency may also exist, as the student teacher may identify themselves as both a student and a teacher, depending on the programme. In some programmes,

teacher education will include internships[1] in which student teachers have increasing responsibility over a class.

The teacher education context can be very valuable in developing teacher agency, by allowing sufficient time to learn by experimenting, and reflecting on, the curriculum (Korthagen, 2016). While still in teacher education, it may be difficult to achieve agency due to the hierarchical dependencies on a supervisor or teacher educator, in addition to balancing high workload with feelings of incompetence (Squires et al., 2022). However, there are ways in which student teachers can develop agency. They can reflect on how their personal goals relate to the course work or internship experiences, thereby increasing feelings of personal responsibility (Stockdale & Brockett, 2011). Within the limits of assignments, there may also be space to express one's own views. While reading and discussing theory or literature, it can be helpful to ask how the readings relate to your own perspective. Such exercises can help to shape both the iterational and projective elements of teacher agency.

Within the context of a university or education institute, teacher educators can make sure there is room for exploration of the student teachers' own values and related actions. This can be achieved by focusing on the student-teachers' learning process, through self-directed learning methods for example (van Woezik, 2020) or by considering democratic or transformative learning methods (Freire, 1970; Vianna & Stetsenko, 2011; Stetsenko, 2019). These educational methods help students to set their own goals, while considering one's own values and making room to discuss these values. By setting personal goals, even if they are bound by a curriculum, a sense of agency can be developed.

With regard to internships, the student teachers' perspective is also valuable, particularly as new teachers can bring a fresh perspective to both the school and teacher education curriculum (März & Kelchtermans, 2020). Such ways of enacting agency are more informal and individual (Snoek et al., 2019). One could also think about more formal ways of enacting agency. For instance, by taking part in a student council or a council in the school in case of an internship. Moreover, one can achieve agency as co-agency (see **Box C**), meaning one could find like-minded peers or colleagues with whom they could voice any concerns or work on a project.

Co-agency

---

1. The word internship is used in this chapter to indicate that student teachers are involved in schools during the teacher education program. Depending on the (national) context, these internships can be highly integrated into the regular curriculum of teacher education or stand alone. Internships may also be known as placements.

Co-agency refers to both individual and collective action to forge new possibilities in the institutional, political and societal power structures that frame the environment. Co-agency emphasises interactions, relations, networks and alliances as the building blocks for agency in guidance practice (Toiviainen, 2022).

The principle of co-agency understands that improving learning requires a joint effort between teachers and students. It highlights that teachers need to align their influence with the students' own power to make a meaningful impact on their development. By applying co-agency in their decisions, teachers focus on enhancing the learning environment and opportunities, aiming to empower students to use their own agency effectively. This principle guides teachers to continuously consider how their actions can encourage and support students in taking charge of their own learning (Hart et al., 2014).

Box C. Defining the concept of co-agency.

Example

A student teacher created a chart of all the learners in their classroom, including the learning preferences and the type and quantity of contact they needed from the teacher. Based on this, the student teacher made a new seating plan where children with higher levels of distractibility would be in the front and centre of the classroom to have as little sensory input as possible, and children with social anxiety would be further in the back having less eye contact with the teacher. The student teacher also mapped children who need encouragement in the walking routes, and those who work well in teams were placed further in the back so they can talk without disturbing others. They discussed the initiative with peers and teacher educators. In this way, the student teacher took advantage of the space in the teacher education curriculum to experiment with this way of seat planning.

In-Service Teacher Education

The role of in-service teacher education is to address challenges and dilemmas that teachers are likely to face at different stages of their careers and to also introduce new ways of teaching and learning to improve school processes and culture. In-service teacher education has the potential to not only improve the professional knowledge and skills of a teacher, but also to facilitate teacher agency. Indeed, research has shown that teacher agency includes directing one's own professional growth and that of colleagues (Calvert, 2016; Imants & van der Wal, 2020). Fullan (1993) argues that a key ingredient for teacher agency is 'mastery', where sufficient expertise is required for educators to bring sustained changes to their context. He further states that "mastery involves strong initial teacher

education and career-long staff development, but when we place it in the perspective of comprehensive change, it is much more than this. Beyond exposure to new ideas, we have to know where they fit, and we have to become skilled in them, not just like them" (Fullan, 1993, p. 4). If, for instance, any new ideas refer to an inclusive classroom practice, teachers will need to rely on their expertise and agency to make decisions on how, or when, they would implement the particular practice. Florian (2014) supports that same view by pointing out that inclusive practice requires teachers to continually develop their practice in order to identify improved ways to reach children. She makes the case for this by stating that the "difficulties students experience in learning can be considered as dilemmas for teaching rather than problems within students" (Florian, 2014, p. 291).

In-service teacher education is important for teacher agency as the projective element of teacher agency calls for teachers to have a vision upon which they can act. In-service teacher education therefore provides an opportunity or a platform where they develop skills that can help them achieve their vision. Fullan also claims that "People *behave* their way into new visions and ideas, not just think their way into them [...] New mind-sets arise from mastery as much as the reverse" (Fullan, 1993, p.4).

In-service teacher education programmes often bring together teachers with varying degrees of experience and backgrounds and in doing so, creates room for collaboration and learning where teachers can share similar experiences which, in turn, may inspire greater teacher agency.

Example

Inspired by a course on autonomy-supportive teaching, a teacher decides to make more space for the children allowing them to choose where they want to work and how quickly they will go through the assignments. Children can also walk in and out of the classroom. The teacher wants to show colleagues this change in the classroom, and invites colleagues to come and observe how the children and the teacher themselves are working. After a short observation, the teacher and a colleague sit together. They discussed what was going well and identified areas for improvement, such as checking in on the children that are outside the classroom. The observation also led to a discussion about the role of the teacher, the core values (e.g., autonomy for the children versus transfer of knowledge), and how the teachers feel agency to enact such changes in their classroom.

Early career

As an early career teacher, one may feel like there is still a lot to learn. Early career teachers tend to have less experience, which previous research indicates may play a key role in the achievement of agency (Burkhauser & Lesaux 2017; Dampson, 2019). Some early career teachers can feel overwhelmed in the first period as a teacher, having responsibilities for their own classroom and getting accustomed to a new environment. However, it is also worth bearing in mind that teachers will have a lot to learn. As an early career teacher,

one might bring a fresh perspective on the school and the classroom, thereby enabling them to identify practices that could be changed or addressed. Early career teachers also bring new ideas and insights that can be valuable for the school. This is called innovative professional potential (van Leeuwen, 2024). Innovative professional potential has been found even during stressful times of teachers' careers, indicating that even though it is influenced by external factors, it is not always constrained by them. Oolbekkink et al. (2022) describe early career teacher's agency across different categories ranging from restricted to extended. For example, teachers who experience restricted forms of agency can only enact agency within strict limitations relating to methods used in the classroom or school regulations. Teachers who experience extended agency often notice that they are invited by their school leaders and colleagues to experiment or expand their influence.

Example

I teach a year 3 class (7-8 year olds) in England. Our school uses a pre-packaged scheme of work which provides prescriptive topics, termly plans and descriptive lesson plans. The topics tend to be interdisciplinary meaning a range of subjects are integrated. This term, the topic has been Prehistoric Britain. This scheme of work is very restrictive as "what" I am teaching and sometimes "how" I am to teach are prescribed. For example, this week our objective in topic (history) was "to understand what Stonehenge looks like". Stonehenge is believed to be a religious monument built in the prehistoric period. The scheme of work provided a PowerPoint presentation which identified facts and different parts of Stonehenge and a follow-up activity sheet for the children to complete labelling different parts of Stonehenge. However, I knew my class liked to build and do practical tasks. I asked senior management if I could get the children to make models of Stonehenge using materials in school, such as Lego, building blocks and cardboard, instead of using the worksheet. With the support of senior management, I was able to achieve agency within my classroom.

However, as a newly qualified teacher, the scheme of work has been beneficial (in some cases). For example, it supports my curriculum coverage and, by having pre-made resources, it saves me time as I do not need to create my own. Without having this scheme of work this year, I would not have known where to start planning my history lessons. I believe confidence with curriculum content and coverage will come with time and I hope to diverge further away from the scheme of work.

Picture A. Reconstruction of Stonehenge, photography of the author. The picture shows several wooden squares positioned upright and put in a circle, with sticks on top and smaller blocks in the middle of that circle.

Picture B. Photography of Stonehenge by Uliana Sova from Unsplash. The picture shows several stones positioned upright and put in a circle, with stones on top and smaller stones in the middle of that circle.

As a teacher, one can achieve agency in an informal way, meaning that one takes action in the classroom or in the school based on their initiative. This can be seen in the example above. Such an initiative might resonate with school leaders, and lead to a formal position. This means that whilst coming from personal effort, one might move to having an allocated role and time to work on these issues. Individual initiatives may also spark the interest of colleagues and lead to forming a group of colleagues with a shared vision or goal resulting in a collective way of working. Working in a collective is helpful to find support and more traction for one's cause. Communities of practice are a specific form of this.

Communities of Practice

Although there are multiples terms used for the groups of professionals who work on an issue or just collaborate on a daily basis, (i.e., professional learning communities or learning communities), we can define them as groups formed by individuals who share a concern, a problem, an intention, or a passion about a topic that collaborates and interacts on a regular and consistent basis (Wenger, 1998). In this chapter, we will use the term "Communities of Practice" (CoPs) to refer to such groups, to highlight the notion of practice and reflexivity inherent in these groups.

However, it's also important to make the distinction between other familiar structures in order to create a better understanding of how CoPs may interact with teacher agency.

These familiar groups that may be mistaken for a CoP and are often identified as "teams", "task forces", "training groups", and "networks" (Wenger-Trayner et al., 2023). While a team, task force, training group, or a network may have a focus on developing a product, solve an issue, follow premade curriculum in a time-bound process in which hierarchical relations may be present, a CoP focuses on collective learning and reasoning where the practitioners have the lead and share common values and a group identity (Wenger-Trayner et al., 2023). With this comparison in mind, let's look at how teacher agency in the context of inclusion may benefit from engaging in CoPs. It is safe to say that there are multiple ways in which a CoP can foster agency and inclusion. Possible benefits can be categorised as follows:

- Shared Leadership: The inherent horizontal relationships between community members fosters individuals' capacity to take action. This way of forming relationships also encourages people of the community to share the leadership role in addition to collaborative decision-making practices (Harris, 2003; Campbell et al., 2019). As a result, they provide a space for teacher agency to foster and nurture individual's capacity to act on their visions.
- Collaboration & Reflective Practice: CoPs create a highly conductive and interactive environment for establishing effective collaboration among teachers by creating space for professional solidarity (Ayan, 2020). Therefore, the members share competences, skill sets, strategies, etc. In this collaborative environment, individuals also find a space to engage in collective reflection where they can critically analyse their practices and make more informed decisions (Schon, 1983). Moreover, the nature of collaborative practice also provides teachers with new resources which they may otherwise not be able to reach. It can also provide the teachers with privileged access to resources extending from personal experiences to documents and tools (Wenger-Trayner et al., 2023).
- Professional Development: CoPs provide ongoing, relevant professional development that supports teacher growth and responsiveness to new educational challenges (Desimone, 2009). CoPs also build knowledge capital involving human, social, tangible, reputational, learning capital (Wenger et al., 2011).
- Fostering Inclusion: CoPs promote understanding and respect for cultural diversity, enhancing teachers' abilities to create inclusive classrooms (Gay, 2010). In CoPs, through teachers' interaction, members can address diverse student needs, developing inclusive strategies and practices (Ainscow et al., 2006). As diversity is inherent in the CoPs, members can acquire different perspectives on issues. In addition, problem-solving activities within CoPs allows members to tackle complex educational issues, enhancing their critical thinking abilities (Jonassen, 2000). Engaging in collaborative inquiry and dialogue within CoPs also encourages the questioning of assumptions, exploration of diverse perspectives, and development of critical thinking skills (Cochran-Smith & Lytle, 2009).

As school populations become increasingly diverse, teachers need to consider how to make schools more equitable and inclusive for all learners. CoPs provide opportunities to employ agency by allowing shared leadership, promote collaboration and reflection, support professional development, and at the same time foster inclusion. To summarise, it can be argued that a community of practice which fosters diversity has the potential to produce solutions that will meet the diverse needs of all learners. As previously mentioned, this stems from the fact that communities that encompass different perspectives and different modes of existence will generate a variety of solutions to problems, which will, in turn, pave the way for the creation of more inclusive solutions via classrooms (Ayan, 2020).

Reflexivity

Research has shown that reflexivity of teachers is crucial for agency, inclusion and social justice, as well as for professional development in general. In daily practice, teachers often report lacking the time to reflect on their professionalism, identity, beliefs, and values, nor having time to consider structural, cultural and material dimensions. Indeed, these are often taken for granted. In some school contexts, it is common to hear statements like "I'm doing it because we are used to doing so," which indicates a lack of critical reflection on potential inequalities and the solutions needed to address them. The problem with unexamined presumptions within institutional contexts is that they can sustain unequal educational outcomes for certain students. Pantić (2017) discovered that even inclusive educators who believe in their crucial role in advancing social justice and removing barriers to education often perceive students and their families as vulnerable, and instead focus on helping them conform to existing standards. Without questioning their underlying beliefs about schools as politically neutral and equal-opportunity environments, these educators might view special schools or self-contained classrooms as more suitable for students' well-being and safety, while also seeing disability as inherent and unchangeable (Broderick & Lalvani, 2017; cf. Li & Ruppar, 2020). In the literature, *reflection* has been inquired since the 1980s but there is not always consensus on its conceptualisation. In order to better clarify some key terms, this next section distinguishes between reflexivity, reflexive posture and reflective practice.

Reflexivity refers to an explicitly knowledge-oriented process that is based on a "complex network of relationships aimed at giving meaning to actions and stimulating new ones, and aimed at interpreting the experience through which we understand the reasons why we act in a certain way" (Nuzzaci, 2011, p. 11). In this definition, the role played by *experience* clearly emerges, which, paraphrasing Dewey (1986), can be understood as the interaction between subject and object, between organism and environment, and which manifests itself in problematic situations in which the individual tries to overcome a problem to respond to his or her own need or necessity. This process is similar to that described by Mezirow who conceptualises the *transformative learning* process as a series of stages

through which an individual, starting from a challenging situation (which he calls *disorienting dilemma*), tries to revise its own schemes of meaning, reworking them and making them more appropriate to the situation, until coming to a new, more adequate conceptual perspective (Mezirow, 2003; 2016; crf. Baroni, 2021). Reflexivity is thus configured as a deep learning process, which also involves the emotional dimension of the subject, as well as the behavioural one (Nuzzaci, 2018). Alternatively, when one speaks of *reflexive posture*, one refers to an attitude "that is episodic and spontaneous in character and leads one to reflect discontinuously on a certain practice without an assumption of awareness or change in action" (ibid., p.11).

The third one, *reflexive practice*, is understood as integrally part of the teacher's professional identity, since it consists in being able to operate a constant reflexive process to guide action, regardless of the obstacles or difficulties encountered (Altet, 2008; Perrenoud, 2001). Moreover, in this practice, the professional can recall possible functional strategies to carry out a given task. This shares commonalities with reflexivity in that it presupposes a habitus (Bourdieu, 1972), i.e. a way of acting in practice, constituted as much by actions, as by languages, rules, objectives and implicit strategies (Nuzzaci, 2011). Thus, it is the case that the practitioner in question is constantly engaged in a reflexive operation that leads him/her to become more and more aware and thus sustain his/her resilience (La Marca & Longo, 2016).

Engaging in reflective practice is not always easy, especially as an early career teacher or when you work in structures that do not foster such practices. Still, it may be worthwhile to look for possibilities. You can think about finding like-minded colleagues, with whom you can reflect during a coffee or lunch break. Perhaps there are opportunities within the school to find a mentor or other form of professionalisation that will help you find time for reflection. Or you might even address the issue with school management, perhaps together with other colleagues.

Underlining the role of reflexivity, and of being a reflective practitioner (Schön, 1993) is crucial while working towards the implementation of inclusive school practices. In particular, it is necessary to find space and time in which the individuals and the groups (crf. community of practice) can create opportunities to step back, recognise and assess situations of inequality, find solutions to leave behind routinised mechanistic practices, and act positively (Pantić, 2015).

We could understand reflexivity as a "superpower" that empowers teachers in monitoring both self and the society, enabling them to accomplish their purposes. Research has shown that educators that are able to reflect on their practice could positively enact change through agency, such as "reflecting on their own practices and environments in seeking to accommodate all learners; constantly monitoring their own actions with respect to their commitments (…); articulating practical professional knowledge and justifying actions; making sense of the structures and cultures in their schools as sites for social transformation" (Li & Ruppar, 2020, p. 48).

Example

In the "Action Research Teacher" programme facilitated by Teachers Network, a dynamic community of educators was established through ongoing discussions focused on inclusive classroom practices. Supported by the organisation, this community collaborated closely with experts from an inclusive education centre, engaging in a continuous cycle of observation, discussion, design, implementation, and reflection. As part of this process, teachers maintained observation diaries where they reflected daily on their own practices and classroom environments within the context of inclusion. These diaries often revealed exclusionary practices, discourses, and identified vulnerable groups and identities. Group reflections on these observations led to broader discussions and a sense of empowerment, enriched by the diverse experiences of the community members (Yurtseven et al., 2021).

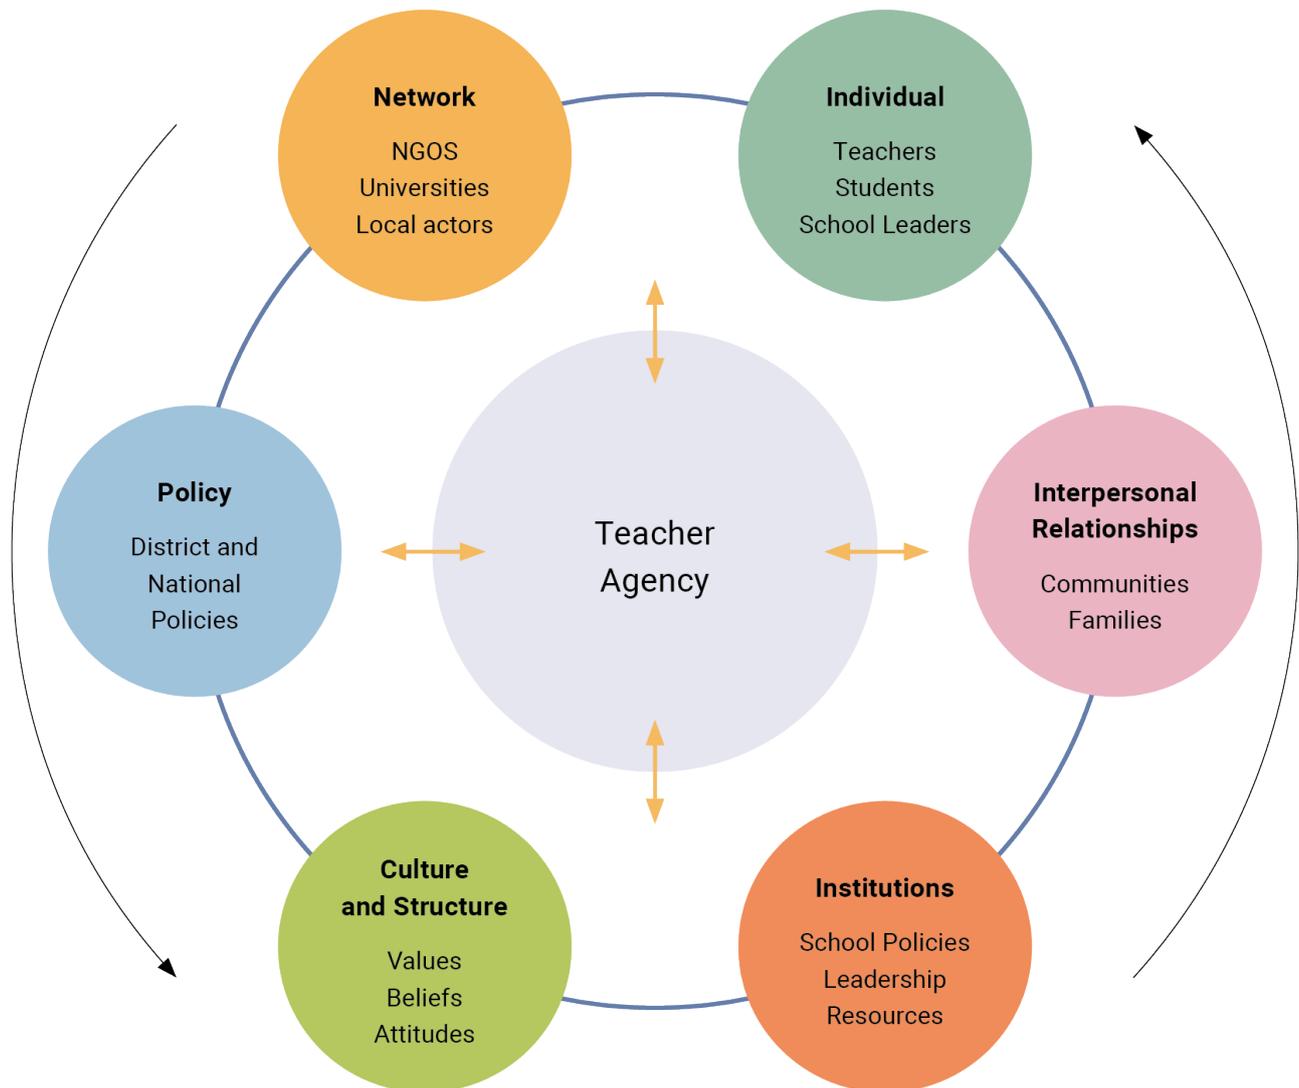
How can teacher agency be achieved?

As teacher agency is understood more as an ecological concept instead of an individual capacity, our answers on how to achieve teacher agency should also adopt an ecological approach. As discussed in this chapter, teacher agency should not be defined as another task or a skill that teachers need to complete or achieve on their own. In order to understand how to develop agency inside the ecosystem shaping agency, the system itself and its actors need to be highlighted. Priestley and colleagues (2021) identify five distinct sites of activity including; nano, micro, meso, macro, and supra, that interact in the context of teachers' classroom practices. Although they offer a model for reframing the curriculum making process, the same ecological model can be applied to teacher agency, as the actors and the sites of activities do not change.

Building upon the established ecological models of education and agency (Bronfrenbrenner, 1994; Biesta & Tedder, 2007; Priestley et al., 2016), a revised framework is proposed, in order to reframe the model and diagram to better fit the context of teacher agency. Refraining from repeating a hierarchical structure, the current model illustrates the system in a nonlinear/non-hierarchical way, to account for the constant interaction between the actors in the system and the sites of action in various directions.

To achieve teacher agency, teachers remain the core actors, and their engagement with the whole system drives teacher agency. In addition to their systematically constructed capacity of agency, their impact on the ecosystem itself (through forming relations, groups, as advocates for more inclusive policies, and challenging the prejudices inherent in the culture), can reshape the whole system. However, teachers are not the only actors in our model that function in the individual domain. Students and school leaders can also be taken into consideration in the individual domain whose iterational, practical-evaluative and projective elements of agency shapes teacher agency in the ecosystem. For example, a school leader's projective value on inclusive classrooms may enable teachers' understanding of inclusion and consequently may build autonomy in the school system

which directly contributes to teacher agency. On the other hand, students' various personal histories, identities, values, and discourse may also foster teachers' vision for an inclusive classroom and may cause teachers to reflect on their own values and identities. Therefore, the individual site of agency as not being restricted to teachers' themselves, is the core of teacher agency. Importantly, the ripple effects of individual agency has similar repercussions on other actors within the ecosystem?

Figure 3. An illustration of the ecological model of teacher agency developed by the authors.


The illustration shows the words 'Teacher Agency', with a circle around, divided into six parts which say 'Individual', 'Interpersonal Relationships', 'Institutions', 'Culture and Structure', 'Policy' and 'Network'. There are arrows around the circle to indicate movement, and there are arrows inside the circle pointing towards the words 'Teacher Agency'.

Interpersonal Relationships

Aside from the individual, interpersonal relationships are defined as another actor which shapes agency. The web of relationships and engagement between the actors in the

individual level (such as colleagues, students, school leaders, and support staff) acts as another sociocultural factor reframing, enabling or hindering teacher agency. Beyond this site, there is the institutional domain where school policies, leadership and resources available may shape how agency is perceived and practised. This site also links to the practical-evaluative elements of agency heavily by fostering or hindering the teachers capability to act.

Institutions

As a teacher, it is important to engage in conversation with your school leader or department head. School leaders are an important asset for teacher agency as they can provide the autonomy teachers need to enact their agency. Sometimes, school leaders are not aware of the needs of teachers, so it is important to advise them if there are areas which could benefit from improvement or change? This may also help to frame your ambitions in line with the school vision or societal needs. School leaders might look upon student teachers and early career teachers as people who still have a lot to learn. While this is true, early career teachers are also assets who may bring new perspectives and ideas to the school. Knowledge of the organisation culture, beliefs and structure to navigate their environment is also important. Kelchtermans (2019) labels this micropolitical literacy as it allows teachers a degree of freedom for actions and decision making which may impact on their learners. The organisation structure, restrictive as it may be, is not a one-way interaction. Therefore, it helps to dive into the organisational structure of your school and find out how it might be possible to make changes.

Network

Taking one step into the larger social structures, in areas Bronfenbrenner (1994) refers to as exosystem and macrosystem, we see sites of network, policy, and culture and structure. In our model, we identify the site of the network where NGOs, local organisations, universities that interact with the school and the teachers themselves, play an important role in achieving teacher agency. An NGO working on teacher empowerment or a university project, may help teachers to act upon their visions, and inspire and develop more inclusive approaches can greatly affect teacher agency. In this site, through interactions and experiences , teachers may even transform their understanding of agency and inclusion, and influence their teaching practices.

Policies

Beyond the network domain, there are educational policies at the district, state, and national levels that also have a profound impact on teacher agency and inclusion which may also shape the level of interaction inside the network around the school ecosystem. For example,

a ministry of education may enforce prescriptive practices, form centralistic and rigid hierarchical interactions; therefore limiting the area of network, institutions, relationships, and individuals.

At the outermost layer, the culture of the society involves the values, beliefs, and attitudes within the school and the broader society. A culture promoting values such as inclusivity and autonomy is essential for enhancing teacher agency. So let's start with what can be done. How can we achieve and nurture teacher agency in this complex web of relationships and interactions? We can start by talking a little about the core, the individual, the teachers themselves and what they can do to support their own agency?

Culture and Structure

The cultural and structural aspect of teacher agency concerns societal beliefs about teachers and the importance placed on them in policy. If policies are too hierarchical and seek to control the role of teachers, this would limit one's agency. As some scholars have stated , teachers should not be role-takers, they should be role-makers. Teachers' roles need to be viewed beyond that of implementers of policies. To be agentic here would mean teachers need to critically think about how a particular policy affects the inclusion of children. Teacher agency needs to be seen as an integral part of the profession, and structures need to ensure teachers are not working in isolation and instead make room for collective agency (as seen in CoP).

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=651#h5p-36

Closing questions to discuss or tasks

1. Think about a recent situation in which you experienced teacher agency. Try to analyse it through the teacher agency model (iterational, practical-evaluative, projective).

2. Think about your school's structural, cultural, material dimensions. How can you achieve agency within this context?
3. How does collaboration with peers and/or colleagues support teacher agency and promote inclusion? Make concrete examples.
4. Can you think about situations that may limit or inhibit the achievement of agency? What can you do?
5. Do you believe that you can always have agency, or can you think of a situation where you would have no agency? Discuss in groups.
6. How can you be an agent of change for inclusion in your own practice?

About the authors

Günalp Turan

Günalp Turan is an NGO professional and an educator with a focus on communities of practice and teacher empowerment. He has a BA in language education and has taken graduate studies in cultural studies. He has been managing and advising national and international projects and organizations on inclusive education, critical thinking, community building, and andragogy.

Madhusudhan Ramesh

Madhusudhan Ramesh is an assistant professor in inclusive education. He heads a PG diploma programme in Inclusive Education designed for mid-career educators. His research interests include teacher agency, inclusive pedagogy, teacher professional development, and children's experiences of difference and disability.

Rhianna Murphy

Rhianna is a former primary school teacher with international teaching experience. She has a background in educational research, with a focus on curriculum-making and teacher agency. She has also worked on a range of small scale research projects with British Educational Research Association (BERA) and has experience lecturing on a range of teacher education courses.

Sara Baroni

Sara Baroni is Doctor of Research in Pedagogy and Didactics and primary school teacher. She is interested in wellbeing and equity at school, education in emergency situations, teacher reflective practices and inclusive education. She is part of different research groups in Italy and abroad.

Tamara van Woezik

Dr. Tamara van Woezik is assistant professor in teacher education with a focus on affective learning processes. She coordinates and teaches courses about pedagogy and teacher professionalisation. Her research focuses on sense of belonging, inclusion and autonomy-support using qualitative and arts-based methods.

ANTI-BIAS EDUCATION

Example Case

Suki, a British-born student of Indian heritage, was incorrectly placed in an English for Speakers of Other Languages (ESOL) course despite English being her first language. She was identified as having severe literacy difficulties, but rather than receiving targeted support for her needs, she was enrolled in ESOL due to her low reading and writing proficiency.

Suki was placed in an ESOL course designed for non-native English speakers, despite being a native English speaker. This placement failed to acknowledge her primary challenge—dyslexia-related literacy difficulties, not language acquisition.

The college refused to assess Suki for dyslexia, claiming that her reading and writing skills were too low to meet the criteria for formal testing. This created a systemic barrier that prevented her from accessing the specialist support she needed. Despite her strong verbal communication skills, Suki struggled significantly with reading and writing, leading to frustration and disengagement. Without appropriate intervention, she was placed in an environment that failed to address her specific learning needs. Had she received the right support in a mainstream course, she could have thrived academically, but instead, the lack of tailored assistance reinforced feelings of inadequacy and limited her educational progress.

Institutional rigidity: Attempts to challenge her placement were met with resistance, with educators asserting that the system could not accommodate alternative solutions.

This case highlights a critical gap in educational support systems for students with undiagnosed or misdiagnosed learning difficulties. Suki's case was not an issue of ESOL eligibility but a failure to recognise and support dyslexia.

Suki's experience highlights systemic issues in literacy assessment and support, particularly the rigidity of criteria that hinder early identification of dyslexia. Her case emphasises the need for individualised learning pathways, ensuring students are placed in appropriate courses based on their actual needs rather than standardised test scores. Greater advocacy and awareness are essential to empower educators to challenge these shortcomings and implement meaningful interventions. To address these issues, Further Education institutions must recognise that low literacy does not automatically qualify a student for ESOL, implement early dyslexia screening regardless of reading level, and provide specialist literacy support within mainstream education. These reforms are crucial to preventing the unnecessary segregation of students with additional learning needs and ensuring equitable access to education.

Had Suki been given the correct support, she could have developed her literacy skills within an inclusive, mainstream environment—rather than being placed in a lower-level ESOL class that did not meet her needs. This case study serves as a powerful reminder of the importance of challenging systemic barriers and advocating for the right support for every learner.

example case by Nysha Givens, University of Wolverhampton, UK

Initial questions

In this chapter you will find the answers to the following questions:

- What is anti-bias education?

- Why is anti-bias education important?

- How is anti-bias education connected to inclusion?

- Why should anti-bias education be an essential part of teachers' everyday work?

- What is intersectionality?

- How can teachers implement anti-bias education in the classroom?

Introduction to Topic

This chapter introduces the concept of taking an anti-bias approach to education. Unfortunately, children do not grow up with equal opportunities, they can be disadvantaged or advantaged because of their social identities. Taking an anti-bias approach means that you are aware of these inequalities and take steps to create an environment where differences are celebrated as well as creating an awareness around the different positions children may have in society. Taking an anti-bias approach is necessary to ensure you are an educator who is truly inclusive in their teaching, and it also prevents children from being further disadvantaged in the classroom. This chapter will take you through the goals of anti-bias education and provide you with the information you need to start taking an anti-bias approach to teaching.

Key aspects

What is anti-bias education?

Anti-bias education is an approach to teaching that acknowledges and celebrates differences in identities. It is about building a community that encourages diversity, critical thinking and self-discovery. With an anti-bias approach, children can be strengthened in their self-identities as well as their social identities and learn to interact respectfully with others despite their different backgrounds. Inclusion and equity are the heart of anti-bias education, so students are taught about the impact and unfairness of bias and discrimination and how they can stand up for themselves and each other.

Why is anti-bias education important?

"Children are not only learning to read and write texts: they are learning to read and write human possibilities. They read each other's faces and clothes as they do any storybook, and they write each other's future in the stories they imagine" (Dyson, 1997).

Societies around the world are becoming increasingly heterogeneous, socio-culturally, strongly due to the continuous movement of migrants, refugees, and asylum seekers (Adebayo and Chinhanu, 2020). While the sociocultural changes experienced in societies globally have brought about a richness in diversity, it has also led to the observation of "how many societies try to fit people into a cultural box" (Adebayo and Chinhanu, 2020; Vandenbroeck, 2007). In other words, minoritised and disadvantaged communities/people worldwide continue to experience bias and discrimination due to their backgrounds.

Furthermore, recent events in the United States have brought about the urgent need to respond to institutional and structural racism worldwide. Within the context of education, the momentous Black Lives Matter Movement has highlighted the cruciality of developing

anti-bias education and promoting equity and inclusion in education (Adebayo, 2020). Additionally, the recent COVID-19 outbreak led to the closing of schools worldwide, and this resulted in "1.6 billion children missing out on education, which has further amplified inequalities inherent in many education systems" (Adebayo, 2022).

Furthermore, the current global landscape highlights the urgent need to address the Sustainable Development Goals (SDGs) outlined by the United Nations in 2015, specifically SDG 4, which aims to ensure inclusive and equitable quality education and promote lifelong learning opportunities for all. However, new evidence indicates that the world is falling short of achieving these targets by the set date of 2030 (Adebayo, 2022; UNESCO, 2020). One crucial aspect hindering the progress of SDG 4 is the challenges faced by teachers who play a vital role in realising the goals. In multilingual and diverse classrooms, educators are struggling to meet the diverse needs of their students (Adebayo and Chinhanu, 2020; UNESCO, 2019). These classrooms are characterised by a wide range of languages spoken, varying cultural backgrounds, and unique learning requirements, making it increasingly challenging for teachers to provide inclusive and equitable education.

The demands placed on teachers to accommodate diverse learners require specialised skills and knowledge that many educators currently lack. Inadequate training and resources often leave teachers ill-equipped to effectively engage students from different linguistic and cultural backgrounds. This deficiency in teacher preparation directly impacts the quality of education and hinders progress towards achieving SDG 4 (Adebayo, 2022; UNESCO, 2020). To address this pressing issue, it is crucial to invest in comprehensive teacher training programs that equip educators with the necessary tools and strategies to effectively teach in multilingual and diverse classrooms. By empowering teachers with the skills to navigate cultural and linguistic diversity, we can create inclusive learning environments that cater to the unique needs of every student.

Following the above, we posit that the development of anti-bias education and competencies for teachers is crucial for education systems worldwide to ensure that all learners have access to equitable and quality education. According to Killoran and colleagues (2004: 150), "many teachers only scratch the surface of what a true anti-bias education should be." Therefore, we argue that anti-bias knowledgeable teachers can be considered 'quality teachers' in this contemporary era (Adebayo, 2019).

Furthermore, anti-bias education is crucial to an inclusive learning environment (Dash and Peters, 2021; Derman-Sparks and Edwards, 2019; Vandenbroeck, 2007). Therefore, we cannot genuinely have an inclusive teaching and learning environment without anti-bias education. Apart from adding richness to students' learning experience, anti-bias education has many benefits, and they include the following:

– Anti-bias education develops students' skills to think critically and be culturally aware to recognise, acknowledge, and confront discrimination and bias personally, institutionally and within the society at large.

− Anti-bias education helps students in developing intercultural relationships by embracing cultural diversity.

− Anti-bias education commits teachers and educators to the emotional and cognitive development of all students, irrespective of their cultural values.

− Anti-bias education creates room to support the development of students' self-confidence and identity by recognising, acknowledging and celebrating cultural diversity and differences.

How is anti-bias education connected to inclusion?

Anti-bias education connects to inclusion because it promotes interaction between children who are different from each other. Instead of shying away from and being uncomfortable with these differences, an environment is created where these differences are accepted, understood, and celebrated. At the same time, children are taught that society does not treat or value everybody in the same way, precisely because it does not embrace the differences in identities. Anti-bias education helps children grow up with a better understanding of themselves, others, and society in general and − hopefully − a more inclusive mindset. Anti-bias education is based on the same values as inclusion. It can be seen as a practical approach to inclusion. One big question that teachers have regarding inclusion is often "But how exactly can I do it?" Anti-bias-education provides an answer to this question.

Why should anti-bias education be an essential part of teachers' everyday work?

It is essential that teachers make anti-bias education part of their everyday work because students cannot just leave their social identities at the door. There is a very institutional element to discrimination and marginalisation, and unfortunately schools are no exception. Without an anti-bias approach, we are not equipped to adequately recognise and respond to discrimination within the school. If a black student faces racism, we need to be able to acknowledge that, name it and act accordingly. Without the proper knowledge and tools, we might (accidentally) downplay situations in which students faced discrimination, or we might even subconsciously discriminate against students, making the classroom an unsafe environment. We might put or hold barriers in place that students must work hard to overcome or cannot overcome at all, giving them a disadvantage that could affect how they perform in school. For example, there is the possibility that we might overlook access needs or other ways in which we are unaccommodating, making education inaccessible for children with a disability. If we want to be fair to students and make sure they feel included and seen, anti-bias education is indispensable.

The anti-bias approach assumes that everyone has biases. It does not distinguish between "good" people who are not biased and "bad" people who are. Everyone has some

amount of unconscious bias. We might not think of ourselves as biased, or we might not know about our biases even though they are within us; that's the unconscious part. It happens quite often that we are biased towards people or towards certain groups.

We have grown up in societies with, for example, racist, sexist, ableist, or fatphobic ideas 'floating around' and they are part of our way of thinking, of the stories we tell ourselves as a society, of our languages, and the words we use. There are so many words which have hidden messages about certain people, and certain groups. Furthermore, these ideas, this bias, are also in our institutions and structures. We are all surrounded by these ideas from the first moment we are born. Research has shown that children "know" about differences and stereotypes when they are 3 to 4 years old and apply them in interactions with other children and other people in general (MacNaughton, 2006: 3, in German: Wagner 2009).

The problem with biases is: They influence how we perceive other people and their actions. In this way, they also influence our work with other people, whether we want to or not. It is important for everyone to learn about their unconscious bias, but it is especially important for teachers. Bias influences how we perceive people, how we perceive their actions and how we treat them. For example, bias impacts who we perceive as capable. Who do we think is capable of learning and doing certain things, and who might be seen as incapable?

When our biases are not conscious, it happens that we create barriers for students and their families without even realising it. So, we will unintentionally produce barriers for students which could harm their wellbeing and their chances for learning. It is also possible that we do not recognise barriers that already exist for them. Hence, if your bias remain unconscious you will not be able to do a good job as a teacher. Of particular importance is that from the perspective of anti-bias education, it is not possible to be "bias free", but it is possible to be "bias conscious." The German version of the anti-bias approach is called "Vorurteilsbewusste Bildung und Erziehung" and the word "vorurteilsbewusst" translates as "bias conscious." The idea is, thus, already in the wording of the concept (Derman-Sparks, 2010).

Another important thing to note is that becoming conscious about your own biases is a long, maybe even lifelong, process. It is not something that is done in a week of training.

Teachers need a certain knowledge, certain skills, to make their classroom more inclusive, to realise anti-bias education. The knowledge needed is different from what people often imagine it to be. Sometimes, teachers imagine they now have to learn about every disability that exists, or they have to know all the languages spoken in their classroom, and so on.

However, a different kind of knowledge is needed. For example: Teachers need to know about which differences exist in their society and how these differences influence people's experience of the world because we are not all experiencing it in the same way. Teachers need to know about inequality, about barriers that exist for some people, and privileges that exist for others, and also how privilege makes it really hard to perceive barriers. This

knowledge helps them understand why they might be able to perceive some barriers but not others. Teachers need to know how discrimination works and what form it can have, so they can detect discrimination when it happens at school. All this knowledge helps to identify barriers that affect or may affect students and their families. Only then can teachers remove the barriers and make it possible for all students to feel welcome, to feel seen and appreciated, to learn and develop well.

If we want to analyse situations or institutions so that we can work against discrimination, we need to know what discrimination can be, what it can look like, or else we do not recognise it.

However, the problem is, when we think about discrimination, we often think about a certain type of discrimination that happens in interactions between people. We imagine one person with bad intentions saying something discriminating against another person, or even becoming physically violent. However, discrimination is so much more than these situations. Many forms of discrimination are more subtle and are not so easily recognised, especially for people who are not affected by it.

For instance, these can be the so-called microaggressions. These are very small situations that seem harmless for someone not affected by it. However, for the people affected by it, they happen again and again and again, and become something that takes up a lot of energy and can be very hurtful and damaging. One example in Europe or North America is the question "Where are you from?" to people who are not white and are perceived as not coming from the country they are living in, even if they might have been born there. For some people this is a harmless question, but for others it is something they hear again and again in their life, and it comes with the message of "you do not belong here" and a feeling of being excluded. This is a form of microaggression that happens to people who are perceived as having a migration background, be it is because they have dark hair, maybe dark skin, but also maybe because they have a name that seems to be not, for example, German or Dutch or Swedish. There is a video explaining microaggressions and it uses the metaphor of mosquito bites. It says that some people get bitten once every so often, but other people get bitten by mosquitos several times every day and all these bites really add up, and it is really harmful for people affected by it (Fusion Comedy, 2016).

Turning back to discrimination in general, to put it in a nutshell can be very tricky: discrimination can even happen when we have really good intentions, and this can also happen at schools. Teachers may discriminate against students, their families, or colleagues while having the best intentions. For example, if a teacher has internalised the prejudice that disabled people are not as capable and competent as other people and therefore, gives a disabled student easier tasks, even though the pupil would be able to work on more difficult tasks, and able to learn more. It is not the intention of the speaker or the person doing things that decides if something is discriminating, but the effect it has on other people.

It is important to know that discrimination does not solely exist on a personal level.

Discrimination is also systematic and institutional. It can be woven into processes, how things get decided, into how things are done in institutions. If you do not know about these processes or instances, you cannot detect them in your classroom, or in your school, then discrimination just perpetuates itself and forms barriers for students.

An intersectional approach to realizing anti-bias education

Intersectionality is a way of describing how social identities such as race, disability, and gender intersect. Picture it as a crossroads where different identities come together, which causes specific forms of discrimination and marginalisation, such as mysoginoir (mysogyny directed towards black women). Intersectionality is crucial in anti-bias education, as a student can face more than one form of discrimination. In order to accommodate them accordingly and create an inclusive and safe environment, it is important to be aware of the fact that someone can be marginalised in more ways than one.

In this chapter, we use the work by Crenshaw (1991) on intersectionality, as well as by Derman-Sparks & Edwards (2010) and Derman-Sparks & Edwards (2019) on anti-bias education as a conceptual framework to address the "simultaneous intersections" (García and Ortiz, 2013) between languages, cultures, gender, race/ethnicity, (dis)ability, and socio-economic conditions. Indeed, diversity can be, and should be, conceptualised as "the broader array of multiple social identities", rather than (only) different abilities (García and Ortiz, 2013: 32). Derman-Sparks & Edwards's (2010; 2019) framework enables teachers to support each child to develop to their fullest potential.

People can be discriminated against or marginalised because of different dimensions of their identities. An immigrant female student's experiences of being bullied may be shaped by her being a girl and having a migrant background, and not speaking the local language well enough yet. Her experiences may become even complex if she has dyslexia, and if she has just moved from a country at war.

In this situation in real life, therefore, different discourses such as sexism and racism (and xenophobia and disablism) intersect. However, despite these realities, in feminist and anti-racist practices, these discourses are often not seen as intersectional (Crenshaw, 1991)

Crenshaw (1991) observed that in the response of activists to combat social injustices, it is often that the multiple dimensions of our lived experiences are treated separately. Feminists and anti-racist activists, for example, tend to view the discriminations and other disadvantages happening to a girl student of an immigrant background as if the issues are disassociated. Crenshaw argued that such a single-faceted approach that sees identity as girl/woman or person of colour or having poor language skills, and then responds to one or the other dimension, is in fact not effective. This is because it will cause such a student to be marginalised in all three dimensions: gender, racism, and languages/cultures (and/or disability, or class). Rather, an intersectional perspective and approach that goes beyond the traditional boundaries of separate discourses, and that recognises the student as

having intersectional identities and being affected by them, is necessary. This intersectional approach responds to all three dimensions, and therefore, will be helpful in understanding people's experiences and informing responses and practices.

As a single-faceted theoretical lens seems not comprehensive enough to address the complexities of social injustice discourses, teachers may want to adopt more intersectional approaches. These approaches help them understand the multiple dimensions of anti-bias education, attend to within-group differences, and start to employ it in the classroom.

Avoiding a deficit approach: 'microwave' anti-bias education

Within the context of anti-bias education, teachers need to understand the differences between equity and equality in education. While there are complexities around the two concepts, equity in education is how teachers respond to the specific needs of all students to ensure they access quality teaching and learning. On the other hand, equality is based on fairness, that is, treating all students the same (Adebayo, 2022). In other words, equality is 'giving everyone a shoe' while equity is giving 'everyone a shoe that fits' (Naheed Dosani).

A deficit approach to anti-bias education bases its implementation on a perspective that foregrounds students' problematic sociocultural background to argue for their poor academic performance (Vandenbroeck, 2007). This particularly concerns students from marginalised or culturally diverse backgrounds. In other words, a deficit approach personalises failure, i.e., when educators believe that if students work harder, there will be no need for anti-bias education. This approach to anti-bias education must be avoided to ensure that all students have access to equitable and quality education, irrespective of their sociocultural background. Anti-bias education is for all students. We can avoid a deficit approach to anti-bias education by taking it as a school-wide commitment that adds richness to the learning experiences of all students (Dash and Peters, 2021).

A US-based educator named Cornelius Minor came up with the term 'Microwave Equity,' which is explained as a situation in which teachers and educators attempt to quickly reach the goal of equitable education for all learners. Mirroring this idea, one may also identify 'microwave anti-bias education' when educators intend to achieve the goals of anti-bias education within a short time. However, both are not possible because equitable education for all, and truly implementing anti-bias education require patience and a substantial investment of time (Adebayo, 2022). The real work towards anti-bias education is a lifelong process that requires the continuous investment of resources and efforts to create an anti-bias teaching and learning environment. This is why Dash and Peters (2021: 59) strongly emphasise that educators working towards anti-bias education should continue to ask themselves: "Are we doing the right thing?"

An intersectional framework for classroom anti-bias education

As indicated above, anti-bias education is based on the value that differences are good,

and differences need to be respected and celebrated (Derman-Sparks et al., 1989; Derman-Sparks & Edwards, 2010; 2019). However, the framework is also action-oriented: it enables teachers and students to identify and confront unfair beliefs and behaviour. In particular, Derman-Sparks & Edwards (2010; 2019) discussed the four goals of anti-bias education which include the dimensions of identity, diversity, justice, and activism.

Goal 1: Identity: This goal is seen as the starting place for all children, in all contexts. Derman-Sparks & Edwards (2010; 2019) proposed that each child shall have the opportunities "to demonstrate their self-awareness, confidence, family pride, and positive social identities" (Derman-Sparks & Edwards, 2019: 7). Children are able to confidently express who they are, while respecting who others are. They are also able to positively describe their social or group identities (for example, gender, racial/ethnic, cultural, language, religious, and socio-economic class groups) without being superior, or inferior, to others (Derman-Sparks & Edwards, 2010; 2019).

Goal 2: Diversity: With this goal, children are able to "express comfort and joy with human diversity, use accurate language for human differences, and form deep, caring connections across all dimensions of human diversity" (Derman-Sparks & Edwards, 2019: 7). Children learn to understand the differences, as well as similarities, between themselves and others, and use that   to treat each other in a caring and just way (Derman-Sparks & Edwards, 2010; 2019).

Goal 3: Justice: This goal helps children develop a sense of fairness and justice. They will "increasingly recognise unfairness (injustice), have language to describe unfairness, and understand that unfairness hurts" (Derman-Sparks & Edwards, 2019: 8). Children learn to empathise with others, but also to engage in critical thinking in order to identify negative, hurtful, unjust practices around them. These can be in the form of ideas and attitudes (for example stereotypes), comments (for example teasing, shaming), and behaviour (for example exclusion, discrimination) (Derman-Sparks & Edwards, 2010; 2019).

Goal 4: Activism: This goal aims to enable children to stand up to unjust ideas, attitudes and behaviour, and act against injustice: "children will demonstrate a sense of empowerment and the skills to act, with others or alone, against prejudice and/or discriminatory actions" (Derman-Sparks & Edwards, 2019: 8). Children learn to take perspective, perform positive interactions with others, resolve conflicts, and create a fair classroom environment (Derman-Sparks & Edwards, 2010; 2019).

Derman-Sparks & Edwards (2010; 2019) emphasised that the four goals are interconnected and all of them should be continuously incorporated into the curriculum and daily educational practices. In realising the four goals of anti-bias education, the role of teachers is to encourage and nurture students' construction of identities, perspectives, and the ability to take action. It is important, therefore, for teachers to observe and listen to students' questions, thoughts, and ideas, to be aware of the hurtful biases, stereotypes and misinformation that students are exposed to, to look for 'teachable moments' – where teachers see the opportunities to expand students' thinking, to help them further develop

knowledge and understanding, and to plan the curriculum and teaching accordingly. Anti-bias education should be a combination of student-initiated activities, teachable moments, and teacher-initiated activities (Derman-Sparks & Edwards, 2016; 2019).

How can teachers implement anti-bias education in the classroom?

Embracing and implementing anti-bias education is a process, and entails challenges (Derman-Sparks et al, 1989). However an awareness of, and a sensitivity to, emotions, attitudes, beliefs, identities, as well as stereotypes, biases, and even discomfort (Nganga, 2020) will be a starting point for teachers. In what follows, we suggest implications for anti-bias education, classroom tools and inspirations for teachers that may help them in this process.

Creating opportunities for students to express their identities

As establishing a confident, strong sense of personal and social identities serves as the foundation for students to continue to achieve the next three goals of anti-bias education (Derman-Sparks & Edwards, 2010; 2019), teachers can help create as many opportunities as possible for students to express who they are with confidence. Ice-breaker activities that allow students to introduce themselves, their family, and backgrounds can help students start talking about their identities in a natural context. For example, an activity called "The meaning of my name" can be an engaging homework activity. When discussing that homework in the class, the teacher can start by explaining their name first: what it means, what it means in their family, and what it means to them, personally; then students, in pairs or small groups, can talk about their names. This activity can especially be relevant and meaningful for a culturally and linguistically diverse classroom and can be a good start to introduce plurilingual and intercultural competence. Students can also creatively express their identities, something special and unique about themselves, what they like, what they dislike, through narrative and creative writing (free writing, story, poetry), and by using multimodality (for example combining talking, writing, drawing, dancing, and acting). These activities can accommodate students' different needs, interests, abilities, and language capabilities. Regarding identity expression, Derman-Sparks, Edwards, and Goins (2020) suggest that teachers can also use materials as a tool to make all students feel welcome; for example, by including images of people from diverse groups and backgrounds in the materials.

Supporting students in respecting and celebrating differences

Teachers can help students change their attitudes towards differences: often differences are the cause of discrimination. Students will understand that each person is unique – they have unique traits, appearance and physical features, and different opinions and ways of thinking; and these differences in their personal and group identities must be respected. More than that, these differences can also be regarded as positive because they help widen and enrich one's knowledge, experiences, and world views. At the same time, students

also need to learn about how they are similar to others (Derman-Sparks & Edwards, 2016), so that they can relate to, and connect with, each other. This can be done by teachers asking students to share their prior experiences, for example, in solving a problem, or in dealing with a real-life situation or dilemma that is relevant to their contexts. Discussion activities that encourage students to express their personal thoughts and opinions can also help students learn to respect differences, for example, traditional music from different countries, or the paralympics can be possible topics.

One helpful strategy identified by Derman-Sparks, Edwards, & Goins (2020) is that teachers go through their teaching materials and critically check if they represent diversity fairly and accurately, and if there are possible hidden biases and stereotypes. For example, a gender perspective (Sadker & Silber, 2007) can be used to critically detect if housework is always associated with girls and women and not boys and men (stereotype bias), or if all astronauts are portrayed as men (selectivity bias). Critical multiculturalism can be a lens for teachers (Nganga, 2020; Yu, 2020) to investigate if some particular ethnic groups, cultures, or languages are portrayed as dominant or invisible, privileged or marginalised, or in stereotypical ways.

Extra-curriculum activities can also be designed on themes of diversity, for example, a theme day on the topic of multilingualism (How many languages can students speak at our school?) can generate discussions on languages, cultures, and history. Students are to be encouraged to share their own knowledge and experiences in learning more about other cultures as well as their own cultures.

Teaching students about empathy

Empathy is the ability to imagine oneself in another person's situation and having understanding and feelings towards their experiences – in other words, changing perspectives to put oneself in other people's shoes. Research (Athanases & Sanchez, 2020) has shown that drama-based pedagogy can help students develop empathy and be engaged in social justice-oriented discussions. Teachers can make use of role-play and other drama-based activities to help students relate to others' thoughts, feelings, and experiences. This will enable them to empathise with others and to see the world from different perspectives. Drama-based teaching, possibly done in small groups, can be beneficial for a diverse classroom, because the approach is inclusive in itself: it allows students to explore, express, and learn in varied, non-conventional ways. Besides drama-based pedagogy, experiential learning can also be implemented to teach students about empathy, for example, thematic days on different forms of impairment can be organised at schools, where people with disabilities are invited to be speakers. Students can visit the home of people with disabilities, so they better understand their challenges and lived experiences.

Promoting students' critical thinking

To promote students' critical thinking, teachers may choose a critical approach to

teaching, where self-reflection and critical thinking are considered. When working with reading and literature, teachers may ask questions that activate reflective discussions.

Escayg (2019) suggested that anti-bias education on the topic of race can be introduced to even young children by teachers asking questions to help them first deconstruct the system of racial ideologies, power and privilege in everyday life. Based on the responses from students, teachers can then ask students to consider if this system is fair to everyone.

Helping students develop a sense of fairness and justice

Although it is not always easy to define what is 'fair' and 'just', teachers may introduce students to essential values such as democracy and human rights, and that aggressive and discriminated attitudes, words, and behaviour including isolation, rejection, and exclusion, can be as hurtful as physical aggression and violence is. Teachers may invite students to express their thoughts and opinions about statements or situations overshadowed by societal inequalities and injustice.

Teachers also need to be explicit when dealing with injustices. As mentioned earlier, children even at an early age can become involved in (race- and ethnic-based) verbal and physical bullying towards their peers (Yu, 2020). It is suggested that teachers should explicitly bring in racial and ethical issues into discussions with children. This can be done, for example, by discussing with the children concepts such as stereotype and bullying, and not just stop at vague scolding such as "being mean" or "disrespectful towards others" (Yu, 2020).

Another way to help students start to engage in the questions of fairness and justice is to support them to approach one problem from as many perspectives as possible. Thus, students will learn to be open-minded, and adopt multi-angled views rather than only one-sided views. Problem-solving and debate activities can be helpful for this purpose. Additionally, teachers can provide students with comprehensive information about particular groups (why helping them be aware that identities are fluid and dynamic) and encourage them to learn to critically evaluate the information they receive.

Facilitating students to respond to injustice issues

In helping students to become activists, to stand up to unfairness, inequality, and injustice, it is important that teachers are their role models. Teachers need to be aware of their own bias and implement anti-bias education, values and principles in their daily practices.

At the same time, teachers can enable students to actively participate in creating a fair, tolerant classroom environment. Students can also learn to resolve possible conflicts. Restorative justice approach is a mediation method implemented in several countries (Reyes-Quilodran, LaBrenz, & Donoso, 2019) where students learn to build peace by acknowledging and owning their mistakes. In order to do that, students need to know the necessary language and communication skills in conflict-resolution. For example, when an incident happens between students, teachers talk to each involved party separately first,

then call a conference where all parties talk about what has happened, listen to each other, reflect on their actions, acknowledge their mistakes, and apologise.

Democratic education can also be an approach to empower students to respond to injustice. Students' voices can be heard through student committees, where they can raise and discuss issues. Schools and teachers can provide opportunities for students (for example by using surveys, polls, forums, and in-class discussions) to express their opinions and wishes to actively contribute to the curriculum goals and content, as well as how this content is going to be taught.

In all cases, it is important for teachers when implementing anti-bias education in their classrooms to remember that all forms of support and intervention need to be closely linked to the realities of children's lives, and thus their needs (Derman-Sparks & Edwards, 2019).

Building relationships and partnerships with parents for anti-bias education

Engaging parents in the educating of their children is vital for developing anti-bias education. Some ways educators or teachers can build relationships with parents include teachers making the first move in building trust with parents. This is particularly relevant for parents of minority ethnic migrant backgrounds who may not be familiar with the host country's school system. This may result in these parents being timid and not effectively engaged in their children's schooling. Secondly, teachers can find out what culturally diverse parents value in terms of engagement and activities and outcome. It is crucial for teachers to see parents as a vehicle to understand their children's background. Thirdly, teachers can personally invite parents and use phone conversations and in-person encounters instead of letters or emails, which can be a huge barrier for parents with weak proficiency in the host country's language of instruction. This will help teachers build a cultural knowledge base useful for effective teaching in culturally diverse classrooms.

Conclusion

In conclusion, implementing anti-bias education in the classroom is a critical endeavor that requires a multifaceted approach. By embracing strategies such as creating opportunities for students to express their identities, supporting students in respecting and celebrating differences, teaching empathy, promoting critical thinking, fostering a sense of fairness and justice, facilitating students to respond to injustice issues, and building relationships and partnerships with parents, teachers can create inclusive and empowering learning environments.

By valuing and affirming students' diverse identities, teachers lay the foundation for respectful and inclusive classrooms. Encouraging students to share their experiences and perspectives helps promote understanding and empathy among peers. Through activities that challenge stereotypes and biases, teachers can foster an appreciation for differences and promote a sense of belonging for all students.

Promoting critical thinking enables students to question and challenge societal

inequalities and injustices. By providing accurate information and encouraging students to critically evaluate the world around them, teachers empower students to become active participants in creating a more equitable society. Furthermore, it is crucial for teachers to model anti-bias principles in their own practices and engage in ongoing self-reflection to address their own biases. Building strong relationships with parents and involving them in the educational process enhances collaboration and cultural understanding, ultimately benefiting the students.

Incorporating anti-bias education into the classroom is a continuous and evolving process. It requires teachers to be open-minded, adaptable, and committed to ongoing learning. By embracing these strategies, educators have the power to create inclusive spaces where all students feel valued, respected, and equipped to navigate an increasingly diverse world. Through their efforts, teachers play a vital role in shaping a more equitable and just society for generations to come.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

Choose three to four of the following tasks:

- How do you think your own biases could influence your approach to teaching? Can you think of a moment where you might have acted on a bias, even unconsciously? How would you address this in the future?
- What practical steps can you take as a teacher to create an inclusive and equitable classroom environment? How would you ensure that all students feel seen and valued?
- How can empathy be cultivated among students in a way that supports anti-bias education? Share an example of an activity or strategy that might help students develop empathy.
- How can understanding intersectionality help educators address the diverse needs of students in their classrooms? Provide a hypothetical example where an intersectional approach could improve a student's experience.

- How can teachers help students critically evaluate stereotypes and biases they encounter in daily life? Can you think of a classroom activity that would achieve this goal?
- What challenges do you anticipate when implementing anti-bias education in a classroom? How might you address these challenges?
- Considering that anti-bias education is a lifelong process, how can schools create a culture that continuously supports this approach among staff and students?
- How can teachers effectively involve parents from diverse backgrounds in anti-bias education? What strategies might you use to build trust and collaboration with families?
- Discuss the difference between equity and equality in education. Why is equity essential in an anti-bias approach, and how can it be achieved in a classroom setting?
- How can educators empower students to become active participants in challenging injustice within and beyond the school environment?
- What role should teachers play in modeling activism?

About the authors

Ira Schumann

Ira Schumann works on the topic of inclusive school development at the University of Bremen. She also gives workshops on topics such as inclusion, diversity, racism/critical whiteness and fat acceptance/fat liberation.

Mai Trang Vu

Mai Trang Vu is Associate Professor of TESOL Teacher Education, Department of Language Studies, Umeå University, Sweden. Her teaching and research areas include teacher education, teacher professionalism, teacher knowledge, critical pedagogy, and education policy. She has also conducted research on inclusive education, gender, and internationalisation.

Hazar Chaouni

Hazar Chaouni is a passionate disability rights advocate and a member of Feminists Against Ableism, an intersectional disability justice collective. She actively advises organizations on inclusive policies and accessibility, working to ensure that spaces and practices are inclusive and just for all. Through her essays, workshops, and speeches, Hazar aims to create awareness about disability and ableism, promoting intersectional justice and systemic change. Her advocacy is deeply rooted in her personal and professional experiences, and she emphasizes the importance of the principle "nothing about us without us" in all her work.

Seun Adebayo

Dr Seun Adebayo has over 10 years of experience and a diverse background in global education, equity and quality education, EdTech, research and policy advocacy. His dedication lies in cultivating transformative learning journeys that transcend barriers and amplify possibilities, particularly for learners from marginalized communities. His journey encompasses collaborations with international organizations, steering curriculum improvements, and integrating technology to establish an educational landscape that is both inclusive and poised for the future. His passion revolves around ensuring education's accessibility, equitability, and readiness for all.

PART II
SECTION 2: SUPPORTING INCLUSION IN THE CLASSROOM AND BEYOND

NEUROINCLUSION: A SCHOOL COMMUNITY APPROACH

Example Case

"Imagine a neurodivergent child arriving at school on a Monday morning. For them, the transition to the classroom after a hectic weekend feels difficult. In the chaos of the morning rush, they have forgotten to bring their lunch, and one of their socks is on inside out. On mornings that run more smoothly, this child comes to school well-rested and ready to work. Today, however, they feel tired.

As teacher hands out a worksheet, they describe what they would like the class to do. The child does their best to listen and remember each demand because they want to do well in school even when they are tired. Teacher explains that they want to see each child holding their pencil correctly, not talking to the person seated beside them, and sitting quietly in their chair. The neurodivergent child begins to worry; holding the pencil "correctly" means that their hand gets tired very quickly, and sometimes they find it easier to read when they whisper to themselves. In addition, the neurodivergent child is seated in a squeaky chair, which means they cannot tap their foot and sit quietly at the same time. On top of this, the neurodivergent child notices that teacher's handout has crowded text, which is more difficult for them to read. As their sense of worry grows, the neurodivergent child becomes increasingly aware of the other people around them. They do not want to seem "weird", so they try to calm down and focus. Teacher then says, "Okay, class. Let's begin with a simple task. Correct the misspelled words on the handout".

One way to understand this child's experience is by using the metaphor of a capacity jug. This morning, the child had a smaller capacity jug than they normally would, meaning that their capacity jug became full quite quickly. And, with all of the demands, the teacher's "simple" task could not fit neatly in their capacity jug; the "simple" task causes it to overflow. Yet, the child's day does not end there. We can imagine how the rest of their day might go as they struggle to tolerate keeping their collared shirt buttoned up, as their friend chats with them about their favourite TV show, as the various school bells sound for lunch times, as they go to the sweet shop on their walk home from school. We can imagine their capacity jug growing and shrinking, becoming more or less full depending on the situation and task at hand. We might also notice times when a task did not need to entail so many demands and could have filled the capacity jug less.

There are many variants of this metaphor, however, this version is adapted from Holly Sutherland (2023). The point is that each of us has a capacity jug, with different demands filling our jugs in different ways. This chapter focuses on neuroinclusion and how communities might create a neurodivergent-friendly ecosystem that helps us all to gently expand our capacity jugs, to notice what fills them, and to notice times when demands can be reduced to prevent our capacity jugs from overflowing.

Figure 1 Title: An overflowing capacity jug does not have space for a supposed "simple" task.

Correct misspelled words

"Don't be weird"

Crowded text

Squeaky chair

No talking

Pencil grip

Initial questions

In this chapter you will find the answers to the following questions:

1. What is neurodiversity?
2. Why are neurodiversity movements necessary for neuroinclusion?
3. How might we create a neurodivergent-friendly ecosystem?

Introduction to Topic

The diversity within neurodiversity: A preface

Building on Steven Kapp's (2020) discussion of the diversity within neurodiversity, we would like to acknowledge that there are many ways to approach the concepts covered in this chapter. We would also like to acknowledge that because many people care deeply about this topic, and because this topic can require using new terminology, it can feel risky to engage. Importantly, the meaning of many concepts outlined in this chapter is evolving (Patrick Dwyer, 2022). In addition, conceptualisation and language preferences differ across contexts, as do individual preferences. Therefore, we would like to emphasise that we are not saying ours is the "correct" way to approach this topic. Rather, aligning with Robert Chapman (2020, p.219), the present approach is one we have found to be "epistemically useful" and invaluable in our practices. We are sharing our views at this point in time in the hopes that they help to resource and nurture neuroinclusive communities.

What is neurodiversity?

Collectively developed through the 1990s and 2000s (Monique Botha et al., 2024), in a descriptive sense, "neurodiversity" refers to the fact that all human nervous systems work differently (Steven Kapp, 2020). This means that each of us experiences the world in different ways, and thus we act in different ways. From this perspective, neurodiversity is a subset of biodiversity and a biological fact (Steven Kapp, 2020). The existence of terms like autism, attention deficit hyperactivity disorder (ADHD), dyslexia, and more may be attributed to this fact. If each of our nervous systems worked in the exact same way, then we would not have terms to describe differences from supposed norms (neurodivergences); these terms are a consequence of the fact of neurodiversity. As a concept, neurodiversity includes all types of nervous systems (neurotypes).

Being neurodivergent means having a nervous system that works differently from what is considered "normal". Importantly, there is no consensus on who is considered neurodivergent (Steven Kapp, 2020). For example, sometimes the term "neurodivergent" is used to exclusively refer to people with neurodevelopmental differences (e.g., autism) and not people who have an acquired brain injury or trauma. This chapter does not impose limits on the meaning of "neurodivergent" and instead, aligning with Steven Kapp (2020), invites readers to identify and organise within neurodiversity movements at their own discretion.

If you are not neurodivergent, then you are neurotypical (i.e., neurotypical people have nervous systems that work in "normal" ways). The only way to identify someone as neurotypical is by ruling out all forms of neurodivergence. Therefore, it is best practice to not assume that someone is neurotypical. Some scholars and advocates suggest that neuronormalised may be a more appropriate term than neurotypical and that neurominoritised may be a more appropriate term than neurodivergent. Amandine Catala

(2023) argues that these alternative terms decenter socially accepted (neuronormative) points of reference and serve to highlight the social positions created by the associated power relations. In simpler terms, although neurodiversity is naturally occurring, the way we "judge" neurotypes is not. Instead, what we consider "normal" depends on our context (i.e., which neurotype has more power). So, from this perspective, being "neurodivergent" means having less power in that context. Approaching these concepts in this way can be pragmatically useful because it allows us to distinguish between people who are likely harmed by existing systems versus not. However, given the risk of conflating "being neurodivergent" with "experiencing disability", and given that the terms "neurodivergent" and "neurotypical" are more commonly used, neurodivergent and neurotypical are used throughout this chapter.

What is a neurodiversity paradigm?

A neurodiversity paradigm is an application of neurodiversity at a conceptual level. Nick Walker's (2021) neurodiversity paradigm contains three fundamental principles:

1. Neurodiversity is a naturally occurring, valuable form of human diversity. This means that (i) neurodiversity is not something we create artificially, and (ii) strength is a collective property of diversity; the fact that we are all different is a strength.
2. "Normality" is a social construct. Just as there is no "correct" ethnicity or gender, there is no universally "correct" nervous system. No one "way of being" (neurotype) is inherently better than any other.
3. Neurodiversity operates like other dimensions of equality and diversity, such as ethnicity or gender. This means that neurodiversity is subject to the same types of social dynamics (e.g., privilege and oppression). For this reason, it can be helpful to approach and affirm neurodiversity similarly to the ways we approach other dimensions of human diversity.

To illustrate the principles of Nick Walker's (2021) neurodiversity paradigm, consider the following metaphor (adapted by Alison Stapleton from Alyssa Alcorn et al.'s (2022) woodland metaphor):

Imagine a rainy garden that has lots of plants, specifically one lantern plant, two rose bushes, three viola tricolors, and lots of iris plants. Too many iris plants to count! In fact, most of the plants in this garden are iris plants. In this garden, we can see all three tenets of Nick Walker's (2021) neurodiversity paradigm operating.

First, the variation between plants is an inherent property of the biodiversity in the garden; by nature, each plant is unique. For example, no two iris plants lean in exactly the same way or have the exact same patterns on their leaves. And yet, even though all plants differ, it is

helpful to use the term "iris" to refer to the class of iris plants. We can also see the strength that comes from diversity; the garden is a rich and varied oasis rather than being home to just one type of plant.

Second, all plants in this garden have equal value. We would not say that the lantern plant is inferior to the iris plant, nor would we berate the lantern plant because it did not grow long green leaves like an iris plant. The lantern plant has equal value as a plant. Whether a plant is thriving depends on its environment. For example, lantern plants are prone to root rot if overwatered. This means that it is difficult for the lantern plant to thrive in the rainy garden. Similarly, the garden has snails that eat rose bush leaves, so the roses cannot thrive. This particular garden is also home to a dog that enjoys eating viola tricolors, so those plants cannot thrive.

Finally, we can see that iris plants are in the majority. By default, environments tend not to serve minority groups. Unlike the minority plants, iris plants thrive with lots of rain and are rarely targeted by snails or the dog. Hence, iris plants thrive in the garden because they do not experience the same stressors as the minority plants; the same garden environment is experienced in different ways. So, rather than blaming a plant for not thriving, we can instead shift our focus to plant-environment fit. How can we change our garden so that all plants have maximum opportunities to thrive?

In the same way that each plant is unique in the garden metaphor, each person is unique; even people who share the same neurotype are not the exact same. Yet, it can be helpful to provide people with labels to describe shared ways of experiencing the world (Juwayriyah Nayyar et al., 2024); terms for describing neurotypes can be useful. Similarly, just as the minority plants experienced stressors, neurominorities experience minority stressors such as everyday discrimination and internalised ableism (Monique Botha & David Frost, 2018). In line with minority stress theory, these stressors, including the demands of neuronormative standards (e.g., "you must make eye contact when listening to me"), increase neurominorities' risk of poorer health outcomes (Monique Botha & David Frost, 2018). Importantly, in this context, "minority" and "majority" do not merely reflect differences in numeric quantity. Instead, these terms are intended to highlight differences in power.

In terms of applications, rather than blaming a neurodivergent child for struggling/not thriving, the outlined neurodiversity paradigm allows us to add the environment to our analysis. Attending to person-environment fit offers teachers alternative pathways for supporting neurodivergent children; what can we change in our classrooms so that all children have maximum opportunities to thrive? In this way, teachers can embrace neurodiversity paradigms (be neurodiversity-affirming) and advance neurodiversity movements (be neuroinclusive).

What are some myths and misconceptions about neurodiversity?

If we adopt neurodiversity rhetoric without an understanding of the associated movements and paradigms, then we risk failing to achieve its transformative potential, impeding meaningful change, and/or causing active harm (Dinah Aitken & Sue Fletcher-Watson, 2022). Common myths and misconceptions about neurodiversity and its associated paradigms include:

Myth 1: "When we talk about neurodiversity, we are not talking about the entire human population, rather we are talking about a subset of neurodivergent people".

This is a myth because neurodiversity includes everyone, and, as outlined, neurodiversity is not a synonym for "being neurodivergent". If we apply neurodiversity to just a subset of the human population, then we risk merely replacing dominant terms with neurodiversity rhetoric rather than enacting meaningful system-level change. We also risk reinforcing stigma, further ossifying "us-them" (neurotypical-neurodivergent) categories, and centering neurotypical experiences. In order to push back against stigma, we need a language that includes everyone; neurotypical people are not outside of neurodiversity.

Myth 2: "Neurodiversity is only about celebrating neurodivergent talent".

Although it is important to identify, celebrate, and nurture an individual person's strengths, focusing on individual talents alone does not fully realise the potential of neurodiversity. Relatedly, "superpower" narratives that stereotype neurodivergent people as having special talents may also result in exploitation and reflect performative activism (Patrick Dwyer et al., 2024).

Rather than just centering neurodivergent talent, neurodiversity paradigms can allow us to understand the differences between people as a source of strength. For example, Harriet Axbey et al. (2023) found that, in comparison to neurotype-matching pairs, neurotype-mismatching pairs (e.g., one autistic person and one non-autistic person) worked more creatively when completing a task together.

Relatedly, if we are truly valuing people equally, whether they have a talent is irrelevant; we all have equal value regardless of our strengths and support needs. A failure to frame strength as a collective property risks pressuring neurodivergent people to outperform their peers or somehow compensate for being neurodivergent. It also risks reinforcing systems that value people only by their grades or productivity (Dinah Aitken & Sue Fletcher-Watson, 2022). Critically, who decides what "talents" are? What happens to children who believe that they do not have any talents? How different might our communities be if everyone believed that they had value simply because they were a member of the community?

Myth 3: "Neurodiversity erases the struggles of neurodivergent people".

When we argue that a neurotype is not solely characterised by deficits, that does not mean that we ignore experiences of disability. Embracing neurodiversity movements can involve identifying ways to improve person-environment fit rather than solely framing problems as being located within individual people. In this way, it is possible to reject deficit-focused labels while also attending to experiences of disability. As a movement, neurodiversity can be both needs-affirming and rights-respecting. As Dinah Aitken and Sue Fletcher-Watson (2022) note, "the word difference should point us to acceptance of needs without judgement, rather than denial of needs without support".

Importantly, there are debates about the extent to which neurodiversity movements represent the needs and interests of neurodivergent people who have relatively higher support needs (Jonathan Green, 2023). However, the movement is intended to include everyone; it is important to continually decenter dominant perspectives and ensure all neurotypes are represented.

Related to assertions that embracing neurodiversity erases struggle, sometimes neurodiversity-affirming practice is framed as necessitating a total rejection of conceptualisations of neurodivergences as "disorders" and "deficits" rooted in biology (medical models of disability). Aligning with this, Patrick Dwyer et al. (2024) found that, in a sample of 504 adults with a connection to autism (278 autistic, 226 non-autistic), neurodiversity movement support/identification predicted lesser endorsement of medical models. Yet, Julia Knopes (2024) reported that neurodivergent people's understanding of their lived experience indicated ambivalence towards medical and neurodiversity models, concluding that "rather than imposing one model of disability over another, we might instead pause to consider how people apply different models to appreciate different aspects of their day-to-day lives" (p.27). For teachers, this might mean respecting an individual child's way of understanding themselves and not limiting the child's narrative to one of strength and difference.

At times, depending on the jurisdiction, teachers may be asked to contribute to identification processes for neurodivergent children. In contexts where neurodivergent children are identified solely per pathologizing models and where formal identification is required for access to accommodations and support, it is particularly important for teachers to name children's struggles. By reporting on struggles honestly and gently, with respect and compassion, teachers can help neurodivergent children and their families to access effective support as needed and wanted.

Myth 4: "Being neurodiversity-affirming means anything goes."

In the context of rights-respecting movements, neurodiversity does not mean that "anything goes" (i.e., that there are no boundaries or rules). Being neuroinclusive means facilitating the cohabitation of all neurotypes, not prioritising one form of needs/preferences over

others. Everyone must be aware of the multiple intersections that they occupy and reflect on whether they are using their power in ways that harm others who have less power. Being neuroinclusive means asking questions like, what can I change in this environment to make it safer and more comfortable for everyone?

3.5 The present chapter

This chapter employs a participatory approach and reflects a collaboration between neurodivergent and neurotypical professionals and advocates. In this chapter, we explore why neurodiversity movements are necessary for neuroinclusion and how communities might create a neurodivergent-friendly ecosystem. We adopt a needs-affirming, rights-respecting approach and aim to cultivate neuroinclusive communities that affirm and accommodate all neurotypes.

4. Using Bronfenbrenner's Ecological Systems Theory to Conceptualise the Community

Urie Bronfenbrenner's (1979; 1986) ecological systems theory (EST; later termed the "bioecological model") suggests that children's growth and development are influenced by a set of interconnected environmental systems, namely the microsystem (e.g., teacher-child interactions), mesosystem (e.g., teacher-parent interactions), exosystem (e.g., disability organisations), macrosystem (e.g., neuronormativity), and chronosystem (e.g., neurodiversity movements). Bronfenbrenner depicted these systems as concentric circles, with each system arising from "a place where people can readily engage in face-to-face interaction" (Urie Bronfenbrenner 1979, p.22). EST emphasises the importance of studying a child in the context of multiple ecological systems in order to fully understand their development. As such, the EST framework presents the child at the centre surrounded by influencing subsystems of the environment, the most influential and intimate of which is closest to the child. EST helps us to understand that children and their families do not exist in isolation but rather are embedded into a larger social structure interconnected with other institutions and domains which can indirectly impact the immediate environment of the child. And, from this perspective, development arises as a result of reciprocal processes between a developing child and their systems. For this reason, we argue that a neurodiversity-affirming systems approach is necessary to cultivate neuroinclusion.

Why are Neurodiversity Movements Necessary for Neuroinclusion?

Neurodiversity movements can help us to decenter medical models of disability.

We can reframe supposed "deficits" as differences or strengths.

Historically, medical models of disability have been viewed as oppressive (Andrew Hogan, 2019). At an ideological level, medical models have been described as "personal tragedy models" because they tend to frame disability as "something to be pitied, a personal tragedy

for both the individual and [their] family" (Licia Carlson, 2010, p.5). As conceptualisation frameworks, medical models approach forms of neurodivergence as "disorders" and "deficits" rooted in biology that should be cured, prevented, or suppressed. From this perspective, forms of neurodivergence are viewed as "pathological" deviations from "normal" human species functioning that directly lead to the experience of disability. Hence, medical models can be understood as placing the "problem" solely within neurodivergent people.

Many people believe that the goals and attitudes of neurodiversity movements and medical models are dissimilar (Patrick Dwyer et al., 2024). And, depending on how one defines "neurodiversity", this may be true (Ari Ne'eman and Elizabeth Pellicano, 2022). Yet, mandating a total rejection of medical models may reflect an epistemic injustice (Julia Knopes, 2024), and some neurodiversity approaches aimed to offer a middle ground between medical and other models of disability (Patrick Dwyer, 2022). Hence, rather than imposing a singular model of disability through which neurodivergent people must understand their own experiences, being neurodiversity-affirming may require creating space for multiple types of stories, including those stemming from medical models (Robert Chapman, 2021).

Across contexts, many professionals rely on medical models of disability. For example, many neurodivergent people are identified per the Diagnostic and Statistical Manual of Mental Disorders – 5th Edition (DSM-V; American Psychiatric Association, 2013) and the International Classification of Diseases (ICD-11; World Health Organization, 2022). Neurodiversity movements provide an opportunity to decenter dominant approaches to neurodivergence, including those grounded in medical models. Extending beyond traditional medical models, adopting a neurodiversity-affirming stance allows us to attend to person-environment fit. Rather than asserting that a neurodivergent person just needs to be "fixed", we can expand our lens to include the environment, since the "problem" may be that it is unaccommodating and unaccepting. In addition, rather than pathologising all differences, we can broaden our awareness of the contexts that transform differences into disabilities, and indeed the contexts that support differences serving as strengths.

We can cultivate neurodivergent identities.

Strong medical models tend to only use language that perpetuates stigma, upholds neuronormative standards, and reinforces unfavourable evaluations of neurodivergent people, contributing to ongoing discrimination and marginalisation (Patrick Dwyer, 2022). In contrast, neurodiversity theorist Robert Chapman (2021) calls for a "rejection of default pathologisation of neurodivergence, not of neurodivergent pathologisation as such". In line with this, neurodiversity movements tend to use language that affirms neurodiversity, facilitates greater acceptance of neurodivergent people, and validates neurodivergent identities. By using language that highlights how every human nervous system is unique,

neurodiversity movements center collective strength, thus creating opportunities for all members of the community to maintain a sense of belonging and value. This shift in terminology and understanding is crucial to dismantle neuronormative systems, redress harm caused, and nurture neuroinclusive communities where neurodivergent people are valued and understood.

In addition, some neurodivergent people describe forging their neurodivergent identity as crucial to self-understanding, with neurotype serving as a useful framework for working with their nervous system (Juwayriyah Nayyar et al., 2024). Hence, rather than only using deficit approaches (replacing neurodivergent culture with neuronormalised practices) or difference approaches (teaching neuronormalised practices without regard for neurodivergent culture), true neuroinclusion necessitates an asset-based approach. In this context, an asset-based approach might look like explaining neuronormative standards while actively sustaining neurodivergent culture; inviting all community members to notice their differences, how no one way of being is superior, and how it is not enough to merely respect neurodivergent culture – we must also extend it. See Django Paris (2012) for a discussion of this type of culturally sustaining pedagogy; remember neurodiversity is understood as operating like other dimensions of equality and diversity.

We can empower neurominorities and protect neurominorities' autonomy.

By framing scientists and doctors as cognitive authorities, medical models tend to perpetuate power imbalances and a sense of "us-them", furthering the divide between neuromajorities and neurominorities. This differential treatment can mean that neurodivergent people are viewed as incapable of autonomy, which can lead to a loss of agency and the ability to make decisions about their own lives. This can exacerbate societal exclusion and subjugation.

In contrast, neurodiversity-affirming approaches aim to empower neurominorities and return power to neurodivergent people, protecting their autonomy and agency. This approach is not only more inclusive and supportive but also upholds the rights-based perspective of the United Nations Convention on the Rights of Persons with Disabilities (2006).

Neurodiversity movements can help us to improve our understanding of neurodivergent people's experiences.

Neurodivergent people tend to be misunderstood, in part due to neuronormativity. For example, the way a neurodivergent person expresses their emotions may radically differ from the way a neurotypical person expresses their emotions. In line with Nick Walker's (2021) neurodiversity paradigm, no one way of expressing yourself is "correct", and thus both "ways of being" are of equal value. However, neuronormativity devalues authentic neurodivergent expression in favour of neurotypicality. This means that neurodivergent

people can be judged in less favourable ways than their neurotypical peers, with Noah Sasson and colleagues (2017) reporting that lesser favourable judgements of neurodivergent people were associated with lesser willingness to interact.

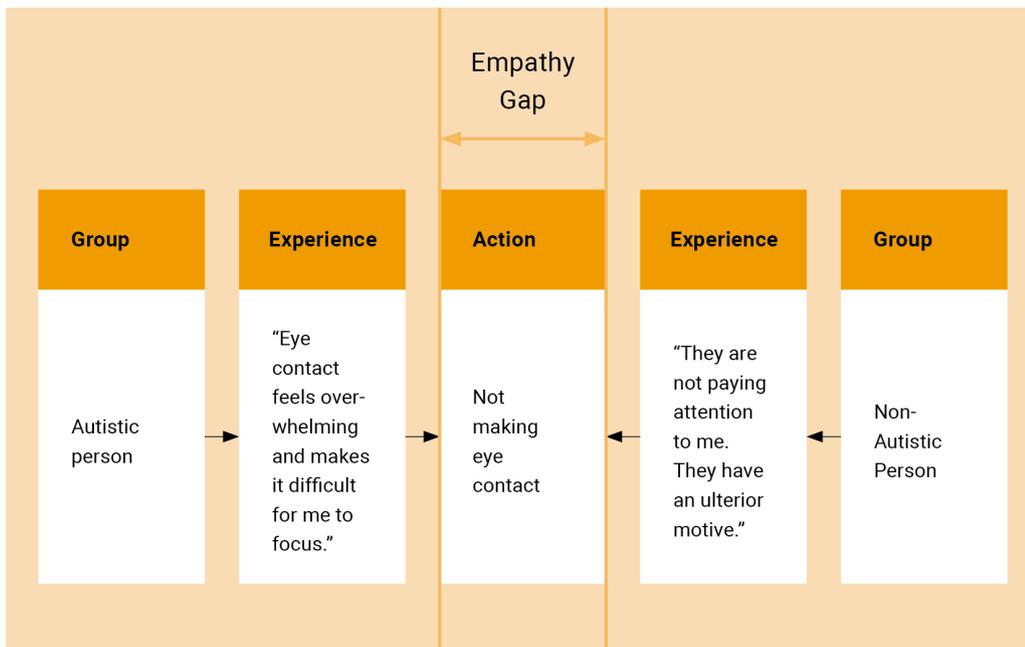
One conceptualisation of misunderstandings of neurominorities that is consistent with Nick Walker's (2021) neurodiversity paradigm comes from Damien Milton's (2012) theory of the double empathy problem. According to this theory, members of different social groups have different experiences and viewpoints on the world (i.e., have an empathy gap). For this reason, miscommunications are likely to occur when members of different groups interact. From this perspective, the "problem" with communication is experienced by both group members (i.e., it is a double problem). And yet, there is inequality to its impact. Power dynamics mean that minority group members are often expected to fully and completely cross the empathy gap (i.e., adjust their responding to better meet the needs and preferences of majority group members). In addition, because majority group members tend not to experience miscommunications, they experience the resulting sense of disconnection as more intense, while miscommunications are understood to be a common experience for minority group members.

To illustrate the double empathy problem, consider the following example. While interacting with a non-autistic person, an autistic person does not make eye contact. From the perspective of the autistic person, they are not making eye contact because it feels overwhelming and makes it more difficult for them to fully attend to what their conversational partner is saying. And yet, the non-autistic person interprets this action as meaning that the autistic person is not paying attention and has an ulterior motive.

In this example, we have two members of two different groups, and thus, we have an empathy gap. A neuronormative way to resolve this empathy gap might involve mandating that the autistic person make eye contact, regardless of how it impacts their ability to engage with their conversational partner. Alternatively, a more neurodiversity-affirming way to approach the empathy gap might involve acknowledging that both the autistic and non-autistic experiences are valid and valuable. Therefore, it is possible for both the autistic and the non-autistic person to adjust their responding. In fact, research has shown that autistic-to-autistic communication is just as effective as non-autistic-to-non-autistic communication (Catherine Crompton et al., 2020). So, it is not valid to assert that a neuronormalised approach to communication is "better". Importantly, neurodiversity paradigms do not dictate how we should approach the empathy gap. Instead, neurodiversity movements invite us to affirm both "ways of being" and think critically about who is crossing the empathy gap and why.

Figure 2 Title: Visual representation of an empathy gap between an autistic person and a non-autistic person by Alison Stapleton.

by Alison
Stapleton

Group	Experience	Action	Experience	Group
		Empathy Gap		
Autistic person	"Eye contact feels over-whelming and makes it difficult for me to focus."	Not making eye contact	"They are not paying attention to me. They have an ulterior motive."	Non-Autistic Person


Although the double empathy problem was first presented in the context of autism, it can be applied to other forms of neurodivergence, and indeed other social groupings. For example, a person with ADHD might interrupt their non-ADHD conversational partner because they are excited, and yet their non-ADHD conversational partner might interpret that action as impatience. Even if you are not neurodivergent, you can likely recall a time you felt misunderstood by someone who had experiences and viewpoints that differed from your own.

Recently, Sebastian Shaw et al. (2023) proposed a triple empathy problem. Applied to education, the triple empathy problem arises when there is both a neurotype mismatch (e.g., autistic versus non-autistic) and a role mismatch (e.g., teacher versus student). Communities should strive to identify empathy gaps as they arise and reduce any inequalities in their impact. This might begin by asking questions like, how can I cultivate safety, comfort, and authenticity in my interactions with people who are members of different groups than me?

Neurodiversity movements can help us to dispel neuromyths.

Educational neuromyths are misconceptions about how the brain works and how this affects learning (Marta Torrijos-Muelas et al., 2021). Neuromyths have been observed in educators, healthcare professionals, parents of neurodivergent children, children, and the wider community (Silvia Gini et al., 2021). Neuromyths are harmful because they can reinforce stereotypes and associated stigma, and can result in misidentification or a complete failure to identify neurodivergence (Patrick Corrigan & Amy Watson, 2002).

There are many neuromyths about forms of neurodivergence; some examples include "autism is a learning disability", "all autistic people have special abilities", that ADHD can be cured by supplementing the diet with vitamins, that ADHD means the brain is over-

aroused, or that mental capacity is hereditary and cannot be changed by the environment or experience (Marta Torrijos-Muelas et al. 2021).

Although the impact of neuromyths on teaching practice is unclear (Brenda Hughes et al., 2022), some research has examined the extent to which educational professionals endorse neuromyths. In their study of general population members and people working in education from preschool to higher education (including administration staff, inclusion managers, and mainstream teaching staff), Silvia Gini et al. (2021) found no difference in neuromyth endorsement between the general population and educational professionals. And, reported familiarity with neurodivergence was not associated with greater knowledge. Neuromyths related to autism were recognised more by teachers rather than neuromyths about ADHD, Downs Syndrome, and Dyslexia. Silvia Gini et al. (2021) suggest that this may be linked to campaigns and government initiatives for raising awareness of autism which suggests more work needs to be done with raising awareness and increasing knowledge of other forms of neurodivergence.

Given that neurodiversity paradigms can decenter dominant approaches to forms of neurodivergence, neurodiversity movements can create novel avenues for research, ultimately helping us to dispel neuromyths and cultivate epistemic justice.

How Might We Create a Neurodivergent-Friendly Ecosystem?

Before describing ways we might move closer toward a neurodivergent-friendly ecosystem, it is important to acknowledge that achieving complete neuroinclusion is not easy. Individual teachers (and indeed their schools) are inherently subject to multiple competing contingencies, i.e., they are embedded in a larger social structure and interconnected with other domains that indirectly impact them.

In examining teachers' views of systemic support within their schools, Stuart Woodcock and Lisa Marks Woolfson (2019) reported that leadership support, professional development opportunities, and adequate funding were deemed vital to support inclusion. Stuart Woodcock and Lisa Marks Woolfson (2019) also noted that participants felt that other teachers' rigidity and unwillingness could undermine inclusion efforts, with some teachers reportedly framing inclusivity as a mere increase in workload for them.

Yet, importantly, we do not know what a true neuroinclusive classroom looks like. As Dinah Aitken and Sue Fletcher-Watson (2022) ask, "How much of the difficult behaviour teachers struggle with in class right now is motivated by children trying to hide their difficulties, or push adults away because they don't feel they can be trusted?". What if true neuroinclusion meant a reduction in overall workload? And, even if it does not, how can we create environments that support systems being inclusive anyway? Neuroinclusion requires systemic change. We cannot mandate that neurodivergent people conform to a neuromajority. Rather than always asking neurodivergent people to change to accommodate their environments, we should explore ways to change environments to

better accommodate and support neurodivergent people. And, we cannot leave individual teachers to do this work without adequate compensation, resources, training, and support from the broader ecosystem. We need a neurodiversity-affirming systems approach.

Given the scope of this chapter, it is neither possible nor appropriate to give specific recommendations for accommodating and supporting particular neurotypes. Instead, we present strategies for becoming more neurodiversity-affirming in general.

Creating a Neurodivergent-Friendly Ecosystem: The Classroom

As part of the microsystem, a child's classroom has one of the most direct, immediate impacts on their development. As best they can, teachers should familiarise themselves with neurodiversity and its associated paradigms and movements, ultimately striving to be neurodiversity-affirming. Additionally, because lack of understanding and stigma are key contributors to inequality, teachers could introduce all students to the concepts of neurodiversity and double empathy (Alyssa Alcorn et al., 2024).

The LEANS (Learning About Neurodiversity at School) programme is one freely available whole-classroom resource that may be used to teach children aged 8 to 11 years old about neurodiversity (Alyssa Alcorn et al., 2022). Through videos and teacher-delivered activities, LEANS aims to inform staff and children about neurodiversity, increase positive attitudes towards neurodivergent people, and increase inclusive actions within the school community (Alyssa Alcorn et al., 2022). Reesha Zahir et al. (2024) reported that LEANS received a high level of support for its usability, acceptability, and usefulness from survey respondents, 50% of whom reported experience working in education. Alyssa Alcorn et al. (2024) found that children who participated in LEANS scored significantly above chance in the Neurodiversity Knowledge Quiz and reported significant increases in the likelihood of behaving in inclusive ways.

Alyssa Alcorn et al. (2024) also found that LEANS participants reported significantly lower agreement with LEANS-aligned beliefs (e.g., "In my class, most people are kind and friendly to people who are different than they are"). However, this unexpected finding was interpreted by Alyssa Alcorn et al. (2024) as suggesting that LEANS led children to think more deeply about their views of the classroom. Notably, one adverse event was reported during Alyssa Alcorn et al.'s (2024) study. This led the LEANS team to add further guidance for teachers about staff-student and staff-family conversations on neurodiversity. The team further emphasise the need for all classroom staff to be involved in safety planning and the need for agreed procedures for handling sensitive conversations. LEANS can be accessed at https://salvesen-research.ed.ac.uk/leans

Another freely available resource that teachers may use to inform their neuroinclusive practices is Catherine Crompton et al.'s (2024b) NEurodivergent peer Support Toolkit (NEST). Codesigned by seven neurodivergent young people (aged 13 to 15 years old) and nine adults who reported experience working with neurodivergent young people (Francesca

Fotheringham et al., 2023), NEST aims to facilitate student-led peer support for neurodivergent children in mainstream schools. Preliminary evidence supports the feasibility and acceptability of NEST, with students reporting that peer groups facilitated friendships, fulfilment, and a sense of community (Catherine Crompton et al., 2024a). Although designed for older children, professionals working with younger cohorts of children may draw on NEST to generate ideas for activities that can be used in their settings. NEST can be accessed at https://salvesen-research.ed.ac.uk/our-projects/nest-neurodivergent-peer-support-toolkit

Beyond extant programmes, less structured approaches to neuroinclusion at a microsystem level might involve responding to children in ways that help them to develop a healthy sense of self. For example, being attentive and responsive when a child identifies how they think or feel, or understanding that a child is the expert of their own experience (Alison Stapleton and Louise McHugh, 2021). As discussed above, each of our nervous systems works differently. This means that we can experience the same sensory input in different ways. Professionals working with neurodivergent children must be mindful of the potential for distortion of neurodivergent people's experiences. For example, a child who identifies a room as being too bright for them might be responded to with assertions that the lighting is fine. From this, the child may derive that they are too sensitive or that their experience can be disregarded so long as the environment is fine for others. This distortion of the child's experience hinders self-advocacy and could be understood as a form of sensory gaslighting that promotes masking (suppression of authentic responses in favor of alternatives). Professionals need to understand that nervous systems work differently and avoid mandating neuroconformity. Being neurodiversity-affirming is about ensuring each child has a comfortable journey and reaches their destination safely; it is not about cramming children into a non-stop shuttle bus headed for society's destination of choice. Other frameworks, such as Mary Doherty et al.'s (2023) Autistic SPACE or Universal Design for Learning (CAST, 2024), may also be useful for professionals seeking less structured approaches to neuroinclusion at the classroom level.

Creating a Neurodivergent-Friendly Ecosystem: The School

At school-level, recommendations from Marion Rutherford and Lorna Johnston (2019) that were highlighted by Dinah Aitken and Sue Fletcher-Watson (2022) include (i) reducing or eliminating the burden of school uniform policies and (ii) not ringing a school bell between classes. Schools may also create sensory-friendly spaces and flexible classroom setups. Given their "whole school" approach, each of these actions may benefit neurodivergent students who have sensory processing differences, including those who have not been formally identified as neurodivergent.

As part of the mesosystem, schools house myriad relationships and interactions between microsystems, such as teacher-parent interactions, teacher-teacher interactions, teacher-

psychologist interactions, and many more. To help create a neurodivergent-friendly ecosystem, teachers could avoid ableist language and challenge neuronormativity within these interactions.

For example, if contributing to a School Support Plan or Individualised Education Program, regardless of whether the child has been formally identified as neurodivergent, teachers could ensure stated goals do not reflect a normalising agenda that prioritises the comfort of the neuromajority at the expense of others (Kristen Bottema-Beutel et al., 2024). Teachers could also critically evaluate whether stated goals are truly measurable, unpacking any in-built neuronormative assumptions (Kristen Bottema-Beutel et al., 2024). In general, it can be helpful for teachers to reflect on apparent priorities; why is this goal being set? Who does this goal serve? What are the implications of this goal for the child? What alternatives are available? It can also be helpful to reflect on which knowledge bases inform our viewpoints (i.e., the child's input, other teachers' input, etc.).

As another example, if participating in identification processes for a neurodivergent child, teachers could report on the child's struggles honestly and gently, with respect and compassion. This is particularly important when children are identified solely per pathologizing models and when formal identification is the only pathway to accommodations and support. In this way, neurodivergent struggles are not erased and dignity is respected, reflecting a needs-affirming, rights-respecting approach.

Creating a Neurodivergent-Friendly Ecosystem: Beyond the Classroom and School

Expanding our focus to exosystem elements, many professionals use the DSM-V and ICD-11 to identify neurodivergent people. As such, these classification systems are often included in curricula for trainee teachers in higher education. If other approaches are not included, then trainee teachers' understanding of neurodivergent people may lack important nuance. For example, they may adopt medical model ideology (e.g., that a neurodivergent person just needs to be "fixed") and neglect alternative viewpoints (e.g., that unaccommodating and unaccepting environments need to be fixed).

Adopting a participatory approach to the co-design of neurodiversity-affirming modules in initial teacher education can help to ensure that curriculum content reflects multiple viewpoints and challenges neuronormative standards, stigma, and discrimination. Per EST, neurodiversity-affirming training in initial teacher education may mobilise neurodiversity narratives in our educational environments and communities, thus contributing to social change. For example, training educators to recognise, support, and actively sustain neurodivergent "ways of being" can lead to more effective teaching strategies and promote acceptance.

Across disciplines (e.g., teaching, nursing, psychology, etc.), one area of development seems to be ensuring that training curricula include examples of neurodivergent people's

lived experiences in different topic areas with educational opportunities including case studies and live simulations (where actors would role-play with students to support their learning). One example of how this could be done is Margaret Quinn and Sallie Anne Porter's (2023) curriculum immersion for pediatric nurse practitioners where content about autism was embedded into existing topics to increase the knowledge and skills of nurses working with autistic people. Curriculum immersion offers a good opportunity to think about how we understand neurodivergence and the language used when sharing information about neurodivergent people regarding assessment and support. Below are extracts of assessment diagnostic formulations describing one form of neurodivergence (autism). Two versions are presented, one more pathologizing than the other. When looking at the extracts, reflect on the language used.

- How might each formulation inform your understanding of the child's strengths and support needs?
- How might each formulation translate to the classroom? What resources may be needed?
- How might you have a conversation with the child and/or their family based on the information shared? Does the type of language used make it easier or more difficult for you to have those conversations?

Sample extracts of assessment diagnostic formulations. Adapted by Nicola Ryan from an example used in assessment by the National Autistic Society UK.	
More pathologizing description	Less pathologizing description
Different, perceived as odd or a loner.	Bob reports feeling different from his peers in many ways. He does not enjoy school and notes finding many aspects confusing, especially navigating social relationships. Bob believes that his peers misunderstand him and feels as though he needs to pretend to be someone else in order to fit in. Bob likes spending time with people, particularly in a one-to-one setting and has enjoyed spending time in group settings when he could rest and recover afterward.
Social communication difficulties, pedantic, inflexible	Bob presents as a precise communicator. He enjoys language and particularly likes to focus on accurate detail. Bob speaks passionately about things he is interested in and reports struggling to focus and maintain interest when other conversation topics arise. Bob is most comfortable with unambiguous, straightforward communication styles.
Obsessive, restricted, and repetitive interests and behaviours. Hypo/ Hypersensitive to his environment.	Bob is a naturally monotropic thinker and is at his best when he can focus on a topic in-depth, particularly without interference. Bob demonstrates good attention to visual detail and touch that allows him to enjoy painting and other arts subjects. Background noise or noises that he cannot explain can be distracting or even distressing for Bob, and Bob notes that his peers may not understand his experience.

Our conceptualisations and the language we use to describe neurodivergent people matters because they can have a cascading effect across subsystems. Consider the potential implications of a neurodiversity-affirming healthcare professional preparing a report on a neurodivergent child's support needs that will be shared with a neurodiversity-affirming teacher. How might outcomes for this child differ from those of a child who has a pathologizing report shared with a teacher who has only learned about medical models approaches to neurodivergence?

Beyond improving curricula, other ways to create a neurodivergent-friendly ecosystem include conducting and addressing sensory audits of built and digital environments. For example, in Ireland, as part of the "Making UCD a Neurodiversity Friendly Campus" project, the University College Dublin Equality, Diversity, and Inclusion Neurodiversity Working Group (2024) developed a sensory audit tool using data from their scoping review, gap analysis, survey, and qualitative interviews. The sensory audit included items assessing layout, signage, décor, lighting, temperature, and auditory, tactile, and olfactory experience. Across the audited areas, concerns included open-plan working environments, a lack of designated sensory spaces, and inconsistency in the use of accessibility features within the virtual learning environment. For another sample audit, see Paty Paliokosta et al. (2024).

Such audits can address all EST subsystems. Specifically, we can focus on the microsystem by improving the physical, emotional, and digital environments where students interact daily. Involving students in the audit's creation strengthens the mesosystem, enhancing connections between different microsystems like students and administration. The audit also impacts the exosystem by influencing policies and practices, creating a more inclusive environment. It reflects societal values in the macrosystem by promoting neuroinclusion. And, finally, the audit's iterative nature aligns with the chronosystem, ensuring the learning environment evolves to meet changing student needs. This comprehensive approach can foster a supportive and inclusive environment for all.

As we come to the end of this chapter, we invite you to return to our Example Case. Recall the neurodivergent child that has arrived at school after a hectic weekend. They have forgotten to bring their lunch, and one of their socks is on inside out. Their teacher asks them to correct misspelled words on a handout. How might we reduce the demands filling their capacity jug? How might we gently expand their capacity jug?

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=657#h5p-37

Closing questions to discuss or tasks

- What fills your capacity jug? What helps you to gently expand your capacity jug?
- When have you experienced the "double empathy" problem, whether on the basis of your neurotype or another group membership?
- Reflecting on your professional training to date, what language do you tend to use to describe neurodivergent people?
- How can you help to create neuroinclusive communities?

About the authors

Alison Stapleton

Dr Alison Stapleton is a multiply neurodivergent Chartered Psychologist, lecturer, and advocate. Alison co-founded the Association for Contextual Behavioural Science (ACBS) Neurodiversity-Affirming Research and Practice Special Interest Group, served on the ACBS Board of Directors (basic science Member at Large), and assists psychological services in identifying, accommodating, and supporting a range of neurotypes. Alison has published several book chapters and scientific articles, including contributions to The Oxford Handbook of Acceptance and Commitment Therapy and a systematic review of adults' experiences of being identified as autistic in adulthood.

Deirdre Forde

Dr. Deirdre Forde is a distinguished lecturer in Inclusive Education at Maynooth University. With a background as a qualified primary teacher and a chartered child and educational psychologist, she brings extensive experience from various educational settings and psychological services to her role. Deirdre's research and teaching interests are diverse and encompass areas such as disability and the dynamics of inclusion and exclusion within educational and societal contexts. She is particularly passionate about amplifying children's voices, advancing relational education, and shaping policies related to Equality, Diversity, and Inclusion (EDI). Her work is dedicated to fostering inclusive environments that acknowledge and celebrate diversity.

Nicola Ryan

Nicola Ryan, clinical nurse specialist in child & adolescent mental health, cognitive behavioural therapist, senior lecturer at Kingston University in the UK. Areas of interest and research include intersectionality, child and adolescent mental health, neurodiversity, psychological and behavioural therapies, education of autism and ADHD for students and educators.

Paty Paliokosta

Paty Paliokosta is an Associate Professor in Inclusive Education at Kingston University and a Senior Fellow of the Higher Education Academy. With over two decades of experience in the field of special and inclusive education, my journey has been dedicated to promoting social justice and empowering diverse learners, particularly

those with special educational needs and disabilities (SEN/D). As an educator, inclusion manager, local authority advisor, researcher, and advocate she has actively contributed to shaping inclusive policies, leading innovative participatory research projects, and championing social justice within schools, local authority, higher education and the community. She leads the 'Inclusion and Social Justice' SIG and the 'Inclusivity, Anti-oppression and Underserved Communities' bidding network. Her full profile can be found here: https://www.kingston.ac.uk/staff/profile/dr-paty-paliokosta-730/

TEAMWORK IN THE CLASSROOM

Outi Kyrö-Ämmälä; Becky Ward; and Silver Cappello

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ama-2025-en/?p=157#oembed-1

Example Case

"A few years ago, I was involved in an Erasmus+ funded project called THRIECE: Teaching for Holistic, Relational and Inclusive Early Childhood Education. Some of the work we did in the Irish part of the project was looking at relationships in the classroom. What was very special about this piece of work was it involved the whole school community. So, everybody was involved: teachers, special needs assistants, the librarian, the secretary, the caretaker; everybody in the whole school community came together, both in terms of teamwork and collaboration in the classroom. What was interesting was that through this project, the barriers across staff roles started to break down. So, for example, previously, if a teacher had a professional question that they weren't sure about, they might ask a colleague, another teacher. However, when we were evaluating this project and having conversations with the people involved, they said one of the biggest benefits of this kind of relational approach across the whole school was that they started to recognise the expertise in other groups of staff. It might not have occurred to a teacher before to ask a special needs assistant for their opinion, and yet there was a huge bank of expertise there, and they were missing out on this expertise by not engaging with special needs assistants. Once those barriers began to break down, it meant that different groups of staff could really collaborate. Or let's say the secretary might have been the first person to see the child on the way in the door and see an angry face on a child and think, "OK, I need to let the teacher know to be gentle here." It made a big, big difference to the staff team as a whole to be able to rely on each other and draw on the expertise that was there."

Dr. Leah O'Toole, Maynooth University, Ireland

Introduction to Topic

In inclusive classrooms, it should be possible for all students to learn in their own local neighbourhood (Slee, 2014), with education that enables them to reach their full learning potential (Booth & Ainscow, 2011), and feeling a sense of belonging to their school community (Qvortrup and Qvortrup, 2018). However, this is not without its challenges, and a teacher can face many difficulties, such as lack of time, material, learning spaces and personnel (Lingard & Mills, 2007). A teacher may also find it challenging to consider students' individual needs (Joseph et al., 2013) and students may be left without appropriate support (Lumby & Coleman, 2016).

In this chapter, we focus on teamwork in the classroom. It is one solution to the challenges that a teacher may confront in everyday school life when working with diverse students. The core of our chapter is to describe what kinds of professional competencies teachers need when they are working in teams.

Teamwork and collaboration are at the heart of inclusive education; collaboration among adults, professionals and parents/carers and, above all, collaboration with and appreciation of the pupils. Inclusive education is values-led. The European Agency for Special Needs and Inclusive Education (2012:11) identifies the values which form the foundation for all teachers in inclusive education.

"These four core values are:

1. Valuing learner diversity – learner difference is considered as a resource and an asset to education.

2. Supporting all learners – teachers have high expectations for all learners' achievements.
3. Working with others – collaboration and teamwork are essential approaches for all teachers.
4. Continuing personal professional development – teaching is a learning activity and teachers take responsibility for their own lifelong learning."

In this chapter we focus on value 3 Working with others and how collaboration and teamwork are vital for teachers. However, teamwork also overlaps with the other core values, especially valuing learner diversity and developing personal skills in continuing personal professional development.

In order to value learner diversity and support all learners, multiple methods and perspectives are needed (Diana Jr., 2014). In this way, the benefits of teamwork become apparent. It is also important to recognise that teachers are lifelong learners and continuing personal professional development is important to improve our attitude and ability to work in teams and to learn skills for effective teamwork (Lindsay, Proulx, Scott, and Thomson, 2014).

The definition of teamwork in the classroom

Just putting people together does not make them a team. It has been stated that teams need "clarity of purpose, accountability, team structure, and trust" (Sparks, 2013: 29). Teamwork happens when a group of people work together to reach a common goal. Although each person brings their individual contribution, they influence the others in the team and in the same way, are influenced by their co-workers. At each step of the project, the team works to make a joint decision, and then moves on to the next step. When there are disagreements and different ideas, the team must work together to find a common solution. Finally, the common goal is reached with each person having contributed to the outcome (Radiæ-Šestic et al., 2013).

In a classroom, teamwork is describing, for example, how educational professionals can work together to prepare and deliver teaching, evaluate the learning, and plan future projects. Well-functioning teaching teams are essential to continuous improvement of teaching and learning, providing mentoring and support for new staff, benefiting students, teacher-teacher peer mentoring, and problem-solving with different perspectives (Sparks, 2013). Through collaboration, a system of flexible support can be built for the social communities of children (Lakkala & Kyrö-Ämmälä, 2017).

There are many different people who influence what happens in the classroom. There may be different kinds of teachers in the school, support staff, student teachers, therapists, the principal and senior leadership team, social workers, educational psychologists, the pupils themselves, and the families of the pupils. In this chapter we use the terms 'student'

and 'pupil' interchangeably to describe the learners in the school. This reflects the language used in different school systems. We use the term 'student teacher' to describe those training to be teachers. Focusing on the classroom, on a day-to-day basis, teachers, student teachers, support staff, pupils and therapists are the people most likely to be in the classroom during the school day. Teamwork can be challenging because it relies on trust within these relationships, valuing different people's contributions, and finding ways to overcome differences of opinion (Whatley, 2009).

Key aspects

Dimension 1: Competence of the Teacher

In this section, the focus is on teachers' competencies based on a document published by the European Agency for Special Needs and Inclusive Education (2012). A combination of professional knowledge, both in terms of content and pedagogy, along with values and motivation aligned to learning, and self-regulation comprise the model of professional teacher competence (Baumert & Kunter, 2013). When characterising teacher competencies, it is crucial to distinguish between two elements: firstly, the concrete and visible actions seen when teachers engage in professional responsibilities, such as teaching; and secondly, the knowledge, skills and processes of perception, interpretation and decision making (including cognitive and non-cognitive competencies) that are critical for implementation but may not be observed by outsiders (richardWeinert, 2001). According to Koster and Dengerink (2008), the competence of a teacher includes a combination of knowledge, skills, attitudes, values and personal characteristics that allow the teacher to act professionally and effectively in specific teaching and learning situations.

In the Profile of Inclusive Teachers (European Agency for Special Needs and Inclusive Education, 2012) teachers' competencies are made up of three elements: teachers' attitude, knowledge, and skills. A certain attitude or belief demands certain knowledge or level of understanding, it also demands skills in order to implement this knowledge in a practical situation. All the elements should be seen as the foundation for specialist professional development routes and the starting point for discussions at all levels on the context specific areas of competence needed by teachers working in different country situations. As identified earlier, the core value of 'working with others' highlights collaboration and teamwork as essential approaches for all teachers.

Teamwork in the classroom is also related to two other spheres: teachers' working with parents and families; and teachers' working with other educational professionals. In this chapter, we focus on teachers' collaboration with a range of educational professionals.

Teachers' attitudes

Teachers' attitudes, beliefs, and values are connected to their practical decisions and

strategies in the classroom (Buehl & Alexander, 2009). These background factors may come from previous experiences of schooling, or they may be concepts that are commonly agreed in the school community (Richardson, 1996). They are subjective, something a person holds to be true, and so may be resistant to change even in the face of conflicting evidence (Buehl & Alexander, 2009).

Attitudes, beliefs, and values behind teamwork in the classroom include some essential ideas, which are introduced in the Profile of Inclusive Teacher (European Agency for Special Needs and Inclusive Education, 2012). Firstly, it is obvious that inclusive education requires all teachers to work in teams. Diverse classes present different challenges for teachers, as they try to be sure everyone is being challenged and learning the material. To do this alone, can be a huge task for one teacher and there are great benefits to teachers working with colleagues in a team. Traditionally, the teaching profession has been seen as an individual profession (Canaran & Mirici, 2020), but now it should be seen more as a team profession. Student teachers should also adopt this way of thinking during their studies. Collaboration, partnerships, and teamwork are essential approaches for all teachers and should be welcomed in all schools and classrooms. Moreover, collaborative teamwork supports professional learning with and from other professionals. In this way, the classroom is a learning organisation where each member learns from everyone and teaches everyone (Kools & Stoll, 2016).

Sometimes tensions arise in teamwork, for example, between teachers and support staff because there is insufficient time to co-plan and reflect (Dixon, 2003). Also, confusion on training and the unclear role of support staff may complicate teaching practices. Sometimes, for example, teaching assistants may not be included in staff meetings, and their work may be ignored in briefings and policy documents (Wilson & Bedford, 2008). The culture of inclusion and teamwork in the school needs to be broad, including all staff, and led by the senior leaders in the school (Wilson & Bedford, 2008). Teamwork needs effective communication, with the benefits resulting in a consistent approach for children in the school (Ward et al., 2021). Teachers act as reflective practitioners (Jay & Johnson, 2002). They analyse their work and develop their practice by assessing and then acting on their own learning.

Teachers' knowledge and understanding

According to the Profile of Inclusive Teachers (European Agency for Special Needs and Inclusive Education, 2012), teamwork in the classroom requires some essential knowledge and understanding including an idea of the value and benefits of collaborative work with other teachers and educational professionals.

Teacher education should develop student teachers' theoretical understanding and provide opportunities for real life experiences about multi-professional work. There is a need to become acquainted with support systems and structures available for further help,

input and advice and multi-agency working models where teachers cooperate with other experts and staff from a range of different disciplines. Also, understanding collaborative teaching approaches is important, where a team approach involves teachers, learners themselves, parents, peers, other school teachers, support staff, and finally, multi-disciplinary team members, for example therapists and teachers should also be addressed in teacher education. A common understanding of the language/terminology and basic working concepts and perspectives of other professionals involved in education are crucial for teachers: they need to have a common language when talking to each other about student issues. Additionally, the power relations between different stakeholders should be recognised and dealt with effectively in teacher education. In some situations, non-teaching staff, for example, support teachers and teaching assistants, are not given a voice and have less opportunities to contribute their knowledge to the classroom; but they may have a lot of experience and a different and valuable perspective in contrast to teachers (Mackenzie, 2011; O'Brien & Garner, 2001). Different types of knowledge exist and are useful for improving learning (Nonaka, 1994; Nonaka & Takeuchi, 1995). Explicit knowledge stems from training courses, reading, and qualifications, whereas tacit knowledge comes from experience, school systems, and the environment or culture. A joined-up team approach draws on each person's knowledge, sharing power, creating space, and opportunity for voices that often go unheard (Nind, 2014; Parsons, 2021).

Teachers' skills and abilities

Teamwork relies on teachers developing social skills, including relational skills, emotional competency, diversity competency, intercultural competency and interaction (Metsäpelto et al., 2021). Furthermore, generic competencies (for example information-processing abilities), and affective and motivational competences (for example abilities to regulate emotions) are fundamental teacher's skills (Blömeke & Kaiser, 2017).

In the Profile of Inclusive Teachers (European Agency for Special Needs and Inclusive Education, 2012), essential skills and abilities related to teamwork in the classroom to be developed during initial teacher education are introduced. The initial teacher education should include implementing classroom leadership and management skills that facilitate effective multiagency and team working. Student teachers need to be equipped for co-teaching and working in flexible teaching teams. For teachers it is also necessary to learn how to work as part of a school community and draw on the support of internal and external resources. In the classroom they need preparation on how to build a class community that is part of a wider school community. When thinking about the development processes of schools, student teachers should have skills to contribute to whole school evaluations, review and development processes and collaborative problem solving with other professionals. Schools do not act alone, and therefore teachers are contributing to wider school partnerships with other schools, community organisations and other

educational organisations. Moreover, they need to be drawing on a range of verbal and non-verbal communication skills to facilitate working cooperatively with other professionals.

In teacher education around the world, efforts have been made to define the key skills of the teaching profession for many years. Teaching is a multidimensional and challenging profession that demands expertise which is developed and renewed throughout initial teacher education and the professional's career. According to Desimone (2009), a teacher's development is a continuous process and includes changes in the teacher's cognitive and affective skills, used in teaching tasks and in adapting classroom practices. Ideally, the core of teacher education includes skills that make a difference in the classroom and promote student achievement (Hattie, 2009). The Multidimensional Adapted Process model of teaching (MAP) (Figure 1) describes the key competence domains perceived to be critical for the teaching profession and depicts them as a comprehensive teacher competence model (Metsäpelto et al., 2021).

Figure 1:

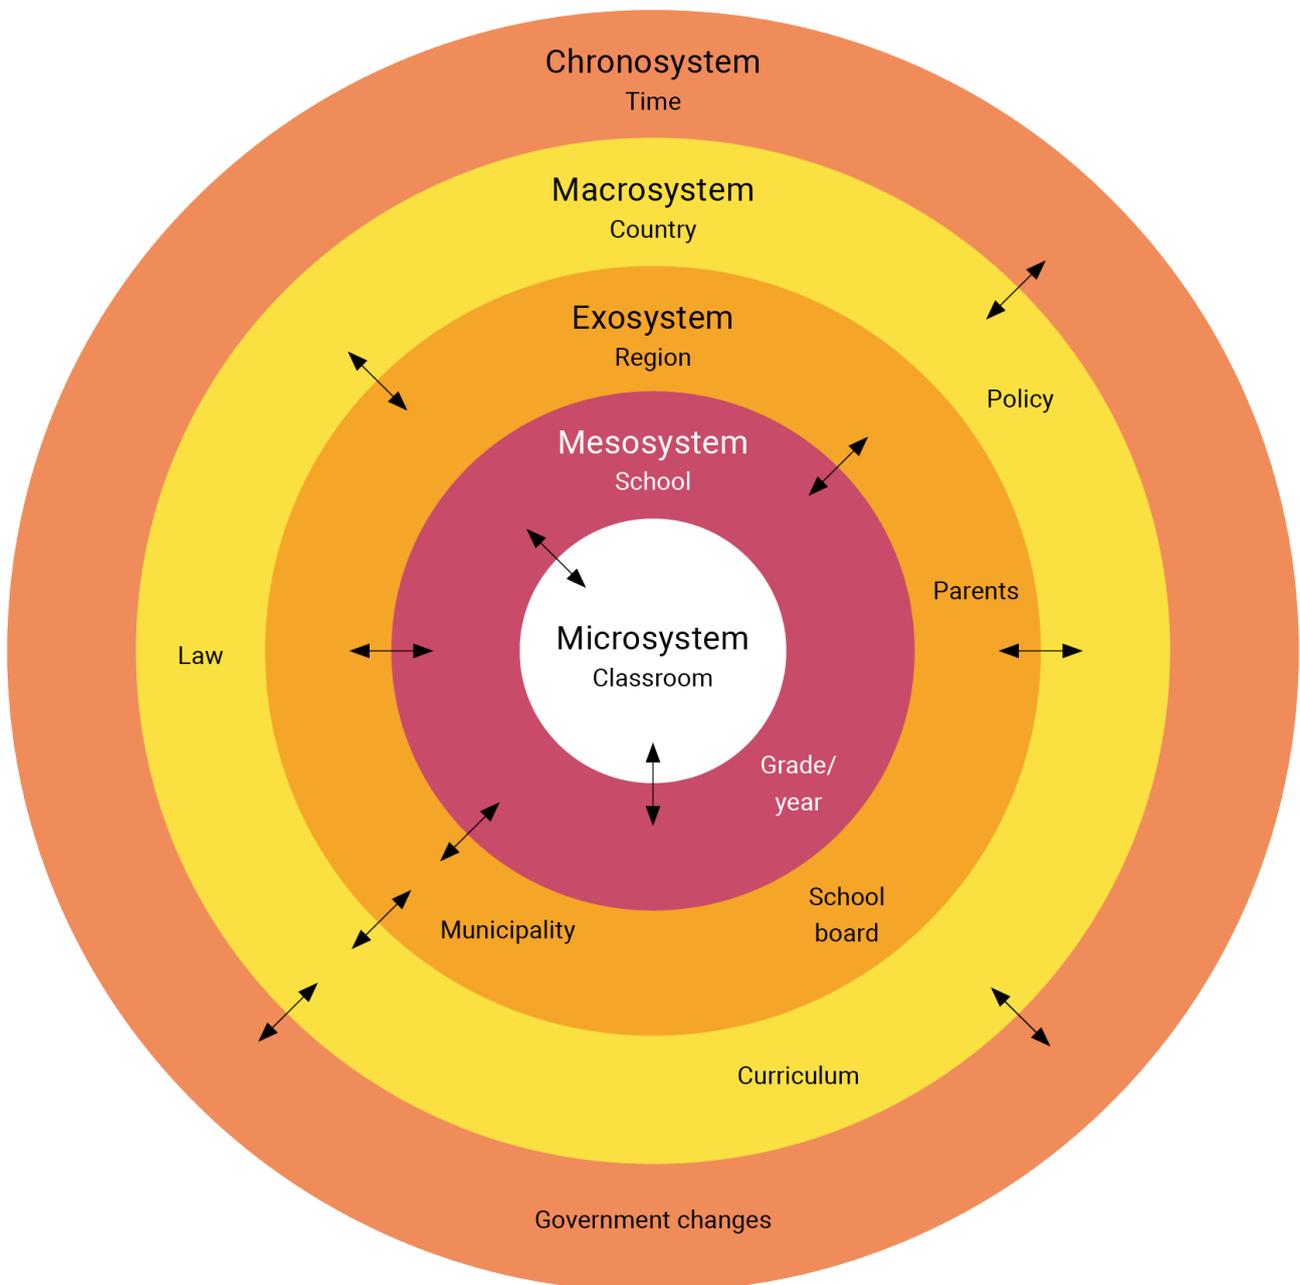
The MAP model is based on Blömeke and colleagues' (2015) model, which divides (1) the competence related to the efficient performance of the teacher's work, (2) the individual knowledge and skills underlying and enabling effective teaching, and (3) the situational skills to perceive, interpret and make decisions in teaching and learning situations. The MAP model outlines a teacher's successful work performance (competence) and the critical knowledge and skills that enable and promote it (competencies) and thus aims towards a more comprehensive understanding of the key skills of teachers' work and their development at different career stages. In the MAP model, there are five core competencies of teachers: cognitive thinking skills, knowledge base of teaching and learning, social skills, personal orientations, and professional wellbeing (Metsäpelto et al., 2021). In the model, the ultimate goal of teacher activity is teacher effectiveness at the students' level, in students'

learning, motivation and well-being. As Berliner (2001; see also Klassen & Kim, 2018) has stated, some attributes thought to be included in teacher competence, are specific to the educational environment and to the cultural, social, and task-specific context, while some other attributes are universal.

Dimension 2: The Meaning of Context

Teamwork is shaped by the context in which teachers work.

Like bioecological systems theory (Bronfenbrenner & Morris, 2006), the classroom teacher is situated in a classroom. This classroom is situated in a school and the school is situated in a regional and national context. At every level, the context influences what happens in the classroom. The chronosystem describes those changes that happen over time. Additionally, the bidirectional interaction between different levels, i.e. the relationship between classroom and whole school or whole school and region, also influences the way in which teachers work in their own classrooms.

Figure 2:


The classroom can be thought of as the **microsystem**. The teacher plans, delivers and evaluates each lesson. They can potentially work as a team with other teachers, student teachers, teaching assistants or external therapists who come into the classroom.

The classroom is situated in the school, the **mesosystem**. Within the wider school, there may be requirements to ensure each teacher communicates with other teachers in the same year group or education phase.

The regional or local school board can be considered the **exosystem**. Schools may be grouped together in local areas, or regional school boards/municipalities may provide guidance or regulations for local schools. This could also include parents and families, and external professionals working with the school.

The regional school board or municipality sits within the national system of education, which can be thought of as the **macrosystem**. The macrosystem includes national

education policies, including the curriculum and staffing structures which will influence how teamwork can happen in your school. There may be a shortage of types of school staff; for example, specialist subject teachers, special education teachers, support staff, or healthcare professionals who work in the classroom.

This macrosystem is situated in the **chronosystem** as changes in policies and procedures happen over time; for example, when a new government is elected.

Some national education policies are very broad, and others narrow. For example, a broad national curriculum provides an overview of each subject area and flexibility and autonomy for individual schools or teachers to plan, deliver and assess their schemes of work and lessons. However, in other countries, the national curriculum is prescriptive with specific textbooks identified for areas of the curriculum and standardised assessments for all pupils. Similarly, staffing structures vary from country to country. For example, in one country a classroom could have one teacher and three assistants for 30 children. Whereas in other countries, a classroom may only have one teacher for 30 children.

At each contextual level, there are several factors to address. Table 1 provides some practical examples from different school systems and contexts considering the members of the team and the way in which this level might influence teamwork in the classroom.

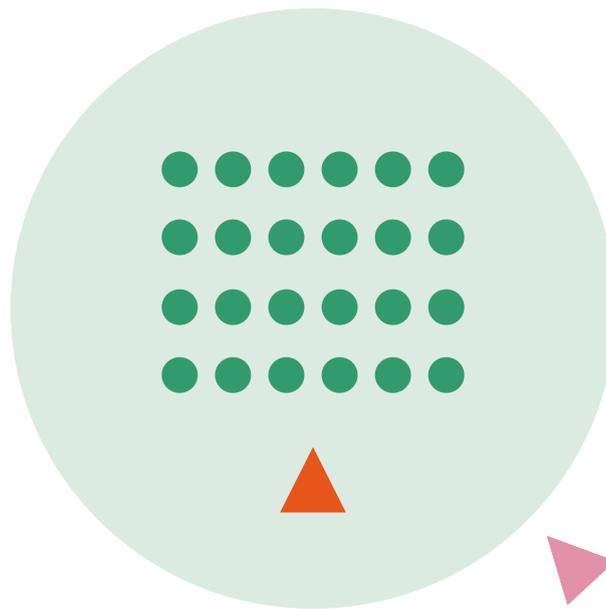
Table 1:

Bioecological system	Education level	Authority/ responsibility	Considerations	Practical examples from different school systems
Microsystem	Classroom	Lesson plans, delivery of lessons, evaluation and assessment	Potential/ actual members of the team in the classroom	A teacher and a special education teaching assistant (TA) work in the same classroom. The teacher asks the TA how to differentiate the learning for a group of children with special educational needs. They then plan the lesson together as a team.
Mesosystem	School	Schemes of work, phases of education	Other classrooms in the year group or education stage	In a school, there are three classes in grade 5. Each class has one teacher and no additional staff. The class teachers want to work as a team but are not able to do this in each classroom. So, they meet outside the classrooms and plan a series of lessons on a topic. Each teacher then delivers the lessons independently in their own classroom. After the series of lessons is finished, the teachers meet again to evaluate the scheme of work.
Exosystem	School board/ regional education body	Regional variations on national policy	Partnerships between schools within a region	Although the national education policy allows solo teaching or co-teaching, a regional school board wants to promote co-teaching and introduces a policy that all schools in their area must incorporate co-teaching in the school. Each school then organises the classrooms to enable co-teaching to happen.
Macrosystem	National education policy	Curriculum, standardised assessments, staffing policies, initial teacher training requirements	Required qualifications/ professional standards for education professionals or external professionals e.g. therapists	The national policy for children with special educational needs requires a child with an IEP to receive individual support within the classroom. The class teacher has 5 children with IEPs within the classroom who are supported by two classroom assistants. There are now three staff members in the classroom who can work as a team.
Chronosystem	Changes over time	New governments, education minister	Introduction and management of new policies and curricula	A new government is elected and changes the education policy which increases or decreases the number of staff in each school and each classroom.

There are many ways in which teamwork can operate in the classroom, depending on the context and the members of the team. Three examples follow, exploring co-teaching, pupils' voice, and collaborations.

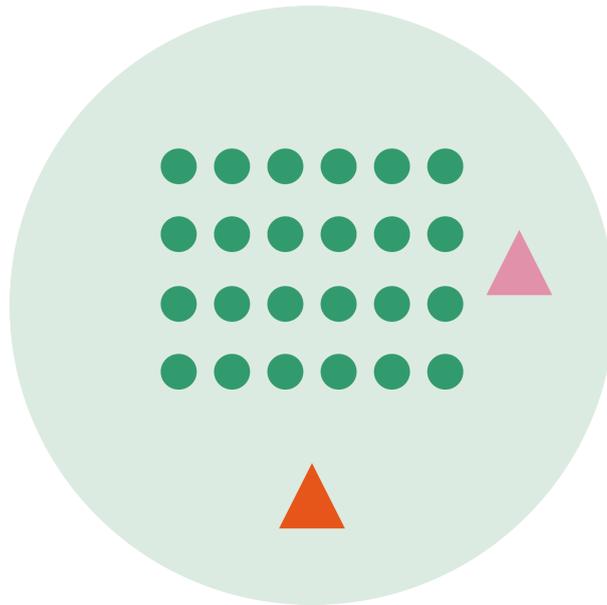
Co-teaching methods and forms of collaboration

One important example about teamwork in the classroom in a practical way could be co-teaching, which is a practice where two or more teachers (class and/or support teachers) plan, teach and assess together for a group of students. According to Friend and Cook (2007), there are six types of co-teaching methods for working in teams, where big triangles are teachers and small triangles are students (Figures 3-8 created by authors), but it is important to use the approach that most effectively meets the needs of the students in a specific context:

Figure 3:


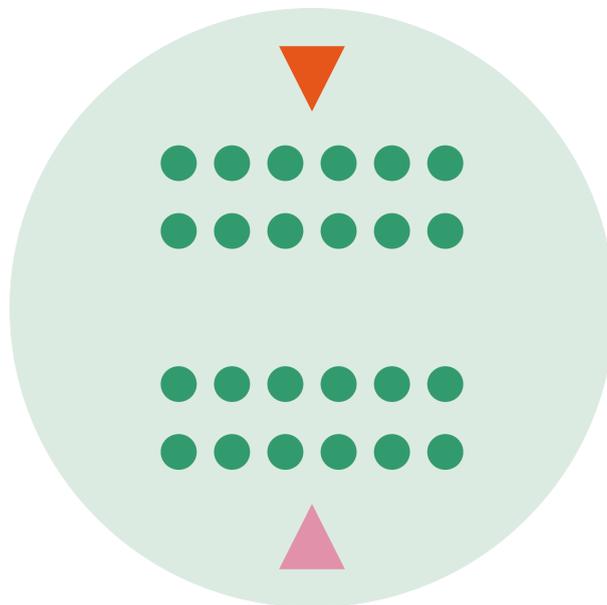
One teaches, one observes.

One teaches, one observes: one teacher conducts the lesson, while the other simply observes students' learning processes and collects different kinds of data which have been determined in advance.

Figure 4:


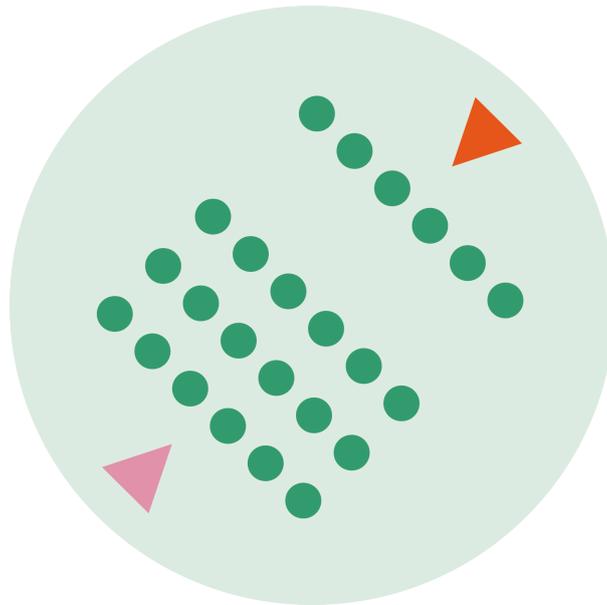
One teaches, one assists.

One teaches, one assists: one teacher teaches a full group lesson, while the other teacher roams and helps individual students, often providing additional support for learning or behaviour management.

Figure 5:


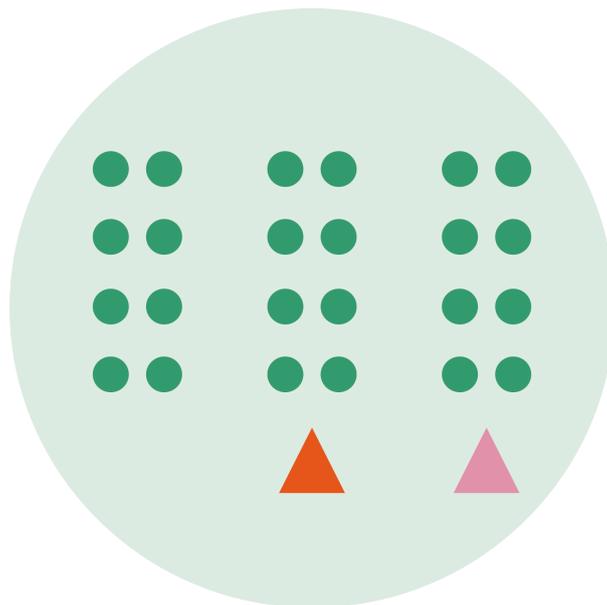
Parallel teaching

Parallel teaching: the team splits the class into two groups and each teacher teaches the same information at the same time to a smaller group.

Figure 6:


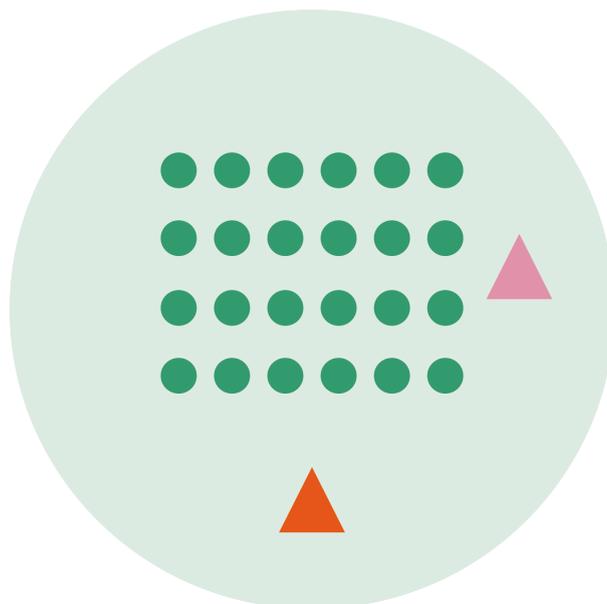
Alternative teaching

Alternative teaching: one teacher instructs most of the class and the other teacher teaches an alternate or modified version of the lesson to a smaller group of students.

Figure 7:


Station teaching

Station teaching: the class is divided into three or more groups, where students rotate through the stations, while the teachers teach the same material in different ways to each group; if there are more stations than teachers, at least one will focus on independent work or practice opportunities, while the others may be managed by students.

Figure 8:


Team teaching

Team teaching: both teachers are in the room at the same time but take turns teaching the whole class, like co-presenters.

Co-planning for positive collaboration

Co-planning is one of the three co-teaching phases. It is really important because it represents the starting point of the process. Teachers have to plan collaboratively (co-plan) because co-teaching is not possible if one teacher handles the planning alone (Shumway et al., 2011). Initially it is not easy, because the collaboration could be influenced by the number of students in the class, pupils individualised or personalised needs, the additional work and time needed, teachers' flexibility, their relationships and their interpersonal communication skills (Cramerotti & Cattoni, 2015).

There are some important aspects for co-planning to be considered. Firstly, the roles and responsibilities for teachers before, during and after each lesson need to be discussed. These would include who does what, when, where and with whom. Secondly, expectations about the lesson structure and the rules for the class need to be agreed to ensure consistency in the classroom. Thirdly, teaching skills, tools, and methods to apply in the classroom need to be agreed. Finally, important documents, such as reports, tables, and tools for working together, need to be prepared and completed. Teachers should co-plan with short, regular meetings, in order to have a common approach to the delivery of the teaching and learning process. The team need to agree on the goals, the learning process and individual needs of students, the teaching methods and lesson structures, the different activities for a variety of groups and single students, and the evaluation methods (Cramerotti & Cattoni, 2015).

Co-planning introduces diversity into the planning and delivery of teaching, as staff members share best knowledge and practice, and increases representation of people from

different cultures, backgrounds, and perspectives. This reflects the wide range of students with different needs and backgrounds. A more inclusive classroom is developed as co-planning between teachers, and of course between teachers and other specialists, enables a multi-disciplinary view of pupils' needs and helps to develop effective interventions. Each staff member brings a diversity of skills and resources ensuring that each student receives the support they need. In addition to this, collaboration between teachers can serve as an example to students of cooperation, empathy, and appreciation of diversity, fostering inclusive thinking.

Co-assessment for teamwork.

Co-assessment covers two different concepts. On the one hand, the teachers need to evaluate their lessons, actively discussing and sharing their ideas and practices (Conderman & Hedin, 2012). This might include self-evaluating the teaching and then revising some of the activities. On the other hand, teachers also need to assess the learning of pupils, including their engagement in the lesson and their completion of the learning outcomes.

Assessment might involve collecting multiple sources of information in which each teacher shares data providing different types of information about students' progress (multidimensionality) (Ghedin, Aquario & Di Masi, 2013). It could also be done using a participative approach to assessment with students themselves (self-evaluation).

Deidda and Silvestro (2015) provide some sample questions for self-evaluation in teams:

- How were the time schedules for planning respected?
- How did pupils react to the proposed activities?
- What effective forms of communication were used?
- List any social skills needing to be reinforced or taught.
- Describe how co-teaching is effective.
- How were the goals achieved?
- Identify any problems that occurred during the lesson. How were they managed?

The inclusion of students' and pupils' voice

The United Nations Convention on the Rights of the Child (UNESCO, 1989) introduced Article 12 in 1989: the right for children and youth to take part in decision-making processes that affect them. As a consequence, starting from the 1990s, educational research has given a central role to students' voice. One particular aspect that has been considered and discussed in educational research is strictly connected with the idea of having a voice and of expressing it as a right, since school and education highly affects children and youth. In this conceptualisation, the word 'voice' goes beyond the understanding of voice in terms of sound and information; it stands for presence, participation and the power

of the individual being (Cook-Sather, 2006). The Student Voice approach in educational research simply means listening to students and taking into account their opinions in order to consider their point of view in research and in changes for education policies. In the field of inclusive education this issue is particularly relevant as it makes research methods more participative and inclusive. It is also very demanding because it requires data collection instruments that can give voice to all students, including disabled students, in a reliable way. Pupil voice has become increasingly important in educational research at an international level, but it can only be authentic if pupils feel free to express their opinions and point of view. The reliability of student voice is also connected with a participatory culture that creates a positive context for expression. Students should be encouraged to participate in debates and to explain their opinions (Fielding, 2004). There is also the issue that students may have something to say, and their contribution is useful for the whole teaching–learning process, but they do not know how to proceed and their opinions remains excluded (Rudduck & Fielding, 2006). For this reason, work has to be done within the school context so that it is seen as a supportive environment for participation, enhancing the quality of research based on students' voices. The Lundy Model of Participation provides a framework for best practice guiding the participation of children and young people in decision-making (Lundy, 2007). The key principles include Space (providing a safe space in which children can speak up and share their views), Voice (facilitating the sharing of views by children), Audience (ensuring that children's views are heard by decision-makers), and Influence (ensuring that children's views are acted on where appropriate). The Lundy Model can be used by any educational setting to guide the development of pupils' voices.

The Montessori approach is an important and concrete example of giving voice to students. This consists of inclusive teaching that respects the individual in their learning, with an environment organised in such a way that the individual pupil can direct their learning, based on their interests, preferred methods, and the time needed to complete the tasks. The Montessori approach provides pupils with the space to take an active role in their learning. For the first six years of age, the materials are mainly sensory, i.e. they allow children to gain appropriate knowledge by actively experiencing phenomena (touching, moving, interlocking, classifying, etc.), while for the following six years, an attempt is made to offer a school environment that responds to the curiosity of boys and girls, to their desire to understand the world, encouraging social participation and opportunities for individual and collective commitments aimed at empowerment (Caprara, 2022). The educational context makes it possible for the pupil to choose a task on which to concentrate and to choose the method of learning; either independently or by collaborating with small groups of classmates. The teacher then devotes their time to observing the class, facilitating the learning for each pupil, providing an educational context characterised by movement, freedom of choice, collaborative work, and self-determination of each pupils' learning goals (Caprara, 2022).

Teachers' collaboration with other educational professionals

One of the teacher's most natural co-workers is the support teacher or teaching assistant. The teacher and the teaching assistant can plan, implement, and evaluate the teaching together and share the responsibilities of the teaching process. Of course, the main responsibility for teaching is always with the teacher, but the teaching assistant is an essential part of teaching a diverse group, as they can be responsible for certain pupils or groups (Groom, 2006). The teacher must recognise the assistant's tacit knowledge: they often have a lot of experience with pupils and know their strengths and challenges very well and so are a real expert in teaching and learning situations (Greenway & Edwards, 2020). Additionally, when teachers and assistants work together in a team, they bring multiple views and attitudes, which might positively challenge those currently holding negative perspectives (Greenway & Edwards, 2020).

Teachers also emphasise the importance of multidisciplinary teams in the classroom (Florian & Black-Hawkins, 2011). To support children with particular special educational needs, classroom teams may also include therapists; for example, physiotherapists, speech therapists and occupational therapists (Lindsay et al., 2014). The benefits of these multidisciplinary teams are that both educational and health-related perspectives can inform the teaching and learning activities in the classroom. A range of strategies and advice can be considered from these different perspectives. Additionally, each professional has their own relationship with the child and can consider how best to support a child in a variety of activities (Lindsay et al., 2014). Therapists can participate in lessons, lead individual tasks, or contribute to joint training with the pupil they support. Equally, the therapist does not always have to work one-to-one with the pupil; seeing the pupil with their peers can broaden the therapist's perspective in the learning process (Richardson, 2002).

The challenges of teamwork in the classroom

One of the challenges for teamwork is finding the time and space to meet, particularly if you have a busy teaching schedule, considering that teamwork will almost certainly involve an increase in additional work at the beginning (Hestenes et al., 2009). Finding space could also be problematic if classrooms are small in the school where co-teaching-methods could be implemented. Having a regular planning session, even an hour each week with your co-teacher, will help teachers to get started in co-teaching. Co-teaching may initially require more time than planning and teaching alone, but over time, as experience is gained and teachers get to know each other better, the need for planning is likely to decrease. No one can be forced to co-teach, and each teacher must be able to do their job in the way that suits them best. However, positive, and effective models of co-teaching can encourage even the most sceptical teacher to give it a try (Cramerotti & Cattoni, 2015).

There might also be challenges to do with your context; whether colleagues in your classroom, school or system want to work in teams, what attitudes your colleagues have

towards each other, or what skills each person has. One particular issue might be teachers' fear of losing autonomy and responsibility in the classroom (York et al., 2007). Additionally, teachers may feel under scrutiny by their peers and anxious about other teachers' perceptions of their approach or competence (York et al., 2007). In order to overcome this challenge, initially, the important thing is to understand why a colleague may not want to co-teach. Rather than making assumptions, ask them what they think the positives and negatives are with co-teaching. If they can only see problems, prompt them to think of any benefits, or suggest some yourself, for example, diversity of approaches. You may even start by explaining that you want to develop your own teaching and so are keen to work with others. You may be able to use examples of how a colleague seems to have very positive lessons with a certain student that you find more difficult to teach, and vice versa.

Resolving differences could present obstacles if teams have very different ideas and practices to share. Conflicts between teachers might be difficult to resolve and if there is confusion about the roles of each team member, it may hinder decision-making (Canaran & Mirici, 2020). This is where it can be helpful to clearly identify each person's role in the planning, delivery, and assessment of the learning. Additionally, it is good to identify practices that both teachers use and incorporate those to start with, before adding in more individual practices once trust has been established.

The benefits and importance of teamwork in the classroom

However, one of the benefits of teamwork is that it brings together different perspectives and different experiences taken from everyday practice. Teachers can then reflect on and evaluate their own practice (Boud & Hagar, 2012; Doppenberg et al., 2012) and build capacity, which tends to show longer-term results (Stoll et al., 2006; Vrieling et al., 2016; Wenger, 1998). There is evidence to show that teamwork for teachers can enable them to develop innovative teaching pedagogies, for example working in small groups, and improve teachers' job satisfaction and self-efficacy (European Commission, 2013).

Another benefit is that pupils see and hear different types of teaching – different explanations, different activities – which can help their learning, meet their different learning styles, and enhance their social development (Murawski & Swanson, 2001; Sapon-Shevin, 2003). Over time, teamwork can also help teachers to share the workload, for example, creating resources and developing lesson plans, and reduce the time that each teacher spends on preparation.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

- What attitudes, knowledge or skills do you need to develop for teamwork?
- Thinking about your context, what are the challenges for you in participating in teamwork in the classroom? How could you overcome the challenges?
- What do you see as the three greatest benefits for inclusive education from working in a team?

About the authors

Outi Kyrö-Ämmälä

Outi Kyrö-Ämmälä, PhD, is a University Lecturer in Teacher Education at the University of Lapland, Finland. Her research interests include teacher education and teacher professional development, inclusive and special education, and students' cognitive skills. She has been involved in several national and international projects developing inclusive education and teacher education. Outi is also a member of the Finnish Teacher Education Forum.

Becky Ward

Becky Ward, PhD, is a collaborative researcher in psychologically-informed practice. She pursues research with and for marginalised groups and individuals, but also has a particular interest in neurodiversity, homelessness and young people. She supervises and teaches both undergraduates and postgraduates in Psychology, including Clinical, Developmental and Educational Psychology. Her PhD from the University of Southampton explored a collaborative model of co-producing school staff ADHD resources. She is an experienced youth worker, trainer and advocate with a demonstrated history of working with vulnerable young people.

Silver Cappello

Silver Cappello has accomplished a PhD in General Education, General and Social Pedagogy at the Free University of Bolzano-Bozen (Italy). He is qualified as primary school teacher with a specialisation as support teacher and he has

worked as primary school teacher (mainly teaching second language), as assistant for people with disabilities, and as research assistant on different research projects at the Competence Centre for School Inclusion of the Free University of Bolzano-Bozen.

"PLEASE, DON´T SIT ON MY SHOULDER" - FROM NEO-LIBERAL TO EMANCIPATORY PERSPECTIVES: SHIFTING LANDSCAPES IN THE ROLES OF TEACHING AND PERSONAL ASSISTANTS

Example Case My Desire for Independence and the Need for Support: Finding the Right Balance

"Don't sit on my shoulder"

"I am a wheelchair user. Increasingly, I have found that I need to balance the support I receive from my Personal Assistant (PA) with the need to build friendship in my own right. For example, on a recent night out for a colleague's retirement, I required support to attend this event from my PA. Of course my PA was involved in some of the social interactions during the evening, but it was important for me to mix and interact with colleagues on my own. This is my preference, and I always make it clear when recruiting staff. It is important for me that my PA is present but not 'sitting on my shoulder'. However, from the point of view of the PA, this can be hard to manage, especially if they are used to working with a variety of people who may have complex needs or if they are used to working in a residential environment and move to supporting someone to live independently in their own home."

Dr Danielle Farrel, Managing Director Your Options Understood (Y.O.U.), UK

Initial questions

This chapter sets out to provide an overview of Teaching Assistants and Personal Assistants. In this chapter you will find the answers to the following questions:

1. What is a Personal Assistant and Teaching Assistant?
2. What roles and tasks does a Personal Assistant and Teaching Assistant undertake?
3. How are they employed?
4. What qualifications, education and training do they have?
5. How can they positively influence social integration?
6. How is the relationship with other professionals or the person they assist characterised?
7.

Introduction to Topic

The purpose of this chapter is to examine the role of Personal Assistants (PAs) and Teacher Assistants (TAs) in supporting people with disabilities in their daily lives. Since 1994, Maher and Vickerman (2018) refer to the Salamanca Statement which "expressly entreated national governments to 'adopt as a matter of law or policy the principle of inclusive education, enrolling all children in regular schools" (UNESCO). Since then, inclusion principles have been reinforced by a number of global and European policies such as the Dakar Statement (Maher & Vickerman, 2018) and United Nations Educational, Scientific and Cultural Organisation (UNESCO, 2009) through Policy Guidelines on Inclusion in Education. Significantly, this topic is enshrined within the United Nations Convention on the Rights of People with Disabilities (UNCRPD) which provides a comprehensive framework to protect and promote the rights of people with disabilities and highlights several key rights. Article 9 stipulates that measures should be put in place to ensure accessibility by removing barriers that hinder full participation in society for persons with disabilities. Article 19 requires

the provision of appropriate support services, including personal assistance, to enable individuals with disabilities to live a full life in the community and exercise their autonomy. Finally, Article 24 recognises a right of access to persons with disabilities to education on an equal basis with others. Hence, the provision of inclusive education, with reasonable accommodations and supports, is necessary to facilitate the effective education of persons with additional needs (United Nations, 2006).

This chapter begins by providing a brief overview of the context for employing TAs and PAs. We then proceed to examine the role of TAs and PAs in supporting persons with disabilities in their daily lives and in educational settings. Next, we endeavour to define the roles, discuss associated terminology and provide an overview of the respective responsibilities associated with both roles. Additionally, we explore how teachers and assistants engage and interact with each other in various settings. Further, we discuss supports that are in place to help Personal/Teacher Assistants (P/TAs) and their employers as well as the influence P/TAs can have on peer relations and social integration. Finally, recommendations for the future are discussed.

At times, the topic is discussed within the context of a few specific countries namely, the UK (Scotland in particular), Ireland and Germany. Beside scientific contents, you will find in the chapter several case studies which illustrate the contents and provide a deeper insight into the perspective of the self-advocates. Most case studies were written by one of the authors of the chapter, Danielle Farell.

Description of structural disadvantages and how to address or prevent them

While there are several structural disadvantages, we have chosen two very significant disadvantages on the recommendation of self-advocates, both of which have received little attention in research so far. Firstly, we discuss the influence of TAs and PAs on social integration, and secondly we focus on the relationship between TAs and PAs.

Structural disadvantage 1: The Influence of TAs/PAs on Social Integration

Social integration of people with disabilities is limited. Many suffer from social exclusion and discrimination, despite the UNCRPD's existence in many countries which supports/ emphasises? greater participation. On the one hand, TAs and PAs can positively support people/pupils with disabilities to participate in social life, however, they can also influence social integration negatively (see Case Study 1). The term social integration has no single definition. Indeed, social integration, social inclusion and social participation are often used interchangeably while social integration as a term is variously defined (Koster et al., 2009). In this section, we employ the definition from Stinson and Antia (1999) discusses the

importance of social integration in relation to peer acceptance and friendship, and view peer interaction as an essential factor in social integration.

Social integration of students with TAs in regular classroom

In general, studies indicate that the social position of students with special needs is particularly poor when educated in a regular classroom. Often, they are less accepted and less popular than their classmates without special needs, and consequently make fewer friends (Banks, McCoy and Frawley, 2018; Saddler, 2014). It is important to notice that pupils with SEN are a heterogenous group. Therefore, peer relations can differ according to the type of special needs (Koster et al., 2009). Nevertheless, it is important to examine how social integration of students can be improved if a TA is involved.

Influence of a TA on social integration

We will now explore the influence of teaching assistants on social interaction. There is a paucity of research in this area and outcomes also vary across studies. Furthermore, previous research has primarily focused on the influence of TAs on academic achievement which generally suggests that TAs have a positive influence on students' learning achievement (Farrell et al., 2010; Saddler, 2014). Research on increased social integration of students in Germany occurred through the promotion of social skills, peer contact and peer interaction (Jerosenko, 2019). Additionally, supporting social behaviour was seen to contribute to more social contacts (Schindler, 2019).

In contrast, however, Webster and de Boer (2021) contend that facilitating the inclusion of pupils with learning difficulties can reduce interactions with teachers and peers and create dependencies on TAs. Zauner and Zwosta (2014) studied the stigmatising effect of TAs on students in Germany and found that most teachers did not recognise such effects (62%) and failed to acknowledge the disturbance of other pupils by the presence of the TAs in the classroom (72%). However, a significant proportion still see some stigmatising effects or disturbances.

In terms of students with Profound Intellectual and Multiple Disabilities (PIMD), high-quality interactions are crucial for their quality of life (Haakma et al., 2021). Due to their profound special needs in terms of physical condition, mobility, health problems, sensory impairments and non-verbal language, one-to-one teaching assistance is increasingly important. Many PIMD students use Augmentative and Alternative Communication (AAC) and therefore their interaction with peers differ. In a single case study, Schwarzenberg, Melzer and Penczek (2016) found that peers often use several communication strategies to interact with the PIMD student who uses AAC. They accepted the student, and some made friends with the student. Additionally, Haakma et al. (2021) revealed that TAs tried to facilitate interactions between peers and PIMD students. For example, some TAs adjusted the student's position by taking a student out of their wheelchair and placing them on

the ground among a group of playing students. However, even if the TAs attempted to facilitate interactions between students with PIMD and peers, these interactions were often unsuccessful. This represents how difficult it is for TAs to initiate and influence peer interaction positively.

Negative Effects linked to Social Integration of Students with SEN and a TA

Several studies point to the negative effects linked to social integration of students with SEN. Giangreco et al. (2005) outline five negative effects: firstly, students with a TA are often seated apart from peers in a corner of a classroom; secondly, students become dependent on support from the TA and are unable to participate without the TA. Thirdly, TAs disturb peer interactions by establishing a physical or symbolic barrier for peers. Fourthly, the TA and the student have a very close relationship by virtue of doing everything together, hence other teachers and peers may be excluded. Finally, students feel stigmatised due to the continuous presence of the TA. Similar findings were identified by Sharma and Salend (2016) which found that TAs often taught SEN pupils separately in individual and small groups, thus spending less time in the classroom with fewer peer interactions. Furthermore, the constant presence of TAs and the delivery of separate instruction also limited student interactions. Students with a TA can be perceived by their peers as different and dependent, which can lead to stigmatisation. For example, Jerosenkos (2019) stated that the presence of TAs was increasing students' dependence and impeding the child's interactions with classmates.

How can TAs positively influence social integration?

In light of these findings, how can TAs positively influence peer interaction and social integration? Firstly, awareness of the roles and responsibilities of TAs in schools should be improved. This includes reflections on roles and responsibilities of TAs which may lead to shifts in responsibilities. Teams should reflect on whether a TA is needed in each situation and the benefit of TAs in specific situations (Giangreco et al., 2005). For instance, Highton (2017) interviewed six TAs and found that the frequency and intensity of peer interactions depended on how the assistants fulfilled their role and how they interacted with the students. If they act in a very dominant, instructive and regulatory way, interactions were prevented. If they acted as so-called "coaches" and offered support to help students in solving their conflicts themselves, peer interaction and friendships can develop over the long term.

In terms of participation, it is important to activate and strengthen the child's voice. In other words, students themselves should be more involved in deciding what support they need. In the majority of the studies, teachers and assistants were interviewed whilst the student's perspective was not considered. Schools need to establish a culture of collaboration within classrooms. Hence, strengthening collaboration between general and

special educators, building capacity in general education, and increasing reliance on natural supports is recommended (Giangreco et al., 2005). In addition, natural support should be considered whereby peers can be more involved in supporting the disabled peer with a TA as peer supporters.

Finally, parental perspectives are examined in terms of how TAs may be best deployed for their children and if their views are consistent with the effective use of TAs in inclusive classrooms (Sharma and Salend, 2016). Parents should be asked why they want support for their child, and how best this support can be offered. These perspectives can then be considered in the deployment of TAs.

The Influence of Personal Assistants on Social Integration

A PA can support people with disabilities to participate in everyday life. However, this can lead to people with disabilities becoming dependent on the PA. and thereby precluding them from making friends and being part of a group (see Case 5). For example, Wadensten and Ahlström (2009) found that PAs can enable the establishment of close relationships, social interaction, company, and a community spirit through activities in, and outside, of the home. Some participants reported that their PAs have a social function where they felt they had new people to interact with and therefore felt less lonely. That said, PAs described "difficulties of being in a subordinate position" (Ahlström and Wadensten, 2012, p. 112) even if they expressed satisfaction with their work. Some reported feeling lonely and missed the work community. They also felt that they have a lack of control in unstructured work and experienced stress with too much responsibility. The majority reported a need for more education (Ahlström and Wadensten, 2012).

How can the balance between support and independence be strengthened? Toward cooperative models of living and working together

When a person with disabilities relies on support from a PA to assist them with social interactions, it is crucial that the PA enables the disabled person to develop their own identity and build their own relationships. The PA's role is fundamental in this instance, particularly if the disabled person has a high level of support needs. Nevertheless, the PA's role must be balanced by enabling the supported person to spend time with their peers, family members and colleagues, and allowing others to build a relationship with the person who requires support, as opposed to building a relationship with them and their PA.

Maskos (2014) criticises that in today's discourse of self-determination, an emancipatory perspective is missing, in which disability, illness and dying are an integral part of life. People are dependent on each other, in varying degrees, including people with disabilities. Therefore, it is necessary to consider how life can be shaped with, and in, these dependencies, rather than requiring that all dependencies be overcome. More cooperative models of living and working together are needed.

Structural disadvantage 2: Relationships between teachers and TAs and between a self-employer and a PA

Relationships play an important role in dealing with the support of people/students with disabilities through PAs or TAs. Relationships, even if professional in nature, are rarely conflict-free, and various factors, such as different roles and responsibilities, influence relationships. In the field of education, there are several professional relationships, such as the relationship between teachers and TAs. The central question is how to work together in a team? The same question can be applied to the relationship between a person with a disability and a PA.

Team Relationships between Teachers and TAs

Many professionals, such as social workers, therapeutic professionals (e.g., speech therapists, learning therapists), as well as TAs are increasingly working in tandem with teachers in schools (Serke and Streese, 2022). The research indicates there is a need for teachers to improve their work with TAs (Jackson et al., 2021). In an international systematic review of 26 studies, Jackson (2021) examines the teachers' perspective of their work with TAs and identified four key themes including; roles and responsibilities, planning and pedagogy, leadership, and interpersonal relationships.

Firstly, the role of a TA, and the expectations associated with the role, cause tensions in TA-teacher relationships. According to Butt and Lowe (2012), teachers and TAs perceive the role differently, and in some instances, teachers are not certain about what level of responsibility TAs should be given.

A second issue, related to the respective roles, concerns the nature of the working relationship between SNAs and teachers. This has been described in terms of collaboration, partnership and teamwork which implies joint planning and problem solving (Logan, 2006). Yet, there seems to be a lack of awareness around the real benefits associated with collaborative planning and indeed in most jurisdictions, time for such planning is often limited (Jackson et al., 2021). Interestingly, Logan's research found that 70% of SNAs perceived that teachers did in fact involve them in planning, whilst by comparison, only 53% of teachers felt they involved the SNA in planning. That said, 85% of teachers felt it was appropriate to do so. Relatedly, teachers are often challenged in understanding whether or not a TA has the capability to assume a pedagogical role, which is often associated with the level of qualification the TA holds. In sum, it could be construed that the provision of time, and awareness building around how and why to engage in planning, may support the development of enhanced collaborative partnership towards better overall provision for the children in their care.

A third theme associated with relationships is that of teacher leadership. Teachers need to assume a leadership role but often lack the requisite knowledge and skill. Jackson et al. (2021) concludes that: "Teachers need to view themselves as leaders of TAs. They

should be involved in recruitment, supervision, and training of TAs yet they need time and supervisory training themselves to learn and hone this skill" (p. 83).

Finally, it has been found that interpersonal relationships between TAs and teachers have been influenced by differences in status, working conditions (Jardi et al., 2022), and school type (Blatchford et al., 2009). Degrees of co-operation are also associated with certainty about one's own role, which in turn affects levels of job satisfaction for TAs (Blatchford et al., 2009).

How can the relationship between a TA and teachers be supported?

Jardí et al. (2022) examined how effective interpersonal partnerships are built. Findings show that having a close affinity with each other, open communication, a sense of belonging, professional compatibility, interpersonal treatment, and trust are equally important. Contextual factors, such as employment conditions, supervision, and administrative support, were less important. They concluded that: "Building a partnership is reported to be a long-term pathway, it is a process that should be purposefully fostered and adjusted through time" (Jardi et al., 2022, p. 8). TAs and teachers need time to get to know and understand each other to ensure collaborative and supportive attitudes. A sense of belonging and the perception of being welcomed are more important for TAs than for teachers. Above all, TAs want to feel respected and valued by teachers.

A recurring theme in the literature is the promotion of effective teamwork. Three specific models have been developed around this (Vincett, Cremin and Thomas, 2005). The Room Management Model (RMM) requires that all adults in the room are given a clear role; the Zoning Model refers to a system of classroom management where adults take responsibility for different zones in the classroom. In the Reflective Teamwork Model (RTM), the participants receive training in skills based on teamwork, with a particular emphasis on effective communication. Additionally, the teacher and the TA are asked to plan and review their teaching sessions in equal collaboration daily (Vincett et al., 2005). According to O'Brien (2010), the RTMl was favoured by participants as it improved communication, developed more positive working relationships, and supported role clarification.

Jackson et al. (2021) concluded that "teachers who are aware of the delineation between their roles and responsibilities and those of TAs may be more likely to implement more equitable and inclusive models of student support" (p. 76). Clearly, all of these point to the need for a redefinition of tasks, roles and responsibilities in addition to a strengthening of structures towards the enhancement of cooperation and collaboration (Serke and Streese, 2022).

1.2.3 Potential challenges of changing roles

A potential challenge for students leaving school is the transition from teaching assistant to personal assistant. Here, it is important to consider how students can be accompanied during the role change and, if necessary, how this can be prepared for in the long term

at school by consciously addressing the process and gradually giving the student more responsibility for guiding the assistant. A gradual transition from assisting the teacher to assisting the pupil can help prepare young people with disabilities for their role as employers.

Relationship between PAs and self-employed / Person with disability – towards more awareness

Despite the fact that PAs play an important role in the lives of people with disabilities, the relationship between PAs and self-employed persons with disabilities is delicate. "There exists, therefore, a disjunction between the ideal image of PA as a commercial relationship free from emotional dilemmas, and a disparate literature charting moral dilemmas and interpersonal conflict within PA relationships" (Porter et al., 2022, p. 632). Porter et al. (2022) reported challenges that PAs faced under three different headings: 1) practical trouble, for example in working conditions and management style; 2) personal trouble, for instance, conflicts because of different personalities or different values; and 3) proximal trouble, for example socio-spatial proximity of a PA. A major area of tension is where the person with a disability is both an employer and an expert in his or her own life, whilst at the same time, is existentially dependent on his or her employees. For example, it can be difficult for the person with disabilities to criticise their PA if, at the same time, they are existentially dependent on the PA. The PA has an intimate insight into the life of the person giving the work, while at the same time being an employee. This tension between the employer's dependence on the employee must always be reflected upon and dealt with professionally (Kasper and Zuber, 2023).

PAs must be aware that their place of work is often within a private home. People with disabilities and their families may feel uncomfortable with having strangers in their home (Porter et al., 2022). Conflicts can arise due to different attitudes and perceptions. In this context, PAs need, among other things, a high degree of attentiveness and considerable practice in expressing their own opinion but only when requested and in a restrained manner. In addition, they should always critically reflect on their own behaviour with regard to possible tendencies to influence the person receiving assistance. Furthermore, PAs should always clarify and become aware of their current role (friend, assistant, advisor, ambassador, bridge builder) (Kasper and Zuber, 2023).

Key aspects

Historical Context for the Establishment of Personal Assistants and Teaching Assistants

Personal Assistants – Independent Living Movement

The establishment of the PA role can be traced back to the so-called "Independent Living Movement" in the 1960s and 1970s. In the USA and the UK, many people advocated for people with disabilities to live independent lives within the community and not in institutions. Experts and organisations in the field of special education and rehabilitation have been partially replaced by a new paradigm, which was developed by people with disabilities themselves (Barnes, 2014). The movement started in the early 1980s in Germany with the slogan of "Selbstbestimmt-Leben-Bewegung" (self-determined living movement) (Maskos, 2014). In many countries, this movement changed views on people with disabilities from a medical or individual model to one of a social model of disability (Barnes, 2014). In contrast to the medical model, where disability is seen as an individual phenomenon, which is addressed with medical measures (Waldschmidt, 2005), the social model of disability is seen as a 'social problem' (Barnes, 2014). Hence, disability is understood as a social construct, created through discrimination and oppression. This shifts the focus to society, rather than the individual (Degener, 2016).

Another model which emerged following the establishment of the Committee on the Rights of Persons with Disabilities (CRPD) is the human rights model of disability (Degener, 2016). In this model, human rights cannot be invalidated by disability, but are taken for granted. This contrasts with the social model, in that human rights could be partially denied through attribution (Degener 2016). Personal assistance is well linked to the human rights model of disability underpinned by the UNCRPD as it empowers people with disabilities to live independently and receive community-based support. One primary goal of the Independent Living Movement was deinstitutionalisation, i.e., the dissolution of institutions for people with disabilities and the provision of assistance to enable people with disabilities to exercise more control over their own lives, and live life to the fullest. PAs, which emerged from this campaign, are perceived as a necessity to support people with disabilities, affording them the same choices and control in their everyday lives that people without disabilities take for granted (Maskos, 2014).

With this movement, there has been an undeniable shift in the landscape of social care resulting in an upsurge in demand for PAs as more people with disabilities now live in their own homes. Notwithstanding this trend, significant work has still to be done as many people with disabilities still live in institutions (Maskos, 2014). To compound matters, the UK and many other countries experienced a recruitment crisis (following the Covid-19 pandemic) across all areas of social care. This has precipitated the need for closer examination of the current provision of services. Consequently, in recent years, the

UK reviewed adult social care services. In England, this review was conducted under the Social Care Reform (Migration Advisory Committee, 2022) whilst the Scotland Government conducted the independent Adult Social Care review (Feely, 2021) aimed at the implementation of a National Care Service. Within this, there are plans for better working conditions for employees in Social Care, including PAs, which in turn may address the increasing demand for skilled people to fulfil these roles. In Ireland, a slower uptake with 'personalisation' is evident – this umbrella term is used to refer to people living with disability who now have choice and control around their support. In implementing this strategy, a similar approach is adopted in Scotland, whereby disabled individuals and families living with disability are afforded options on how to allocate and spend their budget. As a result, there has been an increase in demand for PAs. The same increase in demand for PAs emerged in Germany in 2016 when the so-called Bundesteilhabegesetz (BTHG) came into force. Up to 2023, four reform stages were implemented, which will fundamentally change the law for people with disabilities. The aim is to implement the UNCRPD to help people with disabilities to have more participation and individual self-determination. To this end, services are no longer institution-centred but person-centred (Bundesministerium für Arbeit und Soziales, 2016).

Before proceeding, it is important to distinguish between special educational needs (SEN) and special education needs and disability. As the authors of this chapter are from Ireland, the UK and Germany, both terms are used. The former – SEN – is defined within Irish legislation to mean:

> a person [who has]…, a restriction in the capacity […] to participate in and benefit from education on account of an enduring physical, sensory, mental health or learning disability, or any other condition which results in a person learning differently from a person without that condition and cognate words shall be construed accordingly; (Government of Ireland, 2004, p. 5)

In documentation from the UK, young people who have SEN may have a disability under the Equality Act 2010:

> …a physical or mental impairment which has a long-term and substantial adverse effect on their ability to carry out normal day-to-day activities'…[]…This definition includes sensory impairments such as those affecting sight or hearing, and long-term health conditions such as asthma, diabetes, epilepsy, and cancer. Children and young people with such conditions do not necessarily have SEN, but there is a significant overlap between disabled children and young people and those with SEN. Where a disabled child or young person requires special educational provision they will also be covered by the SEN definition" (DofE & DofH, 2015, p. 16).

In the UK, the term Special Educational Needs and Disability is typically used as an umbrella term, however, SEN usually applies to children with a specific learning difficulty while a child with SEND may also have a diagnosed disability.

The Emergence of Teaching/Special Needs Assistants in Education

In recent years, the increase in numbers of Special Needs Assistants (SNAs) coupled with the provision of greater training opportunities, demonstrates the importance attached to the development of this role. Between 1992 and 1996, there was a 56% increase in the number of staff working in primary schools in England (Groom & Rose, 2005). Concurrently, a commitment to inclusive policies in England resulted in an increase in the number of pupils with Special Educational Needs (SEN) or Special Educational Needs and Disabilities (SEND) attending mainstream schools (Maher & Vikerman, 2018). A similar development can also be observed in Germany. Since Germany signed up to the UNCRPD in 2009, inclusive education has been established in many federal states. Pupils with special needs attend the mainstream school and, within this context, require support. This support is offered by an increasing number of TAs (Sansour & Bernhard, 2018). However, in Germany, the number of hours of special education teachers per student has decreased over the last 30 years, while the number of hours provided by teaching assistants has increased dramatically. Previously the education authority traditionally financed teaching hours, whereas teaching assistants are now financed through the social welfare budget.

The role of the TAs has been identified as critical in the promotion of inclusive schooling. Many students may not have been effectively managed in educational settings without the support of these essential professionals. Indeed, Zhao, Rose and Shevlin (2021) found that in Ireland, SNAs were considered crucial in delivering more inclusive learning environments. However, whilst studies related to the German context highlight the importance of teaching assistants, focus was placed predominantly on the characteristics of and structures for Teaching Assistants within individual federal states, as opposed to examining the topic across states (Lübeck & Demmer, 2022).

Terminology and Definition: Personal Assistant and Teaching Assistant

In the field of disability, the term 'assistance' has become a contested term in recent years. However, most are not aware of what assistance actually means in the context of people with disabilities (Leuenberger, 2023). Across Europe, the terminology used to describe individuals who assist people with additional needs varies from country to country, and sometimes from state to state. Broadly speaking, there are two distinct terms, that is a PA and a TA.

Defining Personal Assistance

A PA is a clearly defined term. The UN Committee (2017) clarifies this: "Personal assistance means person-directed/user-directed human support for a person with disabilities and is an instrument for self-determined living" (UNCRPD, 2017, p. ?). Personal assistance is not

simply another word in the multitude of terms used to describe assistance services, but is closely linked to the enabling of a self-determined life (Leuenberger, 2023). Therefore, personal assistance has been defined by members of the independent living movement as "a tool which allows for independent living" (Mladenov, 2020, p. 2). In Germany and other German speaking countries, the terms "Assistenz" (Assistance) and "Persönliche Assistenz" (Personal Assistant) are used (Leuenberger, 2023). In line with Irish policy, a personal assistant is someone "employed by the person with a disability to enable them to live an independent life. The personal assistant provides assistance, at the discretion and direction of the person with the disability, thus promoting choice and control for the person with the disability to live independently" (Buchanan, 2014, p. 12). These services are generally provided to persons with physical and sensory disabilities. In contrast, persons with disabilities over the age of 65 access the Home Support Service which provides home-based supports, such as cleaning, cooking and sometimes personal care.

Defining Teacher Assistants

TA is generally used to describe support staff who assist pupils in schools. This may also include higher-level teaching assistants (Saddler, 2014), while further afield, in Australia and USA, TAs are also referred to as paraprofessionals, teacher aides, and paraeducators (Sharma & Salend, 2016).

In the United Kingdom, TAs in educational settings can also be referred to as Learning Support Assistants (LSAs) (Groom & Rose, 2005). In Ireland, TAs are known as SNAs and provide schools with extra staff to support children who have additional and significant care needs. Such assistance facilitates pupils' attendance at school, fosters the development of independent living skills and reduces disruption to teaching time for all pupils (DES, 2014). In a comprehensive review of the role of SNAs, the National Council for Special Education (NCSE) in Ireland recommended that SNAs "be re-named as Inclusion Support Assistants to reflect their role in promoting independence and inclusion" (NCSE, 2018, p.7). This indicates a shift from special needs terminology which some students find difficult. Zhao, Rose and Shevlin (2021) confirm this redesignation in the terminology, and highlight their specific care role which differs to the role and duties of the teacher.

It is important to note that these terms may vary from country to country and indeed across regions, depending on local practices and policies. For example, in Germany, terms differ across federal states. Defining a job title is still problematic today, as there are no precise legal regulations on their roles. In addition to the term Schulbegleiter* (school companion), terms such as "Schulassistenz" (school assistance), "Integrationshelfer*in" (integration aide), and "Schulbegleiter*in" (school aide) are used. These terms refer to individuals who support students with disabilities or additional needs in inclusive classrooms (Dworschak, 2010). Progressive states (such as Bremen) are currently testing solutions in which school assistants are not assigned to individual children, but rather are

available to the class as a pool offer (Vanier, 2024) and subsequently support different children as required.

Responsibilities Carried out by Personal Assistants

PAs are individuals who support a person with a disability to live an independent life (Self-Directed Support Scotland, 2021). The role of the PA emerged from the Independent Living Movement (see Chapter 4.1.1 and 5.1). The person with disabilities directs how tasks should be completed by the PA. A PA does not generally assist with making decisions or choices but rather assists the person with a disability in meeting identified outcomes. The key difference between a PA and a paid carer/support worker is that the PA is accountable to their person with disability who is their employer, who, in turn, is responsible for the welfare and safety of the PA, as well as their conditions of employment (Self-Directed Support Scotland, 2021). The case below provides an insight into the role of a PA:

Case Study 1: My Role as a Personal Assistant

"It's a job that is as varied and interesting as the human experience can be"

I've worked as a PA for a few different people over several years, and each job is as individual as that person is. Essentially my job is to support a person with disabilities to live independently. I support them with whatever they might need, anything from attending birthday parties to after-school clubs, holidays or work trips, support to run a business, to perform in theatres, do homework, write an article, or just to get on with their daily lives at home. The job can involve varying degrees of personal assistance, for example, assistance with mobility aids, communication aids or feeding devices, and it requires a high level of trust and respect. It's a job that is as varied and interesting as the human experience can be, and I feel very lucky to be able to do it.

Maria Herbert-Liew, Personal Assistant, Scotland

Responsibilities Carried out by Teacher Assistants

The introduction of additional in-class support has been hailed as the single most important factor in enabling pupils with SEN to be integrated and maintained in mainstream classrooms (Groom and Rose, 2005). Zhao, Rose and Shevlin (2021) explored the role of SNAs within Irish schools and found that SNAs were highly valued in the education system. They contend that SNAs availability has greatly enabled schools to create flexible,

inclusive learning environments for children. However, the authors also stress the complex and multi-dimensional nature of the role. More generally, they describe the multitude of responsibilities comprising physical caretaking, organisational support, managing behaviour, promoting independence, collaboration between SNAs, teachers and other school professionals. In Ireland, the Department of Education (DES) lists the primary care needs provided by a SNA which comprise: assistance with severe communication difficulties; assistive technology, feeding, toileting, general hygiene, mobility, orientation, moving and lifting of children; supervision; administration of medicine; care needs associated with specific medical conditions or requiring frequent interventions or withdrawal from the classroom (DES, 2014). Secondary care tasks carried out by SNAs include: assistance with the preparation and tidying of workspaces; the development and review of plans; monitoring pupils attendance and care needs; enabling access to therapy or psycho-educational programmes; preparation of school files and materials, liaising with class teachers and other teachers; attending meetings and attendance at out-of-school activities (DES, 2014). Blatchford et al. (2009) also identified tasks related to TAs or SNAs, which include: support for teachers and/or the curriculum; direct learning support for pupils; direct pastoral support for pupils; indirect support for pupils and support for school administration, communication and environmental (p. 76). Similarly, Giangreco et al., (2005) refer to the variety of valued roles carried out by TAs, for example, "clerical tasks; follow-up instruction or homework assistance; supervision in group settings (e.g., cafeteria, playground, bus boarding); assisting learners with personal care needs (e.g., bathroom use, eating, dressing and facilitating social skills, peer interactions, and positive behaviour support plans" (p. 29). Whilst educational instruction should be the responsibility of trained teachers, TAs often assume primary instructional roles which can foster improved academic, behavioural and social outcomes for students when they are appropriately trained and supervised. It is evident that the TA role is broad, varied and dependent on the needs of the specific needs of the pupil. The example below is a testimony from a TA:

Case Study 2: My Role as a Teacher Assistant

"He is now able to cope with everyday school life independently"

My name is Simone Manger, I am a nursery teacher and I worked for four years as a Teaching Assistant for a student with special educational needs (SEN). The company I applied for is a GmbH (limited liability company). Beside Teaching Assistants, they employ personal assistants but they offer teaching assistant positions, family support and inclusive

holiday support. My student was nine years old when we met first and he went to the fourth class of a regular, mainstream school. My tasks were to offer the student structures, safety and individual support to get more independent. Together with the class teacher I planned my tasks and responsibilities collaboratively. To avoid stigmatisation by his fellow students, we figured out that I can support other students as well if he doesn't need my support. Another important aspect of my work was the cooperation with the student's parents. They had high expectations for their son's learning. So, I had to clearly distinguish myself and repeatedly demand understanding for their son's individual development. As the close relationship with my student was an essential part of my pedagogical work, it was always a challenge for my student when I was replaced by colleagues he did not know in case of my illness. He often refused to cooperate on such days and conflict with his classmates increased. During the COVID-19 pandemic, my student was supported by another colleague, as I had to homeschool my own children. This colleague spent five hours a day at my student's home, accompanied him during the video conferences and supported him with the subsequent tasks. After the lockdown my student went back to school and I then took over again. I observed that the intensive home schooling had led to a significant improvement in his grades on the one hand, but on the other hand he was less independent in solving tasks and problems on his own. Central aspects of my work were then to support him in regaining his independence at school and the social integration into the class after the pandemic. Within the four years as a school support teacher, I was able to support my student in (further) developing his academic and social skills to the extent that he is now able to cope with everyday school life independently.

Simone Manger, Teaching Assistant, Germany

Employment

Employment of TAs and PAs is organised according to the specific country and differs regarding work situation, qualifications and payment. In this section we focus first on the employment of PAs and then describe employment of TAs.

Employment of Personal Assistants

There are two ways PAs in Germany are employed. Firstly, the PA is employed by a care service/company (see Case 3). The care service/company organises and pays the assistant. Secondly, PAs are employed on the basis of 'direct payments'. People with disabilities become 'employers' or 'contractors' who either directly recruit, hire and manage their personal assistants, or do so through the mediation of independent service providers (Mladenov, 2020). The employment is possible due to the so-called "Persönliches Budget"

("Personal budget"). This concept of assistance is intended to express a different understanding of professional help, and the relationship between beneficiaries and service providers is thus redefined (Konrad, 2019). Which service provider pays depends on the personal situation and on the specific assistance required. For example, if you need work assistance, the Federal Employment Agency (BA) or the Integration Office can pay the costs. As in many professions, the salary depends on the respective employer (Konrad, 2019).

In the UK, if an individual requiring support decides to employ PAs directly, this is usually undertaken through Direct Payment. This is one of four options of Self-Directed Support in Scotland, and is also an option in the south of the UK. Although opting for a Direct Payment gives disabled people and families more choice and control around their support, it also brings with it all the responsibilities of an employer, such as recruitment, ongoing training and managing staff. Payroll companies are also set up across the majority of the local authorities in Scotland to assist PA employers with payroll. Some of these organisations may also be able to assist with the training and recruitment of PAs, however, the supported person is still the employer. The phrase 'employed by' in the Irish context, means that the service user has full control over the PA. Typically, however, service users avail of allocated funding to employ a PA through service providers (Carroll & McCoy, 2022).

The figure below illustrates how support is organised via Direct Payment in seven steps (in Control, 2020).

Figure 1: Information about self-directed support

Danielle and Maria outline seven steps in building cooperation towards support (see Case 3 below).

Case Study 3: How I am Employed as a PA

"She still has all the choice and control around her support and how it's provided"

My name is Maria and I am employed by Enable to support Danielle. Enable is one of a small number of provider organisations that work within a PA structure. The beauty of being supported by an organisation working within a PA structure is that they recruit a team specifically around each person and their support needs. Danielle is involved in the interview process and in deciding whether staff are successful in gaining a post in her team. She still has all the choice and control around her support and how it's provided but she doesn't have the responsibility of being an employer and managing her PA team. Most provider

organisations across the UK, who deliver Social Care services do not have this structure and instead simply send staff where and when they are needed. As a result of this approach, it is often the case that the supported person does not receive continuity of care.

Danielle Farrel, Managing Director Your Options Understood (Y.O.U.) and Maria Herbert-Liew, Personal Assistant, Scotland

Employment of Teaching Assistants

In Germany, the employment of TAs varies across federal states. In a study from 2022, Idel and Korff found that TAs in the federal state of Bremen were employed by different private providers/agencies (such as private providers, foundations, and welfare associations) who all compete for business. There is no legal regulation for the control of these providers consequently costs vary. TAs view their employment situation as precarious, nevertheless, they hold high intrinsic motivation, as extrinsic motivation factors, such as better payment and promotion opportunities, do not exist (Kißgen et al., 2016).

In Ireland, the NCSE "is responsible, through its network of local Special Educational Needs Officers (SENOs) for allocating SNAs to schools to support children with special educational needs" (DES, 2014, p. 13). An SNA's contract of employment is with the managerial authority of the school in which they are employed. An SNA's salary is paid directly by the DES, and prior to the appointment of an SNA, applications are made by the school to the NCSE. Allocations are considered on the basis of an assessment made by a relevant professional who reports that a pupil has a significant medical, physical or sensory impairment. Under certain circumstances, SNA support may be allocated where the care needs relate to behaviour. SNAs are allocated to schools and not individual pupils, and are therefore a school-based resource. Schools manage their allocation by targeting the children in greatest need and exercise autonomy and flexibility in order to provide for the care needs of identified children as, and when, those needs arise. SNA allocations are also time bound and specifically linked to the Personal Pupil Plan (PPP). The allocation may be made initially for a maximum period of three years, but is subject to annual review and a full reassessment of their care needs at the end of this period. As the care needs in schools change, SNA positions may avail of a redundancy scheme operated by the DES (DES, 2021).

In the UK, TAs are employed directly by the school, the local authority, or academy trusts. The average salary for a TA starts at £14,000 per annum and more experienced TAs may earn up to £21,000 (National Careers Service UK). TAs are not generally assigned to a specific child, rather they may provide support fluidly across groups of pupils or only for particular lessons. Models of deployment reported were whole-class support; targeted in-class learning support; or targeted intervention delivery (Skipp and Hopwood, 2019).

Educational Training and Qualifications

As described previously, one major concern in the field of employment is educational training and qualifications of TAs and PAs. In this section we will describe education and training in different countries.

Education and Training of Teaching Assistants

It seems that a very heterogeneous group of people work as TAs. While some TAs have basic qualifications, others have little specialist training or qualifications. Sharma and Salend (2016) contend that TAs rarely receive adequate training and supervision. In Ireland, the minimum qualifications required for appointment to the post of SNA is either a FETAC Level 3 qualification on the National Framework of Qualifications (NFQ) or a minimum of three grade Ds in the Junior Certificate or equivalent (DES, 2021). Despite this, the NCSE states that training opportunities available to SNAs are insufficient. Additionally, although training for SNAs was deemed the responsibility of the Board of Management in schools, funding is not provided. The review concluded that whilst many undertook training at their own expense and in their own time, a generic programme should be available for all SNAs to address topics relevant to the role, along with customised programmes specific to the needs of certain children (NCSE, 2018).

Likewise no regional or national standards exist for TAs in Germany, despite evidence suggesting that high-quality education for children with special educational needs can only be implemented if professionals are appropriately qualified (Billerbeck, 2022). The granting of a TA is subject to varied pedagogical qualifications / or varies according to contexts? For example, if a child gets a TA in accordance with the SGB VII (Social Code Book VIII) of the Child and Youth Welfare Services, a qualification is necessary. However, this is not the case for a child or young person with a mental, physical or multiple disability according to SCB XII (Social Code Book XII) of the Social Welfare Services (Billerbeck, 2022). TAs with qualifications have, in general, a pedagogical, medical or nursing professional background whereas TAs with no qualifications may have experience in a range of working areas (Kißgen et al., 2016). The training rate in some federal states, such as Bavaria, Thuringia, as well as in the Lower Saxony/Hannover region is over 50%, even if no qualification is required. Dworschak and Markowetz (2010) emphasise the professionalisation of TAs and recommend further education and training.

In the UK, schools and local authorities set their own entry requirements. However, entrants into relevant courses usually require 2 or more General Certificates of Secondary Education (GCSE) at Grades 9 to 3 or 4, or 5 GCSEs at Grades 9 to 4 or equivalent (National Careers Service, 2023). College qualifications at certificate level such as Supporting Teaching and Learning in Schools are available where persons interested may enter the

role with a qualification in childcare or early years education. An alternative route is via a Teaching Assistant Advanced Apprenticeship.

Education and Training of Personal Assistants

In the UK, PAs and Support Workers who work for support providers differ in the level of formal qualifications required to fulfil the role. In the UK, staff working for a provider organisation are usually required to have at least a SVQ (Scottish Vocational Qualification) 2 or equivalent in Social Care. PAs are unlikely to be employed full-time and often work under zero-hour contracts. Furthermore, they are less likely to hold formal care qualifications – yet tend to earn more than their care worker counterparts Interestingly, some people with disabilities deliberately choose not to have assistants trained as care workers because they want assistants who act on the instructions of the person with disabilities and not on the basis of previous work experience in the healthcare sector.

Case Study 4: How I organise self-directed support and Personalised Budgets

"Promote my independence and my identity."

My name is Dr Danielle Farrel and I am a Personal Assistant (PA) employer in Scotland. In order to assist with the recruitment of personal assistants, I receive financial support from the local authority based on an individual needs' assessment. I have opted to use a mixed approach to budgeting for the support services I need. On the one hand, I can have a self-directed budget and on the other, I can access funding which is managed by the local authority (Scottish Government, 2013) to assist with the employment of personal assistants. In my personal and professional experience, a number of issues have become apparent to me when employing a PA. Firstly, I believe that qualities such as person-centredness, listening skills and respect for the need to assist me in living my life in the way I want to, are critical. My PAs need to have the ability to promote my independence and individual identity. In addition, my PA should help me in a positive manner to help me to reflect on and address my own identity without "sitting on my shoulder". I continuously strive to advise my PA team of what support/s I require. In this regard, mutual respect is key and both parties should have a clear understanding of the expectations associated with the role. Formal qualifications aren't necessarily a must. These qualities outweigh any formal qualification.

Dr Danielle Farrel, Managing Director Your Options Understood (Y.O.U.), Scotland

Conclusion and recommendations

Over the last few decades, views of disability have encompassed medical, social and, more recently, human rights approaches/perspectives? The human rights model has led to greater empowerment of people with disabilities encouraging a more independent and autonomous way of living. Relatedly, there has been an increase in demand for TAs and PAs and the corresponding rise in terms and labels suggests a need to re-define these roles to ones which accurately reflect their roles and responsibilities??

Similarly, with respect to responsibilities carried out by both TAs and PAs, evidence points to the challenge of balancing adequate support along with fostering independence, choice and autonomy. With regard to teacher and TA responsibilities, other concerns remain. Most notable of which is the regular blurring of responsibilities, which requires careful navigation and most importantly, the need for professional dialogue between all parties. Moreover, there needs to be an awareness of collaborative teamwork. Teachers and TAs should discuss, and clearly define, their roles and responsibilities, respect each other as experts and take time for teamwork. When relationships are collaborative, TAs are likely to feel more valued and appreciated. This equally applies to the relationship between PAs and the person with disabilities as self-employed. to work in a collaborative manner.

Clearly, all of the above point to the need for a redefinition of tasks, roles and responsibilities, in addition to a strengthening of structures towards the enhancement of cooperation and collaboration. The RTM could be adopted to enhance positive working relationships which, in turn, can positively influence peer interaction and social integration. Team reflection on the benefits of having a TA and/or PA in specific situations necessitates the activation and strengthening of the voice of the person with disabilities. They themselves can be more involved in deciding what support they really need. Moreover, natural support is a potential solution, whereby peers or friends are more involved in supporting the person with a disability. Finally, further consultation with parents or relatives about the preferred support for the person with disabilities and how such support can be offered could cast light on the emerging roles of TAs and PAs.

Overall, raising awareness about the existence and roles played by PAs and TAs would be beneficial. TAs support students with SEN to attend mainstream schools and PAs offer people with disabilities to live an independent life. Learning to effectively work with an assistant while in school is essential for students with disabilities. This dynamic empowers the student, positioning them as the decision-maker, thereby fostering their independence and self-advocacy skills. Unlike teaching assistants who operate within the framework set by the teacher, personal assistants work directly under the student's guidance. This distinction is vital in recognising the different support approaches: teaching assistants support educational goals collaboratively with teachers, while personal assistants follow the directives of the student, ensuring their personal needs and preferences are prioritised.

Reflecting on these approaches is essential for creating inclusive environments that respect the autonomy and unique requirements of students with disabilities.

TAs and PAs play a significant role in implementing the rights of persons with disabilities to participate fully in society as decreed by the UNCRPD. Given the importance of this role, training and education varies considerably and is often ad-hoc and non-standardised across countries. Further discussion on baseline qualifications and skills could help to formalise the TA and PA roles? In addition, while employment conditions of TAs and PAs differ from country to country, precarious employment is more common among PAs, who are often employed privately by an agency or directly by a person with a disability. Thus, the terms and conditions associated with this role require greater development and refinement?

Considering the issues highlighted in this chapter, there is a need for a radical shift of the roles for TAs and PAs in the disability sector. Societal perspectives require a shift from the neo-liberal perspective towards an emancipatory approach. Persons with disabilities themselves should decide on what support they need and how best this is organised. While current legislation espouses the right for a person with disabilities to live a fully independent life, barriers exist which prevent the manifestation of this vision. One such barrier is attitudes and perceptions towards people with disabilities who often experience social exclusion and are regularly victims of discrimination. The unequivocal endorsement of empowerment, self-determination and participation as rights is paramount. For this to be realised, heightened awareness in society is the first step, followed swiftly by newly imagined models of co-operative living and working.

Closing questions to discuss or tasks

- Reflect on the balance between providing necessary support and promoting independence. How can TAs and PAs ensure they are not hindering the social integration of those they assist? How can you, as a teacher, make sure they are as inclusive as possible?
- Discuss the potential conflicts that might arise between TAs and teachers or PAs and their employers. How can these relationships be managed effectively?
- Consider the qualifications and training for TAs and PAs in your country. What improvements could be made to better prepare them for their roles?
- How can the perspectives of the individuals receiving support be more effectively integrated into the planning and provision of assistance (especially in schools)?

About the authors

Danielle Farrel

Danielle Farrel has both lived and professional experience in the field of disability. She has a passion for changing the narrative for disabled people and those from other marginalised groups. Danielle graduated with her PhD from the University of the West of Scotland in 2015 and her thesis was entitled 'The 2012 Child Abuse Scandal: The Multifuctional Nature of Online Discourse'.

Marie McLoughlin

Marie Mc Loughlin is a qualified primary teacher with experience of teaching in educational disadvantaged schools. She also worked as a national co-ordinator for a programme of teacher professional development and is currently working as a teacher educator in initial teacher education in a university in Ireland. Her research interests are play, early childhood education, organisational culture, mergers and teacher education.

Eileen Schwarzenberg

Eileen Schwarzenberg is a qualified special education teacher. Eileen graduated with her PhD in 2013 and is since then working as a lecturer in inclusive education in a university in Germany. Before that, she worked as a research

assistant and lecturer at various universities in the field of special education. Her research interests are teacher education, teaching assistants and inclusive education for students with profound intellectual and multiple disabilities and Augmentative and Alternative Communication.

Melanie Eilert

Melanie Eilert has lived experience as someone living with personal assistants. Graduated with a Bachelor Professional in HR Management she is employed at a service provider that provides personal assistance to people with disabilities.

WORKING WITHIN MULTIDISCIPLINARY TEAMS

Example Case

Multidisciplinary teamwork is complex and varies in different constellations and contexts. To give you an impression of multidisciplinary teams in different early years and school context, we provide four short example cases. To engage with the complexities, we provide more information for two cases later in the chapter.

Example Case 1: Multidisciplinary Teams in the Finnish Early Childhood and Care (ECEC)

When I first visited a Finnish daycare, I was amazed by the diversity of professionals involved in educating and caring for small children compared to what I knew from the Romanian school system.

The moment I stepped into the teachers' lounge that morning, I knew something important was happening. In a separate area, away from the noisy group moving in and out in the morning rush, several adults were seated around a table. I couldn't hear what was discussed, and even if I could, my lack of the Finnish language would have impeded me from understanding anything. However, that didn't stop me from asking another teacher not involved in the discussion what that was about. I then found out that in Finland each child receives the needed support based on their assessment and individual learning plan created by the kindergarten teacher in collaboration with the family at the beginning of the school year.

Their plan is revisited and adjusted throughout the year, according to the developmental milestones achieved, and travels with the child throughout the early years and in the transition from early years to preschool and school. Considering the diverse and complex needs of young children when they arrive in daycare, the ECEC team is informed about the trajectory of each child before the age of 3.

When things don't go according to plan, multidisciplinary teams usually gather and give each other an update on the child's progress, renew the existing goals, exchange insights, provide recommendations and inputs on related services or modifications to be tried out in the following weeks or months.

Are you interested in learning more about how Finnish early childhood and care is multidisciplinary by design? Take a closer look! (See section "A closer look on Example Case 1")

Example Case 2: Early Learning and Care [ELC] in the Irish Context

Every morning, we met this little person at the school gate. They clung to their primary carer, arms tightly wrapped around their neck and their legs similarly around the waist. Acknowledging "You are so snuggly and warm around them." They replied "My little koala bear." The educator also acknowledged "It's hard to leave them in the morning." This little person would move from their primary carer's arms to the educator, squeezing them just as tight. Upon entering the classroom, it was loud, and busy, with active children all engaged in play. When the educator was putting them back down on the ground, they could see their eyes darting from side to side. The little person would then rest their head on the educator's stomach 'they were too tired for school; they wanted to go home'.

This little person was struggling with the level of noise in the classroom. At times, they would seek rest from the overstimulating classroom by putting the educator's hands over their ears or leaning really close to their key person to seek rest. From our training and reflective conversation and from the groundwork with the team members we decided to turn an unused art room into a 'nurture nook' for this little person to have comfort and safety from the busy room when needed. An unintended result of this room change meant all the children had more space which made the room less noisy for everyone. This room was equipped with a sliding door the children could open and close depending on their needs. It was used as a place for peer-to-peer and adult/ child communication, story-time and/or a place for the children to have private conversations with educators or with other children. We received funding from an external agency to equip this room with weighted blankets, ear defenders, and speakers to play soft music intermittently. The children added teddy bears to it for comfort.

While this little person started to arrive earlier to school, and their attendance improved, possibly because they were able to transition to school using this room to acclimatise themselves to the bigger group in the morning and throughout the day. Still, school could be a

real challenge for this little person. With consultation with their primary carer, we sought outside multidisciplinary support from the Access and Inclusion Model (AIM) to ascertain supportive strategies when they were changing clothing from inside to outside and strategies for dealing with peer relationships. Their primary carer also accessed support from the multidisciplinary primary care team with Ireland's Health Service Executives (HSE). However, due to COVID-19 and an extremely long waiting list, an appointment was not available before he transitioned to primary school. Nonetheless, using an inclusive, relational approach in our education setting, linking in with the Access and Inclusion Programme, and with the support of their primary carer this little person's strengths-based progress was able to continue with them to primary school.

Example Case 3: Supervision in the Italian Context

Teachers usually perceive their daily routine as overwhelmed with meetings and bureaucratic commitments. They often do not have time to reflect together on their practices, or to talk deeply about the students.

Within the Labs to Learn project (https://labstolearn.it/) aimed at minors in the Piedmont region (Italy) to combat school dropout rates and prevent educational poverty, a monthly supervision for teachers was part of the action Study Method.

Study Method was dedicated to the first-year classes in lower secondary school, so that each child could find "made-to-measure" strategies, considering individual differences, strengths and learning styles (Stenberg, 1998), thereby strengthening perceptions of self-efficacy (Bandura, 1994) connected to school. The supervision, aimed at each class council, guaranteed a space to reflect and talk about challenges connected with the experimentation of personalised study methods in the classroom.

The meetings allowed them to talk about emotions connected with working in the classroom, during and after the pandemic. Throughout the meetings, teachers shared their fears about how to deal with interruptions of the lessons due to the lockdown. They had time to share impressions of each student (beyond marks), including those who have needs that they cannot express clearly. All points of view contributed to a holistic understanding of the students. This approach helped to work on the group dynamics, to generate a sense of togetherness and to find common strategies for a better classroom management.

Example Case 4: Primary School/Pedagogical Counselling Centre in the Austrian Context

Patrick, a boy in the second year of primary school, has difficulty following the lessons and his academic performance does not meet the expectations of the curriculum standards for primary school. The class teacher, who is young and in general ready for open lessons, feels overwhelmed by the "heterogeneity of the learning group" to respond to Patrick's individual

needs within the framework of regular lessons. Talks with the parent or guardian fail, appointments are not kept. Patrick often comes to school with clothes that are not suitable for the weather or without breakfast. He seems neglected and often consumes media that are not appropriate for his age, has access to game consoles etc. and often attracts attention through aggressive behaviour. As the head of the Pedagogical counselling centre at the time, I got to read Patrick's special educational needs assessment during the procedure for determining special educational needs. (PBZ, later Departments of Inclusion, Diversity, and Special Education, FIDS, see Key aspect 3)

It clearly states that Patrick does not show any signs of a disability, but due to his difficult environment and his persistently weak performance at school, he should be given special educational needs for the general special school (learning focus). Instead of assigning him Special educational needs, I worked with the head teacher, the class teacher in charge and a counselling teacher who was temporarily present on site to find out which support system Patrick needs to reduce his barriers to learning and development. We were guided by the following questions, among others:

- *What interventions can be made in the classroom?*
- *What personnel resources can the school authorities provide in the short term to enable the class teacher to teach in a more open and differentiated way as a team?*
- *What extracurricular institutions and contact persons are there that can provide relief and support for Patrick's home environment?*
- *How can the guidance counsellor use her resources profitably for Patrick and the class teacher? Which competencies should be developed within the class?*

Concrete steps were planned, a support system was established inside and outside the school in close co-operation with the school supervision and the guardians, and the SEN (Special Educational Needs) procedure was paused for the time being. Patrick was able to develop positively over the next few months: both his school performance and social behaviour were able to stabilise, the class teacher felt relieved, and the counselling teacher repeatedly reported a positive course of development – for the entire system. As a result, the SPF procedure could be dropped after about half a year and Patrick's barriers could be significantly reduced by establishing a support system without having to receive a stigmatising label.

If you want to know more about the Austrian Departments of Inclusion, Diversity, and Special Education (FIDS), see subsection: Support structures on regional level.

Initial questions

Think about your experiences in educational institutions like kindergarten or school. Apart from your own school days, you might think about your observations during school visits or your experiences during internships or practical phases within your initial teacher education. Furthermore, some of you might have previous or current experiences of working in kindergarten or schools:

- Who is part of the multidisciplinary team in this context?
- What could be the difficulties of working in a multidisciplinary team?
- What are the benefits of multidisciplinary teamwork?
- What practices contribute to positive multidisciplinary teamwork experiences?

Introduction to Topic

"I"-Perspective

Picture a teacher sitting at home thinking:

"Oh, but I was not trained for that (new situation or challenge) …. I don't have enough time (to discuss it with someone else in the professional team) … I don't want/find it hard to work with (other professionals)… I don't know how to deal with this situation…"

The above thoughts depict teachers struggling with a certain situation in the classroom, but not feeling prepared to deal with it properly, not thinking that the training or previous experience helps in any way and not being willing to cooperate with other professionals within and outside the educational setting. When reading the thoughts above, they may sound familiar to you, as these thoughts are common to all teachers, irrespective of whether they are new in the profession or already highly experienced. We are going to examine in closer detail four scenarios that depict different cultural contexts and grade levels that may help you think about the topic differently. These scenarios will be accompanied by the specific working conditions that underpin the connections and dynamics between the members of the multidisciplinary teams. The realities of each of the contexts within which the educators and other professionals of these scenarios (Example Case 1-4) find themselves will be discussed. Throughout the chapter there are reflection questions for the reader to pause and reflect on the section just read. These are highlighted similar to the reflective question below.

What can teachers do when they do not know how to deal with a situation?

Firstly, let's establish that it is normal to have these different thoughts and feelings. Secondly, teachers do not need to work on their own; they do not have to be a lonesome player, although this was common in schools for a long time and in many cases still is (Terhart & Klieme, 2006).

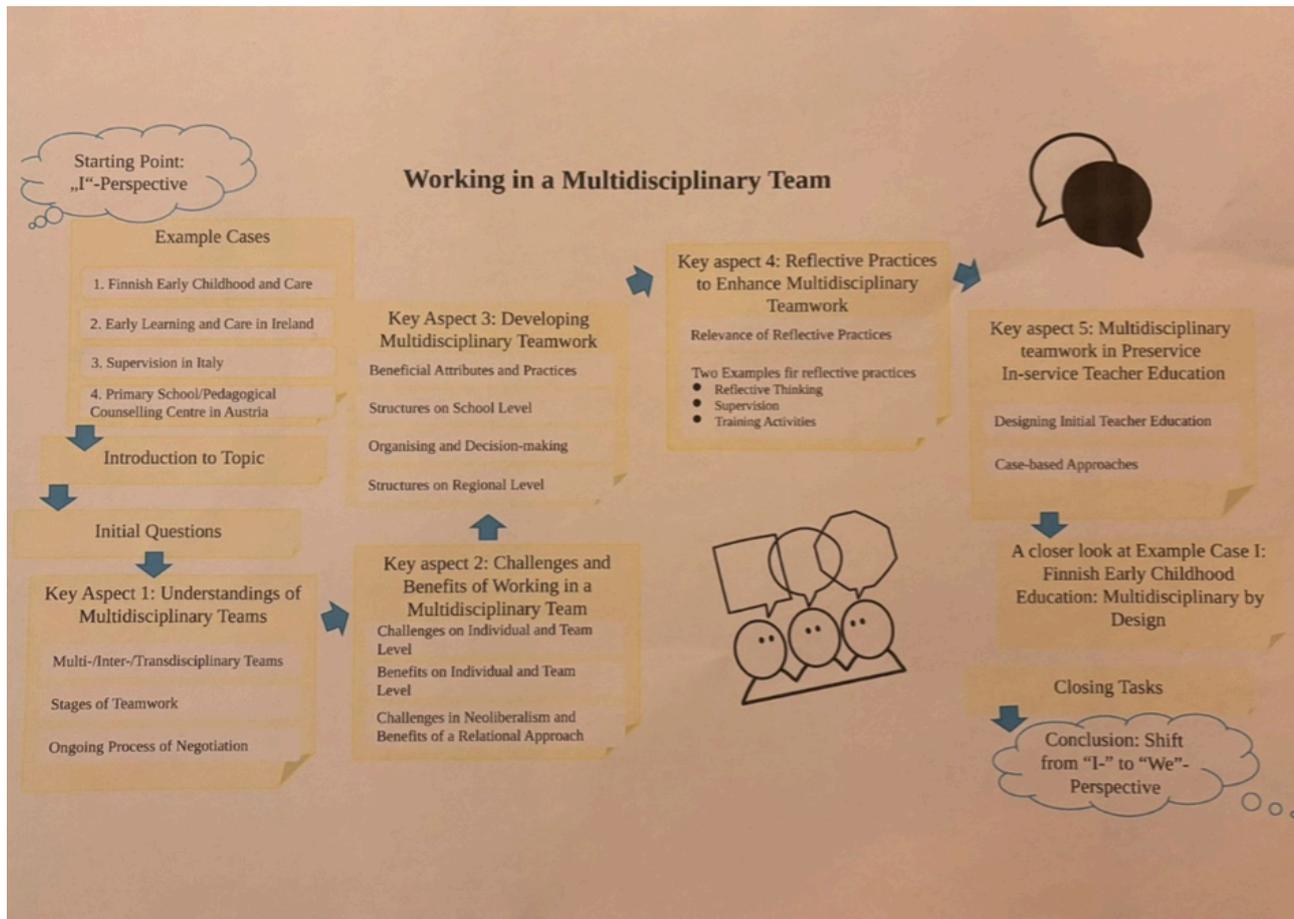
Aiming for an inclusive school system changes the perspective completely: every class is a diverse learning group with diverse needs, and it is normal to look for a wide range of competences and professions (Booth & Ainscow, 2019).

For one person it is overwhelming to identify and overcome barriers of learning and to respond individually to the diverse needs of all students. Whether you are a new teacher or have years of experience, there will always be challenging and new situations. You cannot manage it alone, there is a need for certain support, there is a need for a team (European Agency for Special Needs and Inclusive Education, 2022). If that team is multidisciplinary, it is even better, because then you have a huge variety of knowledge within the team. It is important for teachers to collaborate in the classroom and school community because you will find new and proper solutions when you have other educators, other experts, other views, other perspectives and competences to communicate with (Ahlgrimm, 2021).

Teachers often do not know about the opportunities for collaboration that exist in and outside their school. As a teacher, when you do not know how to deal with a situation, you can look for a team to solve it. You can ask colleagues, your team-teaching partner, relevant actors and other professionals. You can also ask your principal if there are any experts on the situation you are experiencing already in the school. Also, you can seek support from institutions outside your school. There are several support systems established to answer questions, queries, challenges that you might experience. Therefore, it is a competence to ask for advice.

Our starting point refers to the "I"-perspective. In this chapter, we focus on five key aspects: Key aspect 1 refers to understandings of multidisciplinary teams based on a differentiation between multi-/inter-/transdisciplinary teams, stages of teamwork and understanding multidisciplinary teamwork as an ongoing process of negotiation. Key aspect 3 draws on the challenges and benefits of working in a multidisciplinary team on individual and team level and refers to challenges arising from the wider context of neoliberalism and the benefits of relational approaches. Key aspect 3 refers to developing multidisciplinary teamwork by considering beneficial attributes and practices, structures on school level, organising and decision-making as well as structures on regional level. Key aspect 4 highlights reflective practices to enhance multidisciplinary teamwork by summarising the relevance of reflective practices and providing two examples for reflective practices. Key aspect 5 focuses on multidisciplinary teamwork in pre-service and in-service teacher education by referring to designing initial teacher education and case-based approaches. After these five key aspects, we provide "a closer look" at example case 1 to learn how Finnish early childhood education is multidisciplinary by design. In the end, we provide closing tasks and a conclusion which emphasises a shift from "I"- to

"We-"perspective. There is a link to Figure 1 below: https://seafile.cloud.uni-hannover.de/f/ac19978f45894b7e806a/

Figure 1: Overview of the Chapter


Key aspects

Key Aspect 1: Understandings of Multidisciplinary Teams

There are various understandings of multidisciplinary teams. For example, in some contexts, it would be more likely that we would talk about multiprofessional teamwork. Hence, different terms might be used depending on the particular context. At the same time, terms are often used interchangeably. For simplicity, we use **multidisciplinary team** in this chapter to refer to different constellations, intensities, and contexts. Knowing and reflecting about different terms is useful to reach a common understanding.

Let's start, by briefly looking at "team" and "teamwork": A **team** is a group of individuals with a shared understanding of interdependence, the necessity for communication, and the value of teamwork who have been organised for a specific goal. **Teamwork** is the interaction that is demonstrated in the information sharing between team members, which assures the synchronisation, coherence of the pace and rhythm of collaborative activities and results in the effective operation of the entire team and a high level of individual

commitment (Volkova et al., 2021). At the same time, team constellations working together can differ regarding the intensities of teamwork, goals, and context as pointed out by the conceptual model "Multi-/inter-/transdisciplinary teams".

Differences between Multi-, Inter- and Transdisciplinary Teams

Starting from the basic questions of who works with whom with which goal, Friend and Cook (2010: 65) refer to multi-, inter- and transdisciplinary teams as three different models of team interaction.

These differ concerning the **"philosophy of team interaction"** (Friend & Cook, 2010: 65): How do members understand themselves? In **multidisciplinary** teams, members value the importance of contribution of different professional groups or disciplines, but their "services remain independent" (Friend & Cook, 2010: 65). An example of this would be when teachers work together with professionals outside school, for example physical therapists. In **interdisciplinary** teams, members share their responsibilities, however, each professional group remains "primarily responsible" for their tasks (Friend & Cook, 2010: 65). For example, in German or Austrian in whole day schools, there is often an institutional distinction between teachers who mostly teach their lessons before the lunch break and educators who are responsible for various activities in the afternoon. While teachers and educators might not teach together, they might, for example, develop a shared individual educational plan. In **transdisciplinary**teams, members work together "across disciplines" and learn from one another (Friend & Cook, 2010: 65). On the classroom level, co-teaching of classroom or subject teachers with special educators or other specialists is an essential approach for inclusive schools. In one school in Namibia, an English teacher and a sign language teacher co-taught to facilitate English language learning helping all students to understand English better. In Finish early childhood education and care, several professionals like kindergarten teachers, social welfare workers, childcare workers, and special education teachers – to name but a few – are involved in a child-centred task together.

Multi-, inter- and transdisciplinary teams differ in the **way they communicate** (Friend & Cook, 2010: 65): **Multidisciplinary** teams share information about their independent work, for example, on assessment, and develop separate education or service plans. In**interdisciplinary** teams, members meet on a regular basis, for example, in case conferences, and combine their goals for a single individual education plan. In a **transdisciplinary** team, regular team meetings for both sharing information and learning from each other are crucial. This allows them, for example, to assess collaboratively and develop an individual education plan together.

Besides the **"role of the family"** (Friend & Cook, 2010: 65) varies: In **multidisciplinary** teams, families meet with each professional group separately. In i**nterdisciplinary** teams,

families meet with all the team members, but these report independently. In **transdisciplinary** teams, families are more involved in these joint meetings.

Think of your own experiences in educational institutions. How can you relate these experiences to the model of multi-, inter- and transdisciplinary teams? What's important for team interaction in your particular context?

This differentiation between multi-, inter- and transdisciplinary teams supports thinking about the intensity, goals, and context of working together. Even if different terms like multiprofessional team are more commonly used in your context, differentiating between multi-, inter- and transdisciplinary teams helps you to understand your own team better and find starting points for future development. As mentioned in the beginning, we use multidisciplinary team in this chapter to refer to different constellations, intensities and contexts.

Stages of Teamwork according to Tuckman

Another differentiation which is also helpful to understand different constellations of multidisciplinary teams, looks at the development of the teams: Dugang (2020) describes Tuckman's model as a significant method to understand the evolution of teamwork. This model acknowledges that teams do not initially exist in a fully developed and functional state. The model proposes that teams develop through a series of distinct phases, from their inception as loosely connected teams of individuals through their development as cohesive teams with a clear purpose. According to this model, as discussed by Dugang (2020), there are four stages to teamwork that include:

Figure 2: Stages of Teamwork According to Tuckman

Forming	In the early stages of team development, people are still getting to know one another. Everyone is preoccupied with figuring out their role on the team, evaluating one another, and contemplating their purpose for being on the team.
Storming	People start to identify with being on a team. At this point, they could disagree with one another and the team leader about what the team is doing and how things need to be done. As implied by the name of this phase, conflict, and confrontation are typical of this phase as differences become apparent. The performance or focus on the task may suffer as a result.
Norming	In this phase, team members work together, creating procedures, laying out ground rules, and defining who is responsible for what and how things will be done. During this phase, there is a developing sense of 'togetherness'.
Performing	This stage is where increased attention to the work and team dynamics come together to create synergy. People working together successfully promote performance.

The benefit of Tuckman's concept is that it aids professionals in understanding how teams evolve over time. It also helps to think about how people experience various issues at various points in their growth as a team (Dugang, 2020). However, in order to establish and cultivate a pleasant, functional team environment, teamwork depends on the presence of synergy between all team members, creating an environment where they are all motivated to contribute and participate. Team members need to be adaptable enough to function in collaborative contexts where teamwork and social interdependence are prioritised over individualised, competing aims (Tarricone & Luca, 2002).

Multidisciplinary Teamwork as an Ongoing Process of Negotiating Roles and Responsibilities

Multidisciplinary teams are considered as a reaction to (increasing) complexities (Easen, Atkins & Dyson, 2000). At the same time, multidisciplinary teamwork is not a "quick-fix" (Nichols et al., 2010). Hence, it is important to take the complexities of multidisciplinary teamwork into account. Bauer (2014) suggests a process-oriented perspective on multidisciplinary teamwork: in our initial questions we ask who – which professional or occupational group – is part of a multidisciplinary team. Instead of thinking about these

professions or groups as unchanging/unchangeable and self-contained, Bauer (2014) emphasises that collaboration takes place

"between professional actors who continuously have to define and negotiate their specific tasks, responsibilities and abilities, trying to come to terms with each other and sometimes also bargaining against each other. In this process, boundaries between professional groups shift, new tasks and responsibilities emerge and are distributed and assigned" (Bauer, 2014: 274).

This process-oriented perspective refers to the theoretical concept Negotiated Order(ing) by Strauss et al. (1981) which highlights how professionals negotiate their tasks and division of labour. This includes – for example, when new staff members join the team or when new conceptual frameworks or technologies become relevant in a certain field – renegotiating tasks and responsibilities. Overall, (re)negotiation between different professionals stabilises or, at least in the long term, might also change social order (Strauss, 1978). For understanding multidisciplinary teamwork, this raises the important question: what is perceived as (non) negotiable by whom? (Strauss, 1978: 252). In this regard, it's fruitful to pay attention to ways multidisciplinary teamwork is situated (Clarke, 2005), for instance, in different national and local school contexts (Arndt, 2022; Hansen et al., 2020; Naraian, 2010).

Based on an ethnographic study on multidisciplinary teamwork in Swiss primary education, Kosorok Labhart and Maeder (2016) highlight, that planning and clarifying one's roles and responsibilities is part of the continuous negotiation. Overall, understanding multidisciplinary teamwork as an ongoing process enables a change of perspective by not focusing solely on the individual teacher and, for instance, their (lacking) willingness to collaborate, as it is often the case in discussions on multidisciplinary teamwork.

Key Aspect 2: Challenges and Benefits of Working in a Multidisciplinary Team

Teamwork amongst role players is crucial to develop inclusive schools, which involves all school systems. The inclusive school community places teamwork at its core, and it is a key strategy for assisting all participants in such a community. This suggests that no teacher, parent, education support worker, student, or volunteer should have to handle significant challenges by themselves. Successful inclusive education is built on support. The focus of inclusive classrooms and schools is on how to run them as loving and supportive environments where a sense of belonging is developed and everyone feels accepted, encouraged, and cared for by everyone else in the school community (Swarts & Pettipher, 2016).

However, interacting with other people can sometimes be hard. Each one of us has our own personality, character, way of communicating, and habits, and it can be difficult to engage with people who are different from us. However, by working closely with people with different skills from yours, you not only have the unique opportunity to learn something

completely new every day but also transfer to others some of your own knowledge. You can learn from other people's experiences things that you would not be able to find in books, or that would probably take you a long time to learn on your own (Pinti, 2018).

It is important to address challenges and benefits of working in a multidisciplinary team. We take a two-fold approach: First, we take a closer look at common difficulties and benefits on individual and team level:

- Why is it sometimes difficult to work in a multidisciplinary team?
- Why is it worth it to work in a multidisciplinary team?

After this, we situate challenges of multidisciplinary teamwork in the broader context by focusing on tensions arising in education in neoliberalism, especially with regard to the so called 'hidden curriculum'. In this respect, relational pedagogy can form an important approach to critically reflect on these tensions.

Challenges on Individual and Team Level

Working in a multidisciplinary team might be challenging, both at an individual and at a team level. When faced with difficult situations, your first reaction could be to think that it is your sole responsibility to solve it, that it is faster to do it on your own, or that it is less messy, and so asking for help does not come easily.

Challenges at the individual level
● When you see your profession as isolated, at the same time you acknowledge that a different set of skills is needed to respond to the complex situations you encounter in your classroom (Bauer, 2014; Pölkki & Vornanen, 2016).
● For this reason, it can be hard to fully trust other professionals (Ekins, 2015). ● You even rank your and others' input and opinions according to a certain hierarchy, and based on their level of qualification, you might see yourself or others as more or less entitled to contribute to the common effort (Hood, 2015). ● You can be blinded by the human ego, which stops you from seeing the common good that a team can achieve (Herbert & Broomfield, 2019).
Challenges at the team level
● Finding enough resources and the right competencies needed to tackle a situation, and finding the right professionals at the right time can be tough (Unabhängiger Monitoringausschuss der Republik Österreich [UMA], 2023).
● Or even beginning to consider that other professionals in the same school or in the close community might help, can be exceptional (Solvason & Winwood, 2022). ● Collaborating across institutional boundaries can surge the challenges. Without having or designing operating models, guides and procedures, it can be problematic to find common grounds or reach agreements and communicate important information (Behringer & Höfer, 2005).

Benefits of Individual and Team Level

It most certainly is worth working in a multidisciplinary team. Just like with the challenges,

the benefits of working in a multidisciplinary team can be identified at both the individual and the team levels.

Benefits at the individual level
• Not feeling like we are the lone warriors helps us have a broader perspective, helps us respond to the needs of our students better and feels a sense of accomplishment about our work. • Strengthening our communication skills, becoming more empathic, and being willing to adopt other perspectives will help us build more trusting networks and achieve effective cooperation (Kumpulainen, 2013). • By working closely with people with different skills from yours, you not only have the unique opportunity to learn something completely new every day but also transfer some of your own knowledge to others. You can learn from other people's experiences things that you would not be able to find in books, or that would probably take you a long time to learn on your own (Pinti, 2018). Working in a multidisciplinary team shifts the boundaries of individual professions, and adds in new tasks and areas of responsibility, which helps us become more flexible and adaptable; instead of the "everyone does everything" type of culture, there is more clarity in our roles and responsibilities (Bauer, 2014; Onnismaa, 2017).
Benefits at the team level
• When working together in a multidisciplinary team, educators and other professionals exchange information and perspectives about our students, which can do better justice to them and contribute to our commitment to inclusive education (European Agency for Special Needs and Inclusive Education, 2022). • As multidisciplinary team members who develop joint solutions to challenges, we learn from and with each other, and by strengthening our professional actions our workload decreases (Ahlgrimm, 2021). • To provide adequate support to students who face learning obstacles, it is important that all role players in the learning process cooperate and help one another. To do this, it is essential to value each person's knowledge, abilities, and experience while also promoting their engagement and involvement. This calls for collaboration between each and every teacher as well as between educators and other stakeholders in general. In a team that works together, fostering an environment of trust, openness, and dedication needs to be a core rule. Due to the nature of true professional barriers being crossed, this type of collaboration can be referred to as transdisciplinary teamwork (see models of team interaction).

Reflect on your own experiences of working in a group or with a team. Alternatively, you can also reflect on a situation which you observed, for example, during a classroom visit.

What challenges did you perceive – or observe – on an individual level and on the team level?

What were the benefits of working in a team on an individual level and team level?

Challenges in the Context of Neoliberalism and Benefits of a Relational Approach

While we focused on challenges and benefits on individual and team levels before, next we take a closer look at challenges of multidisciplinary teamwork arising from teachers' role as 'lonesome players' by situating this in the broader educational and societal context influenced by neoliberalism. Today, education is still mostly operating based on a confirmative-based ecology to produce the long-term outcomes of an equitable workforce (Öchsner & Murray, 2019). Neoliberal policy in teacher education is creating a competitive

environment stressing the sole interest of an I-focus rather than a We-culture. Thus, eroding a collegial environment promotes teachers' agency to make decisions and problem-solve. By quantifying (measuring) educators' performance and steering an environment of competition over the connection, teachers can be in the space of feeling vulnerable in their work with colleagues, learners and their families. Ljungblad (2021) suggests teachers are finding it really difficult to use pedagogical tact (intuition) when powerful neoliberal agendas – reflected, for example, in policy documents stressing 'efficient', 'effective', 'standards',' tools' – are at play.

To put the above literature into context, focusing on classroom-based education and changes to policy strategies, we could possibly unpack the nested paradoxes that can be layered in professionalisation, for example, leading to greater emphasis on hierarchies—a major challenge for working in multidisciplinary teams. Let us take a look at current development in the Irish early education system seeking to professionalize a newly constructed degree-led profession.

New degree-led profession, new hierarchies in multidisciplinary teams?

Currently, Ireland's Early Learning and Care sector is going through a huge amount of change whilst the leaders are trying to professionalise the sector. The implications of these changes have not been all negative, for example, the under three's now have a voice and are being seen, this is welcomed by most in the sector. However, one of the paradoxes within the Irish context is the government's strategy to professionalize the early years sector by implementing a tiered pay scale for managers and deputy managers running a play school. Also, there was a structured minimum regulated wages requirement for early years educators depending on your level of qualification. By introducing funded pay scales this then establishes a hierarchical classroom by promoting one degree graduate to become the classroom's lead educator. Moreover, moving away from a co-teaching structure to now embed a ranked system in our early years classroom (Nurturing Skills, 2021).

The Irish ELC sector has only recently had an influx of degree-led graduates, many educators with vocational qualifications but twenty to thirty years' experience could not apply for the lead educator positions as they did not have the academic qualifications for the position.

What are the unintended consequences of this decision?

How could an understanding of teamwork be evoked in this situation?

Hierarchies can also be linked to the so called "hidden curriculum" which – in contrast to valuing multiple perspectives in a multidisciplinary team – emphasises certain perspectives: Dean, Roberts, and Perry (2023) admit that neoliberalism has caused a 'curriculum hierarchy' or/and the 'narrowing of curriculum' meaning subjects such as Literacy, Numeracy, and Scientific knowledge are seen as superior or more valuable in the education system because they can be measured. The ramification of this narrowing is effectively changing the teachers' role and identity.

An example below is looking at educational inequality from the Australian context.

Resources for multidisciplinary teams in the context of educational inequality in Australia:

Sahlberg (2011) states this marketisation policy of education falls under the Global Education Reform Movement (or GERM) allowing parents to put pressure on the school system to produce academic outcomes. Australians are noticing educational inequalities from the marketisation of education particularly in learners in vulnerable backgrounds (Dean, Roberts & Perry, 2023). Public funding is being used to fund and resource private education in Australia. Making sure learners attending private school have access to multidisciplinary teams and private educational supports causing a disparity between teachers working in public schools because of underfunding and being under-resourced having a knock-on effect for teachers and what education looks like for these schools. Paving a bigger divide of educational, career opportunities, and inequity for the future of more impoverished families. Perry and Southwell (2014) conducted a study on the effects of socio-economic status on education and found that learners from more impoverished backgrounds had less opportunities for curriculum diversity.

How does this system affect teacher education in Australia in working together?

Think about private schooling versus public schooling in your context, what are the differences, for example, concerning the resources and professional groups involved?

What other differences between schools (for example, special and inclusive schools, urban and rural schools) are relevant when it comes to resources, professional groups and (multi-) professionalism?

By way of example, this reflects the limitations of solely focusing on the school level and highlights the importance of considering the 'ecologies' of the multidisciplinary team (see for an ecosystemic perspective on teamwork: Chapter on teamwork in the classroom).

At the same time, these challenges arising from neoliberalism, highlight the **importance of Relational approaches** to look beyond measures and focus on a We-Perspective. Relational approaches emphasise the importance of the 'whole' learner and their families, working in connection instead of competition for greater opportunities for diverse learners and communities. Through critical thinking, decision making and problem-solving, university educators are trying to tackle some of the tensions between collegial workplaces in communities and sole interest learners (Rodriguez, 2017). Teachers and learners are engaging in relationships all day long making split-second decisions throughout the day. Educators (in training) may at times possibly have a feeling of unease within themselves to conform to academic structures or they may have a feeling of pressure to implement strategies that go against their living values.

Ljungblad (2022) suggests the answer to this problem is the reciprocity of relationships. Knowing these values and beliefs are ever evolving regardless of how long you are in education. Thus, teacher education and third level education play an important role for the ideal of growing and flourishing (Wojciechowska, 2022) which can support the aforementioned benefits of multidisciplinary teamwork on individual and team level.

Key Aspect 3: Developing Multidisciplinary Teamwork

Multidisciplinary teams with members who understand how to learn from shared experience will be the most productive. The different points of view of the team members should complement one another. It is necessary to select team members wisely because, in addition to practical expertise and a problem-solving perspective, effective teamwork also necessitates collaboration and soft skills.

Attributes and Practices to Motivate Positive Multidisciplinary Teamwork

Literature correspondingly provides several attributes that motivate positive multidisciplinary teamwork. Many of these have been consistently repeated, and some are overlapping (Engelbrecht & Hay, 2018; Pinti, 2018; Tarricone & Luca, 2002). Noteworthy attributes and practices that were identified to motivate positive multidisciplinary team experiences are:

- **Open communication and positive feedback**
  A productive work environment is facilitated by attentively listening to team members' needs and concerns, recognising their contributions, and expressing appreciation for them. Members of the team should be prepared to offer and accept constructive criticism as well as give honest feedback.
- **Commitment to team success and shared goals**
  Team members have a commitment to the project's success as well as to the team's success. Successful teams aspire to achieve at the highest level and are highly motivated.
- **Interdependence**
  Team members must foster an environment where their combined contributions will be much greater than their individual ones. The team can accomplish its objectives at a much higher level when there is a positive, interdependent team atmosphere.
- **Interpersonal skills**
  The capacity to be open and honest with team members, to be dependable and supportive, and to respect the team and its members as individuals. It is important to encourage a compassionate work atmosphere, which includes the capacity for productive teamwork.
- **Commitment to team processes, leadership, and accountability**
  Members of the team must take responsibility for their contributions to the team and the project. They must understand team procedures, best practices, and fresh concepts. For a team to succeed, including in shared decision-making and problem-solving, effective leadership is important.
- **Equality**
  Members should actively seek to ensure that all other members feel equally

empowered in their potential to positively affect results and should all experience an equal sense of equality in decision-making.

- **Trust**

  Members should have confidence in the dependability or trustworthiness of the strength, skill, and character of their fellow members. To build reciprocal participatory and collaborative development, interpersonal trust elements such as character trust, competence trust, and communication trust are essential.

- **Respect and Cultural Sensitivity**

  Members must honour one another and act and speak in a way that shows that respect. This calls for introspection and awareness of one's own belief systems, as well as an investigation of one's own comprehension of and respect for other people's belief systems.

- **Modesty**

  Being modest does not require you to minimise your abilities, your job, or yourself. It suggests that while you should be happy with your achievements and recognise your talents, you should not constantly and incessantly boast about yourself or believe that you are superior to others. Recognise both your strengths and your flaws. We are always learning because knowledge is endless. It is highly possible that you will drive your team members away if they think of you as a haughty, conceited person with a big ego who brags, feels superior to others, and has a showy personality. This could have an effect on team communication, making it uncomfortable for your team members to bring up fresh ideas and problems with you. As a result, the success of the team will be hampered.

- **Open-mindedness**

  Respect others' thoughts and give them a sincere ear. Key elements of successful teamwork include meetings, talks, and brainstorming sessions. You need to put the other team members in the same position as you to share and discuss fresh ideas and challenges to find answers and make choices. Do not mock the ideas of others. Allow everyone to speak, listen, maintain composure, and wait to interject until they are through. The success of the team depends on everyone learning and sharing new things, but it also benefits you personally and broadens your knowledge.

- **Supportiveness**

  Ask for assistance and offer to assist. If any of your team members could benefit from your knowledge or experience, make the time to assist them. Offer to assist, even if it is just by checking over a team member's text for errors or keeping an ear out while they practise their talk. Do not be hesitant to seek assistance if you are unable to handle a problem on your own. Of course, there needs to be a healthy balance. Try your best on your own before asking others to help. To build a peaceful work atmosphere, it is crucial that team members feel supported by one another and by the team as a whole.

- **Reliability**

We often find ourselves working on certain project components in multidisciplinary or team projects based on our areas of expertise. This indicates that our work frequently depends on the work of others, and vice versa. Thus, it is crucial that we adhere to deadlines and complete our tasks on time. Regardless of how busy you are, make sure you finish your work as quickly as you can and that your colleagues can depend on you.

Furthermore, an **appropriate team composition** is crucial for developing multidisciplinary teams, which is linked to team members' awareness of their unique roles and requirements. This leads us to take a closer look at the institutional level. For example, we focus on schools.

Creating Structures to Support Multidisciplinary Teamwork at the School Level

Collaboration between teachers and different professionals is considered "an essential part of successful inclusion" (Wallace et al., 2002: 350; see also De Vroey et al., 2015). At the same time – and the difficulties we mentioned above reflect this – it is a common misunderstanding or "myth" that professional collaboration "comes naturally" (Friend, 2000: 132). While this highlights the importance of addressing multidisciplinary teamwork in initial teacher education and continuous professional development (see key aspect 4), developing collaboration between teachers and other professionals can also be considered an important "task" or focus in the ongoing process of inclusive school development (Lütje-Klose & Urban, 2014).

We want to take a closer look at the school level based on a qualitative study on inclusive school development and quality criteria from teachers, school leaders and parents' perspectives in the German context (Arndt & Werning, 2016, 2018): in retrospect, professionals described developing professional collaboration as one important milestone in their school development. With regard to collaboration between special and general education teachers on classroom level, a common starting point was a division of responsibilities in which special education teachers were responsible for students with special needs, while general teachers were responsible for the "regular students" by predominantly using the co-teaching approach; "one teach, one assist" or pull-out strategies. Developing collaboration was based on an emphasis on shared responsibility for all students and using a broader range of co-teaching approaches including switching roles (see for co-teaching approaches: chapter on teamwork in the classroom). Developing professional collaboration appears interconnected with other areas of inclusive school development like ideas on student grouping and cooperation (see chapter on cooperative learning).

On school level, three aspects appeared central for creating structures to support teamwork (Arndt, 2016):

Composition of teams
Within their scope of influence, schools use different strategies in composing teams, for example, to create 'manageable' team sizes in large schools. Schools try to reduce complexity by focusing on teachers' expertise in subject and/or areas in team composition. Another strategy focuses on creating continuity with regard to relationships between teachers and students. Combining both strategies, special and general education teachers form a classroom teacher team at one secondary school: One teacher goes along with the group from year 5 to 10, the other uses their expertise, for example, to facilitate transitions to upper secondary school or vocational training after year 10.
(External) Support for teamwork
Supporting teamwork and team development takes various forms: Linked to continuous professional development, schools focus e.g. on collaborative approaches to Individual Education Plans or developing their teaching approaches. Besides, they use external support like coaching or supervision/mentoring (see below Three Examples for Reflective). For instance, each new year 5 team receives coaching on team development in the beginning as well as a follow-up opportunity (like a "voucher") for another coaching session. This takes into account that professionals with different backgrounds, frames of reference and professional languages might experience conflict while working together (Conderman, 2011).
Regular team meetings
As Kosorok Labhart and Maeder (2016) point out based on an ethnographic study in Swiss primary education, a lack of scheduled team meetings can burden one team member with organising a meeting. Adequate time to meet is considered as important for teachers' professional development (Rytivaara & Kershner, 2012) as well as classroom practices and school development (Arndt & Werning, 2016). Hence, regularly scheduled team meetings are considered as important, while the lack of time for collaboration is considered a major constraint for working in multidisciplinary teams.

Organising and Decision-making in Multidisciplinary Teams

On the school level, looking at creating structures to support multidisciplinary teamwork raises this question: Who organises multidisciplinary teamwork? Based on a mixed-methods longitudinal study in the German context, Lütje-Klose and colleagues (2016) emphasise the importance of school leaders' support of multidisciplinary teamwork. Furthermore, questions concerning the role of teams in decision-making (Idel et al., 2012) arise. In the context of ongoing discussions on autonomy and collaboration (Fabel-Lamla et al., 2021; Kelchtermans, 2006), this leads to questions of autonomy on the team level as well as on participation in decision-making on institutional level.

Think about a school or educational institution:

Which decisions can teams make on their own?

Who participates in 'fundamental decisions' on an institutional level, for example, on working in age-mixed learning groups?

To make decisions and accomplish a common goal, team members should concentrate on collaborative, effective, and creative tasks and be able to merge their different thoughts and experiences (Volkova et al., 2021). The decision-making and support processes in an inclusive educational setting should involve all role-players equally. Thus, it is necessary to develop a cooperative partnership based on similar values, respect, open communication, common goals, and consideration of cultural differences (Nel et al., 2016). However, it

is important to critically reflect on hierarchies and their influence on decision-making, for example, when professionals from medicine and education work together (Bauer, 2019).

Beyond the individual school, this is also linked to different approaches in educational leadership in the broader context: Is there an orientation towards distributed leadership like in the Finnish context (Heikka & Suhonen, 2019)? Or are school leaders more likely to act as the lonesome player though ideas of distributed leadership arise like in Austria (Pham-Xuan & Amman, 2020)? Hence, it is important to look "beyond the school gate" (Ainscow et al., 2012: 206). By way of example, we next focus on support structures on a regional level in Austria.

Support Structures on the Regional Level: The Austrian Departments of Inclusion, Diversity, and Special Education (FIDS)

In Austria, multidisciplinary teamwork in schools is highly influenced by the development of support structures on the regional level. The ratification of the UN CRPD in 2008 in Austria results in far-reaching changes for the Austrian education system. One of the central measures was the anchoring of inclusive model regions (Federal Ministry for Education and Woman, 2015) in three federal states of Austria (Tyrol, Steiermark, Kärnten). The plan was to gradually convert the special school system into an inclusive system through implementing a new support system and thus increase the integration rate at all Austrian schools (BMASGK, 2012: 65). From the beginning, these so-called Pedagogical Advisory Centres had the task to "provide, coordinate, advise and support inclusive education, especially special education, in their areas of responsibility to teachers who teach students with Special Education Needs or with disabilities in general schools. The form of support depends on the support needs of individual students and on the already developed inclusive quality of the class or school" (BMBF, 2015: 6). Multidisciplinary collaboration with key pedagogical and other actors has been a central concern of this reform from the beginning. The schools and the teachers should receive diverse support in the implementation of inclusive education and support in networking (with all relevant pre-school, post-school and out-of-school support systems).

Due to the education reform 2017/18 (Bundesministerium für Bildung, Wissenschaft und Forschung, 2017), the previous special education agendas of the Pedagogical Advisory Centres were transferred throughout Austria to the new federal-state authority "Education Directorate" and expanded to coordinate inclusive education. In each education directorate, a Pedagogical Service Department has been set up, which, in addition to quality management, cooperation in education controlling and pedagogical expertise in teaching staff management, is responsible for the overall management of inclusion, diversity issues and special needs education. Therefore, since 2018, diversity managers control the department and are professionally supported by pedagogical consultants (regional teachers). With the implementation of the concept at hand, the performance of the educational system with regard to its inclusion capacity is to be increased and the

necessary support for each individual child with his or her individual support needs is to be ensured. In addition, experts from school psychology and regional personnel management are available for multidisciplinary co-operation in the educational region.

The new Department for Inclusion, Diversity and Special Education (FIDS) takes over the following tasks in the regions: Determination of (special educational) needs, provision of expertise in the field of inclusion, diversity and special education, participation in regional education monitoring, support of schools in all questions of inclusion/diversity/special education, support of transition processes, concept development of individual questions, parent counselling as well as networking with other school and non-school institutions (Lang, 2023). For these tasks, the FIDS have counselling teachers with different training who cover different areas: learning, behaviour, inclusion counselling, language education and language support. The guidance counsellors pursue the central goal of supporting all those involved in the school system in terms of inclusive teaching development (Lang, 2023). There are also other counselling teachers with a focus on physical and sensory disabilities (Lang, 2012).

School counselling addresses precisely the question of how lessons can be designed so that all children and young people can develop their individual talent potential and participate in both the educational process and the social processes at school? The individual needs of pupils are considered with regard to the existing conditions in the school and class, whereby systemic solution-oriented counselling is assumed here (Lang, 2023).

Key Aspect 4: Reflective Practices to Enhance Multidisciplinary Teamwork

As multidisciplinary teamwork is a complex endeavour, reflexivity is of great importance. Next, we focus on the relevance of reflective practices with regard to enhancing multidisciplinary teamwork. After this, we provide two examples for reflective practices.

Relevance of Reflective Practices

Teaching professionals operate within a framework characterised by constant changes and challenges. Teachers face a complex environment that encompasses cognitive, emotional, affective, and relational needs at both individual and group levels. Decision-making in teaching occurs in unique and unpredictable situations, blurring the line between theory and practice and influencing the overall teaching experience. These changes redefine didactic planning and the teacher's role, shifting from someone who follows pre-established models to a professional who observes the learning environment and employs strategies to achieve predetermined objectives (Crotti, 2017).

Teaching practice is not simply a set of observable actions and reactions, but rather a complex network of relationships in which choices and decisions are made. The choices are influenced by conduct, languages, rules, objectives, and strategies that form the professional community's "know-how" in teaching. In the face of classroom complexity,

teachers often need to make rapid decisions. It is thus essential to accompany these decisions with meta-reflection, a form of "reflection-for-action". This type of critical reflection extends beyond difficult or unexpected situations and also encompasses routine situations perceived as problematic. It involves understanding one's experiences within the social context and utilising acquired knowledge for future practice. This is why reflection makes it possible to generate new skills and new expertise, since through a professional research and development programme teachers can gradually increase the ability to understand their work and as a result, improve it (Stenhouse, 1975).

As reflective professionals (Martins et al., 2015; Schon, 1983), teachers need spaces to reflect on their own professional identity and the contexts in which they are working. Schon (1983) identified two types of reflection in professional education: *reflection-in-action* and *reflection-on-action*. The first one allows teachers to reshape the activity on which they are working while it is unfolding, and it helps to reflect on unpredicted experiences so as to generate both a new understanding and a change in the situation. The second one concerns reflecting on an experience after it has occurred, in order to understand what happened and why they acted as they did.

Establishing communities of practice within the professional context allows reflection to operate collectively, bringing together experiences, history, culture, and shared language to find solutions to complex situations. Reflection in teamwork improves the exchange of knowledge and raises new understandings. Moreover, the multidisciplinary perspective enhances collaborative processes orientated towards seeking strategies with the awareness of working for (and with) all members of the community, students, parents, teachers and other professionals (Cadei, Deluigi & Pourtois, 2016). There are numerous reflection practices in teamwork: below three examples with a multidisciplinary perspective are described.

Two Examples for Reflective Practices in Multidisciplinary Teamwork

1. **Reflective Thinking in Multidisciplinary Teamwork**

Reflective thinking plays a crucial role in multidisciplinary teamwork, particularly when sharing tacit knowledge across different professions. These aspects need to be explicit and shared among team members.
Knowledge of professionals include:

- personal knowledge
- values
- attitudes
- beliefs
- experiences

- theories
- philosophical-ethical elements

Reflective conversations among team members facilitate this process, allowing for the exploration and articulation of personal knowledge. Developing a multidisciplinary practical theory requires communication between implicit personal elements and conscious theoretical elements. Through this approach professionals with different backgrounds can detect differences between languages, concepts, working cultures, roles and identities.

The process of reflection, as Lakkala et al. stated (2017), has different stages and it begins with descriptive reflection, where team members identify a problem that needs to be addressed. Initially, the problem may seem ambiguous or undefined. Emotions and thoughts related to the problem are then examined, and it is framed within a conceptual framework.

Framing the experience enables team members to compare different aspects and questions related to the problem, referred to as comparative reflection. Multidisciplinary teamwork often involves tension and challenges, but it is important to acknowledge that conflicts between concrete experiences and analytic discussions are inherent to the learning process. By creating an atmosphere that allows dilemmas to surface, team members can reach a transformative point where they gain a broader understanding of the problem or reframe it through critically reflective analysis. The final phase of the reflective process is planning, where new solutions are sought and tested. This stage involves generating ideas and strategies to address the identified problem. Through this iterative process of reflection and action, multidisciplinary teams can enhance their collaboration and problem-solving abilities.

2. Supervision

One important reflective practice to enhance multidisciplinary teamwork is supervision: The conjunctive key words in various definitions of supervision are learning, reflection and development (Ērgle & Rutka, 2016). According to Wiles (1967) supervision is the assistance of an external expert in the development of a better teaching learning situation. Moreover, as said by Goldhammer, Anderson and Krajeski (1980), supervision is supportive of teacher growth since it stimulates the professional development, influences teacher's behaviour in the classroom and fosters the selection, development, use, and evaluation of good instructional approaches and materials.

Providing supervision at school can foster shared reflection on the changes observed in class, in which the highlighted dynamics became the subject of reflection from multiple views that were heterogeneous but at the same time, from a single community. The mediation of an external education professional also makes possible to channel shared views into strategies for new designs for the method, in line with the context of reference

and its characteristics, in a virtuous circle of theory and practice that considers micro locations and specific skills, as well as opportunities and critical aspects. It is also a space in which to go further, where teachers use time away from bureaucratic issues to deal with educational stresses and the challenges connected to the class and the specific needs of individuals. Supervision spaces represent the chance to exchange knowledge and planning, to enable meta-reflection, to review actions in terms of their own reflected image and as a result, to recognise and appreciate the images of students with their differences and identities (Cuccu, 2022).

Supervision can be divided into steps as follow:

Figure 3: Phases of Supervision

Design	The composition of the group is an important variable and influences the supervisor's choices. Groups can be homogenous (educators, teachers, social workers, coordinators...) or heterogeneous (different roles). This aspect will guide content, methods, and objectives, taking into consideration the different tasks, needs, and problems of participants. For example, a homogeneous group could focus on roles and/or methods, or share common strategies related to their field, while a heterogeneous group could choose a more general path or concerning the relation among different entities.
Act	The path will start with getting to know the members (if necessary) and activating the engagement with the constant participation of teachers, so as to exchange resources and competencies in a cooperative way. Discussion about case studies can be effective to promote problem-solving skills and bring out reflections from different perspectives. The supervisor will collect and systematize the contributions in order to give back input and generate new reflections from the group toward the design of common strategies.
Evaluate & re-design	Documenting the supervision is important for reconceptualizing the experience. Documentation can be: a recording, a summary, or a diary of the group. The material is also useful for the supervisor, the teacher, or the class council to design an action or redesign the supervision. Through the supervision participants learn how to analyze the coherence among activities and objectives, considering the needs and demands of beneficiaries.

Source: Zanchettin, 2009

Key Aspect 5: Multidisciplinary Teamwork in Pre-service and In-service Teacher Education

For academia to acknowledge that it dominates the design and the process of implementation of teacher education today (Zeichner, 2018, 2022) is a crucial step forward

to understanding what funds of knowledge are usually left out and how they could fill the gaps that appear later in teachers' careers. This is neither an easy fix nor a fast one, which makes it complex and even messy at times. A multi-year and multi-layered approach to working along existing teams and learning to build new multidisciplinary teams is realistic and is precisely what we should aim for in the future of teacher education and for a more collaborative future of education research. (The Collaborative Education Research Collective, 2023)

Students acquire competencies to develop and implement inclusive practices in multidisciplinary teams. The training of future teachers is confronted with the challenge of implementing the UN Convention on the Rights of Persons with Disabilities, (United Nations, 2006), also in the field of education. Student teachers also see themselves obliged to meet these requirements and in doing so encounter a school system that is in the middle of a transition process. The associated paradigm shift within teacher training is therefore of great importance, because an inclusive school system requires educators who are able to co-operate in a team and who do not (any longer) take on the role of lonesome player.

Against the background of these developments in society as a whole, the professional profile of teachers is also changing in the sense that networked and cooperative work by all "education professionals" (European Agency for Special Needs and Inclusive Education, 2022: 18) is of central importance in order to meet the demands of inclusive education: "Teachers do not work in isolation, nor do they work in homogeneous groups of teachers. Inclusive practice is performed by teams of diverse professionals. Therefore, a broader perspective is needed to prepare and support school staff and school professional networks to implement and sustain inclusive practice" (ibid., :18). (See chapter on "Teamwork in the classroom")

Designing Initial Teacher Education at University of Innsbruck (Austria)

The teaching model of the University of Innsbruck (Austria) attempts to form a new teacher personality for the current challenges. The focus is on establishing a professional ethos that considers cooperation with different actors in the school system as enriching and profitable in order to be able to professionally meet the diverse needs of the students (Sonntag, 2023). The teaching concept implies close cooperation with different actors in the educational landscape at Tyrol/Austria (Department of Inclusion, Diversity and Special Education of the Tyrol Directorate of Education, inclusion educators, and guidance counsellors) in order to prepare prospective students for this. In addition, the concept offers a wealth of opportunities for personal discussion, which in the context of a seminar-accompanying learning diary stimulates the basis for the students' self-reflective learning. The seminar is characterised by a variety of methods: in addition to more classical teaching-learning methods (impulse lectures, literature studies, seminar discussions and group work), there are also teaching methods that contribute in particular to students'

personal development (work with the so-called learning diary). Teaching methods that enable a concrete interlocking of scientific theories with professional practice (work phases with external experts or actors from the educational landscape) as well as teaching methods that are research-oriented (qualitative interviews in the form of group discussions at the end of the course, qualitative evaluation of the learning diaries) and represent an important link between teaching and research.

The aim of the learning diaries is to encourage students to engage in "deep learning" (Bräuer, 2016: 22) through a continuous reflection process. On the one hand, regular written follow-up and reflection should enable deeper insights into the seminar content covered. On the other hand, this procedure also creates opportunities to elaborate and reflect on the individual learning process. In this respect, these "knowledge stocks […] form a basis for the formation of schemata and scripts relevant to professional practice" (te Poel, Schlag, Lischka-Schmidt, Wittek, Hartung-Beck & Bauer 2022: 125). The focus is primarily on aspects that are subjectively particularly significant for the students.

Prospective teachers need (specialist) knowledge about different professional groups, structures, theories, models, and concepts of cooperation in schools, about local supporting guidance structures and actors or institutions. They need communication skills to build trusting networks and effective cooperation. Empathy and willingness to adopt perspectives are a prerequisite.

Case-based Approaches in Pre-service and In-service Teacher Education: Reflecting on (Re-)Producing Differences in Multidisciplinary Teams

Within the project "Reflection, Achievement & Inclusion. " Please see link to website here https://www.uni-frankfurt.de/103948295/Reflexion__Leistung___Inklusion A qualitative study was conducted at two comprehensive schools and two advanced secondary schools ('Gymnasien'). Based on this, materials for case-based approaches for both pre-service were developed (Arndt et al., 2021) and in-service teacher education (Lau & Lübeck, 2021). In one workshop of continuous professional development general and special education teachers of one school participated, including the one who is leading the educational stage group and the one who is responsible for the school's concept on inclusive education. During the workshop professionals discussed general and special education teachers' collaboration in student assessment which led to critically reflecting on their current teaching concepts and practices. For instance, they had introduced using a specific room as a flexible way for individual students to work outside the classroom based on their situation-specific needs. However, during the workshop professionals critically reflect on their observation that this room was now used for the pull-out of students with special needs: Students with special needs were pulled out of the classroom during the lessons to provide instruction for them. Professionals started to share first ideas on how to change this structure and practices to provide more flexible support for all students (Lau et al., 2021).

The use of pull-out strategies varies across context and also within schools (Arndt & Werning, 2016; Scruggs et al, 2007). As there is a risk of stigmatisation for students who are pulled out often, pull-out is a good example to demonstrate why it is important to reflect on the (unintended) consequences of division of task and responsibility within a multidisciplinary team. One possible starting point is to take a closer look at students' perspectives within cased-based approaches in teacher education.

Example for Casuistic Material: Student's Perspective

At one comprehensive school, in 6th grade, the student Tim was interviewed. The interviews were conducted in German. We refer to a translated and slightly shortened version (see for the original excerpt from the interview: Arndt et al., 2021:11). The interviewer who also conducted participant observation refers to students who sometimes work in a small group and ask Tim about it. Tim states:

"In the small group, it's something quite different from the large group. You understand much faster and better in the small group, because […] it's the four of us and Mrs. Peters [special education teacher] explains everything individually. If you need help, it takes only one or two minutes or like thirty seconds."

Tim explains that they are taught separately ('to be outside') in the main subjects like Maths, German lessons and English. They work on teaching and learning material which is easier compared to the one of the students within the (main) classroom. Tim prefers to work in the "large" (main) classroom or group. The interviewer asks if Tim can explain why. Tim tells:

"Because it's much better in the large [main] classroom. […] The teacher also explains really well. I rather prefer to stay inside. […] If we are in the small group […], well I don't know, but I want to be in the large/main group. […] Because the ones in the large group will have more success. They will get a Realschulabschluss […] or […] Gymnasialabschluss.

Asked about the small group, Tim adds: "And in the small group, we can only get a Hauptschulabschluss". Tim refers to different school leaving certificates in the German stratified school system: "Hauptschulabschluss" refers to the general education leaving certificate after 9th grade (lower secondary school). "Realschulabschluss" refers to the general school leaving certificate after 10thgrade, "Gymnasialabschluss" refers to the Abitur which is the secondary school leaving certificate after 12/13 years and general higher education entrance qualification.

What is your first impression when you read about this?

How does Tim characterise the "small" and the "large/main" group?

Based on interviews with students on primary level, Laubner (2014) refers to special education teachers as 'highlighting the difference' (by pulling-out students with special needs). Take this as a starting point for discussing potential unintended consequences of roles and responsibilities in multidisciplinary teams.

Engaging with students' views (Messiou, 2019) can form a starting point to reflect on unintended consequences and (re)producing of difference in multidisciplinary teamwork.

As classrooms are not only sites of responding to differences, but also of (re)producing differences with regard to intersecting "difference categories" (Plösser & Mecheril, 2012: 797), reflecting on constructions of differences in pre-service and in-service teacher education is important with respect to multidisciplinary teamwork. Multidisciplinary teamwork can also be characterised by underlining tensions if (specialist) support is linked to certain "target groups", especially in funding (Moser, 2017). Based on a qualitative study on multidisciplinary collaboration in Denmark, Hansen et al. (2020) raise questions on direct forms of provision in which the specialist works directly with the child as well as indirect forms in which the specialist works directly with the teacher and indirectly supports the child.

A Closer Look at Example Case I: Finnish Early Childhood Education – Multidisciplinary by Design

The Finnish ECEC is multidisciplinary by design: it was initially under the Ministry of Social Affairs and Health until 2013, which has influenced how the daily teamwork and leadership of early childhood is still organised today (Kinos, 2008). Known as Educare or ECEC (Early childhood education and care), it strongly relies on multidisciplinary teamwork ideology and comprises care, education, and teaching, seen as an open care or community care system. Groups of multi-skilled professionals are involved in a child-centred task together (Solvason & Winwood, 2022): early childhood healthcare services, primary healthcare, specialised medical care, developmental disability services, and social services, are all highly involved in a wide range of activities in the child's life to support the flow of ECEC and other aspects of life (Äikäs & Pesonen, 2022).

Early interventions can influence the entire life of a child. Early years are recognised as being critical times when children's development depends on various factors and when with the intentional help of daycare professionals, children's and families' safety and well-being can be considerably increased and supported accordingly. A multidisciplinary team, with a larger array of qualifications and perspectives, is more prone to provide profiled support, for example, for families with special needs, as well as guide them to attend child guidance clinics or other special services (Pölkki & Vornanen, 2016). Therefore, what better time than early years for multidisciplinary teams to work collaboratively to influence the beginning of the story, so that they can influence the whole story? (Belloni, 2019).

Pedagogical and Welfare Professionals and their Qualifications

The regular contact staff in ECEC consists of Pedagogical professionals and Welfare professionals (Onnismaa, 2017):

- Kindergarten Teacher (Lastentarhanopettaja)

- Social Welfare Worker (Sosionomi)
- Practical Nurse/ Nursery Nurse (Lähihoitaja)
- Children's Instructor/Childcare Worker (Lastenohjaaja)
- Special Education Teacher (Erityislastentarhanopettaja or Varhaiskasvatuksen erityisopettaja)
- Special Needs Assistant (Avustaja)

Other professionals that might supplement the needs of the regular contact staff can be kindergarten teachers who become specialised in one particular, for example:

- Finnish as a second language teachers (can be dedicated to one daycare or can travel in between daycares to support children with cultural and linguistic diverse backgrounds)
- Curriculum developers (who are dedicated to one daycare and help improve their curriculum)
- Psychologists
- Therapists (e.g., Speech, Art)

The minimum qualification requirements for ECEC staff in Finland varies a lot. Approximately 30% of all employees have tertiary-level education. The highest level of training is required to become:

- a Kindergarten Teacher – Bachelor's degree of 3 years of university training specialising in early childhood education
- a Social Welfare Worker – Bachelor's degree of 3½ years higher education institution (polytechnic) specialising in social services
- a Special Education Teacher (early childhood) – 1-year postgraduate university study route in special needs education following qualification as Kindergarten Teacher (university route) and 2 years work experience as Kindergarten Teacher

All three are core practitioners with group responsibilities and can also be centre heads (Ministry of Education and Culture, 2017).

It is important to mention that as part of their studies in education, future kindergarten teachers study **Pedagogical leadership and multidisciplinary cooperation** (University of Helsinki, 2023), and then during their workplace learning they become acquainted with administration and working as a member of multidisciplinary teams and networks. So, becoming an active member of a multidisciplinary team is highly regarded in Finland and is given space and time to be studied and practised even before being a qualified EC teacher.

Approximatively 70% of the Finnish ECEC staff has vocational training, which is required for:

- Practical Nurse/ Nursery Nurse (3 years upper secondary vocational qualification in social welfare and health care)
- Children's Instructor/Childcare Worker (3 years upper secondary vocational qualification in childcare, education, and family welfare)
- Special Needs Assistant (Recommended: 1–2 years vocational training)

The first two are qualified co-workers and the last one is a non-qualified co-worker.

Roles and Responsibilities

Some of the **Kindergarten teachers' responsibilities** are: teaching the group; creating individual study plans and following their implementation in co-operation with the educational team; evaluating and developing the culture of the whole educational community; multidisciplinary and networked cooperation between the school, the health service and the with the health care and special services for children, especially when this cooperation is related to the child's development and learning issues; cooperating with families; developing practices that enable parents to participate in the development of early childhood education and care activities; communicating the pedagogical activities of the group.

Some of the **ECE social worker's responsibilities** are working closely with families to promote the child's well-being and networking between families; being familiar with the network, services, and practices of municipal and provincial family services; being able to guide families in various situations requiring support at a low threshold; supporting other staff in the educational community in this area of specific responsibility.

The **EC special education teachers** can be consultants or group supervisors. They are specialists in planning and assessing the identification of a child's need for support and assessment of the child's needs, and to take these into account in the activities of the child, the group, the adults, and the day nursery. They are also experts in the development of learning environments and pedagogy.

Some of the **Nursery Nurses' responsibilities** include having a sensitive interaction with children and focusing in particular on the overall well-being and health of the children, while working in partnership with families in the area of responsibility.

For multidisciplinary teams to work well, the roles of each professional group are mentioned in the Act on Early Childhood Education and Care (540/2018), so that the so-called 'everyone does everything' culture is avoided (Onnismaa, 2017).

The above-mentioned professionals are not the only ones who can contribute to the success of appropriate care, education, and teaching in Finnish education. Based on the children's needs (Douglas, 2020), the expertise of the multidisciplinary teams requires flexible arrangements and continuous collaboration within the community.

For example, when working with culturally diverse children and their families, the ECEC

team might require some **language support from interpreters**, in which case, for some specific time, speakers of various languages Somali and Arabic join in and provide the permanent team with language support. Moreover, with young children who don't speak Finnish at all, or are just starting with it, at the municipal level, it is decided which kindergarten teachers focus their daily activity exclusively on **teaching Finnish as a second language**. In such cases, kindergarten teachers move from one group to another and from one daycare to another to cover as many children who need support as possible. Currently, these teachers are not specialised in universities to be second language teachers, but they go through ongoing professional development courses in order to learn more about the most effective interventions and discuss with researchers how they can turn theory into practice.

Good interaction and cooperation among multidisciplinary team members working in ECE is the basis for the process (Salminen, 2017). Since Finnish ECE staff come from different educational backgrounds and form a multidisciplinary community (Kangas & Ukkonen-Mikkola, 2019) they need to build a learning community in which all members learn from each other and develop community action (Kinos, 2008). When the ECEC team members have sometimes more, sometimes less, or no ECE training, pedagogical leadership is highly awaited by kindergarten teachers in Finland (Kahila et al., 2020).

Considering their training profile, their pedagogical and curriculum design responsibility, **kindergarten teachers** in Finland **lead** the planning, assessment, and development of pedagogy, and at the same time, they also engage their multidisciplinary colleagues in the process, so that everyone works together to achieve the learning goals set for every child. (Harju-Luukkainen et al., 2022). These exchanges of ideas and perspectives are planned and usually take place during the weekly team meetings, when kindergarten teachers initiate and enhance the reflection of the daily practices among the team members, bringing up topics that they find important. It is crucial that all members of the team are present, they are all heard, and their ideas are taken into consideration, and that everyone learns with and from everyone, by complementing one another's views and daily work.

As a result of such meetings, the kindergarten teachers can observe that it would be useful, for example, to develop various practices, or create a more systematic documentation of their practices. Agreeing on and verbalising the goals makes these goals more visible in the planning and in the practices of the entire multidisciplinary team.

Challenges and Support in Multidisciplinary Teamwork

In the absence of professional trust between different groups (Ekins, 2015), when competition between groups, rather than co-operation predominates (Rose & Norwich, 2014), or when "implicit professional hierarchy" between team members with different levels of qualifications and status takes over (Hood, 2015) instead of the **greater good** for the group, **the big picture**, and the benefits for the children (Herbert & Broomfield, 2019)

– multidisciplinary teams cannot function. It is important to know that and to be aware of the human ego that can come in the way of successful multidisciplinary teams. Everyone in the team contributes to a fruitful or fruitless collaboration. Everyone's expertise as well as appreciating the expertise of others, and feeling valued as well as valuing others, are key components of a nurturing environment for multidisciplinary collaboration (Solvason & Winwood, 2022).

As mentioned earlier when challenges on individual and team level were discussed, similar challenges can be observed in the Finnish context as well. We must acknowledge the fact that sometimes it can be hard for multidisciplinary teams to come to an agreement. Take for example a recent study by Savolainen et al. (2021) about how multidisciplinary collaboration in children's mental health promotion functions in Finland. More than half of the about 500 professionals who took part in the study were not satisfied with the multidisciplinary collaboration between their organisation and child psychiatric services. They referred to the lack of 'clear operating models and agreed guidelines,' besides low financial and human resources needed to focus their attention on the needs of children with psychiatric symptoms. Some of the ECEC teachers felt that they were alone with the problems encountered with symptomatic children and did not get occupational counselling, though they felt they needed it. In such cases, cross-sectoral collaboration can be affected by the lack of technical solutions and coordination across the service systems required by multidisciplinary collaboration (Äikäs et al., 2022; Savolainen et al., 2021).

What would then help in such cases? One possibility is ECEC professional training (Bricker et al., 2022), but also for multidisciplinary team members to take part in multidisciplinary education (Fox et al. 2018; Labrague et al., 2018), for them to acquire the competencies needed in collaborative practice (interprofessional communication, or appreciation of interprofessional team roles). The realistic description of individual and multidisciplinary team competence is that in the negative scenario, when the children's situation is experienced as challenging, the responsibility lies with the professional alone to identify and organise significant support, but in the positive scenario, it is heavily collaborative (Äikäs et al., 2022).

For multidisciplinary teams to work, cultural factors should also be regarded. Considering that Finland has been identified as a country of low power distance and equalitarian culture, it is common that the dynamics within the ECEC multidisciplinary teams to involve open and frank discussions, backed by confidentiality and humour, which leads to an overall atmosphere of collegial trust, support, and cooperation. Especially when teams are composed of experienced teachers, shared leadership is quite common and is based on strong collaboration between teachers, which helps support their leadership responsibilities.

When the multidisciplinary teams are effective, this will only benefit children and their families by creating opportunities to improve multidisciplinary collaboration, which is needed for the inclusion of all children, which is a central aim of ECE. At the same time,

functional multidisciplinary teams increase job satisfaction and improve pedagogical quality, for which enhancement of multidisciplinary teamwork skills is required (Kumpulainen, 2013). Nonetheless, for multidisciplinary teams to complement each other's work on a daily basis, they need sufficient time to focus on specific cases or problems, and dedicated opportunities for professional development and high-quality interaction (Douglas, 2020).

Conclusion

Shift from "I"- to "We"-Perspective

As we read before, learning to work in a multidisciplinary team is complex and requires a change of perspective. It is essential to switch from an "I-perspective" – the focus on myself, my tasks, my problem, my loneliness at work if this is the feeling in one's own context – to a "We-perspective" and the perception of ourselves as a part of a professional team that work together. It is an ongoing process, and it takes time.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

https://book.all-means-all.education/ama-2025-en/?p=535#h5p-29

Closing questions to discuss or tasks

At the end of this section, we propose a method to reflect on one's own and the other's strengths in educational contexts, to be more aware of personal resources and of the team.

Individual level:
Think about an educational context in which you are currently working or have worked before. Alternatively, go back to one of the example cases in this chapter: Find three images that represent your three main resources as a (student)teacher. You can draw them, cut them

from a magazine or find them on internet. Then put them on a sheet of paper or on a virtual document. Think about: What kind of resources do your images represent? In what situations do you use these resources?

Team level:

In a group of 3-5 colleagues, share your images with the others. They should look at your images and try to interpret the meaning. It is likely that not all interpretations will be precise, but it is important to allow the sharing of a large number of positive characteristics connected to the colleague(s). Afterwards, you describe your composition: My resources are… I choose these images because…

Closing reflection: What did this activity give? What did you experience during it?

About the authors

Alexandra Anton

Alexandra Anton, researcher specialising in teachereducation at the Åbo Akademi University. Her research is situated at the intersections of early childhood, teacher agency, and just pedagogies for multicultural and multilingual learners. She is an experienced practitioner in early childhood, language learning and teaching, and is involved in cross-cultural research projects.

Ann-Kathrin Arndt

Ann-Kathrin Arndt, research, teaching and developing teacher education in the field of inclusive education. PhD on collaboration between general and special education teachers (Leibniz University Hannover). Main research areas: Multidisciplinary teamwork, constructions of difference in inclusive classrooms, inclusive, diversity-sensitive teacher education.

Miriam Sonntag

Miriam Sonntag, practitioner and researcher in the field of inclusive education, focusing on interdisciplinary and multiprofessional collaboration. Experiences as a special education teacher in inclusive schools, research associate, teacher trainer, in-service trainer, director of a pedagogical consulting centre for inclusive school development, lecturer at colleges and universities.

Beausetha   Juhetha Bruwer

Beausetha Bruwer, instructor of inclusive education, deaf education, and sign language. Experiences as a teacher of deaf children and as a teacher and sign language interpreter trainer at college and university level. Her key areas of research interest include, among other things: language education, early literacy and language acquisition/ development for deaf learners, sign language linguistics and practices, Deaf culture, mother

tongue education, multilingual education, early childhood inclusive practices, play pedagogy, outdoor pedagogy, and teacher preparation for inclusive practices.

Miriam Cuccu

Miriam Cuccu, pedagogist and subject expert in general and social pedagogy at the University of Macerata (Italy). She is involved in projects focused on intercultural education with a community-based and arts-based approach. She collaborates in monitoring and evaluating interventions to counter educational poverty and in training for education professionals. Her main research interests include dialogue between cultures, community participation and empowerment through creative languages.

Lydia Murphy

Lydia Murphy is a trained educator in Early Childhood Care and Education. Her special interests include relational pedagogy, love in education, empowering voices, and reflective practice. As an early years researcher she studies the role of the early years professionals supporting reciprocal relationships with themselves, babies /toddlers/children, their carers and educational environments/communities. Within this she explores potential deficit narratives that trickle into communities particularly those experiencing disadvantage.

'TO BUILD UP A COMMUNITY' - COLLABORATION WITH PARENTS

Assimina Tsibidaki; Linjie Zhang; and Nico Leonhardt

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ ama-2025-en/?p=421#oembed-1

Example Case

"I have many, many examples where we succeeded with parental involvement, but I want to give you one example. I have worked in a community that is still very nomadic, and they keep cattle, and it's important for everybody in the family to participate in cattle grazing and other chores. So, the school was having parental meetings, and they were having these meetings at the school. The school reported to us that they have tried to bring in parents on different days of the week, but they always had to cancel or postpone the meetings because the parents wouldn't come. So, when they approached my research team, asking how they should handle the issue, we asked them, how about doing this meeting in the community, which is about 50 kilometres from the school, and asking the parents what time would suit them for the meeting? The very first meeting they held in the community, they had almost 100% attendance (except for those who had responsibilities of going to find the lost cattle and so on), because the parents decided on the time of the meeting, felt at home in the community and felt free to speak in their language. The school reported to us that it was the first time that they had this kind of attendance and this kind of involvement. So, I think it is very important to first consult with the parents who you want to involve and to give them a choice about the time and how the meeting should occur. In my country, "parents" are not only the biological parents of the learners. Parents can be community members; a parent can be in the form of an uncle; they can be older siblings and so on. They say that if they had this kind of meeting at the school,

they wouldn't even have a place big enough to host the parents. But in the community, everybody attended because you qualified to be a parent. That's my story."

Cynthy Haihambo, Lecturer, University of Namibia

Initial questions

- **Why is collaboration between parents and schools essential in fostering an inclusive educational environment?**
- **What are the main barriers that prevent effective parent-teacher collaboration, and how can schools address them?**
- **How do cultural and socioeconomic factors influence parental involvement in their children's education?**
- **What strategies or models are discussed in the chapter to enhance meaningful partnerships between schools and parents?**
- **How can schools shift from a teacher-centered approach to a more community-based model of collaboration with parents?**

Introduction to Topic

Collaboration with parents constitutes a process that requires a personal commitment based on a clear rationale and a high level of collective and personal self-efficacy. This commitment, honours the diverse structures and backgrounds of the families, employs real communication skills, provides curricula and problem-solving solutions that are aligned with the parents' and students' goals and occurs within a parent-driven relationship (Porter, 2008). Successful home-school collaboration is more about how individuals share their work, and it is characterised by voluntariness, mutual goals, parity, shared responsibility for critical decisions, joint accountability for outcomes, and shared resources (Friend & Cook, 2017).

This chapter aims to explore the importance of teacher-parent collaboration in inclusive education. In particular, it highlights what it means to collaborate, working with parents,

and the key barriers and risks in collaboration. Finally, it seeks to provide key principles and examples of effective and efficient home-school collaboration.

It is worth mentioning that this chapter is based on the philosophy of inclusive education, focusing on human relations, and its main goal is to create an inclusive school and an inclusive society.

Key aspects

The meaning of collaboration with parents

The term "collaboration" is of high value and quality. A common definition of collaboration is a partnership to achieve a common goal or a set of goals. It refers to a reciprocal dynamic process that occurs among systems, schools or classrooms, and/or individuals who share decision-making toward common goals, solutions and decisions in order to support student success (Cowan et al., 2004; Gerdes et al., 2022; Minch et al., 2023; Witte et al., 2021). Collaboration is characterised by voluntary, co-equal, and authentic partnerships between parents and teachers (Cox, 2005 as cited in Minch et al., 2023).

The importance of good parent-teacher collaboration has been well documented. More specifically, promoting collaboration in education improves children's academic and social outcomes, both in early education and beyond (Castro et al., 2004). When collaboration is focused on improving the well-being of children and adolescents, decades of research show that children benefit. Benefits include improved academic, social, behavioural and mental health outcomes (Witte et al., 2021). The collaboration continuum describes the three dimensions of co-work as cooperation, coordination and collaboration (McNamara, 2012).

Collaboration with parents constitutes a process that requires a personal commitment based on a clear rationale and a high level of collective and personal self-efficacy. This commitment honours the diverse structures and backgrounds of families, employs real communication skills, provides curricula and problem-solving solutions that are aligned with the parents' and students' goals and occurs within a parent-driven relationship (Barker & Harris, 2020; Jorgenson, 2023; Porter, 2008). Successful home-school collaboration is more about how individuals share their work, and it is characterised by voluntariness, mutual goals, parity, shared responsibility for critical decisions, joint accountability for outcomes, and shared resources (Friend & Cook, 2017).

Various theoretical models for fostering cooperation and collaboration between parents and educators are delineated and scrutinised within the academic literature, utilising a range of adaptable frameworks (Sadownik & Višnjić Jevtić, 2023). Among the most prevalent models are (Figure 1):

1. The *expert model* portrays parents as passive recipients of professional expertise.

2. The transplant model endeavours to harness parental involvement by viewing parents as executors of received expertise and guidance.

3. The *consumer model* positions parents as rational and well-informed decision-makers, while educators serve as purveyors of information and facilitators of various educational options.

4. The *empowerment model* aims to promote collaborative decision-making and upholds the right of educators to create the necessary framework (Dale, 2008).

5. The *negotiating mode*l promotes a partnership characterised by shared responsibilities. This model emphasises negotiation to reach mutual decisions and resolve any disagreements that may arise. Negotiation may result in a consensus or disagreement, and the model advocates for adaptable roles and mutually agreed-upon outcomes. It underscores the valuable and distinct contributions of both parents and educators, asserting that their differing perspectives are essential for fostering successful collaborations that yield positive outcomes for the child (Abed, 2014).

6. The *partnership model* underscores the importance of collaborative decision-making and shared accountability (Hornby, 1989; 2011).

These models address diverse aspects and dynamics inherent in parent-teacher relationships, underscoring the necessity of tailoring approaches to suit specific contextual nuances and requirements (Sadownik & Višnjić Jevtić, 2023).

Figure 1: The models of parent-teacher collaboration

1. The expert model:	2. The consumer model:
Teachers deal with the child without active relationships with parents	Parents are considered as a consumer for teacher's services
3. The transplant model:	4. The empowerment model:
Teachers transplant their knowledge to parents, and assist them to be like teachers	Parents have the right to choose the services that they will offer to their child, and teachers assist parents in their empowerment
5. The negotiating model:	6. The partnership model:
Both parents and teachers have helpful and separate contributions to offer	Parents have a central role regarding their needs and strengths

Aiming to meet the increasingly demanding tasks of parents as well as the complex requirements of school learning, a common understanding of collaboration is needed (Walper, 2021, 343). In the sense of inclusive education, it is about the design of inclusive learning and living spaces for pupils and a networked cooperation of many actors, especially parents and teachers. To reach the students, to get to know their situation, their lifeworld's, we have to see parents or families as partners in education (Leonhardt et al., 2024, in press). We have to integrate parents into the school communication and relationship culture (Werning & Avci-Werning, 2021). An inclusive understanding of school and education not only ties school success to an increase in performance but also aims at the well-being of the students. This requires a systemic view of schools and students. This means that collaboration is not a bilateral negotiation, but rather the building of a community that includes teachers, parents and the social space of the school. This process is challenged by various aspects (see Section 3). Above all, however, it is to recognise the school as a powerful system (Leonhardt et al., 2023; Liebel 2020), especially in order to take into account the mentioned and necessary exclusion analysis.

The idea is not just to bring students with differences into the system, it is more a question about educational justice from a human rights-based perspective. In this sense, inclusive processes are always connected with a continuous determination of the

relationship between inclusive and exclusive aspects (Oldenburg, 2021). For that, it is important to always analyse different kinds of exclusion also.

We must think about different kinds of aspects of school (like classes, social interaction, pedagogical relations…) and if they are really inclusive. We must also think about this for the parents. In this inclusive understanding, school is like a learning organisation and so it is important to integrate this thinking into school development processes.

International studies show that parents play a significant role in school learning success (Desforges & Abouchaar, 2003; Jeynes, 2005, 2007, 2011; Kruschel et al. 2023; Textor, 2009,). However, it is not so much 'passive' or formalised formats of parent collaboration that lead to student success (Pomerantz et al., 2007). Rather, the active participation of parents is central to creating successful learning environments and inclusive educational spaces for students (Sacher, 2013; Schwaiger & Neumann 2011). This is therefore central to the design of inclusive school development processes. Also, in relation to collaboration with parents, it is important to approach different levels together in order to uncover and reflect on possible exclusion processes.

Different backgrounds of parents and how these influence the collaboration

Research shows that parents, despite all their differences, share a multitude of perspectives and commonalities (Müller, 2014). Many parents are mostly satisfied with inclusive forms of learning if the necessary equipment is provided (ibid.). However, when it is about inclusion, it is not just the students who are very diverse, the parents are also. There are more parents with many different backgrounds. At the same time, there are many connecting aspects with parents that need to be considered. The 'old' ways of thinking about parents or collaboration doesn't fit anymore, especially in inclusive schools.

To think teachers just must inform them isn't enough. The lifeworld and the biography of families are very different, so we need to create different ways of working together. These different family backgrounds have a huge impact on the types of parent collaboration. For example, research shows that social background has an influence on successful education (see below). What is their experience and connections to school? What do they know about the school system? Those are just some of the questions that are very much related to teacher-parent collaboration. Also, other kinds of experience and dimensions can be very important in this case, for example, cultural, religious background or experience in relation to the sexual orientation or experience of disability.

As the example from Namibia at the beginning made clear, in some cases it is not exclusively the birth parents who are responsible for the students. It can also be family members, guardians or other community members. There is a lot of diversity to be considered in this regard also. Furthermore, in the sense of dialogue-based cooperation, it is important not only to keep the different life worlds of the parents in mind but also to critically and reflectively consider the previous experiences of the teachers. Expectations,

ideas of normality, prejudices, and false ability requirements in the sense of classist or ableist attributions can decisively shape the actions within the cooperation (see also the chapter 'Teacher Habitus' or 'Labelling').

In the following, we would like to take this broad understanding of two dimensions (social/cultural & disability) as examples in order to show the influence of different backgrounds.

First dimension – social, cultural

Several studies indicate that there is an imbalance in parental participation even within the same school (Hornby & Lafaele, 2011; Lareau, 2003; McNeal, 2014). Disparities in parent inclusion and involvement are evident based on factors such as race, ethnicity, social class affiliations and students with and without special needs (Harry & Klingner, 2014; Hill & Tyson, 2009; Lareau, 2011). Additionally, when examining schools located in American low-income neighbourhoods and communities as the primary focus, researchers have frequently observed that parental engagement in school-centric activities and programs tends to be sporadic, minimal or entirely absent (Hill & Tyson, 2009). One of the reasons for this is that these parents are "not sufficiently perceived with their fears and concerns" (Paseka & Killus, 2021: 180, translated).

The existing research on parent involvement in low-income school communities highlights various intricate sociocultural and political factors that can contribute to limited parental engagement in activities initiated or centred around the school. The Corona period has made visible the dependence and linkage to family resources, as well as the close connection to the perpetuation of educational inequalities (Huebener et al., 2021: 182). Studies have shown that disparities in parental participation among different socioeconomic groups could be attributed to the conflictive relationships and interactions between teachers and low-income parents (Hill & Tyson, 2009; Lareau, 2013). These interactions are frequently marked by conflicts that stem from disparities in societal status and power (Delgado-Gaitan, 2004). Scholars in the field noted the prevalence of school-centric and ethnocentric communication patterns within the interactions between teachers and parents, which can further exacerbate these conflicts (Hannon & O'Donnell, 2022; Henderson & Mapp, 2002). Additionally, recent research has raised questions about the extent to which some low-income and ethnic minority groups could engage in institutional processes shaped by dominant cultural norms and frames of reference (Warren & Mapp, 2011). Moreover, Henderson and Mapp (2002) emphasise the critical role of recognising and addressing racial and cultural issues within educational institutions. Failing to acknowledge and address these issues, especially when there are disparities in treatment and opportunities, can reinforce racial and cultural divisions and boundaries between schools and families (Warren & Mapp, 2011). Parents in challenging life situations are less recognised as a resource and thus less actively involved in school (development)

processes. At the same time, they themselves have fewer resources to become (self-)actively involved. This problem becomes even more acute in challenging neighbourhoods since the perception of students and parents in these areas tends to be more problem-oriented than appreciative (Fölker & Hertel, 2015). At the same time, it is evident that teachers are mostly middle-class-oriented, which can lead to difficulties in comprehension and a lack of habitus sensitivity. (see chapter Teacher Habitus)

In low-income, ethnically concentrated school communities, the concept of parental engagement seems to be both constrained and constraining. It is constrained because of the fact that it is mostly defined and applied by educators within a relatively narrow, yet significant, school-centred framework. Its constraining aspect arises from the fact that parents often perceive and define the significance and roles of parental involvement beyond the confines of the school, whereas teachers' predominantly technical interpretations suggest that the term might only capture a fraction of their understanding and expertise regarding school-family interactions.

When exploring the dynamics of role construction involving both educators and parents, parents and teachers in low-income school communities often find themselves in conflicting roles, subsequently influencing the extent of parental involvement in educational institutions. According to Pantić and Florian (2015), educators' roles are typically characterised by specificity and limitation, which promotes a more objective and impartial assessment of children's behaviour, development, and readiness. This perspective stands in stark contrast to the broader and boundless viewpoint of parents, who tend to perceive each child through the lens of their personal experiences and circumstances (Henderson & Mapp, 2002). In summary, these marked disparities are believed to engender discontinuities, disconnections, and cycles of blame between families and schools, with detrimental repercussions for children, families, and educators alike (Epstein, 2018).

Second dimension – Special Educational Needs-Disability (SEND)

Example Case – "I work with children with seven kinds of disabilities and difficulties. If f I need some kind of successful example, it should be to build an educational network which involves us as the school. It can involve all kinds of actors that are around the child or the young people, such as teachers, family therapists and doctors etc… We need to talk about this because when we talk about disabilities, it is a really complicated situation. We must have functional communication with all of these actors. I truly believe that school can play a central role in this. It is easier to have a school in which families and therapists can go inside and have a moment to dedicate to a particular child or a particular kind of problem." (Francesca Mara Santangelo, teacher for special needs education, Italy)

Collaborating with parents raising children with special educational needs and disabilities (SEND) is essential. The collaboration process brings educators, parents, and other specialists together to support children and adults with SEND. The goal of the

collaboration is to ensure that students with SEND have access to the resources and supports they need to succeed in school and life (Saikat, 2022).

It is important to note the literature confirms a range of benefits associated with effective inclusive education (Sharma et al., 2022) and home-school collaboration for students with and without SEND (Hehir et al., 2016). Some parents of children without SEND may object to their children sharing a classroom with students with SEND, believing that their difficulties or needs could impact the learning of other children (Cardona, 2006). However, parents gain knowledge about inclusive education, they may change their perspectives and become advocates for inclusion (Kalyva et al., 2007). Moreover, they recognise the positive effects on their children without SEND, such as improved academic outcomes and greater acceptance of diversity (Hehir et al., 2016).

In addition, when working with a family raising one or more children with SEND, we need to follow a basic principle, that every family is unique. We may come across families that have one or two parents with a disability and/or one or more children with a disability. Disabilities vary in type and severity, so in every process of working with the family, we should have an individualised and holistic approach (Dale, 2008; Seligman & Darling, 2007). Collaboration with parents raising children with SEND is child-centred, providing parents with a voice on placement services. Both parents and children participate in the decision-making. Parents who are the most familiar with their children can contribute to a partnership by sharing information about their children. However, before they openly collaborate, they must trust the team (Bennie, 2023). Parents' collaboration is not only beneficial for children there are also possible gains for all parties (Saikat, 2022):

- Parents increase interaction with their children with SEND, become more responsive and sensitive to their needs and more confident in their parenting skills.
- Educators acquire a better understanding of families' culture and diversity, feel more comfortable at work and improve their morale.
- Schools, by involving parents and the community, tend to establish better reputations in the community.

The key components of effective collaboration in special education include:

- A common understanding of the goals of the student's Individualised Education Program (IEP).
- Open communication between all members of the team. This includes both verbal and written communication.
- Respect for each other's roles and responsibilities on the team.
- A willingness to work together towards the best interests of the student with SEND (UNICEF, 2014).

Main barriers to parent-teacher collaboration in inclusive education

In the context of parental co-operation within education systems, there are numerous barriers and challenges that can vary significantly from country to country. These differences are often rooted in distinct historical and cultural backgrounds that shape each education system.

> **Please be aware** that the barriers and challenges in the context of parental co-operation may differ from country to country. For example, education systems may have very different historical backgrounds, which are important points of reference. This can also lead to different questions and challenges for parents in relation to inclusion. For example, in German-speaking education, which is mostly characterised by segregation, a much bigger debate exists about whether pupils learn better in inclusive settings than in separate classes. In other countries, where there are (almost) no special schools, this question may be less of an issue for parents.

Despite the strong theoretical and research acknowledgement of the benefits of family-school collaboration, there are many challenges to putting this into practice (Hornby & Blackwell, 2018; Minch et al., 2023). The barriers related to all parties involved. The various barriers to collaborating with parents can be considered as follows (Hornby & Blackwell, 2018; Minch et al., 2023): Societal factors (which influence the functioning of both schools and families), individual parent and family factors, parent-teacher factors, and child factors.

Common barriers from the parents' perspective can include:

- Parents' work demands and lack of time.
- Parents feeling overwhelmed and outnumbered.
- Language, cultural or socioeconomic difference.
- Parent attitudes about the school.
- Prior negative experiences with schools.
- Lack of parent education to help with schoolwork.
- Shared or complicated custodial situations.
- Limited access to technology.
- Unequal power relationship between parents with low status and mainstream cultural values.

Common barriers from the teachers/school perspective can include:

- Limited school resources.
- School policy versus reality.
- Inflexible work schedules.
- Staff attitudes toward parents.
- Unspoken expectations about family engagement.
- Lack of parental understanding.

- Language differences between parents and staff (IES – NCES, 1998; Parentpay Group, 2022; Understood, 2019).
- Teachers' lack of ownership, withdrawal and scepticism caused by exclusion from schools' program development

Teachers lack ownership of school reform initiatives in part because they are excluded from planning those programs. As a result, they are less likely to become involved and believe that new reform initiatives about collaboration will result in real change (Datnow, 2020).

- Teachers' negative attributions caused by the school's use of incentives

Incentives for parent involvement could lead to the negative effect that teachers feel caught in a value conflict. Even when parents get active in their children's education, incentives drive teachers to believe that parents do not fundamentally value education (Henderson & Mapp, 2002).

Barriers from the children's perspective can include:

- Children may have negative attributions of parent involvement which could lead to difficulties when establishing positive connections between teachers and parents (Loughran, 2008).

While parent-teacher collaboration has numerous benefits for all (parents, teachers and children), the literature has identified a variety of beliefs, attitudes and behaviours that act as barriers in collaboration in inclusive settings. Research has also revealed many facilitators of teachers-parents collaboration that we will discuss in the next section.

Core principles for effective school-family collaboration in inclusive settings

Hoover-Dempsey and Sandler (1997) suggested that parents usually become involved in their children's education when three necessary conditions and preconditions exist:

- Parents have developed a parental role that is affirming to parental involvement in education.
- Parents have a positive sense of efficacy in helping their children succeed,
- Parents perceive positive opportunities and invitations to become involved in their children's school.

The following suggestions might be helpful in achieving these three conditions (Turnbull et al., 2015):

- Communication: Teachers and parents communicate openly and honestly in a medium

that is comfortable for the family.

- Professional competence: Teachers are highly qualified in the area in which they work, continue to learn, and communicate high expectations for students and families.
- Respect: Teachers treat families with dignity, honour cultural diversity, and affirm strengths.
- Commitment: Teachers are available, consistent, and try to ensure individual needs of the learner are successfully met.
- Equality: Teachers recognise the strengths of every member of a team, share power with parents, and focus on working together with families.
- Advocacy: Teachers focus on getting the best solution for the student in partnership with the family.
- Trust: Teachers are reliable and act in the student's best interest, sharing their vision and actions with the family.

Loughran (2008) suggests that due to the diversity among parents and to best communicate with each parent, it is necessary to:

- Communicate succinctly and clearly. Organise your thoughts ahead of time and review written messages.
- Make clear to each one that he or she is respected and his or her participation is encouraged.
- Be flexible, encouraging working parents to participate actively and be involved when and where possible.
- Secure multiple methods of two-way communication: email, telephone, postal mail, face-to-face communication and apps (for example, WhatsApp, REMIND, Blackboard, ClassDojo, etc.) (Gerdes et al., 2022).

Lawson (2003) argues that schools play an important role with regards to building up school-community partnerships. Schools can:

- Create a cooperate-friendly environment in which parents, children and teachers are all involved and share equal power as well as access to resources, so that they can positively engage with each other.
- Help to build consensus on cooperation between families and teachers.
- Provide additional support for disadvantaged families as a social service referral agent.

Finally, think of the TEAM acronym (Bennie, 2023):
T – Together **E** – Everyone **A** – Achieves **M** – More.

Selection of some good practice examples for successful parental

collaboration

Example Case – "I also have many examples. One that I can share with you would probably be about one of many Arabic families who came to Germany in 2015. I've been accompanying these people from day one until the present day, and I remember the first contact was difficult because they had a lot of expectations. There was a language barrier that we needed to overcome and there were cultural differences also. It was very difficult for me at first to establish a relationship because we had to work with translators. I found this very distracting because you never have direct communication between two people, it is always with somebody in between, no matter how nice they may be. The families started learning German and I started learning Arabic f. It was a lovely experience because I would so to their home for a coffee and try to learn Arabic. Not only was a learning the language but I also seeing a different context by getting an opportunity to see the families background and establish a different type of relationship with each other. It was really nice for them to teach me Arabic because, of course, I made a fool of myself because I did not speak Arabic proficiently. Of course, it is still something that we can laugh about together. In Arabic culture, they were very apprehensive to speak German, because it is often customary to laugh at you if you make mistakes. They found that if they made mistakes when speaking German to me, I would not laugh, and I would not judge. That was sort of the foot in the door to establishing this relationship. That relationship became really important in teaching them how to get by in the German system by explaining to them how the system works and what our values and traditions are. I also showed them what things they need to abide by. And it's not just about telling somebody you must do this, and you must not do this, but for them to truly understand how it works, which is important for them to be successful. It takes many, many years to understand all of this. I recall a lot of situations when they were very overwhelmed by the German paperwork. You feel very vulnerable when you are in a different country, and you cannot read or write their language, and you don't know what to do or you have to ask for help. They would ask me, and I would help them and I tried to establish some kind of system with them" (Chris Carstens, secondary teacher, Germany).

There are many successful examples of collaboration with parents. Some have already been presented at the beginning of this text. In order to gain further insight, we now want to present more good practice examples. However, these examples have always been developed in a specific individual and social context. The following are some examples of best practice to give the basic 'idea' of collaboration.

Examples of building 'bridges' between school and parents

In the context of appreciative and successful parental cooperation, the extracurricular programme of the so-called *'bridge builders'* in Basel (Switzerland) was conceived (Leonhardt & Kruschel, 2023). The main questions that were addressed for this project

were, how can we reach more parents and how can a dialogue be established and maintained?

The project has a goal-oriented effect on three levels:

- Parents: Strengthening and empowerment through information and resource-oriented support
- Children: Increasing equal opportunities through improved parental cooperation
- Professionals: Sharing background knowledge and strengthening intercultural competence.

The trained 'bridge builders' (https://www.heks.ch/was-wir-tun/brueckenbauerinnen) all have experience in intercultural mediation and/or in parental co-operation. Together they speak approximately 16 languages, have diverse cultural backgrounds and are themselves very familiar with the social environment. The target groups are parents with children in the age of pre-school to primary school. Contact is usually established through recommendations by the school staff, parents' evenings, participation in school conferences or through written information channels (newsletters, press in the neighbourhood, flyers). The central tasks of the bridge builders are:

- Meeting with the families at agreed locations, determined by the families, to support, inform, advise and accompany them.
- Providing information and advice on educational support services.
- Accompanying them to the appropriate services or specialised agencies.
- Support in understanding forms, letters or information from schools.
- Help with orientation in the neighbourhood, for example, by providing information about services for families with children.
- Support in contacting the school and in exchanging information with teaching and specialist staff.

At the Burgweide school in Hamburg, so-called *'parental mentors'* (https://www.burgweide.de/eltern-elternberatung.html) support co-operation with parents. Parents were trained to support other parents in challenging situations. On the one hand, this is intended to strengthen co-operation and, on the other hand, to give parents an understanding of school. A school culture has also been developed that considers parents who work here as part of the staff. The 'parental mentors' mediate between school actors and parents by creating awareness for each other through their services. They are 'contact people' and 'networkers' at the same time.

Concrete offers are:

- Organisation of counselling services within the framework of a parents' café.

- Support with applications and communication (mis)understanding, for example, correspondence with the school.
- Organisation of further education, tailored to the parents' living environment. These could include language courses, digital learning formats, reading and spelling courses.
- Language translation for important development talks or training courses.
- Representation and networking in the district/social space.
- Support in catching up on qualifications (parenting school).

In Groningen (Netherlands) there is a similar type of bridge building. Whereas in Basel the bridge builders are actors from outside the school, in the Dutch city positions are created by teachers directly in the respective school. There are now 20 positions in a total of 12-13 schools. The so-called *'brugfunctionaris'* (https://gemeente.groningen.nl/brugfunctionaris) are teachers without current teaching duties with the task of intensifying co-operation with parents. The focus is less on cultural mediation and more on school connection and relationship building between school and parents.

The 'brugfunctionaris' are described by the school team as an important resource for building a trusting relationship with parents. An important task is also to make it easier for parents to access the school premises and to talk to them directly on site.

Further support and exchange opportunities

Some schools offer various thematic courses and training for parents. The schools offer a wide variety of topics and focal points, also because they are very much geared to the individual needs of the parents. Exemplary topics are:

- Parent-child courses.
- Language courses.
- First aid courses.
- Life skills.
- Digital learning media.

Some of these courses are designed to help parents better support their children in their learning journeys. Others are designed to empower parents to acquire educational skills themselves. These services are also supported by networking with other actors in the social space. In this way, individual meetings take place with actors from outside the school thus relieving the teachers at school. At the same time, parents have the opportunity to (re)gain trust in the school. Extracurricular partners also make use of such educational offers in order for parents to understand more educational processes.

A frequent form of easy contact is the so-called 'parental café.' Parents can meet at these cafés for a certain amount of time. They have some snacks and talk about various uncertainties and questions. This is also an opportunity for the schools to learn more about

the needs of parents and the parents can build trust in schools and school stakeholders. This is a way for communication to increase and gain clarification on many topics ranging from information in letters the parents may have received to gaining a greater understanding of the structure of the school system.

Do we actually need 'collaboration'?

Collaboration should happen necessarily with equal evolvement of each side. Both parents and teachers should be reflective of their predominant opinion of co-operation.

For example, some teachers perceive collaboration with parents as school-based parent involvement. They believe that parent involvement within the school setting should primarily aim to improve students' learning experiences. It should contribute to students' success by aligning with the school's and teachers' requirements. From this perspective, teachers see the welfare of students as contingent upon the presence of supportive parents and families. Therefore, teachers' perception of collaboration can be characterised as both children-focused and school-centric.

Educators often perceive the importance of co-operation with parents because they understand that success in school is frequently associated with the socioeconomic capital and resources that parents can provide (Lareau, 2000). This perception leads teachers to hold the view that intergenerational patterns within families are reproductive, as not all parents possess equal ability or resources to offer the necessary support for their children's success in the school system (Bourdieu & Passeron, 1990). For instance, parents with higher educational attainment and stable employment may have greater financial resources to invest in educational enrichment activities, such as tutoring or extracurricular programs, which can positively impact their children's academic outcomes.

In contrast, families facing low educational attainment, negative social modelling, and unemployment often find themselves in an environment characterised by hardship and persistent educational challenges (Lareau, 2000). These challenges can perpetuate a cycle of disadvantage and contribute to a sense of inescapability. Teachers, recognising the influence of these external factors, do not believe that schools, or even themselves individually, can single-handedly reverse such complex and deeply ingrained cycles of inequality (Bourdieu & Passeron, 1990). This happens because teachers, influenced by the pre-existing subconscious acceptance of social reproduction theories, tend to integrate these beliefs into their practical approaches, resulting in specific causal chains of events that ultimately lead to predetermined outcomes.

Some parents' theories of action are deeply rooted in their conviction that the school plays a pivotal role in fostering their children's success. They believe that the school is not only capable, but primarily responsible, for ensuring their children's academic achievements (Epstein, 2018). This perspective often results in an expectation that the school should take full responsibility for their children's learning, from providing high-quality instruction to

addressing any challenges or obstacles their child may encounter during their educational journey. For example, these parents might expect the school to provide extensive academic support, such as additional tutoring or specialised interventions, if their child faces academic difficulties. They may also look to the school to address non-academic issues, such as behavioural or social challenges, assuming that the school should take the lead in resolving these issues. In this regard, parents' conceptions and strategies for parent involvement are both child focused and community centric.

As a result, and somewhat ironically, the theories of action held by teachers and parents exhibit a dual nature of simultaneous alignment and near contradiction. They align in their child-centred focus, yet they diverge significantly due to teachers' school-centric and parents' community-centric perspectives, which consistently lead to conflicts between them.

These intricate (adverse) exchanges arise due to the divergence in perspectives, conflicting knowledge frameworks, and action theories held by teachers and parents: they have varied interpretations and understandings of the purposes and roles of parental engagement.

School as a social institution serves as the society and has a significant role of creating the school-community partnerships. The concept of a partnership typically implies a collaborative relationship where individuals or groups are perceived to have equal influence and equitable access to resources (Lareau, 2013).

It is recommended that individuals and processes should establish clear provisions when shaping and guiding the framework for mutually beneficial school-family practices. These provisions should consider issues such as recognising and addressing power imbalances and dynamics. Efforts to acknowledge and respect the strengths and perspectives of parents should be implemented without creating a division that devalues school-centred involvement activities that can enhance children's learning and well-being, and without diminishing the genuine needs of teachers for meaningful support, professional growth, and acknowledgment (Lawson, 2003). In doing so, it is possible to align teachers' and parents' perceptions of collaboration, thereby reducing the disparities caused by school-centred parental involvement.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

- Why is it important to collaborate with parents in inclusive education?
- In your opinion, which barrier is the most significant to teacher-parent collaboration and how can we work with it?
- What opportunities do teachers in schools have to support parents in co-creating and understanding structures and practices?
- What could a non-judgmental culture of dialogue and cooperation with parents in schools look like?
- How the educational inequality could be reproduced during collaboration with parents? How to improve that?
- Why it's important to develop a consensus of collaboration between parents and teachers ?

About the authors

Assimina Tsibidaki

Assimina Tsibidaki is an Associate Professor of Special Education in the Department of Primary Education at the University of the Aegean, Greece. Her research interests include students with special educational needs and disabilities (SEND), families raising children with SEND, home-school collaboration, social support networks, technology in inclusive education, and the portrayal of disability in children's literature and cinema. She has authored two books and contributed to edited volumes, academic journals, and conference proceedings. Additionally, she has presented her work at numerous national and international conferences.

Linjie Zhang

Linjie Zhang is a researcher at the University of Vienna. Her primary research interests encompass structural inequality within the educational system, the development and management of international schools, elite education, neoliberalism and globalization, educational policy, and the application of capital theory in education.

Nico Leonhardt

Nico Leonhardt is research assistant at the Leipzig University (Institute of Special Education). His work and research focuses are inclusive school development and social space orientation, inclusion-sensitive higher education development, accessible language, participatory research and teaching.

NAVIGATING HORIZONTAL TRANSITIONS: BUILDING PARTICIPATION AND SUPPORT FOR YOUNG LEARNERS AND FAMILIES IN EDUCATIONAL AND COMMUNITY SETTINGS

Chris Carstens; Francesca Mara Santangelo; and Nariko Hashida

Example Case

Let us start by reading about this experience of a horizontal transition and the development of an educational network that took place in southern Italy.

Three years ago, I worked with a boy who had severe behavioural difficulties and a total lack of control over his emotions. As you may know, the Italian school year begins in September. From September to December, this boy had four special needs teachers, each of whom shortly thereafter abandoned their position due to the difficulties of managing the child, his aggression, and other behavioural issues. One day, the last support teacher to arrive called me because she had known me for some time, and they were desperate at the school. I went to the school and met this boy, his teachers, and his classmates. He was eight years old at the time and was as tall as me. I had a fun and creative time with them at school. My initial goal was to build a relationship with the young learner and gain mutual trust. This is because I strongly believe that in any educational and care relationship, the person must be placed at the centre, with the resources revolving around them in a harmonious manner and in dialogue.

Around the young learner, we built a network made up of the family, the school director, the teachers, me as a pedagogist, the psychologist, the neuropsychiatrist, and the managers

of two social communities responsible for designing personalised educational and health interventions through laboratory and occupational activities.

For all of us, the first step was to identify the most important need of the child and his family. In Italy, we have a very important official document, namely the community educational pact, drawn up by all the actors involved in an educational project: the family, school staff, therapists, and the rehabilitation and educational associations or communities involved. Within these agreements are the educational objectives that are intended to be achieved for the well-being of a young learner and their family.

In our case, we identified the actors involved and defined not only their roles but also the spaces and times to develop the educational project for this child. After several conversations with the young learner and his parents, we came to define his educational project, of which I'm going to list only the most important features.

Political institutions made a free transport service available to the family, responsible for accompanying the child to various places during his day: school, the rehabilitation centre, the headquarters of an association, and finally home. Together with the head teacher, the parents, and the health facility managers, we decided that the young learner would spend 3 to 4 hours at school with his classmates, carrying out normal teaching activities with the support of a special needs teacher in the classroom. Then, he would be taken to the rehabilitation centre, where he could participate in therapeutic activities to improve his behaviour and gain emotional control. Before returning home, on some days of the week, he would take part in educational and recreational projects with other peers at the school or at the headquarters of other associations.

Over time, the results highlighted a reduced stress load for the family, who, having other children, were unable to manage the entire situation, including the necessary travel. Even more importantly, the therapeutic objectives achieved allowed for more peaceful teaching activities in the classroom, better family management, and a greater sense of well-being for the young learner, who never lost contact with his classmates and peers and was able to benefit from a strong support system created with and for him.

Initial questions

In this chapter, you will find the answers to the following questions:

- What does horizontal transition mean, and what situations does it include?
- What are the barriers to building an educational network for horizontal transitions?
- How do horizontal transitions between different educational settings (e.g., public to private schools, or between different school districts) affect young learners' performance and their social and emotional well-being?
- What are the primary challenges faced by schools and educators in managing horizontal transitions, and how can these challenges be mitigated?
- What strategies and support systems are most effective in facilitating successful horizontal transitions for young learners?

Introduction to Topic

Horizontal transitions in education refer to the changes young learners' experience within the same level of education, such as moving between schools, shifting from one classroom to another, or transitioning between educational programs. Unlike vertical transitions, which follow a clear progression from one life stage to the next (e.g., moving from primary school to secondary school), horizontal transitions occur when young learners move across similar educational environments. These shifts can result from various circumstances, such as family relocations, changes in educational needs, or placement in specialised programs.

It is essential to remember that not all individuals experience a wide range of horizontal transitions, and the types and impacts of these transitions can vary significantly. For some, horizontal transitions may be infrequent or limited to a single shift between schools or classrooms. Others may face multiple transitions in a short period, each requiring them to adapt to different social, academic, and environmental factors. For instance, while one young learner might transition from a mainstream to a specialised program within the same school, another might shift between multiple schools due to frequent relocations, each time confronting new routines, peer groups, and expectations.

These transitions are often complex and layered, as they require learners to adjust to new surroundings, teaching styles, peer dynamics, and support systems—all while trying to maintain academic progress and emotional stability. For vulnerable young learners—such as those with disabilities, learning difficulties, or emotional and psychological challenges—horizontal transitions can be particularly demanding. The unfamiliarity of each new setting may heighten anxiety, disrupt learning continuity, and amplify feelings of isolation or instability. For such young learners, additional resources, personalised support, and careful planning are crucial to ensure they continue to thrive in their new environment.

Furthermore, the nature of these transitions varies not only across individuals but also within different educational or cultural contexts. For example, an adult refugee moving between countries due to political or economic instability may experience horizontal transitions that are more radical than those within a single country or educational system. A young learner with a disability may need to transfer between mainstream education and a rehabilitation or specialised educational community, each with distinct support structures and expectations. Recognising these variations in horizontal transitions underscores the importance of personalised planning that is responsive to each individual's unique needs and circumstances.

Effective management of horizontal transitions is vital for minimising disruption and promoting continuity in a young learner's education. Schools and educational institutions play a key role in facilitating these transitions by creating supportive, inclusive environments and by coordinating efforts among educators, families, and specialised services to meet each learner's specific needs. Addressing the emotional, social, and academic aspects of these transitions is essential to help young learners feel secure, resilient, and empowered in their new settings.

As you read through this chapter, keep in mind that each learner's experience with horizontal transitions is distinct, shaped by their personal, social, and educational context. Developing an awareness of the diverse ways these transitions manifest will enhance your understanding of how to create effective, tailored support plans that enable learners to adjust smoothly and maintain their educational progress.

Key aspects

Definition

Understanding transitions requires recognizing the multiple layers influencing a learner's experience, as outlined in Bronfenbrenner's Ecological Model. This model emphasises that a young learner's ability to adapt is shaped by immediate settings, such as family, peers, and school, as well as by the interactions between these groups. Beyond these, broader societal factors—including policies, cultural norms, and the availability of resources—further impact transitions. By acknowledging these layers, educators and stakeholders can better identify the barriers that may hinder a young learner's adjustment, as well as the support structures that can help them succeed. This holistic perspective sets the stage for creating educational environments that foster smoother, more supportive transitions for all learners (Bronfenbrenner, 1979).

We can distinguish between two types of transitions: vertical and horizontal. Vertical transitions refer to the major chronological events in life, such as progressing from birth, to nursery, to primary school, and eventually entering the workforce and retirement. These

transitions, mapped on a vertical axis, reflect the stages everyone passes through. However, comprehensive planning for these transitions is often lacking (Ginger & Patton, 1996).

Horizontal transitions are less visible than vertical transitions and occur frequently. They refer to the everyday moves that children (or any person) make in different parts of their lives, such as going from home to school or from one care setting to another (Cappello, Ferrel, Pallokosta, and Iturria, 2023). In other words, all those things happening on the same temporal plane, placed precisely on a horizontal axis. Such transitions could be, for example, the transition from public schools to private schools, a transfer to different school districts, or a change in educational programs within the same institution. These transitions are common due to various factors such as family relocations, academic demands, or personal preferences. However, the implications of these transitions on young learners' academic achievement and social and emotional well-being are profound and multifaceted. Understanding the challenges and opportunities presented by horizontal transitions is critical for educators, policymakers, and parents.

Using Bronfenbrenner's Ecological Model as a lens, these transitions reveal how support structures at different ecological levels—family, school, peer groups, and the broader community—impact the young learner's ability to adjust. For instance, vertical transitions may demand strong institutional support and curriculum alignment to bridge educational gaps. Horizontal transitions often depend on more immediate support systems, like consistent peer and teacher relationships, to create stability and continuity in the learner's educational and social experience. This figure underscores the importance of tailored support systems that respond to the specific nature of each transition, helping young learners with special needs navigate new environments and maintain their well-being.

Figure 1: Vertical and select horizontal transitions. Note. From Transition From School to Adult Life for Students with Special Needs: Basic Concepts and Recommended Practices

Birth	hospital → home	
	technology → assistance no technology	
Preschool Years	home → preschool	
	public setting → private setting	
School Years - Elementary	separate school → neighborhood school	
	special education → general education	
School Years - Secondary	special education → general education	
	special/general education → alternative ed	
Earty Adulthood	single → maried/partner (children)	
	living with family → living alone/with others	
Middle Adulthood	family care → alternative care	
	residential placemen → community living	
Older Adulthood	family relationships → alone	

Source: J. R. Patton, 1995, Austin, TX: PRO-ED. Copyright 1995 by PRO-ED. Reprinted with permission.

The figure above illustrates both vertical and horizontal transitions specifically for young learners with special needs. Vertical transitions, shown as milestones like progressing from primary to secondary school, signify shifts to new educational stages with increased expectations and challenges. Horizontal transitions, in contrast, represent moves within the same educational level, such as transferring between special education programs or changing schools due to family relocation.

One of the most important and frequently discussed horizontal transitions is the movement from separate settings to less restrictive, more inclusive ones (Ginger and Patton, op.cit.). Moving from segregated to more inclusive settings is important for the

horizontal transition of people with disabilities. Figure 1 highlights several such transitions for individuals with disabilities from a chronological perspective.

The need for transitions into inclusive communities, though not always labelled as "horizontal transitions," has been a topic of discussion since the 1980s. Fish (1986) argued that the objectives of these transitions should be the same for everyone, regardless of disability. He identified four key, interrelated objectives for successful transitions:

- Employment, useful work, and valued activity
- Personal autonomy, independence, and adult status
- Social interaction, community participation, leisure, and recreation
- Roles within the family

The objective of social interaction, community participation, leisure, and recreation highlights that greater community involvement can promote increased personal autonomy, independence, and shifts in family roles and relationships. In essence, participation in a more inclusive society can foster greater independence and autonomy for learners with disabilities or other needs, ultimately transforming their relationships and helping them achieve personal and social milestones.

Throughout this chapter, we will analyse the process of horizontal transitions, starting with the framework of Schlossberg's theory and identifying four key concepts that, in our opinion, outline the fundamental aspects of a horizontal transition.

Schlossberg's Transition Theory

Schlossberg's transition theory, named after Nancy Schlossberg, professor emerita of counselling psychology at the University of Maryland, can be really helpful in understanding not only what transitions are but also how people experience change and what could help them cope well with this process.

Whatever type of transition we are discussing, they tend to exist on a continuum, so they can be formal or informal. For example, it could be leaving one school to move to another. It could be planned. It could be something that was planned for two years and then gradually happens. Or it could be completely unplanned. This could be someone having to flee one country to move to another or transitioning between occupations. As we can already imagine, some of these transitions may be easy, while others are exceptionally difficult.

The theory was developed by Schlossberg, who conducted research on a group of adults who had been unexpectedly fired from their jobs. Suddenly facing unemployment and an unplanned transition, these individuals responded to the situation in different ways. Schlossberg was curious to understand why some people were able to navigate this transition positively, achieving favourable outcomes, while others struggled. Originally, the theory was part of research on adult development, designed to help understand and

manage life transitions as part of the "ordinary and extraordinary process of living" (Evans, Forney, Guido, Patton, & Renn, 2010). Over time, it has become a guiding framework for understanding and explaining horizontal transitions in other life phases, beyond just adulthood.

Referring to Schlossberg's theory to understand and intervene in a transitive process, understood by the authors as "any event or non-event that translates into a change in relationships, routines, assumptions, and roles," we can outline it as follows (Anderson, Goodman, and Schlossberg, 2012):

A. Look carefully at the transition

a) Identify the **type**. Schlossberg's theory identifies three: anticipated – refers to foreseen events, unexpected – refers to sudden and unplanned transitions, non-events – concerns events that should have occurred but did not take place.

b) Clarify the **context** – the circumstances in which the transition occurs.

c) Evaluate the **impact** – the reactions that arise from a specific transition.

B. Create the resources framework

The theoretical model identifies the so-called **4 S**, i.e. four main factors that influence a person's ability to face a transition. These factors are:

a) **Situation** – the context in which we find ourselves: what are you starting from? What or where are you moving towards?

b) **Self** – personal resources: who are we? What kind of psychological resources do we have? What are our prospects? What is our perspective or what values do we have?

c) **Strategies** – how we deal with events in our lives, especially unexpected ones? It is a fact that we all go through transitions throughout our lives. But what are our strategies when we discover that something stressful is happening? Do we deal with the situation by avoiding it or pretending it's not happening?

d) **Support** – external resources: what support do we receive from family or people in our networks? Having relationships that generate support and support plays a fundamental role in transitions, as it represents a protective factor against the risk of negatively facing a sudden event and experiencing situations of marginality, social isolation and vulnerability.

C. Strengthen resources and intervention

The resources available during a transition can either provide opportunities for growth and improvement or, conversely, lead to decline. According to Goodman et al. (2006), transitions can be broken down into three phases:

1. Moving in: This represents the moment in which you learn the characteristics of the new situation, including the rules, expectations, and new roles.
2. Moving through: This is about finding balance in the new dimension of life.
3. Moving out: This represents the end of the transition process and the continuation of life, awaiting new transitions.

In this process, the person will face the transition in a positive, neutral, or negative way, based on the resources they have available. Regarding the first "S" (Situation), key factors include the nature of the event, its timing and duration, the level of control the person has over the situation, changes in their role, and any simultaneous sources of stress. The second "S" (Self) refers to how personal attributes—such as age, gender, cultural background, socio-economic status, health, values, beliefs, ego, resilience, and psychological resources—affect how someone navigates a transition. The third "S" (Strategies) involves developing flexible and varied action plans, which offer a wider range of responses to challenging events. This includes coping strategies, the ability to adapt and adjust, and the capacity to manage stress while maintaining a focus on self-care and well-being. Finally, the fourth "S" (Support networks) comprising emotional connections with family, friends, intimate relationships, institutions, and other community resources, are crucial in creating a protective environment around the individual during times of transition.

Barriers to horizontal transitions

Transitioning to a new educational environment often requires young learners to adapt to a curriculum with different levels of progression and difficulty and to form relationships with new peers, teachers, and staff. Young learners are expected to navigate these significant changes in a short period, but not all young learners experience a smooth horizontal transition. This section discusses possible barriers to horizontal transitions between schools or education systems at the same level.

Differences in curriculum

It is well known that the vertical transition between primary and secondary school is often challenging. Hanewald notes that during the transition from primary to secondary school, young people move from small, self-contained classrooms to larger, more heterogeneous schools with increased expectations of independent academic performance and less teacher support (Hanewald, 2013). Galton et al. suggest that around 40% of pupils experience a hiatus in progress during vertical transitions, particularly when moving from primary to secondary school, due to a lack of curriculum continuity between these educational stages (Galton et al., 2000).

However, this type of difficulty can also arise during horizontal transitions between schools or programs at the same level of education. Higher levels of school mobility are associated with lower academic performance, more emotional or behavioural problems, and greater difficulties with social adjustment (Snozzi et al., 2024). As this type of transition is not necessarily experienced by many young learners, little attention has been paid to the issue.

Young learners experience horizontal transitions and difficulties in different ways, even within the same stage of education. Slightly higher rates of young learner mobility are

reported for young learners with special educational needs (SEN) than for young learners without SEN, and mobility appears to be particularly high for young learners with emotional disturbance (Snozzi et al., 2024).

When a young learner with SEN moves from a special education program (school or class) to a mainstream program (school or class), the young learner may find it difficult to adapt to the faster paced and more advanced curriculum. Demetriou et al. explain the decline in motivation in terms of a loss of self-esteem in a larger and more overtly competitive environment (Demetriou et al., 2000). Conversely, young learners moving from mainstream to special classes may find the content too easy and unengaging (Tsutsumi 2019), leading to decreased motivation to learn. Thus, differences in content and learning levels resulting from school transfers can reduce motivation and hinder young learners' ability to learn in a new environment.

Furthermore, migrant and refugee young learners attending schools in different countries need to study subjects through a foreign language other than their mother tongue. Japanese research suggests that acquiring a foreign language as a language of study takes longer than learning it as a language of life (Kinnan 2024). This presents unique difficulties for migrant and refugee young learners, extending beyond mere academic catch-up and impacting their overall learning progress.

Changing relationships

As Spernes' review shows, the transition from primary to secondary school may elicit social and emotional challenges for young learners (Spernes, 2020). Traditionally, schools have facilitated a smoother transition from primary to secondary school by ensuring that pupils move to the new school or class with at least one good friend (Demetriou et al., 2000). Having a peer helps young learners meet their social needs for familiarity and companionship in the "big school," easing some of the anxieties that come with the transition (ibid). As Blatchford (1998) points out, "friendships can help reduce uncertainty and thus facilitate adjustment to school." Additionally, a positive relationship with teachers plays a key role in promoting young learners' commitment to learning. When a young learner moves to another country or state or switches to a different educational program, maintaining previous friendships and relationships with staff becomes increasingly challenging. They must rebuild relationships with others in a new community. However, migrant or refugee young learners may face additional barriers, such as limited proficiency in the local language, hindering their ability to connect with their peers.

Additionally, some teachers and young learners at the new school may view new young learners as 'newcomers' and struggle to empathise with their feelings. Demetriou et al. describes a 'good teacher' for young people as someone who consults them, who is fair, who makes them feel important, and who treats them in an respectful way (Demetriou et

al., 2000). To facilitate a smooth transition, it is necessary to support both young learners and teachers in the new school to cultivate positive relationships.

Schools, classrooms and communities that exclude diversity: Barriers and reasons for horizontal transition

Traditionally, schools and classrooms have played a role in perpetuating and reinforcing homogeneity, often at the expense of valuing diversity. Therefore, children who belong to a minority group are more likely to face exclusion due to their perceived 'differences'. International research has emphasised the exclusion and bullying experienced by vulnerable children, including those with disabilities, refugees, and children affected by migration (Menesini and Salmivalli, 2017).

Considering that positive relationships between children can influence their academic performance, there is concern that excluded and bullied children may underachieve. Furthermore, poorer performance or difficulties in adjustment may lead to children being placed in segregated educational settings, such as special classes and schools. The over-representation of children from migrant backgrounds, as well as children with disabilities, in special education is also believed to be linked to the high level of exclusivity in mainstream education (Kinnan, 2024).

Therefore, inclusive schools and classrooms that recognize and embrace diversity and do not exclude children from different cultural and social backgrounds, are essential. Holistic school programs to prevent bullying are often successful, and in several countries, it is a legal requirement for schools to have an anti-bullying policy (Menesini and Salmivalli, 2017). In schools in England, disability equality training has been led by disability organisations to eliminate bullying of children with disabilities and promote diversity inclusion (Hashida 2024).

Difficulties in sharing information and coordination

When young learners transition between schools or education systems, seamless coordination and information sharing between the local education authorities, schools, families, and young learners are crucial.

Teachers and coordinators at the previous school are familiar with their young learners' learning achievements, special educational needs, and social dynamics, such as how they relate to their friends. Sharing such information enables teachers at the new school to effectively support the learning and relationships of transferred young learners. This requires developing systems to share data on young learners' learning, friendships, and support needs. If the previous and new schools fall under the same inter-municipal authority, communication and information sharing are relatively easy. However, when young learners move to schools in a different country or region, communicating and information sharing become significantly more challenging.

Even when information is shared, there is no guarantee that the new school can offer the same learning content. In England, for example, the introduction of the National Curriculum was intended to ensure continuity and coherence of learning across schools. However, Galton et al. found that in spite of this curriculum framework, there were still serious discrepancies between the work pupils were given before and after the transition from primary to secondary school. Their research in the English education system shows that these gaps in curriculum alignment can significantly disrupt young learners' progress during this key educational transition (Galton et al., 2000).

Moreover, young learners with special educational needs may not receive the same level and quality of support in their new school due to potential differences in inclusion policies, staffing structures, and teacher attitudes between schools. These difficulties in information sharing and coordination can disrupt the smooth transition of young learners to their new school or educational program. Snozzi et al. said that if a young learner transferred from a special class to a mainstream class, it could be determined that the young learner received SEN support in the special class, but there was no information in the data about whether the young learner continued to receive SEN support after the transition (Snozzi et al., 2024).

Collaborative strategies and support systems for successful horizontal transitions

Effective strategies and support systems are essential for ensuring successful horizontal transitions, such as moving between schools or educational programs. Addressing not only academic but also social and emotional needs is critical to helping young learners adjust. Collaboration between teachers, peers, families, and the wider community plays a key role in this process. Strong communication among all parties ensures that personalised support is in place, while peer and teacher relationships provide young learners with a sense of belonging and stability. Family and community involvement further reinforces these support networks, helping to create an inclusive environment where young learners can confidently navigate their transitions and thrive.

Collaboration and communication

Collaboration and communication are key components in managing horizontal transitions within the educational system. Effective collaboration and communication between various stakeholders – including young learners, teachers, parents, and administrators – can significantly impact how well young learners adjust to these transitions, ensuring both their academic progress and emotional well-being.

Let us read this example case from Germany:

Germany is reputed to be extremely bureaucratic and any kind of legal procedure involves a large amount of paperwork going backwards and forwards. Even though the standard procedure requires mandatory meetingsconcerning childrens' welfare or educational paths,

these rarely involve authentic communication between participants or with children and their respective families. Because of this we often lack transparency and real human connection. A school I used to work at for example was in an area which had extremely high rates of crime and poverty which occasionally made it necessary for us to report certain incidents, seek assistance or even relocate children if their home environment was deemed unsafe. Despite this the school had a notoriously bad relationship with Child Protective Services (CPS), which made collaborating almost impossible. Mails went unanswered, appointments were denied and any kind of feedback concerning the young learners who needed assistance was non-existent. Case workers would simply show up in my classroom unannounced and try to arrest young learners in order to take them to a general holding facility – this was both traumatic and catastrophic considering school needs to be a safe environment for everyone. I used to have a huge problem with that, until one day we wanted to take a young girl into care because there was a very dramatic situation in her home, and it was clear she would not be able to return.

First of all, I sat down with the girl and I explained to her what the situation was and how the procedure worked so that she would understand exactly what the next steps would be. Transparency and predictability are extremely important in such stressful and traumatic situations. She had her bag packed beforehand and we discussed the phone call she and I would now have to make. We were optimistic because we had planned this transition in advance and had selected a lovely foster family who knew the girl in advance and was willing to take her in. In my eyes it was the best you could have made out of a drastic situation. But CPS does not work that way in Germany. You basically have to call a hotline and you do not know who is going to pick up the phone, and it is more than likely that they will simply take over the case without any further collaboration or planning. That usually ends up in the child being taken to a general holding facility until further evaluation. I had to explain this to the girl, because I think it is very important to prepare them for all the possible scenarios, so that they can brace themselves. In this case, luckily enough, a gentleman whom I had not met before, picked up the phone and was extremely laid back and helpful when I explained the situation and our ideas to him. He agreed to let me take the girl to the foster family in my own car and met us there to evaluate and assess the situation on the same afternoon. We actually sat outside in the family's garden and had coffee and cake, and the girl got to explain her situation and the case worker got to know everybody and wrote his respective report. This was the smoothest transition and the most ideal outcome for a very dramatic situation.

Additionally this turned out to be a very fruitful development for my collaboration with CPS because over coffee I got to explain the troubles our school had been having with their institution and how I wished it could be different. From that we struck up a kind of friendship and started meeting on a regular basis to discuss cases, ideas or just vent about everyday work problems. Meanwhile we have included many others in our meetings, organiseworkshops together and have formed a very constructive and supportive network which transcends school and CPS themselves. I now have an insight into who the people

on the other end of the paper trail are and what their work schedule looks like. Our regular meetings have broken down barriers and helped form trust and an authentic human connection in order for us to successfully work together.

The role of collaboration in horizontal transitions

Collaboration among educators, young learners, and families is essential in facilitating smooth horizontal transitions. When teachers and school staff work together to coordinate young learner transitions, it reduces academic disruptions and ensures continuity in learning. This collaboration often involves sharing information about a young learner's learning needs, academic progress, and social-emotional status to ensure that the receiving teacher or school is well-prepared to support the young learner.

Collaborative strategies such as team meetings, joint planning sessions, and professional development programs allow educators to align their practices and expectations. This is especially critical in transitions involving diverse learning needs, such as young learners with disabilities or English language learners. For instance, ensuring that there is sufficient planning beforehand such as the US model of Individualised Education Plans (IEPs) or that language acquisition programs are seamlessly implemented across different schools or classrooms requires close coordination between educators and specialists (Willis, Doutre, Jacobsen, 2019).

Additionally, collaboration between schools and outside organisations, such as community centres or after-school programs, can enhance the support provided to young learners during transitions. These partnerships often provide additional resources, such as tutoring or mentoring, which can help young learners adapt to new learning environments more successfully (Graham et al., 2022).

Communication as a critical factor

Open, consistent communication is critical in ensuring successful horizontal transitions. When communication between schools, families, and young learners is strong, it promotes transparency, reduces anxiety, and allows for proactive problem-solving. One key aspect of effective communication is providing clear, timely information about the transition process, expectations, and available resources. Studies show that when families are well-informed about what to expect during a transition, they are better able to support their children, helping them feel more confident and prepared (Harper, 2016).

Teachers and administrators must maintain ongoing dialogue with young learners to understand their concerns and ensure that they feel supported throughout the transition. This may involve regular check-ins, feedback sessions, and creating a culture where young learners feel comfortable expressing their challenges and needs. Open communication between young learners and educators helps identify potential issues early, allowing for timely interventions that address both academic and social-emotional challenges.

Parent and teacher communication is another vital element of successful transitions. When teachers engage with families and actively involve them in the transition process, young learners benefit from a more cohesive support system. This is especially important when young learners are transitioning between different learning formats, such as in-person to online learning, as families play a more active role in facilitating their children's learning in virtual settings. Communication tools such as parent-teacher conferences, newsletters, and digital platforms can help connect home and school, making sure that families stay informed and involved.

Collaborative models for successful transitions

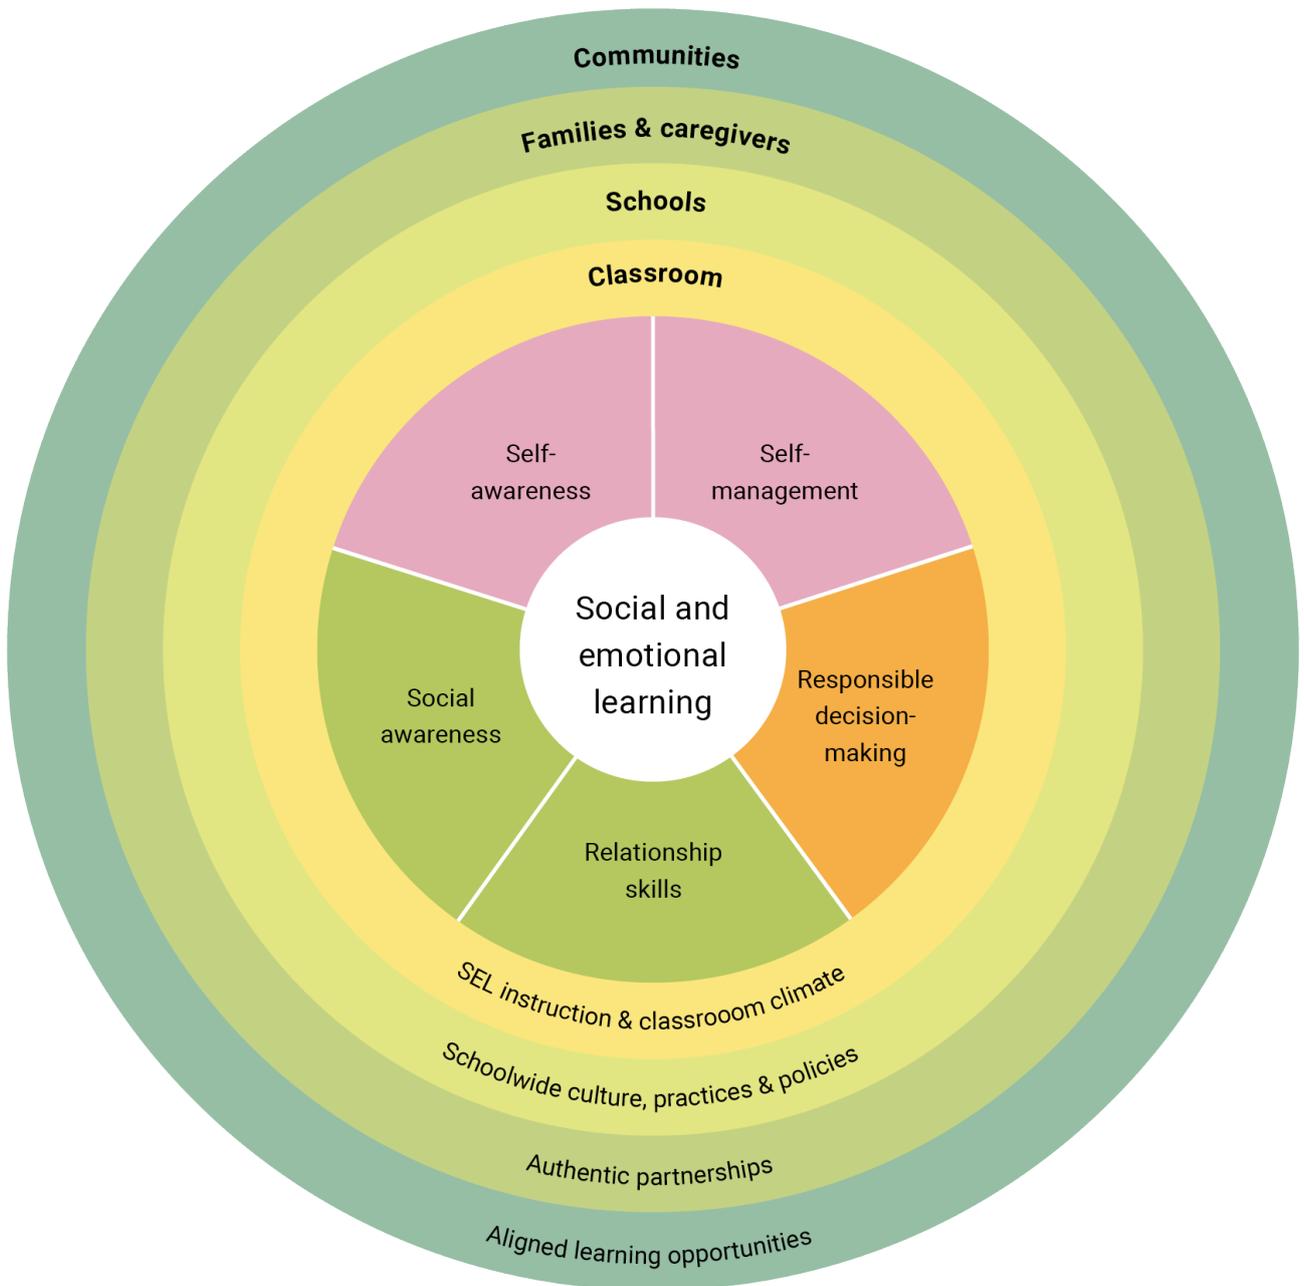
Schools that implement structured collaborative and communication frameworks see more successful transitions. For example, multi-tiered systems of support (MTSS) integrate both academic and social-emotional support strategies through collaboration among teachers, counsellors, and administrators. These systems use data-driven decision-making to monitor young learner progress and adapt interventions to meet individual needs (McIntosh & Goodman, 2016).

Similarly, teacher collaboration networks, where educators from different schools or departments share best practices and strategies for supporting young learners during transitions, have been shown to enhance the overall effectiveness of the transition process. As Hargreaves (1999) emphasises, simply working alongside one another is insufficient; genuine collaboration and open dialogue are crucial. Meaningful collaboration and collegiality are key to fostering educational change. Collaboration and communication are essential to managing horizontal transitions in the educational system. Through collaborative efforts among educators, families, and communities, young learners can experience smoother transitions with minimal disruption to their learning and emotional well-being. Effective communication ensures that all stakeholders are well-informed and engaged in supporting the young learner's adjustment to new learning environments. By fostering these connections, educational systems can better meet the needs of young learners and create a more inclusive and supportive transition process.

Social and emotional support

Social and emotional support during horizontal transitions can play an important role in how young learners adjust to new environments and maintain their academic performance. Additionally, emotional support systems help develop resilience, supporting young learners to cope with the challenges of transitioning without feeling isolated or overwhelmed.

Support systems that focus on social and emotional well-being can reduce the potential for disconnection, which often leads to academic decline or disengagement from school. According to the Collaborative for Academic, Social, and Emotional Learning (CASEL), incorporating emotional learning strategies into school environments helps young learners

develop crucial skills such as self-awareness, self-management, and social awareness, which are essential during transitions.


Source: Casel 2020

Peer and Teacher Support

One of the most effective forms of social support in educational transitions is peer support. Peer relationships offer a sense of belonging and shared experiences that can ease the stress of new environments. Peer mentoring programs, for instance, have been shown to positively impact young learners who are transitioning by providing them with role models

and a peer network that can answer questions, offer guidance, and create social bonds (Stapley et al., 2022).

Teachers also play a key role in creating an emotionally supportive environment. When educators are attentive to the emotional needs of young learners during a transition, they can create a sense of security and stability. Teachers who prioritise social-emotional learning (SEL) in their classrooms can help young learners manage their emotions, build healthy relationships, and stay engaged with their studies despite the changes in their environment (Jones & Kahn, 2018).

Family and community involvement

In addition to support from peers and educators, family involvement is a significant source of emotional security for young learners navigating horizontal transitions. When families are actively engaged in the transition process – communicating with teachers, offering reassurance, and maintaining open lines of communication – young learners are more likely to feel supported both at home and at school. Research by Eden et al. (2024) shows that young learners whose families are involved in their education tend to exhibit higher academic achievement and better emotional adjustment during transitions.

Communities also play a role in supporting young learners during transitions. Community-based programs, such as after-school activities, provide young learners with additional opportunities to build social connections and access emotional support networks, further buffering the potential stress of transitioning between schools or learning formats (Mahoney et al., 2005). Social and emotional support is a vital component in ensuring that horizontal transitions in the educational system are smooth and successful for young learners. Through the combined efforts of peers, teachers, families, and communities, young learners can develop the emotional resilience and social connections needed to thrive in new learning environments. Without adequate support, transitions may lead to feelings of isolation, anxiety, or disengagement. However, when properly supported, young learners are more likely to experience positive academic and emotional outcomes, ensuring long-term success in their educational journey.

6. Participation and learner-centred approaches

A young learner-centred approach recognizes that each young learner is unique and gives priority to young learners' needs, interests and experiences rather than strictly adhering to a standardised, one-size-fits-all, teacher-led model. This approach helps to welcome individual differences as a source of richness and as a starting point for teaching and educational action, considering that within this diversity young learners learn and adapt to new contexts. Furthermore, this approach allows us to listen to the voice of the young learners, to take care of their point of view, creating ample space for open discussion. Unfortunately, it is customary in educational work to take it for granted that we educators

know what is best for our young learners and evaluate them, because this is our job. We believe we know what they are capable of doing and what is best for them without asking. A young learner-centred model can encourage young learners to take more responsibility for their own learning and improve their motivation, strengthening personal resources during transitions and helping them develop the skills they need to cope with change.

This approach involves adapting instruction to different learning styles and needs of young learners. For example, it is possible to implement differentiated instructions and personalised learning plans to help young learners improve their autonomy and awareness of how they learn, helping to adapt to a new environment effectively. By allowing flexibility in how young learners demonstrate mastery of content, such as through project-based learning, portfolios, or assessments that reflect individual learning goals, teachers can create more inclusive environments that support all young learners during transitions (Tomlinson, 2017).

Finally, the young learner-centred approach focuses on the importance of creating a classroom environment that creates a sense of belonging and emotional safety. This is especially important during horizontal transitions, when young learners may feel uncertain or disconnected from the new environment. A welcoming and inclusive school environment helps ease the transition and helps young learners feel valued and understood as they adapt and acclimatise to their new environment.

Participation in the transition process

Student participation in decision-making and the learning process is another key component of successful transitions. When young learners are actively involved in shaping their educational experience, they develop a greater sense of ownership and agency, which can help them manage the challenges of moving between learning environments. Participation not only empowers young learners but also helps educators and administrators understand young learners' needs and preferences, allowing for better support during transitions (Eden et al, 2024).

One effective way to promote student participation during transitions is through student-led conferences or transition meetings. In these meetings, young learners, parents, and teachers come together to discuss the young learner's strengths, challenges, and goals, giving the young learner a voice in their educational journey (Eden et al, 2024). Bailey and Guskey (2001) point out that student-led conferences encourage young learners to actively engage in their own educational process. By discussing their progress, strengths, and areas for improvement directly with parents and teachers, young learners gain a stronger sense of responsibility and ownership over their learning journey, which can be especially beneficial during times of transition

It must be considered that one of the greatest risks of a transition, in our opinion, is that of losing one's identity or part of it. Consider a child facing vulnerabilities who,

despite great effort, works to discover and build their strengths. With each transition, this process can be disrupted, slowed down, or even undone. Similarly, think of an adult refugee, forced to leave their home, culture, and everything that is familiar. Having grown up in a certain environment that shaped their identity, they now face the challenge of adapting to a new culture, language, and people. Without a support network to guide them through this transition or a welcoming community to create a safe space in their new environment, there is a risk that they may lose important parts of their identity.

Peer collaboration and mentorship programs can enhance young learner participation during transitions. When young learners are encouraged to work together, whether through group projects or peer-led activities, they develop social skills and build relationships that help ease the stress of transitioning. Peer mentoring programs, where older or more experienced young learners guide those who are new to the school or classroom, have been shown to improve social integration and academic outcomes (Graham et al., 2022). These programs provide young learners with both academic support and a sense of community, making the transition process smoother.

The benefits of a learner-centred and participatory approach

In summary, implementing a learner-centred and participatory approach during horizontal transitions has several benefits. First, it increases engagement, which is particularly important during transitions when young learners may feel disconnected or overwhelmed. Engaged young learners are more likely to be motivated, participate actively in class, and demonstrate better academic outcomes. By focusing on student interests and involving them in their own learning, educators can help maintain engagement even during challenging transitions.

Furthermore, a learner-centred approach promotes the development of critical skills such as self-regulation, problem-solving, and adaptability, which are essential for managing transitions. When young learners are given the autonomy to make decisions about their learning and are supported in reflecting on their progress, they become more independent learners who can adjust to new academic environments with confidence (Evans & Boucher, 2015).

While autonomy and a learner-centred approach are important in transition processes, challenges arise due to inherent power imbalances in educational settings. It is important to keep in mind that young learners may not always have the authority to make decisions about their learning, as policies, school expectations, and curriculum standards often dictate certain aspects of their educational experience. Additionally, some decisions—particularly those involving transitions or support needs—are made by teachers, administrators, or parents who may feel they are acting in the young learner's best interest. This dynamic can limit young learners' agency, requiring educators to be mindful of these

constraints and strive to create opportunities for genuine choice and involvement within the structure of their roles.

Finally, this approach creates a sense of belonging and community within the school, which is crucial for successful transitions. Young learners who feel supported and connected to their peers and teachers are more likely to adapt positively to new environments. Research indicates that schools that emphasise student participation and a learner-centredapproach see lower dropout rates and improved social-emotional outcomes for young learners during transitions(Crosnoe, 2011). A learner-centred approach that promotes active student participation is essential in managing horizontal transitions in the educational system. By tailoring education to individual student needs and involving young learners in decision-making, schools can create a supportive environment that fosters academic success and emotional well-being. Encouraging student participation through peer collaboration, mentorship, and reflection activities helps young learners develop the skills needed to adapt to new environments and remain engaged in their education. Ultimately, this approach supports young learners in navigating the challenges of horizontal transitions with greater confidence and resilience.

Developing an educational network

A network facilitating information sharing among teachers, support staff, families, and young learners involved with a transfer student is essential for a smooth horizontal transition. This network can communicate and share details about the young learner's achievements, learning progress, and friendships.

Communication and coordination between schools are particularly important in the case of children with SEN, as different schools are likely to offer different resources and support. Effective liaison and coordination between schools and local authorities are vital, given the diverse policies on inclusive education, support, and funding across countries, local authorities, and schools.

In the London Borough of Newham, England, the SEN team facilitates a smooth transition by attending transfer reviews for young learners with EHC (Education, Health and Care) plans in the summer term prior to the young learner's admission. They meet with pupils with SEN and coordinate appropriate provision when a child with SEN changes schools (Little Ilford School, 2022). Student profiles are devised for all young learners on the SEN Register; these profiles are issued to teachers and teaching assistants so that they are aware of the needs of these young learners (ibid). Appropriate information sharing and coordination through such networks can support seamless horizontal transitions for pupils.

In some US schools, transition coordinators have been introduced to prepare young learners with disabilities for life after school. They have valuable resources and support smooth transitions for young learners with disabilities by linking them to resources within

and outside the community and school (Scheef and Mahfouz, 2020). In this way, the coordinators support smooth transitions between schools and from school to community.

Training programs for teachers, support staff and young learners

To develop a support system for transfer students, a training program is needed for all teachers, support staff, and volunteers. This program creates an understanding of the psychological challenges associated with transitioning to a new environment and the various barriers that such a transition presents. In these training programs, teachers and support staff should participate in role-playing and reflection exercises that focus on two key areas: (i) the challenges a young learner might face when changing schools, and, (ii) how they would want to be treated by teachers, peers, and support staff if they were in a similar situation.

In addition to understanding these difficulties, teachers and staff should explore the human and material resources available within the school and community that can support transfer young learners in precarious situations. They should contemplate specific support strategies such as individualised learning support, utilising local networks, offering pre-school during long holidays, and other concrete measures. Through such training, teachers and support staff can gain insights into facilitating a smooth 'horizontal transition' for each young learner, effectively utilising available resources in the school and community.

The Spanish government's National Institute of Educational Technologies and Teacher Training also places a particular emphasis on inclusive education, student diversity and intercultural education with the provision of professional learning programs for teachers (Brown et al, 2022). These programs focus on raising teachers' awareness of young learners' academic as well as social and emotional needs (ibid).

Such a training program could also be useful for children to prevent bullying of transfer students. In some cases, organising training or workshops for children to reflect on the difficulties faced by transitioning pupils can be beneficial. Through such opportunities, children can gain empathy for learners with different needs, foster positive friendships, and value their unique backgrounds and roots.

Conclusion

In conclusion, horizontal transitions in education are complex and require a coordinated approach to ensure young learners' academic, social, and emotional well-being. The case from southern Italy at the beginning of the chapter demonstrates the importance of building a collaborative network involving teachers, families, health professionals, and community organisations. This network successfully tailored a support system that improved the young learner's behaviour, reduced family stress, and maintained social connections. Schlossberg's transition theory highlights that resources such as coping strategies, support networks, and personal attributes play a key role in determining whether a transition is

positive or negative. Vulnerable young learners, including those with disabilities or displaced due to migration, are especially in need of personalised interventions to prevent disruption to their development and identity. Peer and teacher relationships are crucial, as they provide stability and a sense of belonging. Involving families and communities further strengthens the support system, ensuring a holistic approach to transitions. Open communication between stakeholders is essential to managing expectations and addressing challenges proactively, while professional development equips educators to better understand and support young learners through these changes. Ultimately, successful horizontal transitions are driven by a student-centred approach that recognizes individual needs and creates flexibility, emotional support, and inclusive environments. By engaging all stakeholders, schools can help young learners navigate transitions with confidence, resilience, and continuity in their personal and academic growth.

Closing questions to discuss or tasks

1. In what ways can peer support and teacher relationships reduce the stress of horizontal transitions, and what strategies can schools implement to cultivate these supportive relationships?
2. What factors should be considered when designing personalised educational plans during horizontal transitions, especially for young learners with complex needs or behavioural challenges?
3. How can educators and support staff ensure that vulnerable young learners—such as those with behavioural difficulties or special needs—receive personalised interventions during horizontal transitions without disrupting their development or sense of identity?
4. In the context of horizontal transitions, how can communication and collaboration between schools, families, and external organisations be improved to provide a

seamless and supportive experience for young learners, particularly those moving between different educational programs or systems?

About the authors

Christine Carstens

Chris Carstens, based in Bremerhaven, brings extensive experience in teaching English and German, alongside certification as a trauma educator with a specialization in supporting children and young adults facing social and emotional challenges.

Francesca Mara Santangelo

Francesca Mara Santangelo is a pedagogist with expertise in disability, marginality, and Behavioral Neuroscience. Her research focuses on Special Education and Inclusion. As a musician and teacher trainer, she also works on designing and implementing early educational interventions coordinating networks of schools, institutions, families, and various stakeholders. Her professional experience combines solid expertise with a continuous commitment to promoting inclusive education and fostering neuropsychological well-being starting with children.

Nariko Hashida

Nariko Hashida is a Japanese educational researcher at Chiba University. She specialised in social education and lifelong learning and worked as a social education officer in a community learning centre. Her doctoral thesis was a study of learning activities for the inclusion of people with disabilities, based on fieldwork in Japan and the UK. She is the author of the book "Learning Activities to Develop a Sense of Agency around Disability Issues" (Akashi Shoten, 2024, in Japanese).

NAVIGATING INCLUSIVE EDUCATIONAL TRANSITIONS FOR ALL

Example Case

"I started attending a local mainstream primary school at the age of 4 ½.

Prior to my first day at school, my parents had to challenge the Education Department in order for me to obtain a place at the local mainstream Primary. At this point it was the Education Department's belief that my disability would be disruptive for the rest of the class. However, this was not the case. I excelled academically and reached the same milestones as my non-disabled peers.

By the time I was ready to transition to secondary school, the opinion of the Education Department had completely changed. They had previously questioned whether I could achieve academically. Having proved that I could, the Education Department was keen for me to remain in mainstream education. However, due to access barriers at the local mainstream secondary school, I decided with the support of my parents to move to the Special Education school which at the time was the only school of its kind to follow the mainstream curriculum, and this was where I obtained my qualifications.

From here I was supported to attend mainstream college for one day a week to assist me in deciding whether I felt this was the next step for me. I decided that it was, and after returning to mainstream education I went on to obtain a Higher National Diploma in Media Studies, before progressing to university, graduating with my Bachelor of Arts Honours degree in the same discipline.

Despite challenges in finding employment, after graduating I successfully transitioned into employment with the role as a Research Assistant at the university where I studied. During this time, I was presented with the opportunity to return to education and study for my PhD. I chose to do this and completed this chapter of my life in 2015 when I graduated with my PhD. Since then, I have established my own business and now successfully use my lived experience of disability to provide a range of services for individuals and families living with disabilities, businesses and employers seeking to be fully inclusive.

On reflection, I have achieved what I have due to my self-determination and resilience. However, if I did have Person-Centred Planning support sooner that focused on my dreams and aspirations and what support I needed to achieve this, I feel strongly that my educational transitions to date would have been far smoother. However, with the knowledge I now have around this I feel that this will be the case for my future transitions."

Dr Danielle Farrel, Managing Director, Your Options Understood (Y.O.U.)

[1]

Initial questions

In this chapter you will find the answers to the following questions:

1. In this chapter, we are using the term "disabled" rather than "individual with a disability" in accordance with the perspective of the social model of disability, as discussed by Oliver (1990). The social model of disability underscores the importance of recognising that disability is not an inherent characteristic of an individual but is, instead, a result of social and environmental barriers and attitudes. In this context, the term "disabled" serves as a reflection of this perspective. By using "disabled," we aim to emphasise the impact of societal factors and structures in shaping the experiences of individuals with disabilities. We acknowledge that language is a complex and evolving aspect of discussions surrounding disability, and we respect the diverse perspectives within the disability community. It is essential to note that the choice of terminology can be a matter of personal preference and cultural sensitivity. We encourage ongoing dialogue and reflection on the language we use in discussions of disability, with the utmost respect for the autonomy and self-identification of individuals with disabilities. Teachers and educators involved in transitions should be taking permission from the young people and their family for appropriate use of terminology that they feel describes them accurately.

1. Transition process and laying the groundwork for meaningful engagement among the team, families, and children.

2. Initial Meetings a couple of months before the academic year and enrolment: Families may get familiar with the school through events such as familiarisation days and pre-enrolment. These activities are part of the initial meetings that help families understand and feel at ease in the school setting. During this time, families can also enrol in school.

3. First Group Meeting and individual meetings with the family the first days of the academic year: The first meeting allows families to come together as a group and strengthen their ties to the school. Families gain insight into their child's daily experiences at school, including activities and interactions, during this meeting. It provides an opportunity to address any concerns or questions that families may have. On the other hand, the first individual meeting between families and educators is crucial. This meeting establishes a climate for communication and collaboration while emphasising the significance of the transition. It addresses issues such as physical school environment setup, maintaining a respectful distance, understanding the child's space and activities, and sharing critical information.

4. Preparing for the First Days of School: Careful planning is required for the first days of school. Teachers and educators must make sure they have the resources that they need to meet the needs of both children and families. Exchanging information during drop-off and pick-up times, leaving notes, and making regular phone calls all contribute to creating a good and comfortable environment for both children and families.

5. Creating Individualised Connections: To ensure that everything goes smoothly and effectively, it is essential to establish a strong emotional connection between the child and their reference caregiver, which should be as solid as the connection they have with their mother or father but adapted for the school environment. In order to create a secure and supportive school experience, thorough attention must be given to the child and their family. This involves careful planning and organisation of spaces and materials that can assist us in providing what they need. It is crucial to select play materials that cater to the pupils' interests and needs, ensuring that they are well-engaged. Similarly, the physical space should be arranged in a way that allows for a small space to be allocated for families.

6. Respecting Developmental Stages: Recognising children's developmental stages is critical. Some pupils may still require their baby bottle, while others may have transitioned or never used a bottle. It is critical to recognise, respect, and incorporate these differences into the transition process.

7. Providing a variety of areas: It is preferable to provide more than one space, allowing children who do not wish to remain in the classroom to move outside. This can also be a great opportunity for new families to meet in a relaxed and cheerful atmosphere, as well as for pupils who prefer to stay inside the room to do so. Furthermore, a special area can be created

to make families feel at ease in school. Placing a sofa, for example, can allow families to take a break from activities while remaining close to their children. This way, during transitions, children can stay in a familiar spot, and families can rest assured that they will find their child in that familiar spot, bringing a sense of calm and spreading a positive influence on the school environment.

8.   Reflection and adaptation: The transition process is not a one-size-fits-all approach. It requires conviction to interpret how each child and their family feel about the school environment. Finding signs of comfort and security, showcasing initiatives, remaining open to change, and addressing fears and needs without judgement are all part of it. As a result, assessing the transition process should be qualitative rather than quantitative. Understanding how the process unfolds, embracing moments of stillness and progress, and allowing for flexibility and adaptation are all part of the process.

Introduction to Topic

Transition etymologically refers to a change from one state or context to another. One generic definition could be the following:"Transitions are key events and/or processes occurring at specific periods or turning points during the life course" (Vogler et al., 2008: 1).

Key aspects

Overall, as the authors argue, the transition to school is a complex process that involves building connections, understanding each child's uniqueness, and fostering emotional security. It is a journey that requires careful planning, ongoing communication, and a deep respect for the emotional well-being of both children and families.

On the other hand, the educational organisation Penn State Extension (2020), related to horizontal transitions, explained how the process of transitioning from one activity to another within the early childhood classroom setting can present difficulties. Many toddlers struggle to switch activities as some children can be frustrated when they have to leave something they are enjoying or feel they are almost done. Other children may be confused or worried by transitions. This is usually due to a lack of structure. Other children may not understand why they are being asked to do something else, view the situation as unfair, or be unsure of what to do next. Children handle uncertainty differently. When transitions are unexpected or unclear, they may have frustrated anger, increased anxiety, and this may affect their day.

In this regard, these are some of the strategies that they provide in order to smooth activity transitions and avoid unexpected changes:

- Make a schedule: It is easier to deal with expected transitions than unexpected ones. Explaining the day's plans and providing reminders about what comes next could be beneficial. As the development of each child will be unique, visual schedules will also be helpful.
- Stick to the schedule but build in transition times: Following your schedule will help children develop routines and expectations. However, flexibility is also necessary in order to respond to children appropriately.
- Let people know when to switch: To reduce schedule confusion and surprises, use verbal and non-verbal cues to indicate when to move to a different activity. Provide warnings, incorporate instruments to signal the next activity, incorporate transition songs and so on.
- Pairs transition: Planning partner activities or asking a child who transitions well to help another child get ready could be another strategy. This should be framed as supporting rather than as a punishment for the child that is struggling with the transition.
- Think positive: Transitions are challenging, especially for young children who might struggle to understand your expectations. Experiencing frustration during transitions makes it more difficult for your children. Children often mirror your emotions. During transitions, children will pick up on your composure and appropriate behaviour and attitudes.

From early childhood to primary school

The Transition: A Positive Start to School Resource Kit (DET, 2017) was designed by the Victorian Educational department to provide current, research-based, and practical advice. This guidance is intended for early childhood professionals who work with children and families during the critical school transition period. This Kit comprises of six sections. The first section offers an overview of the significance of a positive transition to school, covering transition contexts and effective practices. Sections 2 through to 5 detail vital elements of successful transition strategies, such as fostering relationships, addressing equity and diversity, ensuring learning continuity, and planning for transitions. The final section, Section 6, outlines practical tools for supporting effective transitions, including the Transition Learning and Development Statement, alongside various assessment, and planning methods. These are some of the strategies that are provided for smooth school transitions:

- Foster respectful, trusting, and helpful relationships with children and their families.
- Establish mutually beneficial connections that actively encourage the exchange of pertinent information and its value.
- Create professional roles and collaborations that promote ongoing reflective practice.
- Recognise the agency of children and their role in transitions.

- Respect the cultural histories and heritage of all individuals involved in the transition process.
- Recognise the assets and abilities of all participants in transitions by setting high expectations and committing to fairness.
- Utilise approaches that are adaptable and flexible to the diverse family contexts within local communities.
- Provide appropriate and ongoing support to educators, teachers, children, and families.

In terms of relationships, Dockett and Perry (2005) participated in a special project, called 'buddy programs', in two schools in Sydney, Australia. 25 students studying to become teachers and 130 children in Year 5 took part. These programmes pair older students who are familiar with the school with new students who are just starting. It helps new students adjust and lets older students show they care about their school. They all attended special training days to develop communication skills, reflection, and community building skills. Through interviews, the researchers find out what concerns the new kids had and how they could help. These provided the basis for the development of 'training' experiences by the teacher education students and also the evaluation of the program.

Following with the same authors, they developed an instrument over a 20-year period, and it has been utilised in multiple ways in both research and practise in a number of regions. The Peridot Education Transition Reflection Instrument serves as an instrument for documenting and leveraging the findings of a school program evaluation, facilitating reflection on existing programs and the formulation of future ones (Dockett & Perry, 2022: 177-180). It relies on the four components outlined in the position statement: opportunities, aspirations, expectations, and entitlements. Each position statement comprises four tables illustrating four levels of achievement for each of the four key stakeholders: children, families, educators, and communities. This set of tables empowers partners to make informed assessments based on evidence for each of the constructs (see table 1, 2, 3, and 4 in appendix).

From primary to secondary education

An English research project explored the practice of a Transition Club with a sample of 38 students (Humphrey & Ainscow, 2006). It was a pilot project for a group of students who had underachieved in maths and literacy at the end of primary school. Data was collected through participant observations, questionnaires, and a focus group interview. Transition Club took place over a six-week period towards the end of the summer term (at the end of the last year of primary school). In each week students spent 3 days at the secondary school and 2 days at their primary school. This exploratory project was successful in providing students with a sense of belonging, helping them to understand the secondary school structure, and making learning fun. This practice revealed interesting

results highlighting what vulnerable student groups are concerned about. The study showed that new expressions of inclusive practice typically emerge in a collaborative situation rather than working alone. Furthermore, innovative educational practices can help in facilitating students' social and psychological adjustment to the new school with a sense of belonging, orientation, and enjoyment.

The 'STARS' research study, conducted at UCL and Cardiff University, aimed to understand how to facilitate a successful transition for children from primary to secondary school. Over the course of the study, approximately 2000 pupils from South-East England, UK were tracked during this transition. Information from pupils, parents, and teachers was collected to assess well-being, academic progress, and their experiences with school and relationships. The study established two key aspects of a successful transition: academic and behavioural engagement in school, and a sense of belonging. These were measured using the 'START' questionnaire completed by primary school teachers. Most children had initial concerns about moving to secondary school, which gradually lessened after starting. However, worries related to friendships, discipline, and homework took more time to subside. Friendships underwent significant changes during the transition. Parents were found to have insight into their children's transitional needs. Vulnerability to a poor transition was not linked to a single group of children; rather, various risk and protective factors influenced the outcome. Therefore, an effective approach to support pupils during transition might involve general strategies to address common concerns, with additional, personalised strategies for vulnerable individuals based on their specific needs. Primary and secondary schools employed different strategies to support children during the transition. Systemic strategies, like building connections between the two school levels, were effective at reducing school anxiety. Several secondary school practices promoted academic progress in Year 7. These strategies were well-received by teachers, suggesting their high acceptability. Furthermore, secondary schools implemented various practices to aid pupils in forming friendships, as this remained a persistent concern. The questionnaires, resources and the report of the research can be seen here.

From secondary education to further and higher education

In Spain, the Red SAPDU (2020) highlights a concerning trend where many students with SEN do not progress to higher education beyond compulsory schooling. Limited statistical data availability makes it challenging to compare various SEN student groups between non-university and university settings. Recent data indicates a significant drop in SEN students transitioning to university compared to those who enter high school, potentially due to the demanding educational journey they face. This gap emphasises the need for a transition guide to facilitate higher education access for SEN students. The Red SAPDU (2020) created a practical guide to aid departments, support teams, university services, and

various stakeholders in enhancing SEN students' access to higher education. The guide serves as a dynamic tool and should be regularly updated within the SAPDU Network.

The guide encompasses the following aspects:

- Support Structures in Universities: Nine out of ten services offer personalised guidance to SEN students, bridging communication gaps between students and faculty. They uphold legal rights, advise on best practices, and suggest improvements. Disability-specific recommendation guides are also available.

- SAPDU Network: Created in 2009, this network unites technical staff from disability support services in around 60 Spanish universities. It operates under Crue-Asuntos Estudiantiles, a sectoral commission of Spanish Universities. Working groups focus on topics like curricular adaptations, employment, mobility, communication, and ICT. The network fosters information exchange, best practices sharing, and collective decision-making.

- Transition, Access, and Welcome (TAA) Model: This model ensures smooth NEAE student transition to university. It involves support programs from pre-exam phase to successful university integration. Key elements include vocational pathway guidance, collaboration between support services and secondary schools, stakeholder involvement, and collaborative adaptation implementation during university entrance exams.

- University Entrance Exams: Adaptations for SEN students during entrance exams are determined with input from educational guidance departments and education administrations. These adaptations build on previous curriculum adjustments, ensuring fairness and accessibility.

- Welcome Process at the University: Before the start of the academic year, accommodations are made for physical accessibility and communication. Personal support, resource acquisition, academic support requests, and more are addressed.

- Support Services in the University: These services provide information, guidance, and advice on rights and resources. They collaborate with exam committees and process support requests. They offer advice on curriculum and assessment adaptations, provide individual tutoring, and promote inclusion through activities and awareness initiatives.

- Non-academic Tutoring Action Plan: Tutors offer support and guidance for the holistic development of students. They provide information, monitor academic progress, offer solutions, and facilitate transitions.

- Technical and Material Resources for Accessibility: These resources include an assistive products bank, virtual platforms, universal accessibility tools, and communication tools to ensure equitable education.

- Scholarships and Grants: Financial assistance is available for SEN students to facilitate their higher education journey.

- National and International Mobility: Universities offer resources for mobility, enhancing students' educational experience.
- Internship and Employability: Efforts are made to provide SEN students with opportunities for internships and enhance their employability prospects.

Involving family and ensuring effective coordination between administrative structures and services are essential for SEN student success. Overall, the guide aims to empower SEN students in their journey toward higher education, offering a roadmap for inclusivity and accessibility.

From secondary school and university to the employment sector

As the OECD (2022) states, the transition from education to the workforce is influenced by various factors, including the duration and quality of schooling, labour market conditions, economic environments, and cultural contexts. While some countries adhere to a traditional sequence where individuals complete their education before seeking employment, others have concurrent systems where education and employment occur simultaneously. Gender disparities in this transition are evident across different nations, with significant proportions of young women facing challenges in entering the labour force.

During periods of unfavourable labour market conditions, such as high unemployment rates, there is often an incentive for young people to prolong their education to acquire additional skills. This extended investment in education can serve as a strategic response to unemployment, contributing to future economic growth by aligning individuals with the skills demanded by the labour market. Moreover, providing support to employers through incentives to hire young people can facilitate smoother transitions from education to employment.

The absence of employment can have enduring consequences, particularly for individuals experiencing prolonged periods of unemployment or inactivity, leading to discouragement. Notably, young people not in employment, education, or training are a significant policy concern due to the negative impact on their labour market prospects and long-term social outcomes. For this reason, it is considered important to identify social and economic inequalities that sometimes are overlooked. Some of the policies or incentives that are carried out prioritise the need of employers over the well-being of the workers. Advocating for policies that prioritise equitable access to education and employment opportunities may address structural barriers. By embracing a more inclusive and socially conscious approach, we can create a fairer and more resilient economy that benefits everyone, not just some privileged ones.

An example of creating inclusive social economy business, as it is stated in GUREAK (2024): "GUREAK is a Basque group of companies which generate and manage steady work opportunities, suitably adapted, for persons with disabilities, with priority for people with intellectual disability in Gipuzkoa. It is a diversified group, mainly active in the industry,

services, and marketing domains". Throughout their commitment to social responsibility and inclusive practices, they strive to make a positive impact on both the economy and society.

→ *From mainstream school to special settings and vice versa*

Parents and educators should consider several parameters when planning such transitions, including:

● Individualised support to the specific needs and abilities of the child. This support might involve specialised teaching methods, individual education plans, emotional support, such as therapy, or counselling.

● Open, consistent, and constructive communication between parents, teachers, and the child is crucial. Regular meetings and updates can help address concerns and adapt the transition plan as needed with support from a transition support team.

Strategies should be in place to facilitate the child's social interactions. This may involve:

● peer support
● social skills training
● extracurricular activities.

Modifications and reasonable adjustments (Equality Act, 2010) may be necessary in mainstream or specialised settings to ensure that the curriculum is appropriate and aligned with the child's abilities and learning style.

The research that is currently being presented is situated within the research project 'Promoting a Culture of Participation in order to make both the Community and School for all.' It was carried out by the Zehar and Hazitegi research groups from Mondragon Unibertsitatea between the years 2020 and 2022. The aim was to encourage everyone in the centre to get involved and collaborate as a community. This also involved empowering children and young people to participate more actively in making decisions about the future and the community, creating a stronger sense of togetherness, and ensuring that nobody was feeling excluded. To help students move smoothly from one school level to another (from Infant Education to Primary Education; from Primary Education to Secondary education and between the three cycles of Primary Education), we looked closely at these transitions. We did this by talking to students (through participatory and engaging techniques), families (through questionnaires), and teachers (through semi-structured interviews), to understand what problems they face and how things can be made better. It was discovered that making an action plan for these changes could help reduce worries, adjust expectations, improve relationships between new students and teachers, give helpful guidance and information for families, and ensure good coordination throughout phases. Voluntary teachers, families, and researchers created a transition plan considering all children, family, and teachers' ideas. After the plan was put into action, the evaluation was

made again asking all children, their parents and their teachers about the actions that were carried out, their experiences, suggestions, and areas that needed improvement.

On the other hand, the Armenian study report (Bridge of Hope, 2015) examines the country's educational transition difficulties and potential practices from the viewpoints of teachers, parents, children and young people, specialised personnel, and other important stakeholders. It examines learners as they go from kindergarten through primary school, then to secondary and higher/vocational school, as well as additional learning options and jobs. It emphasised the crucial support needed for children, particularly those with disabilities and suggested strategies like:

● Appointing transition staff or 'liaison workers' in both the 'old' and 'new' schools to facilitate information exchange and ease the transition process.

● Identifying emotional, behavioural, developmental, or academic challenges by existing staff and conveying this information through an Individual Education Plan (IEP) or relevant documents.

● Completing and sharing IEPs before the transition.

● Organising meetings between upcoming students with disabilities, their guardians, and teachers who will be involved, potentially including home visits.

● Recommending trial/transition days for students to visit the new school, along with friends and family, for getting acquainted with the environment. Acknowledging the necessity for staff training, especially when the new school's staff requires support for specific identified issues.

Although various strategies and examples are provided for different and specific transition stages, given that transitions are continuous and are an ongoing process, it is believed that all strategies can be applied to each of the transitions, tailoring them to each specific one.

General approaches to facilitate educational transitions

It is important to explore various approaches that support transitions for children and young people across different age groups and stages. Bridging programs can be valuable in assisting students, young learners, and individuals as they navigate significant milestones in their educational journey or broader life experiences. However, when considering these programs and approaches, it is crucial to acknowledge and address the systemic barriers that may impede successful transitions, particularly for those at risk of marginalisation.

When examining individuals in transition, such as young children transitioning from early years to primary education or from home to early years settings, it is essential to adopt a holistic perspective. This entails considering socio-emotional interventions, academic support, effective utilisation of community resources, and multidisciplinary collaboration (Fabian & Dunlop, 2007; Pianta, Cox & Snow, 2007). For example, when working with

individuals, it is vital for teachers and educators to establish meaningful connections with relevant stakeholders, ask pertinent questions, and ensure the inclusion of diverse voices.

The concept of "voice" is particularly significant, recognising that very young children may not express themselves in conventional ways, but their needs are valid and must be attended to. Involving families and being mindful of linguistic, social, cultural, and heritage factors is crucial in promoting inclusive practices that involve co-production. Furthermore, in contexts where individuals may experience oppression or marginalisation, employing a relational pedagogy approach is vital (Doane, Hartrick-Doane & Varcoe, 2020; Woodrow & Staples, 2019). This involves equipping teachers and educators with the necessary tools to establish meaningful relationships, which in turn facilitate active listening, genuine co-production, and purposeful planning. These are inclusive practices that empower individuals who may otherwise be marginalised or oppressed.

Student and family voice

Understanding that participation is a key element in terms of inclusion, it is essential to place the voices of children and their families at the centre of the school community. Especially, during transition processes, listening, understanding, and taking into account their experiences, perspectives and identified improvement aspects will be crucial in order to design appropriate contexts for them.

Children and young people are active participants in their educational journeys. By incorporating the child's voice and perspective, the transition process becomes more child-centred. A method that acknowledges that children have unique and diverse ways of expressing their perspectives and experiences is the Mosaic approach. It is aptly described as "a mosaic- an image made up of many small pieces, which need to be brought together in order to make sense of the whole." Essentially, the Mosaic approach provides young children with various avenues to express their viewpoints, allowing them to communicate their thoughts using what has been aptly referred to as their "hundred languages" (Clark & Moss, 2005).

This approach aligns seamlessly with the concept of a "pedagogy of listening." A pedagogy of listening emphasises the importance of actively listening to children's thoughts and perspectives. It treats knowledge as something that is constructed, and provisional. In other words, it recognises that knowledge is not merely the transmission of a fixed body of information from adults to children but rather a dynamic and context-dependent process (Paliokosta and Kindness, 2011).

A key aspect of this pedagogy of listening is that it respects the individuality and uniqueness of each child's perspective. It does not seek to make all children the same or impose a uniform set of ideas. Instead, it recognises the diversity of experiences and viewpoints that children bring to the table. It is a way of understanding and valuing the individual voices and perspectives of children, acknowledging that these voices contribute

to the rich tapestry of experiences and knowledge. This approach not only ensures that the child's views are considered but also empowers the child to take an active role in their own transition (Dahlberg & Moss, 2005). The use of the Mosaic approach (Clark & Moss, 2005; Dahlberg & Moss, 2005) and a pedagogy of listening can significantly enhance effective educational transitions for children, young people and their families in the following ways:

● Understanding Individual Needs (Ade, A. R., and Da Ros-Voseles, 2010): The Mosaic approach, with its emphasis on valuing each child's unique perspective, allows educators and professionals to gain a deeper understanding of the individual needs, preferences, and strengths of each child. This insight is invaluable during transitions because it helps them tailor the transition process to the specific requirements of each child.

● Emphasising Continuity: Effective transitions often involve creating a sense of continuity and familiarity for children as they move from one setting to another. The pedagogy of listening ensures that the child's voice is heard and respected throughout the transition process. This continuity can reduce anxiety and provide a sense of security during the transition.

● Reducing Anxiety and Resistance: By actively involving children and their families in the transition process, potential anxiety and resistance associated with change can be reduced. When children feel that their voices are heard and their concerns are addressed, they are more likely to approach transitions with a positive and open mindset.

● Building Positive Relationships: Effective transitions are often facilitated by strong relationships between educators, professionals, and families. The pedagogy of listening promotes open and respectful communication. It encourages them to listen to parents' and children's concerns, ideas, and expectations. This collaborative approach builds trust and fosters positive relationships, which are essential for successful transitions (Clark & Moss, 2005).

● Supporting Special Needs and Disabilities: For children with special educational needs or disabilities, understanding their unique perspectives and needs is even more critical during transitions. The Mosaic approach allows educators to create targeted and individualised plans for such children, ensuring that they receive the necessary support and accommodations as they move into new educational settings.

● Ensuring Smooth Information Flow: The pedagogy of listening encourages a culture of open communication and information sharing among all stakeholders. This is crucial during transitions because it ensures that relevant information about the child's needs, preferences, and progress is effectively transferred between settings, preventing disruptions in the child's education.

The term student voice that is used above can also be illustrated through Hart´s (1992) ladder of participation that illustrates the different ways in which children and young people can participate.

Figure 1: Ladder of Participation

Degrees of Participation

Non-participation

8.
Child-initiated,
shared decisions
with adults

Children have the ideas, set up the project, and invite adults to join with them in making decisions.

Children have the initial idea and decide how the project is to be carried out. Adults are available but do not take charge.

7.
Child-initiated
and direcled

6.
Adult-initiated,
shared decisions
with children

Adults have the initial idea but children are involved in every step of the planning and implementation. Not only are their views considered, but they are also involved in taking the decisions.

The project is designed and run by adults but children are consulted. They have a full understanding of the process and their opinions are taken seriously.

5.
Consulted and
informed

4.
Assigned but
informed

Adults decide on the project and children volunteer for it. The children understand the project, and know who decided they should be involved and why. Adults respect their views.

Children are asked to say what they think about an issue but have little or no choice about the way they express those views or the scope of the ideas they can express.

3.
Tokenism

2.
Decoration

Children take part in an event, e.g. by singing, dancing or wearing T-shirts with logos on, but they do not really understand the issues.

Children do or say what adults suggest they do, but have no real understanding of the issues, OR children are asked what they think, adults use some of their ideas but do not tell them what influence they have had on the final decision.

1. Manipulation

Source: Hart (1992)

This view and participation can be ensured verbally and non-verbally as it recognises that not all individuals may express themselves in conventional ways. Nevertheless, all needs are valid and must be attended to. Various methods, such as visual representations in Social Stories (Gray & Garand, 1993) or alternative and augmentative means of communication for transition plans, can be used to understand and incorporate individuals' needs, desires, and aspirations during transitions. Moreover, to ensure the participation of both primary and secondary students in academic and social experiences, various participatory techniques are illustrated by Messiou (2012). These techniques can be effective in encouraging conversation with children.

The importance of acknowledging the student voice has been supported by practitioners, academics, and policy documents. Moreover, over the last decades it has gained attention due to the UN convention on the rights of Children (1989). The convention is the basis of the most complete statement of children's rights ever produced and is the most widely ratified international human rights treaty in history. As it is highlighted in this convention, every child has rights "without discrimination of any kind, irrespective of the child's or his or her parent's or legal guardian's race, colour, sex, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status" (Article 2). All this work reinforces the rights of children to be heard and taken into account through Articles 12 and 13, which is a fundamental part of a child's transition journey.

Addressing transition challenges requires deploying strategies that consider the intersecting nature of various factors. Parental involvement also emerges as a key element in many interventions and should be integrated as an integral part of the process. Although international terminology may differ, the underlying principle remains the same: valuing the voices of individuals, embracing involvement, and promoting meaningful co-production, even for those who may be nonverbal (Egert et al., 2020). Involving families and being mindful of linguistic, social, cultural, and heritage factors is crucial in promoting inclusive practices that involve co-production.

- **Person-Centred Planning (Link)**

For all young people the transition from childhood to adulthood involves consolidating identity, becoming more independent, establishing adult relationships, and living a fulfilled life which may include employment, further education, or any other aspiration that an individual may have. However, for young disabled people and their families, transition can often become more challenging, as a result of disability, than for others.

Person-Centred Planning is a process of "continual listening, and learning, focussed on the person." Planning can support educational transition. For example, as a result of this process of removing barriers, focusing first on the dream and working back from a positive and possible future a Person-Centred Plan can help. Although there are different types of Person-Centred Planning a path is the most commonly used method when working with young people. A Person-Centred Planning path is a way of mapping out the actions required

along the way. It is also very good for refocusing an existing team who perhaps support a young disabled person or a young person from another marginalised group who are encountering problems or feeling stuck, and mapping out a change in direction. With this in mind O'Brien (1998) describes the Person-Centred path process as one that "celebrates, relies on, and finds its sober hope in people's interdependence" (O'Brien, 1998: 10). O'Brien continues by stating that "at its core, it is a vehicle for people to make worthwhile, and sometimes life changing, promises to one another" (O'Brien, 1998: 10).

It may be the case that an individual's Person-Centred Planning journey highlights that they may not be able to achieve every part of their dream. However, even if this is the case, the Person-Centred Planning process explores ways in which the individual's dream can be broken down to identify which aspects can be achieved.

An example which is often given in Person-Centred Planning training is if a young person had the aspiration of becoming an Airline Pilot. If this is not a realistic dream that can be achieved, then the Person-Centred Planning process can help to explore what it is about being a pilot that appeals to the young person. In exploring this further it might highlight that the person potentially associates the idea of being a pilot with wearing a uniform and helping people. Therefore, a positive outcome for the young person might not end up with them becoming a pilot but instead still working in the airport in a role that requires them to wear a uniform and to help people.

Person-Centred Planning also allows for questions to be asked in different ways, for example, "what is important to you and for you?" are often asked as the one question, when in reality they are two very different questions. Person-Centred Planning tools developed by Helen Sanderson can also be used to aid this process such as one-page profiles. These tools assist in gathering different perceptions of the individuals (Sanderson, 2023).

- • – **Self-determination in Person-Centred Planning (Link)**

Self-determination in Person-Centred Planning regularly goes hand-in-hand as often when an individual begins the Person-Centred Planning journey it becomes apparent that they have lost their identity and with it their self-determination. This could be due to external factors such as, but not exclusive to, a negative experience in education or negative interactions with their peers (Legault, 2017)

The Self-Determination theory (SDT) is "a broad theory of human personality and motivation concerned with how the individual interacts with and depends on the social environment" (Legault, 2017: 1). It is thought of as a metatheory in the sense that it is made up of several "mini-theories" which fuse together to offer a comprehensive understanding of human motivation and functioning. SDT is based on the fundamental humanistic assumption that individuals naturally and actively orient themselves toward growth and self-organisation. In other words, people strive to expand and understand themselves by

integrating new experiences; by cultivating their needs, desires, and interests; and by connecting with others and the outside world (Legault, 2017).

However, SDT also asserts that this natural growth tendency should not be assumed, and that people can become controlled, fragmented, and alienated if their basic psychological needs for autonomy, competence, and relatedness are undermined by a deficient social environment (Legault, 2017). Considering this theory, self-determination works on the basis of individuals being continuously involved in social interaction that gives them purpose and is part of them leading a fulfilled life.

Relating this notion back to Person-Centred Planning and educational transitions, it could be argued that one of the reasons Person-Centred Planning exists is because the reality is that individuals from marginalised groups are often not involved with continuous social interaction and being connected with others in the outside world. The reality is that for a lot of people who are regarded to be in marginalised groups of society, Person-Centred Planning aims to change that by removing the barriers that being marginalised often brings, enabling the person to dream big and as a result of doing so often this means that the individual slowly gains their self-determination back. By doing so Person-Centred Planning can help individuals aspire to be all they can be. This in turn should be apparent in their educational transition.

There are various tools that can be used prior and in the early stages of Person-Centred Planning. These various tools are aimed at enabling the individual at the heart of the plan and those closest to them to think differently about their dreams and aspirations, who they have around them, how they build on that, what needs to change and many other factors. One of the tools that is often used to support an individual in thinking about who they have around to support them is a Circle of Support (see Figure 1). This tool enables people to start making connections and perhaps realise what connections they already have but had perhaps overlooked. Connections are important for everyone regardless of ability. One viewpoint of this importance is "When we seek for connection, we restore the world to wholeness. Our seemingly separate lives become meaningful."

- What does transition mean?
- What are the key aspects of successful transitions?
- How and why do educational transitions impact all aspects of our lives?
- Why are educational transitions important in order to address inclusion?
- Are there particular groups at risk of ineffective transitions?
- What are the barriers to successful educational transitions?
- How can school structures and practical activities tackle systemic inequalities?
- Are there theories that can explain the barriers to successful educational transitions?
- What might be some factors that would support teachers and educators in not being overwhelmed by this process?
- How does Person-Centred Planning, self-determination, and co-production relate to

school transition?
- What are practical ways to support effective educational transitions?

"Transitions are generally linked to changes in a person's appearance, activity, status, roles and relationships, as well as associated changes in the use of physical and social space, and/or changing contact with cultural beliefs, discourses and practices, especially where these are linked to changes of setting and in some cases dominant language. They often involve significant psychosocial and cultural adjustments with cognitive, social and emotional dimensions, depending on the nature and causes of the transition, the vulnerability or resilience of those affected and the degrees of change and continuity of experiences involved" (Vogler et al., 2008: 1).

Considering this definition as a starting point, it is acknowledged that transition processes have been studied in various disciplines, namely, anthropology, psychology, sociology, and education.

Nevertheless, in education, many authors have analysed educational transitions from different perspectives. Transition concepts are frequently used in specific ways, such as in terms of vertical and horizontal 'passages' (Kagan & Neuman, 1998). Vertical transitions refer to significant changes from one state or status to another and are frequently associated with 'upward' shifts such as from kindergarten to primary school, from primary to secondary and even, from one grade to another one. Horizontal transitions are less visible than vertical transitions and occur frequently. They refer to the everyday moves that children (or any person) make between different parts of their lives, such as going from home to school or from one care setting to another. These influence children's movement across space and time, as well as their entry and exit from institutions that affect their well-being (Vogler et al., 2008).

There was a time when it was thought that the child had to be ready to make the transition. This meant they had to gain some knowledge and skills before moving to the next level of education. The characteristics of child readiness were introduced by Piaget's theory of development (1936). Levels of cognitive development, maturity, and growth were used to determine what the child had learned. Later, research revealed that a kid's abilities were greatly underestimated, as they were not measured in different ways. This weakened his hypothesis in several ways. However, numerous teachers and educators still employ his idea to acquire a greater understanding of their students' cognition. This understanding of **child readiness** can be experienced as a barrier to ensuring successful transitions from an inclusive perspective, as each child and individual will have a unique developmental and learning process. Indeed, the context, which can be adjusted to better accommodate all children and situations, underscores the importance of discussing school and community readiness (Dockett & Perry, 2022).

Without change, there is no need for transition. This is why, during the transition processes, external and internal changes are experienced (Dockett & Perry, 2014). External

refers to context-related changes. These may be new people, peers and teachers, new ways of interacting, the types of activities they are engaged in and new physical surroundings. Nevertheless, these contextual changes also bring internal changes that refer to new roles, responsibilities, and identities to the individual that is experiencing the transition. Major life events can cause us to reconsider who we are and where we fit in the world. In this regard, transitions may be seen as an opportunity for growth, to build new relationships, develop skills and not as something negative. However, appropriate and supportive contexts must be created to enable such opportunities. They can be interesting processes for personal growth, building new relationships and developing skills, but as it was mentioned before, it will be crucial to build appropriate context and provide support to ensure positive transition experiences, as negative ones, can have a negative impact on social, emotional, and academic spheres.

In this regard, the terms continuity and discontinuity are key concepts in relation to change and transition. Continuity has become a major focus for transition policy, with calls to promote continuity and reduce discontinuity, advocate for strategies that encourage children's learning to continue, promoting lessons and experiences that build on what has come before (Dockett & Perry, 2022) and to avoid a dip in academic attainment (Jindal-Snape & Cantali, 2019).

Even if transitions can be understood as an ongoing process throughout our lives this chapter will focus on the vertical transitions as we have considered that these are key in every individual academic career. The importance of the horizontal transitions in each of them, although not specified, is recognised, and will be addressed in more detail in a separate chapter.

Description of a structural disadvantage

In the education system, a risk of exclusion is directly related to the transition from one academic year to another, because educational transitions represent a critical phase for many learners, especially for those who receive specific support, such as those with Special Educational Needs (SEN). Through the lens of inclusion, transitions represent sensitive phases in the school career in which more vulnerable groups of students seem to experience a higher risk of **marginalisation** (Humphrey & Ainscow, 2006), losing opportunities for participation and learning they experience in the passage from one school grade to the next.

By understanding that it is the context that creates these systemic barriers for learning and participation it is crucial to recognise they can lead to these unsuccessful transitions within the educational sector. Such barriers stem from inequalities in educational opportunities, such as limited access to inclusive classrooms depending on locality, lack of individualised support through education plans, and appropriate accommodations. International and local laws in various countries often mandate the provision of these

supports to ensure that individuals are included within their school environments and not just physically integrated (Lindsay, Wedell & Dockrell, 2020). These systemic factors significantly impact the smooth transition of individuals within educational settings, and it is important to address these factors understanding that every person has unique needs and approaches to learning. This necessitates a focus on equal opportunities and equity, prompting the need for changes and the development of provisions that enable individuals to access their entitlements.

For instance, a lack of appropriate curriculum and reasonable adjustments in primary schools can make the transition to secondary school challenging (Equality Act, 2010; 2014). Failure to identify and address individuals' needs, such as communication difficulties, early on can result in an unfulfilling educational experience and subsequent identification of emotional and behavioural difficulties during the transition to secondary education (Evangelou et al., 2003; Mandy et al., 2016). Limited support networks and lack of relationships with educators, families, other professionals and facilitators further compound these challenges (Coffey, 2013; McLeod, 2023). Thus, the establishment of multidisciplinary networks and support systems is essential in facilitating successful transitions. Teachers and educators cannot be expected to navigate these moments alone, as it is a systemic issue that requires sustainable practices to support both learners and stakeholders. In some contexts, access to expert input and use of technology is vital to ensure the creation of an inclusive learning experience. This involves enabling teachers and educators to implement augmentative support software, screen readers, and communication devices, promoting accessibility for children with diverse needs (Hersh, 2020). Additionally, equal distribution of services within geographical spaces and readiness of families to enter the educational system, including those from rural areas, must be taken into consideration. On the other hand, in some cases, the choice for the appropriate school placement is not always available. For example, some research data revealed that the way certain school systems operate undermine a variety of possibilities for young learners. For instance, the transition from lower to upper secondary school in Italy is connected with the first differentiation in different types of schools, some of them with a more academic-orientation and others with a more vocational orientation. The choice of the type of school at that stage can be a decisive moment in which more vulnerable groups experience marginalisation, in the sense that they enrol to a school which leads to underachievement or that reduces their expectation early on in their school career (Barban & White, 2011; Romito, 2014).

Discrimination, bias, and a lack of inclusive culture and understanding of diversity contribute to exclusionary practices and limit resource allocation. Unconscious biases, combined with limited resources, can lead to discriminatory practices that exclude individuals from meaningful educational experiences and transitions (Council for Disabled Children, 2015). It is important to challenge assumptions about learners' needs, the purpose of schooling and prior experiences to foster inclusivity. These considerations extend

beyond early years (Connolly & Gersch, 2016; Fontil et al., 2020) and primary education and apply to transitions from secondary education to higher education as mentioned above. Unconscious biases and inequalities related to financial status or opportunities continue to impact how decisions are made and how students' work is assessed, as well as decisions about their future.

For example, difficulties in transition can occur due to different backgrounds. An Italian study about immigrant children's transition to upper secondary school has shown that the final evaluations attributed by teachers to students at the end of lower secondary school were predictors of secondary school choice: the enrolment in gymnasium rather than in technical or vocational institute depended on the previous outcome (parental education level of education influenced the choice of school not of previous achievements). Immigrants had a significantly lower probability of enrolling in technical institutes and gymnasium compared with natives and second-generation students. Two possible explanations could be that 1) immigrants and their families had different ideas in terms of investing in education and 2) the choice of a type of upper secondary school was affected by poor and potentially biased counselling received by teachers during the last year of lower secondary school, who suggested the enrolment in a vocational or technical institute even if they had the same results as natives (Barban & White, 2011). Furthermore, another study conducted in two lower secondary schools in Milan has shown that teachers tend to suggest to the family with a low socio-cultural status a lower level for upper secondary school, justifying their reflections with the social background and students' life conditions. In the frequent cases where students' outcomes were not clearly located on one level, but between two levels, teachers' discussions focused on the cultural and economic resources of the families and not about peoples' skills (Romito, 2014). Some statistical data from Italian educational institutions clearly showed that pupils with lower results at lower secondary schools and disabled learners were over-represented in some types of job-oriented schools. For instance, data about disabled students showed a preference towards vocational institutes (6.9%) than technical institutes (2.3%) and gymnasium (1.4%). This means that the majority of them attend a vocational institute (47.2%), instead of a technical institute (32.7%) or a gymnasium (24.9%), even if at the end of the lower secondary school they can choose whatever type of upper secondary school (MI, 2020).

Campus readiness, including physical, emotional, and social accessibility, is crucial for individuals with intersectional needs who require accommodations and support to navigate the system. Higher education has a noticeable lack of representation for disabled students in this setting who tend to experience less favourable outcomes compared to their non-disabled peers. Disabled students are more prone to discontinuing their courses, and those who do complete their degrees often achieve lower academic results. For instance, in the 2016/17 academic year, a smaller percentage of disabled learners in the UK received a first or upper second-class degree compared to those without reported disabilities (Office for National Statistics: 2019). These disparities go beyond disability and to a wider area of

potentially marginalised groups; for example, the disparity in degree attainment between White UK-domiciled students and UK-domiciled ethnic minority (students at the first-degree level is commonly referred to as the 'ethnicity awarding gap.' This gap represents the difference in the percentage of White students receiving first or upper second-class degrees and the percentage of ethnic minority learners achieving degrees of the same calibre (UUK & NUS, 2019). Representation in learning experiences and curricula is vital for students to feel a sense of belonging and experience smoother transitions.

Employment transitions also pose challenges, as prospective employers may harbour negative judgments towards individuals who belong to marginalised groups (Bonaccio et al., 2022). Cultural and linguistic barriers further compound these challenges, particularly in diverse and turbulent times. These barriers can include ethnocentrism, stereotyping, psychological, language, geographical distance, and conflicting values. Bilingual learners' performance is influenced by their prior knowledge, and culturally sensitive questions should align with their familiarity with the subject matter. Culturally sensitive interaction and management strategies are crucial as cross-cultural transitions pose challenges, requiring individuals to learn new skills, resolve cultural tensions, and manage stress (Ward & Szabó, 2019). Children and their families from diverse backgrounds may face additional stressors, including normative and non-normative educational transitions, discrimination, financial vulnerability, and practical problems (Bradley, 2000; Hanassab, 2006; Lee & Rice, 2007; Li & Kaye, 1998; Lun et al., 2010; McGhie, 2017; Sawir et al., 2008; Sawir et al., 2012).

Considering these factors is essential throughout the educational journey, from early years to university and beyond.

We also need to think about when the transition journey should start. In Scotland there is often a debate around what age transition should be expected to begin, especially from secondary school.

Theoretical Frameworks and PPCT model (process, person, context, time)

Given the various systemic inequalities operating during transitions, teachers and educators may easily feel overwhelmed and think they have no control over external factors. These factors include government policies on inclusion or the treatment of underserved communities and populations at risk of marginalisation such as migrants, learners with diverse learning styles to give some examples. This could lead to disengagement and a belief that they cannot make a difference. Theoretical perspectives can help teachers and educators navigate this complexity, make sense of the factors involved, and maintain a sense of coherence. The process of educational transitions involves multiple theories and factors due to its complex nature.

In psychology, the ecological system (Bronfenbrenner, 1979) has been useful in understanding transitions and their significance for children. Children's development and learning are viewed in relation to factors and circumstances covering the micro to the

macro level in this model. This theory defines a transition as changes in activities, relationships, identities, and roles (Ballam et al., 2017). Bronfenbrenner stated that "an ecological transition occurs whenever a person's position in the ecological environment is altered as a result of a change in role, setting, or both" (1979: 26). This definition can be applied to educational transition as meaning that it describes the change experienced by individuals in the moment they enter or leave school or pass from one school grade into the next. It affects the learners' position in their ecological environment in the sense that by crossing social, academic, and procedural issues (Hargreaves, 1990) transition influences their psychological, social and intellectual wellbeing. In some cases, such transitions represent new possibilities, a time to grow academically, socially, and emotionally (Roeser, Eccles & Freedman-Doan, 1999). At the same time, the transition might be characterised by discontinuity in physical location, difficulties in relationships with teachers and alienation from peer groups (Ashton, 2008).

Whereas in sociology, one of the key concepts relating to transitions is considered Bourdieu's "social capital". The goal is to uncover the most deeply buried structures of different social worlds, as well as the mechanisms that tend to ensure either their reproduction or transformation over time (Bourdieu, 1973). Related to a bio-ecological framework, his work is particularly interesting in clarifying how events in the macro-system (societal and cultural norms that shape the development) and chrono-system (the role of the time affecting people's growth and change, including life and historical events) may impact individuals (O'Toole, 2014). This means that for example, some parents will have greater or less access to resources, opportunities, knowledge, and skills inside and outside their family to provide needed experiences to their children.

Bronfenbrenner's ecological systems theory (1979) is a prominent one emphasising on the influence of various systems and stages on individuals during transitions. This is in line with the previous realisation that barriers or indeed facilitators to inclusive transitions which are systemic and intersectional (Fontil et al., 2020). Social constructivist theory highlights the importance of understanding learners within their sociocultural context (Bourdieu, 1973), emphasising the role of cultural responsiveness in creating successful transitions (Vogler et al., 2008). Limited social interactions and collaboration opportunities can hinder learners' understanding and adjustment during transitions. Creating a supportive and collaborative classroom environment that encourages peer interactions and scaffolding (Morcom, 2016) can help mitigate this barrier.

When considering educational transitions, it is essential to acknowledge other diverse theories at play. For instance, trauma response theory could also be considered, especially when learners have experienced difficult or traumatic situations that impact their journey (Department for Levelling up, Housing and Communities, 2023). Taking these factors into account allows teachers and educators to create appropriate accommodations that support students effectively. Implementing trauma-informed practices, such as creating

safe and predictable environments and establishing trusting relationships, can support their adjustment and well-being during transitions.

Notwithstanding the above, in this chapter we are drawing heavily on Bronfenbrenner's ecological systems theory with cultural responsiveness theory. By understanding the multiple systems that shape a person's development, such as the microsystem (including individual needs and family), the mesosystem (interactions between different environments), the exosystem (indirect influences through discourses and language), and the macrosystem (cultural and societal influences), we can provide a comprehensive approach to educational transitions.

Cultural and social factors, including limited representation of students' cultural identities, can affect their sense of belonging and engagement. Culturally responsive teaching practices can address these factors and facilitate successful transitions.

By incorporating a sociocultural perspective and cultural responsiveness, we ensure that peoples' cultural backgrounds, experiences, and identities are valued and integrated into the transition process (Lam, 2014). Recognising the impact of various interventions and connecting the different systems through relational pedagogy fosters a supportive and inclusive environment for individuals during transitions and throughout their educational journey.

Some practical strategies and insights to navigate the complexities of educational transitions will be provided below to equip teachers and educators to better support learners in their transition experiences, fostering their holistic development and creating a positive and inclusive educational environment.

Particularly in the context of Bronfenbrenner's work, his framework on process, person, context, and time in facilitating positive transitions, is mostly found in his later work (Hayes, O'Toole & Halpenny, 2023). The most crucial aspect emphasised by Bronfenbrenner is the process, particularly the relationships involved. Strong relationships between stakeholders, students, and families are vital for successful transitions. The care, empathy, and understanding shown by adults towards children significantly impact their development. While various strategies and approaches exist, it is essential to remember that relationships underpin them all. Kindness and genuine concern for the well-being of learners creates a positive environment for successful transitions. Then, the person element recognises how factors like culture, disability, and socioeconomics can affect the transition experience (Aikens and Barbarin, 2008). For example, an autistic child starting in a new environment may find it particularly challenging (Stoner et al., 2007). Language differences between home and school can also complicate transitions. However, what is significant about Bronfenbrenner's work is that he does not solely attribute responsibility for support to the individual; it also lies within the context.

Considering the context is crucial. Building links between different systems, such as ensuring consistent support for an autistic child or embracing the linguistic and cultural diversity of students, can facilitate smoother transitions. It is important to create an

environment where individuals feel visible and represented, with resources and materials that reflect their identities and experiences. According to a key worker approach the same person should be meeting them at the door. Is this happening? Or in a primary setting, are linkages formed for the child who comes into an educational session with a different language than the one that is spoken and knows what to expect? Is this seen in a deficit way, that she does not speak English, for example, or is it seen in a far more culturally attuned way? Maybe the child does not speak English, but they do speak Russian and Romanian and other languages. Does the child see themselves when they come to the educational setting if they are visible? Are there dolls who look like them in the early childhood setting? Are there books in the primary setting or the secondary setting that talk about people who are like me and my family? Arguably, context is hugely important. Do we create linkages for people in their transition? Or do our structures erect disjuncture and difficulties for people to make those transitions?

Time is another factor to consider, and that can be your personal time, or it can be the more social historical piece. Personal time, such as a pupil's developmental stage, can influence the ease of transition. Younger children, for example, may find it harder to transition to primary school. Social-historical factors, such as the impact of the COVID-19 pandemic on education, also play a role. Recognising the timing and adapting accordingly can help mitigate difficulties.

Continuity in relationships and strategies is important across educational stages, from early years to primary, secondary, and higher education. Using data-informed materials and providing early tutor support can be beneficial, especially for marginalised groups. Establishing and nurturing relationships can help address oppression and cater to individual needs, as advocated by Paulo Freire (1993).

Lastly, recognising that children do not exist in isolation but within families, communities, and cultures is crucial. Educational settings need to value and prioritise these wider relationships. Inclusive strategies for building connections with families should focus on fostering positive encounters rather than relying on specific methods or tools, it is important to someone now, and for the future. "It is not simply a collection of new techniques for planning to replace individual Programme Planning" (van Dam et al., 2008: 3). It is based on a completely different way of seeing and working. The journey of Person-Centred Planning is fundamentally about sharing power and community inclusion.

Key transition moments

As mentioned above, in this chapter we will focus on the following vertical transitions: from home to early childhood education; from early childhood education to primary education; from primary education to secondary education: from secondary education to further and higher education; from secondary school and university to the employment sector; and from mainstream school to special settings and vice versa.

➜ *From home to early childhood education*

This is a key transition because it is the separation of the children from their families. According to Bowlby's attachment theory (1969), which is supported by Peter Elfer's key person approach, cooperation between families and carers or educators is required to ensure secure contexts and facilitate settling (Elfer et al., 2012). Attachment theory supports the value of strong attachment/bond with a primary caregiver and later with the educators who care for them; this is critical to a child's transition and the need to feel secure in order to explore, learn and engage with their surroundings. Ensuring the individual needs of each child are responded to and that the child is supported in establishing a positive relationship with themselves should be prioritised. When children form a strong bond with educators, they are much more likely to feel safe, confident, included, and happy. Many scholars agree that adaptation is a process with a variable duration. It concludes when a child effectively copes with the separation from their primary attachment figures, which may include their mother, father, or grandparents. During this process, the child also takes on their new role as an early childhood student and becomes accustomed to their new physical, emotional, educational, and school environments (Fernández, 2016).

➜ *From early childhood education to primary school*

This change comes at a crucial juncture as it may contribute to future transitions and the child's socio-emotional development. It is a moment in which the discontinuity process is experienced because of various circumstances of personal, social, and academic growth. Children and their families experience feelings of loss of familiarity, concern, nervousness, or uncertainty related to new requirements as a primary student and their new role, not only for children but also for parents. However, it also represents personal, social, and academic stimulation (Niesel & Griebel, 2007). This is related to the differences between the two stages and the volume of changes that are faced in terms of discontinuities in new reference teachers, unfamiliar spaces, different time distribution and new teaching-learning approaches. A positive experience at this stage may affect their ability to reach their full potential and deal with future transitions (OECD, 2017a). In primary education, the learning process begins to be considered as a formal activity. There is evidence that a positive start to school is important for later social and educational outcomes (Davies & Troy, 2020). Children who start positively, may be better prepared to take advantage of the educational opportunities that come their way and develop successful friendships and social networks. In contrast, children who experience academic and social difficulties at the beginning of school are likely to continue to struggle throughout their school careers, and frequently into adulthood (Demirtaş-Zorbaz & Ergene, 2019).

➜ *From primary to secondary education*

According to research, for many pupils, the transition from primary to secondary education is an overwhelming process that requires adequate support (Bloyce & Frederickson, 2012). Adolescents, because of puberty, go through a variety of physical and emotional changes and challenges during this stage. Making the transition for many pupils involves not only adjusting to a new and larger physical environment, but also adapting to different school expectations, new ways of thinking, different teachers, learning in a variety of subject areas, and interacting with a larger number of peers. The ability of a learner to cope with these changes has a significant impact on how they feel about school and progress through secondary education (Hopwood et al., 2016). This can bring the emergence of anxiety processes affecting their self-esteem and academic motivation (Jindal-Snape et al., 2023).

➜ *From secondary education to further and higher education*

All educational transitions are important because they are times of change and potential uncertainty but the transition to post-compulsory education has an added risk and value because it is the first time when learners may decide not to continue their studies. When it comes to promoting equity in education systems and equal opportunities for all students, educational transitions from compulsory to post-compulsory education are crucial points and key components (Egido & Martínez-Novillo, 2020). Moreover, they can present a challenging time for young people with emerging expectations and conflict in terms of perceived independence both at home and in education. This is also a period of exploration when young individuals are shaping their identities, developing personal values, and contemplating future aspirations, often requiring support and guidance (Morris & Atkinson, 2018).

Educational pathways have changed and become more diverse and plural because of recent social changes such as school year extension, lifestyle diversification, and increased labour market flexibility. This "de-standardisation" does not, however, imply that institutional patterns and cultural values do not shape what is perceived as normal in each context and influence students' decisions. In terms of the construction and perpetuation of inequalities, this stage may mark the setting out of various paths based on different social values, resulting in a variety of life experiences and opportunities (Tarabini & Ingram, 2018).

Most education systems continue to differentiate between an academic stream that prepares people for university admission and a vocational route designated for students' training for the labour market once compulsory schooling is completed. Research has shown that this institutional divergence is associated with a class bias since family socioeconomic background may determine the course selected after completing compulsory schooling (Santos, 2023).

Transitioning to university education is seen as a significant challenge for them, involving changes in environment, instructors, and systems. This shift is both anticipated and feared.

For learners, moving from having familiar academic accommodations to the uncertainty of their use in university can be daunting. Lack of knowledge about the new educational system and its resources adds to concerns. The absence of transition measures can lead to difficulties and even dropouts for disabled students. Proper guidance during this stage is crucial, acting as a bridge between secondary and university education. It helps people develop adaptability skills, ensuring a successful integration into university studies and preventing potential failures and dropouts (CERMI, 2020).

➜ *From secondary school and university to the employment sector*

Transitioning from school to work can be challenging and result in unemployment. Early school dropouts are considered to have an impact on lower skills and educational attainment, making them more difficult to employ than their peers who stayed in school longer. In OECD countries, most people leave school between the ages of 20 and 24, but 13% of 15 to 19-year-olds have already dropped out. To ensure successful entry into the labour market, individuals must complete at least upper secondary education. Staying in school not only improves educational attainment but also develops skills necessary for a smoother transition into the workforce. As a result, identifying and supporting students who are at risk of dropping out will be necessary (OECD, 2017b).

The transition from university to work can cause feelings of professional uncertainty and a lack of coping, both of which are important factors in the mental health of young professionals. 'Practise shock' is a term used to describe the gap between two areas of knowledge (Geirdal et al., 2019). Studies on the transition from university to work have addressed learner identity, student engagement, the fit between higher education and the labour market, motivation, emotions, and approaches to learning (Izzo et al., 2022). The above study shows that the issue is complex and there are no clear and easily applicable solutions from a business, policy, or societal perspective.

➜ *From mainstream school to special settings and vice versa*

In some countries, special schools still operate as part of the education continuum and there is an evolving role of special schools in the context of educational inclusion for children with Special Educational Needs (SEN) where the traditional role of special schools as providers of segregated education is being challenged, with an advocated shift towards a partnership with mainstream schools to offer inclusive education (Allan & Brown, 2001; Department for Education and Skills DfES, 2004; Fletcher-Campbell, 1994; Gibb et al., 2007).

In the context of this, children may experience transitions from:

- **Mainstream Class to Special Class or Special School:**

'A student who has been in a mainstream class transitions to a special class within a mainstream school or a separate special school.' Concerns may involve the child's ability to adapt to a more specialised environment, the impact on friendships, and the tailored support available. Parameters to consider are the specific needs that drove the transition, the suitability of the new setting in addressing those needs, and the continuity of support.

- **Special Class to Full-time Mainstream Class:**

'A student who has been attending a special class in a mainstream school moves into a full-time mainstream class.' Concerns may include the child's ability to adapt to a larger class size, the pace and complexity of mainstream curriculum, and their social inclusion.

Parameters to consider include the provision of additional support within the mainstream class, modifications to teaching methods, and strategies for fostering social interactions.

- Special School to Special Class in Mainstream School:

'Some students with special educational needs start in a special school and then move to a special class within a mainstream school.' Concerns may revolve around the child's adjustment to a new, larger environment and interacting with a more diverse group of peers.

Parameters to consider include the level of support needed in the special class, alignment of the curriculum with the student's needs, and the transition's impact on the child's social development.

Each transition scenario above, and others that may not have been covered here, requires careful planning and consideration of the child's unique needs and circumstances. Parameters like individualised support, effective communication, and emotional well-being should be addressed to make the transition as successful as possible.

Ways of supporting key transition moments

In this section, we will describe various experiences of aforementioned vertical transitions, which will be presented in the following order again: from home to early childhood education; from early childhood education to primary education; from primary education to secondary education: from secondary education to further and higher education; from secondary school and university to the employment sector; and from mainstream school to special settings and vice versa.

- *From home to early childhood education*

As Febrer Bellostes and Jansà (2011) stated, the process of transition begins well before children actually start attending school. These are some of the key aspects that should be taken into account:

Explaining the next academic year School Plan: Educators plan in advance for the upcoming school year, often before the current year ends. Discussions with families and students take place during this planning phase to ensure a smooth transition. This includes the initial meeting with other families, during which the physical spaces and schedules of the school are established. "This meeting is critical for communicating the significance of the transition and we discover how truly necessary we are to each other" (Neill & Sanderson, 2012: 4).

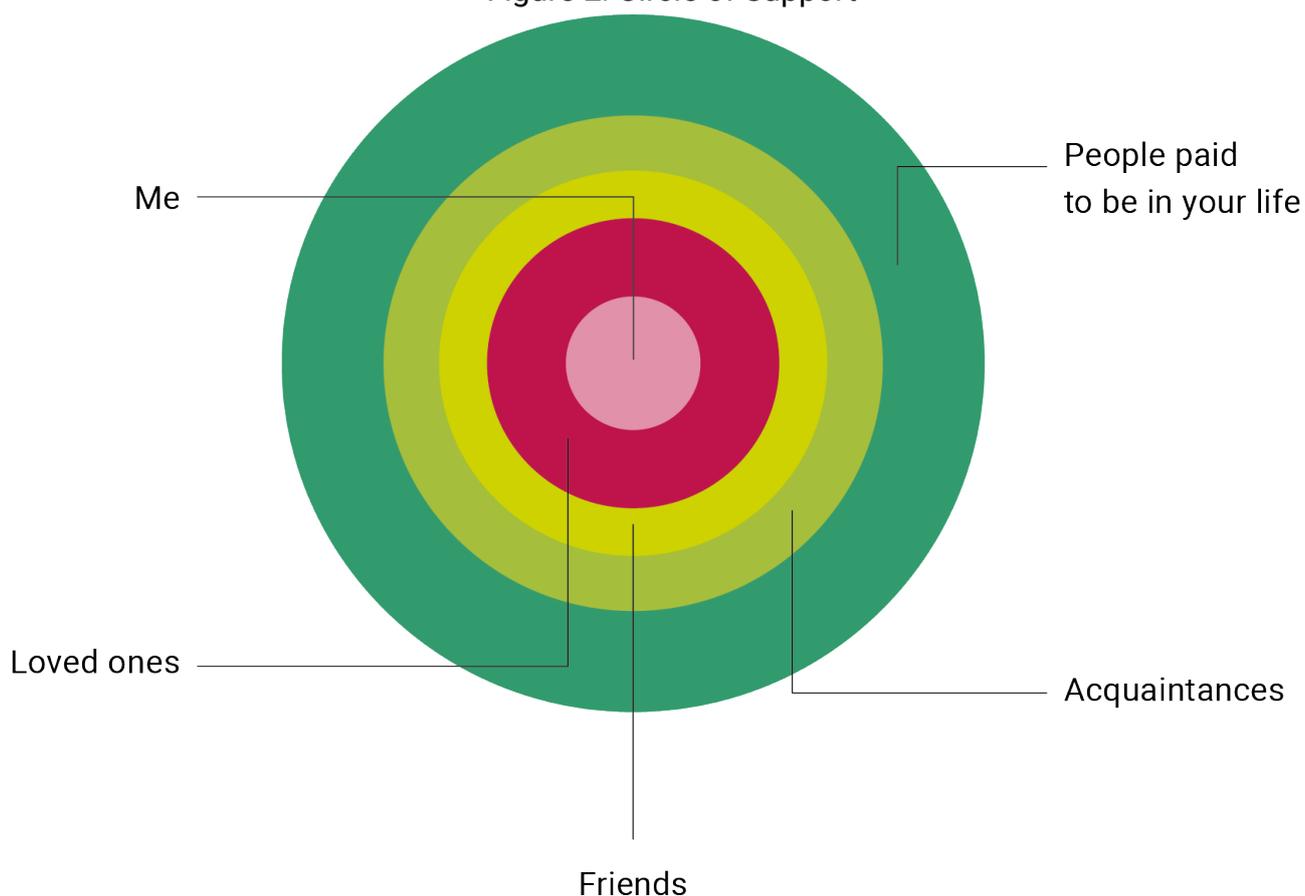
- Co-production

Another useful approach is the so called "enabling co-design" (Curto & Marchisio, 2022) or simply co-design or co-production, where the purpose is to support individuals from marginalised groups and their families at an early stage in a life path with transitions without predictable and pre-selected options, but on the contrary, it allows people to live the life they would like, in a more complex and articulated way. This takes place as a right without conditions and by means of a global accompaniment of people in various aspects and transitions of their life, taking into account possible unforeseen events along the way, without something pre-established or rigidly predefined, but promoting empowerment for ensuring them the control of their existence with all the freedom of decision-making and the space to imagine their future (Barnes, 1990; Marchisio, 2019; Rappaport, 1977). In this way, there is no longer someone who directs and fits individuals into rigid and structured paths that others consider more suitable for them (Prinz, 2018). In fact, the educators' role changes radically from a care model, mainly based on reduced options and pre-packaged answers, offering instead a service in a dialogic process made up of different points of view, in which their opinion can represent only as a piece of advice or a suggestion, which is added to the other multiple possibilities in a common and shared decision-making process (Bianquin & Besio, 2021; Marchisio, 2019). The educator, rather than providing answers, has the task of asking questions to guide the process in support of their choices. Basically, there are two key questions: "Who decided this?" and "If it were me?" With the first, therefore, it is important to understand that choices are in individuals' hands, from the smallest to the most important, both in the short and long term. With the second question, on the other hand, it is possible to imagine a certain condition of life and to put oneself in the other's shoes when a decision needs to be made. Through co-design approach it is therefore possible to support individuals in their life project with different educational transitions, where they establish and build their aims in an articulated system of relationships, mapping

the network with and around them and their family, based on unpredictable situations and nonlinear paths (Marchisio, 2019).

- Circle of Support

If we refer back to the quote mentioned above, it indicates that we are all human and we all require support whether we are categorised as being from a marginalised group of society or not. Being human, we are all different, but in many ways, we are all the same. We are the same in that we all require connections and to feel that we have the support of others around us. In relation to **Circles of Support** illustrated in the diagram below, this method assists those from marginalised groups to identify who they have around them and how to build either on the Circle of Support they already have or to build a new one. Circles of Support are important in a child's transition because it helps them and those closest to them who they have around them. In doing this they can identify who is the best person to support the child at particular stages of transition and think about how to build on their circle of support.

Figure 2: Circle of Support


Source: Danielle Farrel based on Marsha Forest and Jack Pearpoint

The idea of a circle is both simple and ancient. It is the way that the first human beings decided everything about how they would live. A circle is simply a group of people who come together regularly with a common purpose, who think and talk together, then agree

and take actions that will further that purpose. It is based on humanity and human relationships, and on the way that a group of people working together can harness their mental and physical resources toward a common end. When a circle is built around a person who would otherwise tend to find themselves underestimated and excluded from society, the circle's focus can be turned onto challenging it's members to explore ways of enabling the person at its centre to reach their highest potential, to develop positive roles and relationships and to live the kind of life that makes most sense to them. It links the person up with others but also links everyone involved with each other. This is often the case when supporting individuals from marginalised groups to build a Circle of Support. Often people from those groups have dreams and aspirations as referred to earlier in the chapter, that without support would not be achieved or need to be reframed. Therefore, as a result of challenging the members of an individual's circle, it is opening up exploration of ways to assist the individual at the heart of it to achieve their dreams.

Most people build their own circles quite naturally and informally through their everyday lives. However, one issue that is common to many people who are from marginalised groups of society, is that they become socially isolated. Often people find that the only people consistently in their lives are close family or paid carers. This is indicated on the diagram provided and built upon through the suggested task at the end of this chapter.

When it is the case that an individual from a marginalised group is feeling isolated it becomes necessary to consciously build circles and connections with the person, because for some people connection does not occur easily or automatically.

Sometimes a circle can even begin with just the focus person and one other person making a commitment to work to build a Circle of Support around the person, however difficult that is, and however long it takes. This more 'intentional' work of building connections in order to overcome a person's social isolation is what is meant by a 'Circle of Support' (Neill & Sanderson, 2012).

Circles are very diverse. They must, by their nature, reflect much of the culture and values of the participants, who own the circle together. We do feel, however, that there are certain clear principles that are common among Circles of Support:

1. Purpose: Circles are drawn together by a common purpose and by motivations that are unique to each individual involved. Overall, the purpose of cultivating circles at scale is to build the capacity of our communities to include and welcome everyone.
2. People: People come to the circle to help build the life of the person and the strength of the community around them. Those closest to the person come because of their love or friendship for the person. Others come because they wish to create and expand community capacity. Some are invited because they can provide a useful service to the person or the circle, some are paid service providers.
3. Vision: Circles create a shared vision of the future based on what is learned about what is important to the person and who the person is. They find ways to move toward this

vision.

4. Capacity: Circles speak the language of capacity. They seek out their own capacities, the person's strengths and gifts, and the resources of the community and find ways to appreciate, value and use these gifts to the full.

5. Inclusion: Circles call to the values that lie deepest in our hearts and ask us to have the courage to express them. The circle is a space of respect and honesty. We keep working to earn the trust that enables this. Circles are a practical inclusion tool that expands the capacity of society to welcome and support all its members.

6. Listening: Everyone in the circle must have time to think, time to speak. The circle practices listening mindfully and with respect to create a soothing space where diverse opinions and knowledge can be shared.

7. Thinking: Circles create a thinking environment to think together about possibilities. Spending time together to think is far too rare in social care. When supporting a person's whole life, it is useful to spend a couple of hours thinking about its direction and quality.

8. Learning: The circle has a radical openness to learning; a preparedness to change anything and everything based on what is discovered during their interaction with the person and the world.

9. Power: The circle is founded with the aim of establishing 'power with' rather than 'power over.' An understanding of power and a sharing of roles and responsibilities helps us generate 'power to' and 'power within,' both in the circle and in the person at its focus (Neill & Sanderson, 2012).

In recent times Health and Social Care and the way services are designed and delivered have gone through lasting change in several areas of the world. Due to this, the potential for a reinvigoration of the idea of Circles of Support seems immense. Using the control over resources that personal budgets in health and social care offers to people, coupled with the practice of building a supportive network of allies around a person becomes a powerful mechanism for implementing change in that person's life, change in the way services interact with that person, and a fundamental change in the way communities receive and regard people who require long-term support. Circles are actually a deeply practical way of building social and community capital and of harnessing 'social productivity.' Circles of Support, coupled with personal budgets, have the potential to become powerful methods of delivering support for many more people, and not just disabled people, although this will require an investment of resources, commitment, and energy at many levels from the leadership of health and social care (Neill & Sanderson, 2012).

Closing questions to discuss or tasks

1. Think about your transitions' experience, could you reflect on key transitions important in your life, identifying main barriers and helpful strategies in these key moments?
2. Think about your students, could you reflect on key transitions important in their life?
3. Considering the Bronfenbrenner ecological system, can you apply this theory to broaden your understanding of relationships and how these can differ for marginalised groups?

Task for readers: Based on what you have learned about Circles of Support, draw your own Circle of Support and think about who you would have in each of the circles (loved ones, friends, acquaintances and people paid to be in your life). Once you have done this, cover up the 'friends' and 'acquaintances' circle. You should now only be left with the circle entitled 'me' which represents you, the 'loved ones' circle, which is for family and those closest to you, and the circle representing 'people paid to be in your life'. The purpose of doing this exercise is to represent that this is the reality for many individuals at risk of marginalisation that they only have loved ones and those paid to be in their life who are actively in their life. How does the prospect of this make you feel? The overall outcome of this exercise is to enable the reader to reflect on how they would feel if they were in that position, but also how in their professional role would they support those from marginalised groups to broaden their Circle of Support and think about how to get more of the right support around each individual.

Glossary terms

Marginalisation: The state of being considered unimportant, undesirable, unworthy, insignificant and different resulting in inequity, unfairness, deprivation and enforced lack of access to mainstream power (UNDP, 1996:1) Marginalised populations are defined as groups and communities that experience discrimination and exclusion (social, political and economic) due to unequal power relationships across economic, political, social and cultural dimensions (Vaccine, 2011).

Person-Centred Planning: Person-Centred Planning means putting the needs of the individual, their views and feelings at the centre of planning their care and support.

It helps everyone involved listen to them and understand and respect what's important to them and how they want to live their life. Person-Centred Planning is a journey that removes the barriers that marginalisation often brings and enables people from those groups to dream big and identify ways and what they need to be in place to assist them in achieving their dreams and aspirations (Neill & Sanderson, 2012).

Circles of Support: Circles of Support are a way of helping an individual to identify those they have around them and in what capacity they can support them. This method of

support can assist someone in building a Circle of Support from scratch and making new connections or building on the support they already have. This way of support can be used when helping those from marginalised groups recognise what support they have and/or what support they need. However, everyone regardless of their background, social status, etc. could benefit from having a Circle of Support as this method is underpinned by being human and by being connected (Neill & Sanderson, 2012).

Child readiness: Readiness holds varying definitions for different individuals. Sometimes, it's linked to age or developmental stage. In other cases, readiness is assessed through checklists of skills and knowledge to determine what children should know before starting school. Moreover, certain interpretations of readiness highlight social and emotional aspects. However, the overarching theme in these viewpoints is the emphasis on the individual child and whether they have reached a specific point that signifies readiness (Dockett & Perry, 2009).

About the authors

Silver Cappello

Silver Cappello has accomplished a PhD in General Education, General and Social Pedagogy at the Free University of Bolzano-Bozen (Italy). He is qualified as primary school teacher with a specialisation as support teacher and he has worked as primary school teacher (mainly teaching second language), as assistant for people with disabilities, and as research assistant on different research projects at the Competence Centre for School Inclusion of the Free University of Bolzano-Bozen.

Danielle Farrel

Danielle Farrel has both lived and professional experience in the field of disability. She has a passion for changing the narrative for disabled people and those from other marginalised groups. Danielle graduated with her PhD from the University of the West of Scotland in 2015 and her thesis was entitled 'The 2012 Child Abuse Scandal: The Multifuctional Nature of Online Discourse'.

Paty Paliokosta

Paty Paliokosta is an Associate Professor in Inclusive Education at Kingston University and a Senior Fellow of the Higher Education Academy. With over two decades of experience in the field of special and inclusive education, my journey has been dedicated to promoting social justice and empowering diverse learners, particularly

those with special educational needs and disabilities (SEN/D). As an educator, inclusion manager, local authority advisor, researcher, and advocate she has actively contributed to shaping inclusive policies, leading innovative participatory research projects, and championing social justice within schools, local authority, higher education and the community. She leads the 'Inclusion and Social Justice' SIG and the 'Inclusivity, Anti-oppression and Underserved Communities' bidding network. Her full profile can be found here: https://www.kingston.ac.uk/staff/profile/dr-paty-paliokosta-730/

Irati Sagardia-Iturria

Irati Sagardia-Iturria after completing her studies at Mondragon Unibertsitatea (Spain) in Primary Education and specialising in Special Education, she adopted the principle of creating inclusive environments and processes as a core value in her life. Motivated by this, she decided to further her education by pursuing both a master's and a doctorate at the same university, with a focus on educational transitions and inclusive processes. This academic journey provided her with a unique opportunity to actively engage in a research project led by the Zehar and Hazitegi groups, which also forms the context for her thesis, following the purpose of generating and transferring knowledge in the field of innovation and intervention in inclusive education. Additionally, she has gained experience as a university lecturer across various modules, aiming to raise awareness of the importance of the healthy development of all children (emotional, social, cognitive, motor, and linguistic), and the role of the educational community in that development and creating inclusive contexts (the role of the teacher, organisation of time and space).

AN INTRODUCTION TO PERSON CENTRED PLANNING – AND ITS POTENTIAL FOR SCHOOLS

Example Case

Example story 1

He made a difference

"Tow was an eight-year-old boy in China, diagnosed with Attention Deficit Hyperactivity Disorder (ADHD) and emotional behaviour disorders. He was very aggressive and often came into conflict with his classmates, even hitting other people at times. Students and parents were angry and complained to Tow's teacher.

Tow's parents were divorced, and he lived with his father and his grandparents. The father was unemployed, and his parenting style involved 'fist and violence.'

The grandmother took care of the whole family and was under a lot of pressure. She felt that her neighbours were unfriendly because of their unhappy family. She was also emotional and complained endlessly.

The school felt challenged in terms of Tow's education, while there was also tension in the community where Tow and his family lived. The school and the community sat together and talked about how to improve Tow's education and community life. They developed a plan with the boy and his family, by holding discussions two or three times a month. Multiple departments in the school and beyond worked together. For example, social workers and a psychologist visited the family; community workers communicated with the residents to develop their understanding and acceptance of Tow and his family. Medical doctors were also involved when needed. School teachers encouraged empathy and care from classmates and parents. They helped the boy to develop his interest in music and carried out positive behavioural interventions.

Thanks to the support from both inside and outside the school, over time, Tow's life greatly improved. He started to really enjoy coming to school and got along much better with his classmates.

In the neighbourhood, someone said, "Oh, his mother is not around, I would like to be his 'mother,' or to give him the love of a mother." Tow's family also made some changes. His father became more positive and tried to find a job; his grandmother felt the passion and friendliness of the people in the community, and established good relationships in her neighbourhood. As Tow grew, so did the teachers. Learning by doing, teachers constantly study and experiment with intervention methods, and they were inspired by Tow's progress."

Yuzhen Xu

Example story 2

A boy always said: I want to become a medical doctor!

"My name is Ines, and I'm a very lucky person because I had the chance to learn about Person Centred Planning and support circles, and I facilitated a lot of these circles during the last 30 years. I really must warn everybody because it's something you can be longing for, if you know how to do it, because it's a very essential thing. In a way, it's a key thing for feeling humanism in the world – and it is at the heart of inclusion. It's not a method I was operating, but when I heard about it, I was sure that I wanted to do things like this. To give you just one example:

There was a young man who, as a little child, already started to think about his future. He thought about 'What would I like to work as? I want to become a doctor, a medical doctor!' This is what he said. When he explained this to his mother it was a little bit special because he had Down's Syndrome, he had the 21st chromosome three times. However, in some cases, our societies seem to know what is possible and what is not! So, the mother felt all the time: 'Oh, how can I explain to him that this will never happen, and no university will accept him?' This was a big thing in the family.

It was a wonderful thing when he was a youngster that his mother told others: 'Oh, he always tells me he will be a medical doctor in the hospital. How shall I stop him from this stupid idea?' They built a circle around him. They had a meeting, and they did some Person Centred Planning. So, they gathered all their friends around and the people who facilitated these processes, they all knew that it's a gift if somebody has a certain dream. Very often you have to work to see what the dream is and here this young man was always talking about his dream.

The group had the challenge of finding out what the quality of this dream was and what lay behind all this. What does it mean for anybody to be a doctor, and especially for him, if he can express it? Maybe it means to be an important person, a helpful person. Maybe it means how to be dressed and to receive respect because of what he is doing and so on. So, the wonderful thing about this circle was that they were thinking in that way: Okay, we have to find a position for him, and create it, if it's not already existing, where he can have all the things he wants without going to university and studying medicine. And luckily, one of the friends sitting there, she knew somebody who knew somebody … and sometimes you need these types of relationships.

So, to make a long story short: The outcome of the whole thing was that he got a job in a clinic for people who lay in a coma. And yes, his role was wearing a white skirt, he was going into the rooms, filling with the disinfectant for everyone's hands. He ensured that everything was where it needed to be for when the beds were dressed. He was also allowed to sit at the beds of people and touch their hands, to talk to the people, to be soft with them, and to tell them some stories about what is going on outside. I could cry from being so moved when I relay this story.

Then he genuinely didn't miss any medical studies, and he never asked to go to university. He was happy being a relevant person in this context, and his dreams were fulfilled. Maybe one day he will be unhappy. Or maybe one day somebody will tell him that this clinic doesn't work anymore and so on. Then he will know that it's a wise thing to gather good people around you and talk about what you're longing for and then find relationships to help solve these problems. Find steps to bring it into the world if it doesn't already exist. Then the community will win, will gain a lot, and will change. I'm sure this is a win-win-win-situation. It certainly has been in this clinic. He will always be a winner if he does it this way. That's my story. This was one example with a person labelled as having a disability."

Ines Boban, Germany/Croatia, long-time activist for facilitation of Person Centred Planning

Initial questions

In this chapter you will find answers to the following questions:

- What are the basics of Person Centred Planning?
- What makes Person Centred Planning specific in relation to other forms of planning?
- What are the main principles of Person Centred Planning?
- What is the difference between Person Centred Thinking and Person Centred Planning?
- What are the areas, potentials, and challenges of Person Centred Planning?
- What theories could help explain why Person Centred Planning works?

Introduction to Topic

Person Centred Planning happens when a group of people come together, dream and gather ideas during one, or several, meetings. Mostly the planning is done with and for one person, which we refer to as the 'main person.' It can also be done for a group, a project, or systems – like schools. During the planning process, a collective vision is created on what a good life in society could look like and how it can be achieved together. The focus is on the strengths of the person, group or system and relies on a form of co-construction.

Person Centred Planning is interesting for several reasons, not least for teachers:

Firstly, it helps to start dialogues. Of course, teachers have lots of dialogues, but often about academic topics, or *about* children (with colleagues and parents) and perhaps not so much *with* children about their dreams and thoughts about the future, especially if they define themselves mainly as a teaching person and less as a learning supporter.

Secondly, Person Centred Planning promotes thinking outside the box as there is an emphasis on dreaming and developing new ideas in a safe space without judgement. As Person Centred Planning is independent from institutions, the place, or the institution should not limit reflections and ideas.

Thirdly, it helps to see the whole person and their future, not just past experiences or individual achievements. Person Centred Planning is – as the name suggests – centred on the person, not on some aspects relevant to school.

Fourthly, it helps to reflect on your own role as a teacher and your ideas and dreams for your future.

Finally, it may inspire you to look for opportunities to start Person Centred Planning

processes in schools – for students and perhaps even for the school itself, in a person centred context.

Key aspects

Basics of Person Centred Planning

In order to present the underpinning conditions for Person Centred Planning, we draw on Beth Mount's work as she identifies four central aspects. We refer to these as the four cornerstones of Person Centred Planning (Mount, 2014), as can be seen in Fig.1.

Figure 1: Four cornerstones of Person Centred Planning

Source: Own illustration adapted from Mount, 2014.

The first of the cornerstones is about *finding the gift* in the person. This is based on the idea that everyone is unique and has their own set of key interests and abilities. It is important to note that this is not about finding a hidden talent or 'superpower' within the person. The 'gift' does not have to be extraordinary; it can be a wish to help others, or to care for animals, for example. It is about finding out what 'makes someone tick,' or what makes someone smile in the morning. While some are very clear about their own strengths, interests, and dreams, many people need help from others to figure out what that is. In practice, there are many ways of exploring this with the main person. For example, you may ask a question such as '*What would an ideal day look like for you?*' Or: '*What are the things you think about when you feel really good?*' These types of questions are utilised to find out what the *gift in the person* is. In the school setting, perhaps you as a teacher could pay particular attention to the subjects or topics that a student is interested in, to explore that further.

The second cornerstone, *building relationships of commitment,* on the one hand focuses on people coming together for the Person Centred Planning; thinking together; coming up with ways of supporting each other. During the planning meeting, relationships are

deepened, or sometimes even just started. These relationships can be based on mutual interest, for example, during a planning meeting two people find out they are both big fans of the same soccer club and decide to watch games together at the weekends.

Also, these relationships can be based on mutual care and support, the interest in each other's well-being. For example, one person at the planning meeting agrees to accompany the main person to their doctor's appointments, making sure that the voice of the person is heard, and the person understands what the doctor says and wants.

On the other hand, the relationship aspect also focuses on *broadening the relationship circle.* Expanding the circle is a way of developing social networks of people and looking for people that are not yet part of the circle but could be helpful for what the circle is working on or could also benefit from being part of the circle. In a school setting, it could be something as simple as running a board games club at lunch time, to help broaden the social circle of a student – creating opportunities for students who share a similar interest to make new friends.

The third of the cornerstones is *asking for more from organisations*. This is about acknowledging that when there is a dilemma pr problem, it is not always an individual that should have full ownership of that problem. Often, issues can be structural and shared with other people in the same, or similar, settings. When structures are in place which lead to several people, or groups, experiencing difficulties, organisations should be asked how they can change or develop to support individuals, or groups, better. An example from a school setting is, there could be several students who have an issue with the school uniform policy, maybe because of a gendered dress code which makes them feel very uncomfortable. Rather than coming up with a workaround for one student at a time, we could be asking for more from the organisation, in this case the school! This may involve empowering the students to come together to influence and have a say in how we can make the school uniform policy more inclusive.

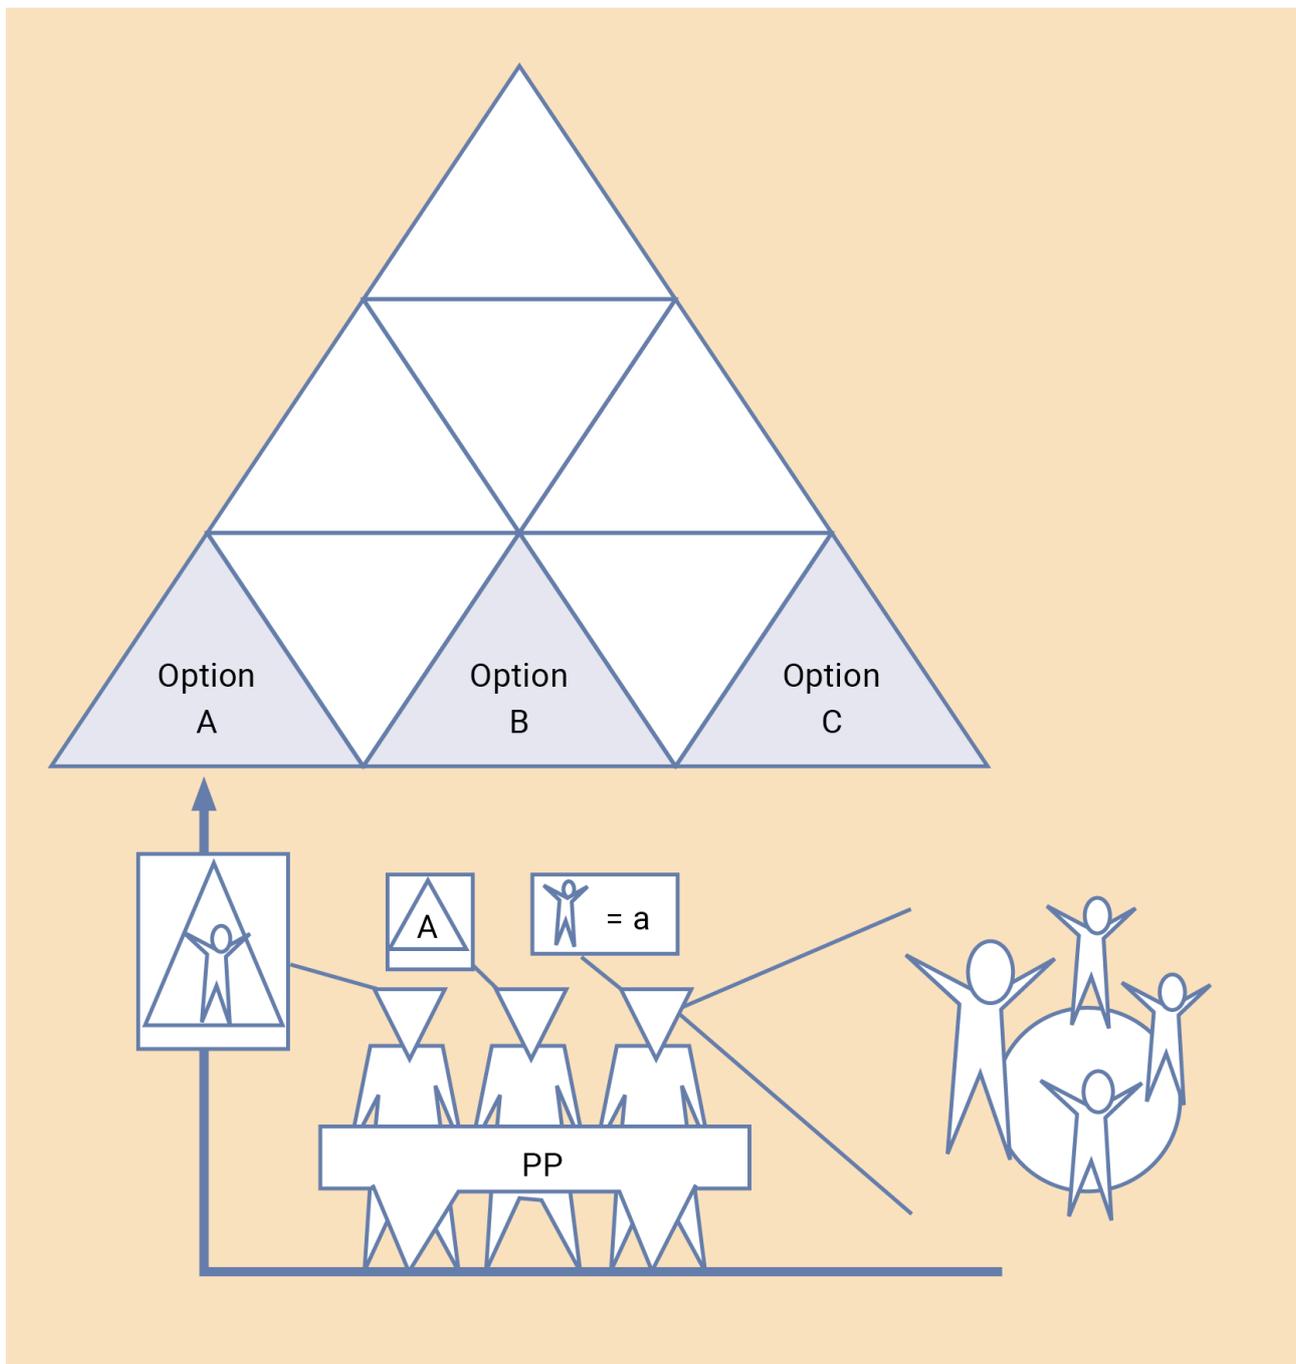
In other scenarios, it may also be a neighbourhood that could be 'asked to do more,' like in the case of Tow where the neighbours were instrumental to the solution of a difficult situation. Or it could be a medical clinic, as in the case of the boy with Down's Syndrome, where a bespoke solution led to a meaningful job where he could realise his dream.

The fourth cornerstone, Beth Mount refers to community: *finding assets and openings in communities, looking for places where people can thrive*. Or to paraphrase: '*digging into the social goldmines of community.'* With this fourth aspect, Beth Mount emphasises the need and potential for connection. Within communities, either local or distant, there is almost infinite potential, if we keep looking for it. Find people, explore places, look for groups, events and organisations to *find these openings* that create opportunities for people to lead a good life. Also, this cornerstone emphasises the need to look for a diverse group of people participating in Person Centred Planning. The more richness and variety, the bigger the connections into various places and communities will be so the main person, and the circle, can benefit. In case of a school, the *places in community* can be clubs or organisations that

would like to co-operate, for example, a sports club that offers its' training field to interested students, or a local bakery that offers their business to a group of students for a limited time in order to learn about production and sales from the actual process of producing and selling baked goods.

Different approaches to planning

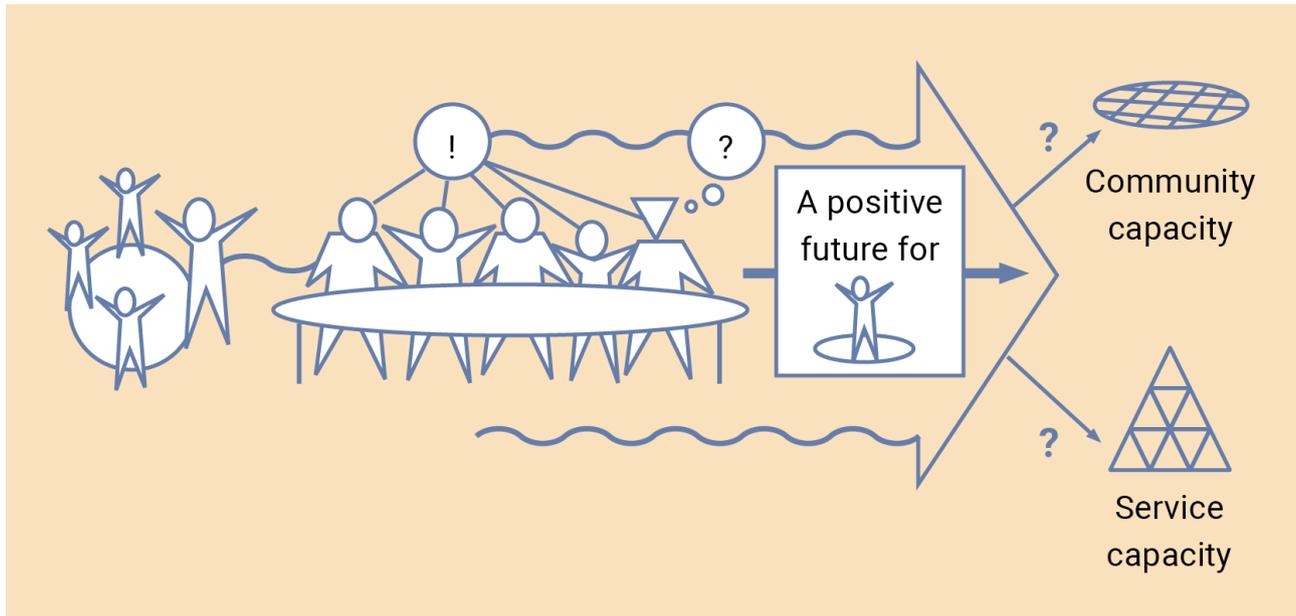
In order to highlight what the essence of Person Centred Planning we are drawing comparisons with more traditional approaches to planning. In general, there are many different forms of planning. John O'Brien, one of the developing pioneers of Person Centred Planning, illustrated this very well in his publication from the 1990's, with the two images (Fig. 2 and Fig. 3).

Figure 2: Individual Program Planning


Source: O'Brien & Lovett, 1992: 8

In Figure 2 the idea of a more traditional approach of individual program planning is illustrated. There is a team of experts with specific knowledge and context sitting together, displayed here with triangle heads. They are triangles because this fits into the existing system of institutions and pre-existing options. Now, the task for the experts is to find out which existing option fits which person. These options are usually based on medical categories and especially on medical or psychological deficits. Here, quality is defined as being sure to decide on the best match between the person and the option. The power is, of course, in the hands of the professional experts, and the person is just an object of

their decisions. This demonstrates a hierarchy between the decision-makers and decision-recipients.

Figure 3: Person Centred Planning


Source: O'Brien & Lovett, 1992: 9

Person Centred Planning (Figure 3) is based on quite a different way of thinking and making decisions. In Figure 3 there is a group of people sitting in a circle around a table, having round (or maybe egg shaped) heads. Sometimes there is also a professional expert involved, there is a big question mark in the thought bubble, to display a different way of thinking. This group consists of the person, maybe family members, maybe friends, maybe supporters, all of these diverse group members are experts in different ways. They create, reflect and plan a desirable future with, and for, the main person. This brings new challenges for institutions, especially for services, and for the community. However, it also offers a chance to grow inclusively. In this approach to planning, the main person is not an object but a subject and part of the planning process. In this way of planning, quality means something different than before: everyone has the chance to contribute and to participate in the planning process. This decentralises the power of the original decision-makers involved in the hierarchy. The power is in the whole circle, shared between everyone, not only among professional experts. These are two different examples of the planning processes that will display different results and have different consequence with a disparity in quality and power dynamics. This fits into four cornerstones:

1. You need to know about the gifts of a person to create a desirable future.
2. You build relationships within the support circle during this process.
3. You create new opportunities and challenge existing universities to be more inclusive and

4. You connect with communities.

Practices – Ways of Person Centred Planning

Person Centred Planning can be practised in different ways. However, there are some shared aspects which are outlined below. The two main ways to work person centred are *Person Centred Thinking and Reflecting*(sometimes called 'small ways' with less time and fewer people) and *Person Centred Planning* (sometimes called 'big ways' with a lot more time and more people involved).

Shared aspects

There are some aspects which feature across the whole spectrum of person centred practices, namely:

- **Thinking together.** The goal is to bring together all types of ideas from different people with different perspectives and backgrounds – maybe also ideas which seem a bit crazy at first!
- **Everyone's an expert.** People come together, sit together, have time together, and collect ideas. There is no professional expert who tells anyone what to do and how to do it – it is an open process where everyone is an 'expert' and there is no right or wrong. This requires an accepting and non-judgemental mindset.
- **Voluntary.** Person Centred Planning should be initiated freely by the main person – maybe with the support of others. There are no time limits or demands for when, where or what someone should do. It is always a personal decision if a person wants to be involved, when, with whom and where to do it. The main person also sets the agenda for the Person Centred Planning. Very often, it is about the future, how to live a good life, what to work as, with, where and with whom to live – all "great questions," which do not have simple and quick answers (Snow, 2015: 9).
- **Everyone in the circle matters.** Another aspect is that the perspective of the main person is crucial, but also the perspectives of the whole circle are important – as they are all 'thinking with' the main person.
- **Visualisation.** Almost all Person Centred Planning meeting use visual recording on posters. This is important for two reasons: It makes sense that the whole group can see and feed into the visualisation of what has been said – and the poster will be given to the main person afterwards if they want it. This is a way of making dreams visible. Also, visualisation through a poster slows down the process, so members of the circle have more time to think, to share ideas or develop fantasies without limitations. Every idea is valued, there is no competition surrounding ideas, for example, 'my idea is better than yours.' All ideas are welcomed and will have their place on the poster.

These are the main and shared aspects of Person Centred Planning.

Methods of Person Centred Thinking and Reflecting

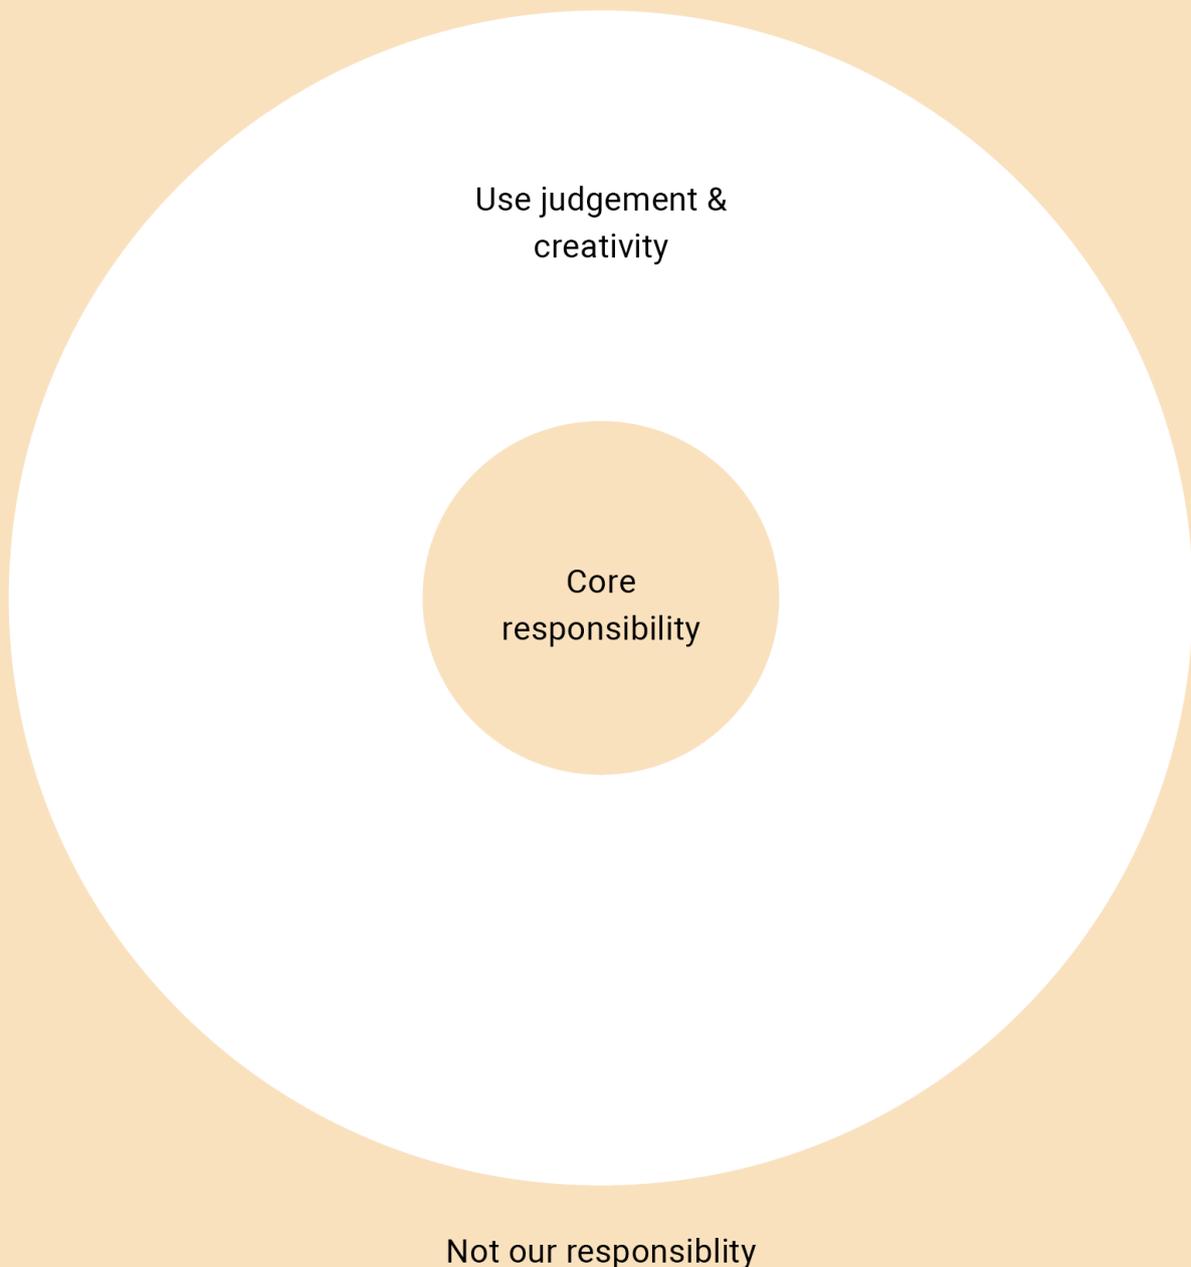
The methods of Person Centred Thinking and Reflecting are sometimes referred to as 'the smaller ones,' as you can use them everywhere – in your school, with your team, in your classroom, at your workplace or elsewhere, for example, in your club or in your choir or wherever you are together with people. They can be helpful from a reflection viewpoint. There are hundreds of different examples, and you can find them on the homepage of Helen Sanderson, a councillor of the English government and many worldwide organisations (https://www.helensandersonassociates.com/person-centered-thinking-tools/).

Figure 4: The doughnut

The doughnut

Use judgement & creativity

Core responsibility

Not our responsiblity


Created by The Grove Consultant International

Source: Helen Sanderson, n.d.

One example is called the doughnut – useful for reflections on responsibilities. You see three concentric circles. The inner one is about the core of someone's responsibilities – there you can write about your duties, things you *have to do*. The second one is about the *'nice to do'* area. If you have enough time and energy, it is nice to do certain things. The third

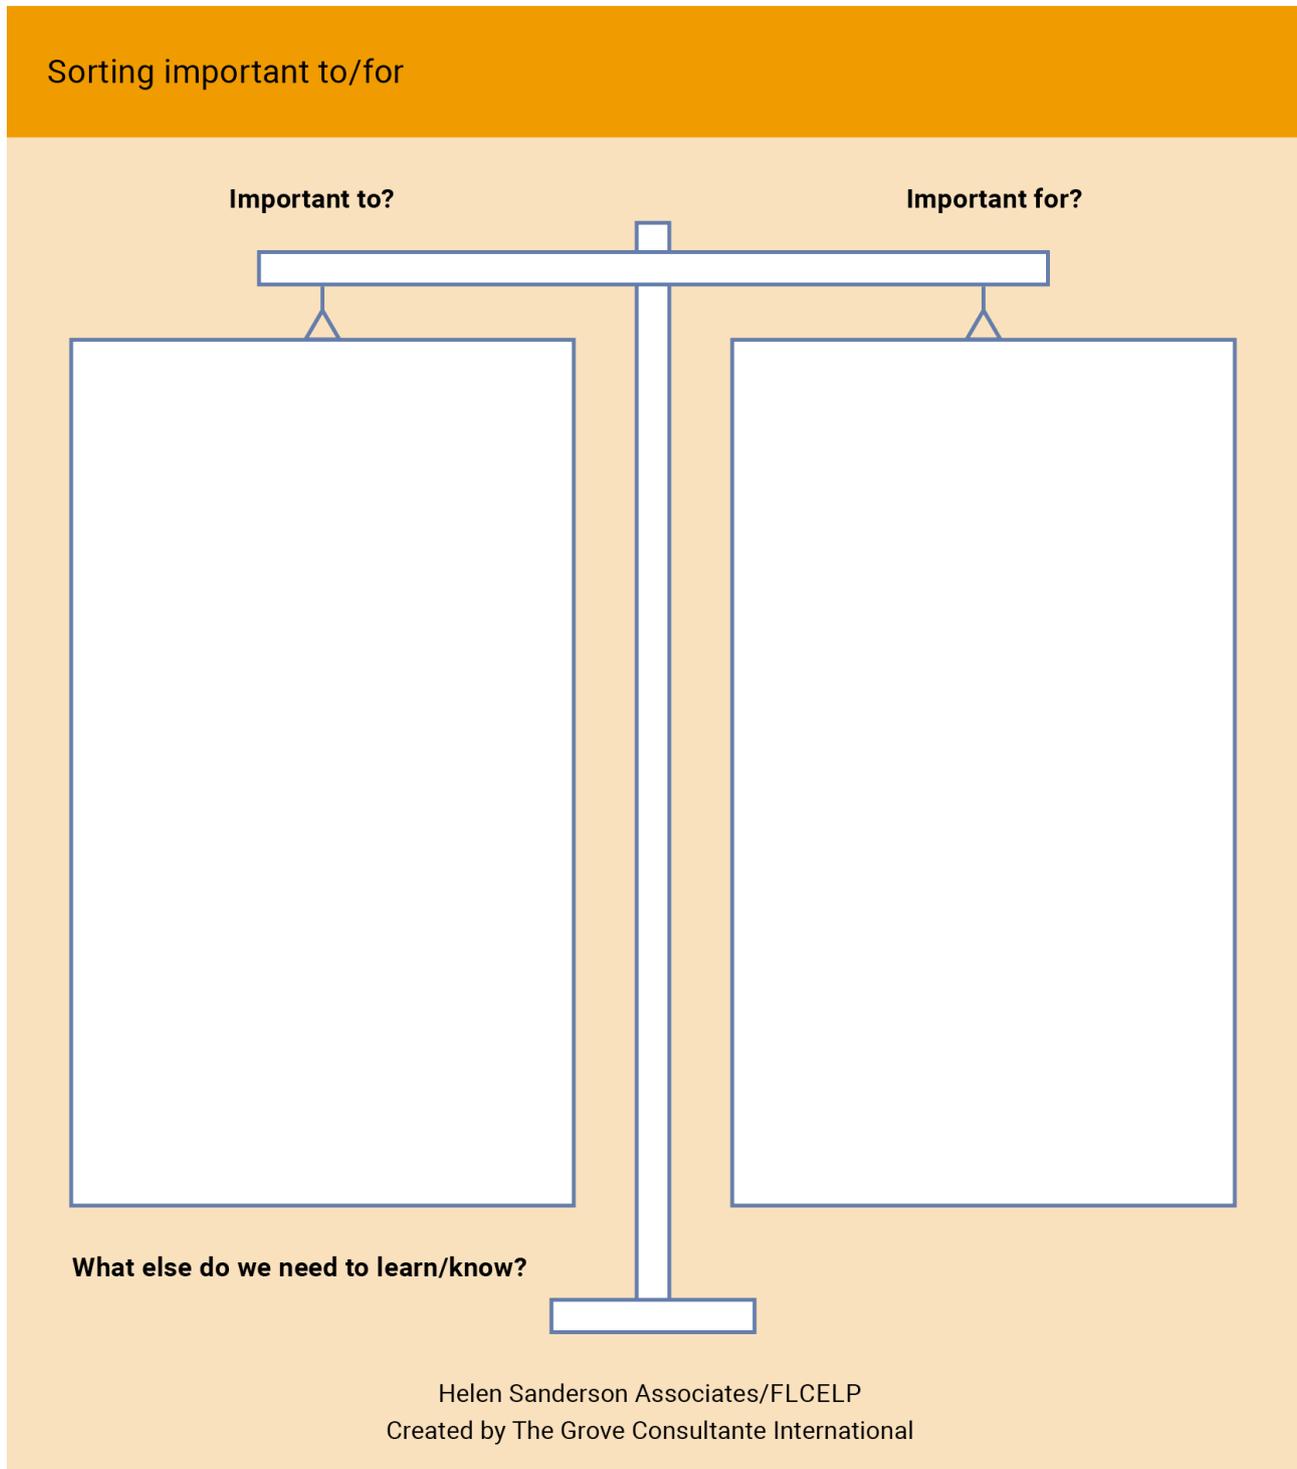
one is about the *'not my responsibility'* area. It's not your task to do that. Sometimes it can be helpful to make that clear for different people within a team who may be in the same situation. Who's responsible for that? Of course, you can talk about it without the poster, but it can be helpful to have this visualisation, to create a picture together. This can make it easier and more structured.

Figure 5: Sorting Important to/for

Sorting important to/for

Important to?   Important for?

What else do we need to learn/know?

Helen Sanderson Associates/FLCELP
Created by The Grove Consultante International


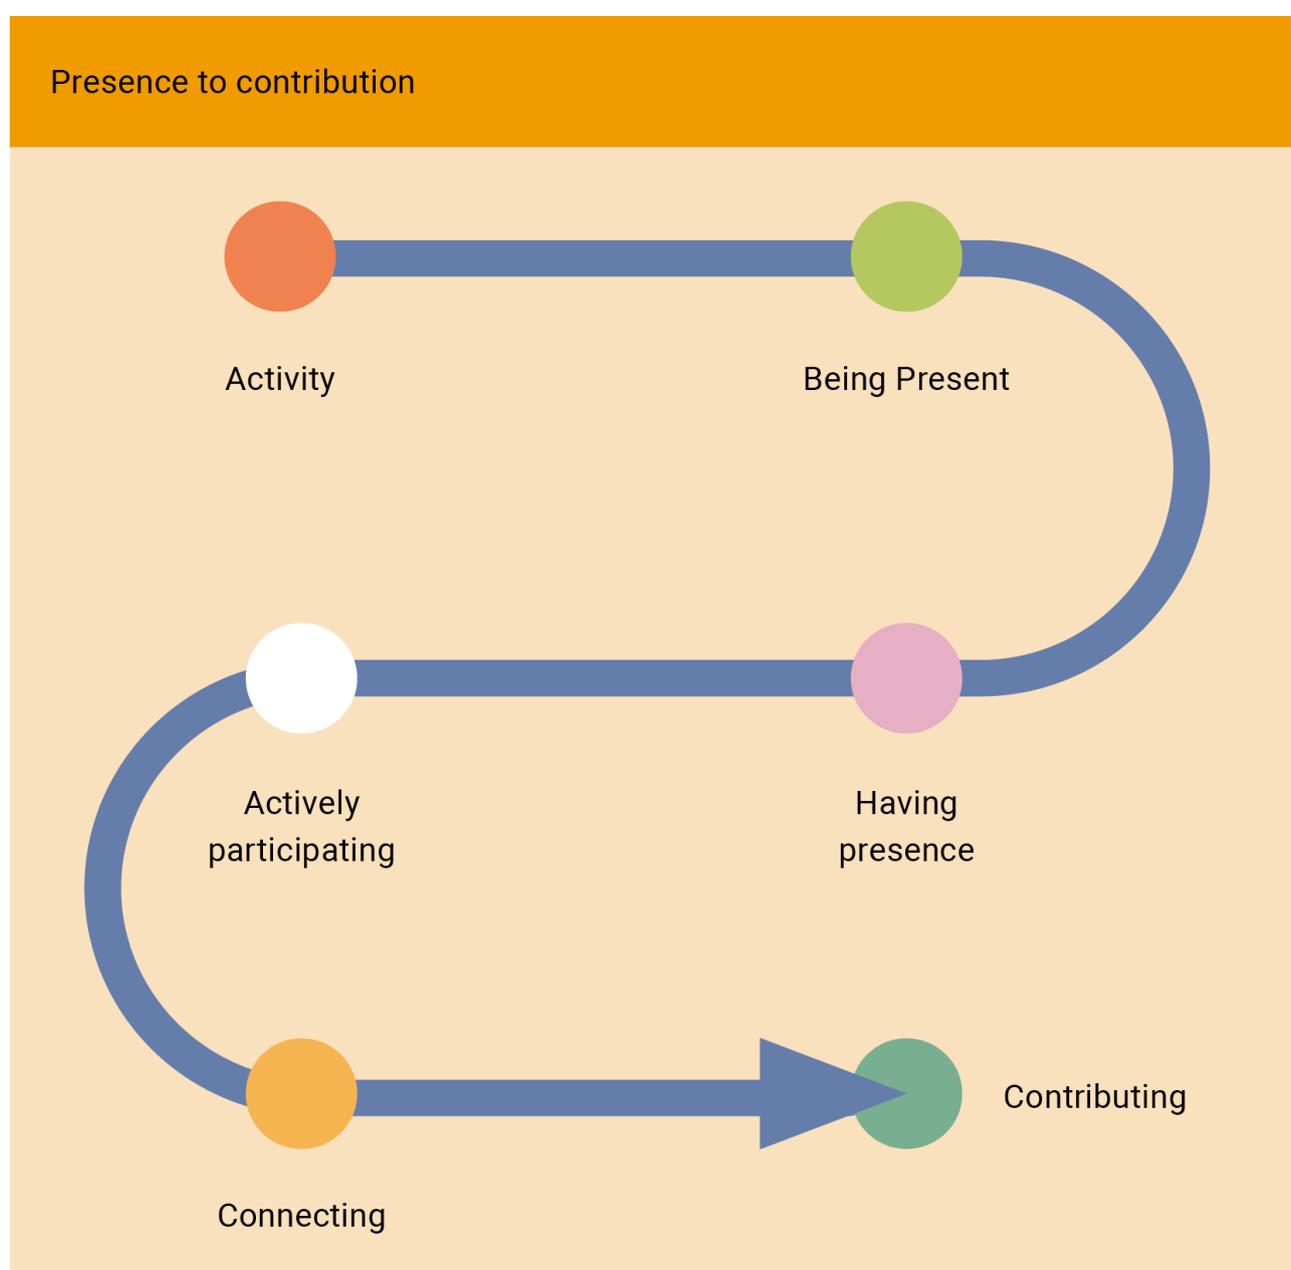
Source: Helen Sanderson, n.d.

Another example is called 'important to/important for.' Often people do not differentiate

between what a person thinks is important *to* them and what others think is important *for* the person. In institutionalised situations this could be quite contradictory. The poster helps to find out who means what and it helps to find items that overlap and items that dissent.

A common way to illustrate this is related to food – whereas a lot of people enjoy eating sweets or snacks – therefore it is important *to them*. A healthy diet including vegetables and fruits is considered important for the human body – therefore it is important *for them*. After adding important aspects on either side, a compromised solution should be developed together.

A third example helps to reflect on and increase inclusive processes in a group situation. This illustrates moving from just being present or in a situation, to being an active contributor in a situation (Figure 6).

Figure 6: From presence to contribution


Source: Helen Sanderson, 2006

If there is a situation where someone is marginalised or isolated, you can sit together in your team, maybe with the parents, and you can think together about how to move from simple presence to more actively contributing to situations. There are several stages in between and different opportunities to participate, connect, and contribute.

These are just three examples of the 'small' ways of Person Centred Thinking and Reflecting. As mentioned before, there are many more available in publications and on the internet.

Ways of Person Centred Planning

In contrast to quicker, sometimes less complex ways of Person Centred Thinking and Reflecting, Person Centred Planning starts with a few preparatory questions and tasks:

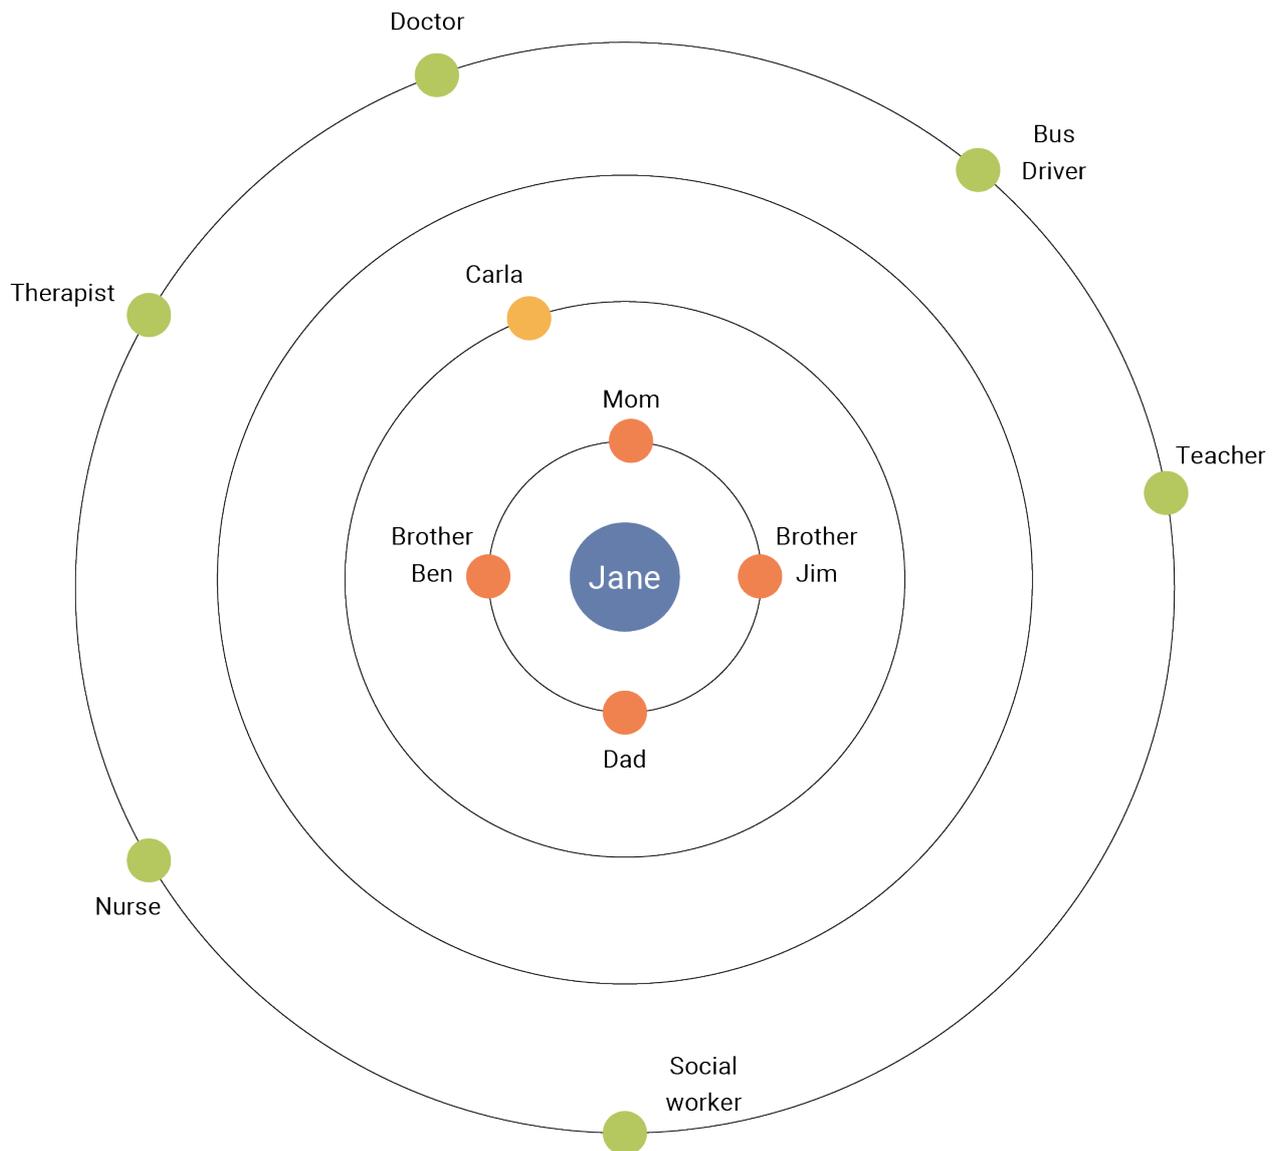
- **Identifying a 'great question' / issue.** The main person is asked to phrase (or develop) the main question or issue that they want to work on with the support circle in the Person Centred Planning process. Sometimes, the facilitator will be involved in this first step. Person Centred Planning is a good way to jointly think about 'great questions.' As Snow (2015: 9) states

 "Great questions are the ones that refuse to be answered. They lead to deeper listening and better connection."

An example might be, that the question will not be about '*What do I like for dinner tomorrow?*', but maybe about '*Who will I be when I grow up?*' or '*Where shall I work?*' It is a big question that needs several people to think and plan together.

- **Relationship map.** Another important question to start with is '*Who is in my life?*' and '*Whom do I know?*' There are various templates for the *relationship map* with multiple concentric circles (see Figure7a). This can help the person to reflect on how important different people are in their lives. However, it can also be done on a blank piece of paper, by naming and writing down all the people that the person can think of.

Figure 7a: Circle of Friends of a High School Student

Source: Falvey, Forest, Pearpoint & Rosenberg, 2000:12
Figure 7b: Circle of Friends of a person with 'at risk'-Label


Source: Falvey, Forest, Pearpoint & Rosenberg, 2000: 13

As shown in the examples above (Figures 7a & 7b), there can be lots or just a few people in a person's life, depending on their current situation, their past or other reasons. It is important to try and gather all the names and then possibly also think about how to increase the circle, for example by 'borrowing'from people who are in the person's life and who do have a full relationship map.

As a second step, it is important to think about '*Whom do I want to participate in the planning?*' and'*Who will be invited?*' This decision will also be influenced by the 'great question' or issue which has been identified.

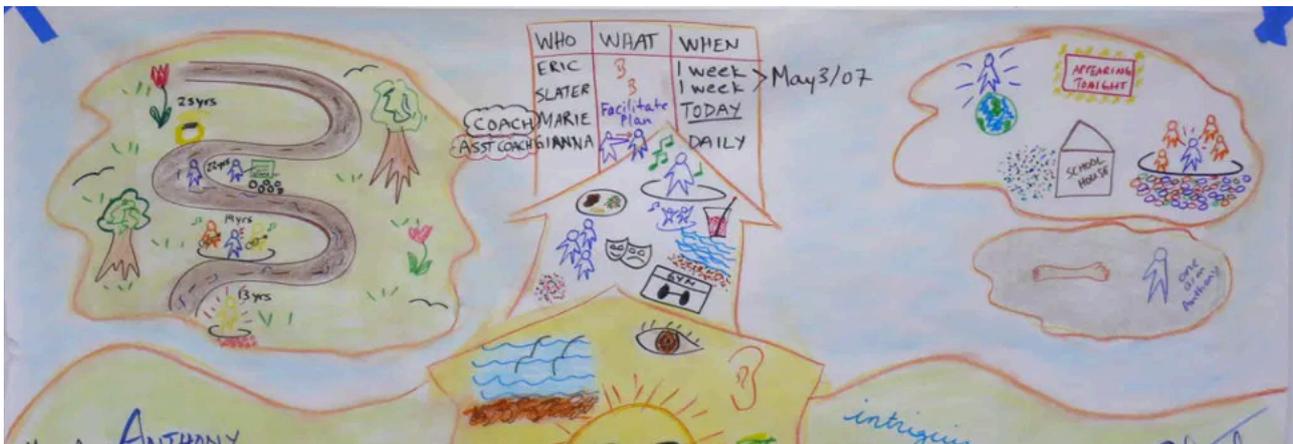
- **Setup.** The next preparatory task is to think about a good place for the meeting. It should be a setting that suits the main person and their needs. For example, it can be their favourite coffee shop that has a quiet second room, a room in a community centre, or also somebody's living room if that is what the person wants. In terms of setup, some thought should also be given to food, decoration, a centre piece in the

middle of the circle, music or other things that contribute to the wellbeing of the people present and to ensure that the planning meeting is a pleasant experience.

- **Facilitation.** Person Centred Planning is typically required to have two facilitators. One facilitator makes sure that everybody's voice is heard and that all people present in the meeting have a chance to contribute. Usually that is also the person who helps to prepare the planning meeting with the main person. The second facilitator is the graphic recorder. Their task is to ensure that everything being said and planned is depicted on the poster. Visualising the things that are happening during a planning meeting with symbols, pictures, and colours is useful to express and depict feelings or images of dreams. It also helps to spark creativity and imagination and leads to a different atmosphere than if things are 'just written down' on a flipchart.

There are different ways of Person Centred Planning. The two most well known are probably MAPS – like a treasure map – and PATH – like a path to the dream (O'Brien, Pearpoint & Kahn, 2012).

MAPS contains a set of questions to learn more about a person, their interests, strengths, gifts, dreams and needs. All questions are thought of together in the group to make sure that everybody can contribute their answers.

Figure 8: Example of a MAPS


Source: https://inclusion.com/path-maps-and-person-centered-planning/maps_planning

PATH is used when there is a need to think about how to achieve big dreams and how to reach certain goals. It invites the planning group to plan, step by step, to think of what else, or who else, is needed to make progress and what the group needs to work towards the dream.

Figure 9: Example of a PATH

Source: https://inclusion.com/path-maps-and-person-centered-planning

Sometimes, neither MAPS or PATH are used in a meeting. Other times, in longer meetings for example, they may start with MAPS and then move on to a PATH planning afterwards (Hinz & Kruschel, 2013).

A Person Centred Planning meeting will very often leave lasting memories for everybody involved. Many people say afterwards that, for them, it was "an honour to be invited." When recalling some of the meetings that we taken part in, there are two aspects that will never be forgotten:

Gathering different ideas and dreams: During the Person Centred Planning process, all people present are invited to share their dreams and visions for the main person. In Sandra's example, which is mentioned below, it was a wonderful surprise both for the main person and the group to look at all the ideas gathered and to realise how diverse and inspiring they were. This variety can only be collected when taking time and planning with a group and not when thinking on your own. Margaret Wheatley says:

"We need time to think about what we might do and where we might start to change things. We need time to develop clarity and courage. If we want our world to be different, our first act needs to be reclaiming time to think. Nothing will change for the better until we do that" (Wheatly 2009:103).

Encouraging the main person by sharing their strengths and talents is done in MAPS. One of the first questions all the participants are asked is to think of the main person's strengths, talents or gifts. During one meeting, everybody was given some index cards to write down all the strengths they saw in the person. After they had written on the cards, they took turns to present their cards to the main person. It became visible, gradually, card by card, how much this meant to the person because with every single card the person sat more upright, became more present and smiled a bit more.

Challenges and misperceptions of Person Centred Planning

As with most things in life, Person Centred Planning comes with some challenges and there are some common misperceptions which this section addresses.

There are many Person Centred Planning projects, practices and publications connected to disability. This makes sense because for people labelled this way, it is much more difficult to leave traditional ways of institutionalisation and to step outside of their boundaries to create their own good life. Some people may say that Person Centred Planning *is* for people with a disability.

However, this would be a problematic limitation to the possibilities of Person Centred Planning. Jack Pearpoint, one of the pioneers in Person Centred Planning, "never thought that this work was about disability" (2011: 76). Person Centred Planning started in the field of marginalised people and their emancipation. It can be used for every person who is in a situation of not knowing how to move on. This method will work for any person needing support in developing new perspectives for their future and some help to find answers to some of life's "great questions."

Some people believe that Person Centred Planning aims to increase self-determination. Of course, it is an empowering process for the main person, but that is not the main aim. It is much more about being and feeling included in the community by using a systemic approach. There are always people around the main person involved. That is why it is not a peer-counselling approach but an approach with a support circle as diverse as possible. Although people of the same age and with similar experiences sometimes are extremely important for free association and for creating a positive dynamic.

"All means all" also relates to age. There is a wide spectrum of people who can benefit from Person Centred Planning – you could say from 5 to 85, as the following two examples demonstrate:

Where to go to school and be welcomed?

There was a five-year-old girl with speech difficulties, facing the challenge of starting school. Of course, she did not say 'I want Person Centred Planning,' but her mother heard about it and it seemed to be a chance for her, as the mother, to gain more confidence and support going to a primary school to enrol her daughter. At the end of the process, three 'best friends' offered to go with her to a school, in a confident and determined manner, and to explain to the principal what an opportunity it would be to have her daughter as a student in their school.

In this example, the main person is the five-year-old girl speaking seven words. Then, secondly, in a systemic understanding of person centredness, the parents, who were feeling powerless, can also be considered main persons.

> *Andreas' example –* ***How to have a good time until the end of life?***
>
> *My mother had decided to move into a senior's home in Germany for her last years. She didn't know what would happen there, she was non-verbal after a stroke. Institutionalisation was evident, starting with ignoring her personal wishes, for example, giving her coffee (which she hated) instead of tea (which she loved), switching on the radio to pop music (which she hated) instead of classical music (which she loved as a former piano teacher) etc… I felt the need for Person Centred Planning for her, or should I say also for me, as her legal guardian. We invited people from the family, the neighbourhood, friends, but no one from the institution, as we had no trust in them. We did something very strange: My mother wasn't there because she didn't feel well, so, we did it without her, which is usually not correct. If you work in a person centred way the main person should be there. However, that was our situation. Finally, right after the meeting, we read the ideas we had agreed upon to my mother and she squeezed my hand a little with her hand, which we interpreted as her consent.*

This example (Hinz, 2015) shows that in addition to the systemic approach, you also have to be flexible, to adapt to the situation, the context and the culture you are in. On the other hand, there are some principles which are really important, for example, not to plan without the main person. These must be followed and respected in order for Person Centred Planning to remain as open and powerful as it has been since its creation. That is why we introduced the four cornerstones at the beginning of this chapter.

After the Covid-19 pandemic, virtual meetings and gatherings have become more common. This might also be an option for Person Centred Planning, at least according to some facilitators and people who don't have much time or don't want to travel. Of course, online gatherings might be feasible if the other option is to not meet at all. It may also work for a follow-up meeting. For the main planning session though, when meeting for the first time and for establishing the support circle, we strongly encourage in-person meetings and believe in the power of people physically gathering in a room, just like Jana Zehle emphasises:

"At the same time, however, I would also like to emphasise that building and maintaining relationships requires a physical, concrete encounter that is created and experienced in dialogue in the sphere of interpersonal relationships and not in the digital realm of possibility or possibly with a digitally controlled counterpart" (Zehle, 2024: 17).

There are also other challenges to Person Centred Planning, which we look at briefly here:

One challenge is connected to the cultural context. In some societies, dreaming is not encouraged (during the day), and it may seem unthinkable to dream together with others – as could be seen in the example story of the boy who wanted to be a medical doctor. In some societies, talking about challenges openly may be seen as a weakness. For example, in Germany, there are often discussions before a Person Centred Planning meeting, reviewing if a person or a family really needs this and if they should rather solve 'their problems' themselves. Even the idea of who could be called 'a friend' differs from society to society. In some places, Person Centred Planning could be seen as something 'exotic.' In other societies, maybe in some parts of Africa, where the culture of Ubuntu is still alive, it may be more acceptable (Asante, 1997).

There are also many challenges for the people who facilitate Person Centred Planning:

- Their role is to make sure that each and every voice is heard and their ideas influence the process and the poster, for example when using MAPS or PATH (see above). On the other hand, no one should be put under pressure to say something and to contribute.
- Sometimes, complicated dynamics could arise. For example, the mother, the primary teacher, and the secondary teacher may compete to see who knows best how to protect and support the main person. Or it could be a family with divorced parents where the father is living apart from the rest of the family. If they meet during the planning, there could be tendencies of devaluing him by sarcastically saying: 'Wow, he has an idea – wonderful!' Or it could be difficult to find a gift in the person, especially if the perception of the circle members is that everything is difficult; everything is terrible; there are no people around; and that there is nothing they can do.

In this instance the facilitator's job is to reframe the situation as even the most terrible situation could have a potential for positive change. Therefore, facilitation is not easy, but it has tremendous potential. As Ines Boban (2007) once said, about the role of the facilitator: "You have to dance with the group!"

---

*Sandra's example – **Deciding on job opportunities***

About 10 years ago I was about to finish my academic education and began to wonder where my 'job path' would take me. I started having conversations with a lot of people, which resulted in many interesting, highly diverse ideas and recommendations. Looking at these possible next steps, I felt unable to find an answer to this question by myself. As I am also a facilitator for Person Centred Planning, the next thought was obvious: I will have Person Centred Planning for myself!

After finding a facilitator friend who agreed to host the meeting, I started with a relationship map and was amazed by the number of people I knew. The page was full of names. Then there was a major task of choosing who to invite to the planning meeting. In the end, there was a group of about 20 people coming together and thinking about my job path. It was great to learn all about what people thought I was good at and what their ideas were about what I could do next. Some of the things I had never thought of myself, so they were quite surprising (like using my interest in books and opening a bookstore). At the end, with the support of the group, I was able to decide, and we jointly developed a '10-year path' and dreamed of all the major steps that would happen in the next 10 years. Looking back, I still feel very empowered by the Person Centred Planning and even though I didn't look at the path too often, I lately realised that almost all of the things written there I accomplished. Maybe it is time for another Person Centred Planning?!?

Person Centred Planning in projects and systems

Until now within this chapter we mainly focused on person centred planning and their families as a systemic background. Person Centred Planning can be practised on different levels (Kruschel & Hinz, 2015). It is also suitable for entire systems, for example, a whole city on the way to inclusion. An example of this is the city of Wiener Neudorf in Austria who started a project to become more inclusive (Braunsteiner, 2016). First, they connected kindergartens with the primary school and the communal parliament, and children began to have a monthly hearing in parliament. The municipal government unanimously decided to commit itself to the values of inclusion. Some years later, they expanded this to the whole city, with areas that were meeting places for people, a better cycling system, a welcome

package for newly arrived migrants and lots more. Again, some years later, the steering group evaluated the development. Every planning stage was done using MAPS and PATH; the initial, the extended, and the reviewing processes. Many different people, from children to the elderly, were involved, and every time all of them dreamt of the most inclusive city they could imagine. Then they implemented lots of steps in the plan, many of them much earlier than planned.

Person Centred Planning can be a great support for projects, for groups, for clubs, for initiatives and for situations of any kind, for example with supported employment or community living. If there is a psychiatric ward to be closed in two years and all former patients transferred to their own flats with support, Person Centred Planning will be helpful (and has proven to be so in the past).

Person Centred Planning can be useful for the development of schools, especially if they do this in a participatory way and with inclusion as a 'North Star' (O'Brien, Pearpoint, & Kahn, 2010: 70-71) or 'Cruz del Sur' (in the Global South), to guide their work. There are some examples on how schools connect planning processes with the concept of the Index for Inclusion (Booth & Ainscow, 2011). Also MAPS and PATH fit as action plans with Mel Ainscow's contribution to phases of school development in the Index if they are adapted and made accessible for children. These posters can be presented to the public for weeks in the school building, which increases the potential of being realised (Boban & Hinz, 2015). Sometimes, schools use Person Centred Thinking posters to evaluate their school development. Also, a participatory action research project with a school in Iceland used these person Centred ways for planning (Jörgensdóttir Rauterberg & Hinz, 2024). Therefore, ways of Person Centred Planning fit with processes of organisational development on different levels, they were in fact adapted from them, as you can read below.

Person Centred Planning, a practical approach – and what about evidence and theory?

Looking back to when Person Centred Planning came about, the focus was on one person, with organisational development methods in the background.

Where did it all start?

Once upon a time, there was a woman called Marsha Forest who worked at York University in Toronto. She had read some wonderful poems by a young lady, Judith Snow, and then tried to invite her to the university to talk to the students. However, she found out that this young woman lived in a senior's home and she was totally shocked. How can it be that a young woman lives in a senior's home? One of the reasons was that her parents were not able to care for her anymore, to turn her over in bed, for example, at night.

Then Marsha started to think about how they could support Judith so she could live as she wanted, and not be forced to live in the senior's home. They started a circle, calling it first 'Circle of Friends,' and later they called it 'Circle of Support.' They asked several people to join, and they worked until Judith had her own flat and her own assistance there. They say this was the first person in Canada who had a personal budget and support. However, the story doesn't end there.

Some years later, Marsha Forest got a breast cancer diagnosis. This time, Judith was the one who said: 'Oh, let's meet again. Let's build a support circle and let's think about what can be done.' There were so many aspects to think about: Who cares for the cat? Who cares for the plants? Who cares for the fishes in the aquarium? Who goes every Friday to her mother to have tea together? Also, who's accompanying her to her next therapy session? So, they sat down and planned for this together. Unfortunately, this story has no happy ending because Marsha passed away in 2000. Nevertheless, she had a much better quality of life than she would have had without all the people supporting her. And what about Judith? She lived until 2015 – 35 years longer than doctors had predicted.

This story shows that the start of the whole development was a very practical one in Toronto during the 1980's (Pearpoint, 1990, 2011). People were caring for one another and supporting one another. From that starting point Person Centred Planning has spread worldwide to many countries and many different contexts.

Evidence

One of the strengths of Person Centred Planning is that it developed from practice and the way it has spread to many different parts of the world speaks to its success.

There are practitioners' networks established, primarily in the disability sector, which support the further development of practices. For example, after two big European projects (Lunt & Hinz, 2011; Niedeck, Lindmeier, & Meyer, 2015) the *New Paths to Inclusion Network* includes organisations of persons with disabilities, service-providers, universities and research centres, which aim to equip practitioners with the knowledge and skills necessary to respond to the individual needs of persons with disabilities.

Although primarily focused on people with (intellectual) disabilities, there is also empirical evidence to support the use of Person Centred Planning (Claes et al., 2010; Gray & Woods, 2022; Gregory & Atkinson, 2024; Holburn, 2002; Isvan et al., 2023; McCausland et al. 2022). However, it is challenging to fully capture the outcomes of Person Centred Planning in research as some outcomes tend to be difficult to measure. For example, how can we measure the impact of the main person fulfilling a dream, or getting closer to doing so? Or how can research capture the *'ripple effect'* on everyone in the support circle or the wider community? If we only measure employment attainment or active participation in formal learning or activities, important aspects related to human flourishing, wellbeing and quality of life get lost.

Theoretical alignments

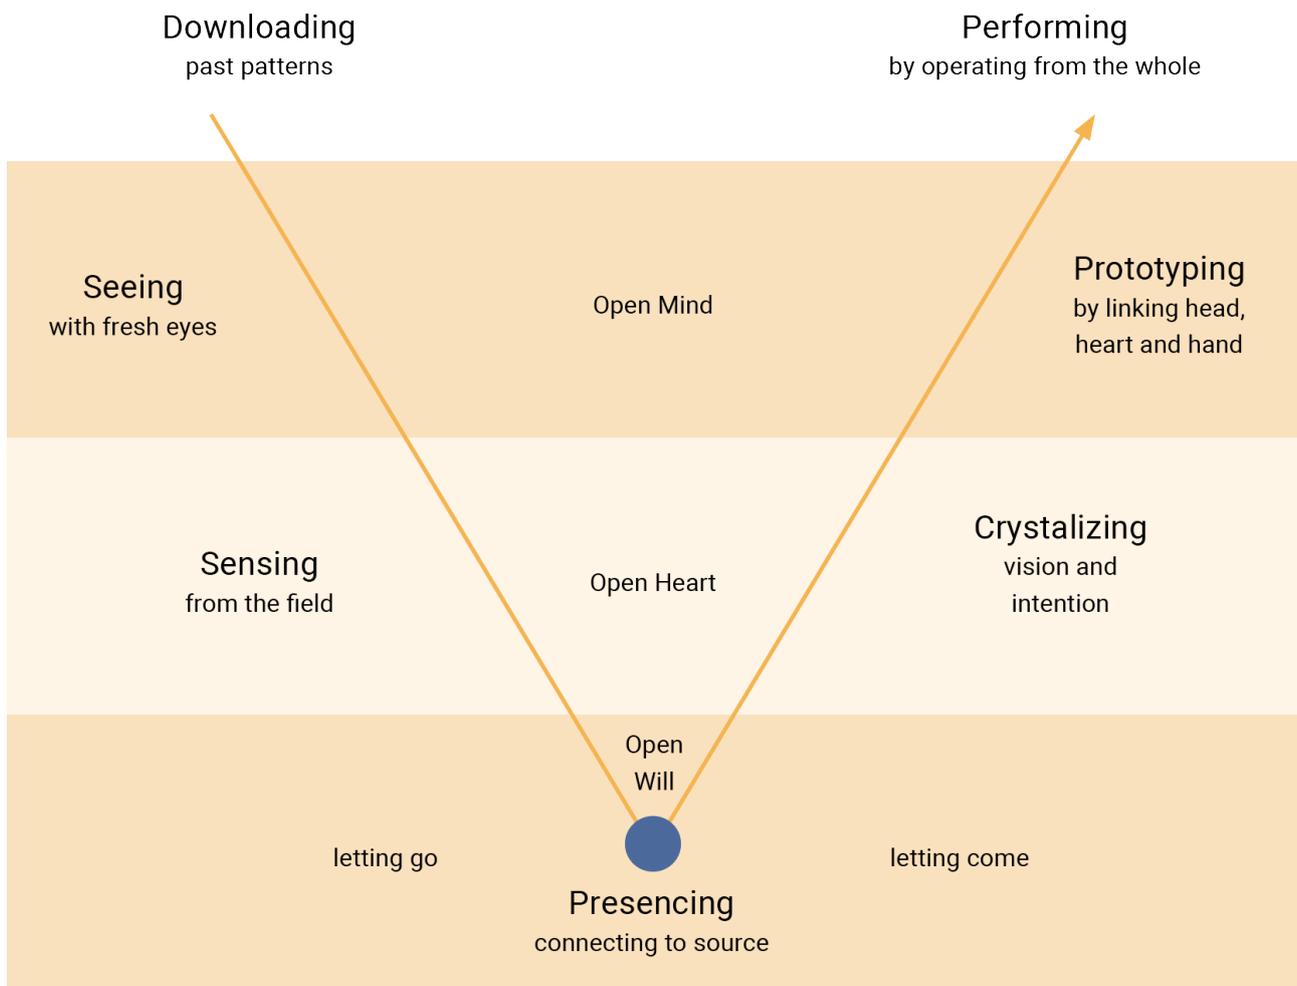
While Person Centred Planning is not associated with one particular theory, we consider here some theories which help to further explain its success story, and why it works. The theories we have chosen to include are Carl Rogers' humanistic and person centred approach, Otto Scharmer's Theory U and Pierre Bourdieu's capital theory. There is of course potential to apply several other theories which we refer to very briefly afterwards. However, for the purpose of this chapter, we have focused on three theories which we consider to be particularly relevant.

Carl Rogers' (1961) person-centred approach has significant connections with Person Centred Planning, not only by name but also in relation to some core aspects which will be outlined shortly. Carl Rogers was an American psychologist who developed a theory from his therapeutic practice and research in the 1960's. However, Rogers went on to contribute more broadly to the field of education through his book *Freedom to Learn* (Rogers & Freiberg,1994).

Central to Rogers' humanistic and person-centred theory is the notion that we are all experts of our own lives, which is also at the heart of Person Centred Planning. It can often be challenging for professionals to step out of the role of 'expert' and try not to be the person with all the answers, not least for teachers who may identify as experts in their subject areas. Nonetheless, it is central that person centred work is grounded in the assumption that each person can make decisions about their own lives, albeit sometimes with the help of others. With this understanding of the person, it becomes essential that we listen to and support the person to dream.

Another assumption of Rogers' theory is that we are all inherently motivated to self-actualise, or to realise our potential. However, Rogers suggests that growth and self-actualisation rarely happen in isolation. For a person to grow, and to live their best life, there must be mutually optimistic, warm and understanding relationships. Again, this supports the use of the 'circle of support' in Person Centred Planning. Rogers goes on to explain that such relationships help to develop self-awareness, self-esteem and confidence in one's own decision making.

Another theory that could provide an explanation for why Person Centred Planning can be successful is Otto Scharmer's Theory U (2009).

Figure 10: Theory U


Own illustration according to Scharmer and Kaufer 2013: 22.

In his theory, Otto Scharmer introduces two different ways of dealing with problems or of answering questions. The most common way is called *downloading*, where we apply knowledge and experience from our past (*'past patterns'*) and try to solve issues based on that. It is relying on our current knowledge. From Scharmer's point of view this creates 'more of the same,' leading to typical results, reproducing well-known solutions.

Person Centred Planning, as we have mentioned, relies on a common process of creativity and generating ideas. This is what Scharmer refers to in his Theory U (*'performing – by operating from the whole'*). Instead of using existing knowledge and solutions, the first important step when faced with questions or issues is to let go of what we already know. He invites us to listen deeply, with an open heart, an open mind, and an open will. Instead of 'downloading,' people should be present and sensitive to collectively generating a culture of listening and awareness that enables new ideas and thoughts (Scharmer & Kaufer, 2013). These new ideas are, in Scharmer's theory, "prototypes" (ibid: 21), new ideas and ways of trying to deal with the questions and challenges we are faced with. After the collective phase of listening and generating, we are then invited to start testing the prototypes, just like in PATH, when we think of goals and steps to achieve and then develop a plan of who will try what, when and with whom.

It's listening to each other, being open to new ideas, being open to whatever wants to be born out of this process and then, putting these ideas into practice, by testing if those are possible solutions or answers to the questions that we face. Due to this large overlap of thinking and theoretic aspects, Otto Scharmer's 'Theory U' has been used as a foundation for several projects implementing Person Centred Planning, for example the European Project "New Paths to InclUsion" (with capital U) and is widely used in that context (O'Brien & Mount, 2022).

Another theorist who never heard about Person Centred Planning but could, based on his ideas justify why it works, is the French sociologist Pierre Bourdieu. In his capital theory he distinguishes between different sorts of capitals which form the position of a person in society (Bourdieu, 1986). They are interconnected and characterised (1986: 241)

- "as *economic capital*, which is immediately and directly convertible into money and may be institutionalised in the form of property rights;
- as *cultural capital*, which is convertible, on certain conditions, into economic capital and may be institutionalised in the form of educational qualifications; and
- as *social capital*, made up of social obligations ('connections'), which is convertible, in certain conditions, into economic capital and may be institutionalised in the forms of a title of nobility."

If Bourdieu knew Person Centred Planning, he could argue that it is a process of increasing social and cultural capital in a very intensive way, because more people, more knowledge, and more connections with others are established through the Planning. People are more included in different contexts through the diverse group of the support circle and not just in 'one bubble.' Person Centred Planning has huge potential to support the main person to go through a process of growth. A person's situation has the chance to become much better than before and enables a better position in society, not automatically but potentially. It can sometimes be seen throughout a planning meeting that the main person is almost physically growing and starting to shine (as mentioned in the example with the index cards).

There are many more theorists who would be able to argue that Person Centred Planning works if they knew about it:

- Axel Honneth (1996) could say that Person Centred Planning is something like a 'bath' in recognition, especially on the level of solidarity between the main person and the support circle.
- Kurt Lewin (1951) would maybe say based on his Field Theory that going through person centred processes is enriching positive 'valences' in the field, which strengthen the person. They could also raise awareness for individuals who act as inspiring and supportive 'crystallisation cores,' as newer adapters of this theory would say (Burow, 1999).

- Uri Bronfenbrenner (1979) could argue that Person Centred Planning is an example of an intense 'proximal process,' contributing positively towards the development of the main person by increasing competency and buffering social connections.
- Riane Eisler would say based on her partnership-domination scale that Person Centred Planning is a way of practising a very partnership oriented, egalitarian communication and co-operation with equally valued and different persons in a circle, ideally far from any tendency of domination and suppression, "nurturing our humanity" (Eisler & Fry, 2019).
- Hartmut Rosa could argue, based on his Theory of Resonance (2019) that Person Centred Planning is a great example of intensive experiences of resonance. Especially in the MAP process where supporters tell the whole circle what they would miss if the main person would not exist, which is often an emotionally overwhelming situation, including being moved to tears (as the example from Germany shows).
- Hermann Haken (1988) developed the synergy theory and emphasises co-operation, co-ordination and complementarity among various elements of disorder in the system, so that various forces within the system can gather and form a joint force, then produce an orderly state and play the overall function. He could argue that Person Centred Planning is a great example for strengthening the connection in school and beyond, building the co-operation mechanism; ensuring orderly and effective collaboration, and taking the development of children as the starting point.

Our central message, which we hope you bring with you from reading this chapter, is the importance of seeing the whole person, and their future, and to recognise that you, as a teacher, can have a significantly positive impact on others by doing this.

If you want to learn more

Here are some good places to start:

Title / Topic	Available
Inclusion Press, Toronto, USA A website, co-directed by Jack Pearpoint & Lynda Kahn, with articles, books, videos etc. on Person Centred Planning and more, for people in education and community settings.	inclusion.com
Helen Sanderson Associates (HSA), UK A large collection of resources (reports, videos, books etc.) aimed at various settings, including schools. Many tools mentioned in this chapter are available for free here.	www.helensandersonassociates.com
Personalising Education – A guide to using person-centred practices in schools, by Sanderson, Goodwin and Kinsella, A collection of person-centred thinking tools and how you can use them in a school setting	https://www.swindon.gov.uk/download/downloads/id/10326/ personalising_education_-_a_guide_to_using_person-centred_practices_in_schools.pdf

HWB, an education website of the Welsh Government Several documents from 2015 available to download, related to working in Person Centred ways in schools and beyond. E.g. ● *Person-centred practice in education: a guide for early years, schools and colleges in Wales* ● *Person-centred reviews toolkit: guidance for education providers* ● *Developing as a person-centred organisation. Guidance for schools, colleges and nurseries on how to become more person-centred*	https://www.gov.wales/person-centred-reviews-guidance
Beth Mount's homepage, with many books, workbooks and artistic cards etc., available to download. Primary focus is on supporting people with disabilities.	https://www.bethmount.org
Inclusive Solutions, an organisation based in the UK that delivers facilitation of Person Centred Planning as well as training in facilitation etc.	https://inclusive-solutions.com

Netzwerk Persönliche Zukunftsplanung A network across German speaking countries on Person Centred Planning	www.persoenliche-zukunftsplanung.eu

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

- If you, as a teacher, was to implement one aspect of Person Centred Planning, what would that be?
- What could be the first step to make that happen?
- Thinking about your life so far – could you have benefitted from Person Centred Planning at some point?
- Thinking about your future – what could be a 'great question' for you to work on?

About the authors

Andreas Hinz

Andreas Hinz was a teacher. From 1999 to 2020 professor for Inclusive Education at Martin-Luther-University Halle-Wittenberg in Eastern Germany, from 1986 to 1999 member of a research team on 'integrative' school experiments in primary schools in Hamburg. Co-founder of a small inclusive hotel (barrier-free and with a mixed team of employees) in Hamburg, working since 1993. Active in Democratic Education since 2008, ten years cooperating with the Institute for Democratic Education at the Kibbutzim College for Education in Tel Aviv, joining lots of European and worldwide conferences of the Democratic Education movement. E-Mail: andreas.hinz@paedagogik.uni-halle.de.

Petra Elftorp

Elftorp, Petra; Dr., Associate Professor, lecturer and course director of a Masters in guidance counselling and lifespan development at University of Limerick in Ireland. Key research interests relate to inclusive practices, person-centred approaches and career development. E-Mail: petra.elftorp@ul.ie

Sandra Fietkau

Fietkau, Sandra; Dr., social worker, has been working on different projects promoting inclusive structures and societal development in the south of Germany for almost 20 years, researcher on support circles, more inclusive service settings

and social space development, also a facilitator for Person Centred Planning and convinced of the generative power of these forms of planning and getting together. E-Mail: mail@sandra-fietkau.de

Yuzhen Xu

Xu, Yuzhen; worked as an itinerant teacher in 2006, helping teachers to plan to profile and address the needs of students, and has chaired research programs on changes of special schools in the context of inclusive education, transition for the disabled children, etc. E-Mail: yzxu2003@163.com

PART III

SECTION 3: CREATING INCLUSIVE LEARNING ENVIRONMENTS AND PARTICIPATION

CREATING A FRAMEWORK FOR INCLUSIVE LEARNING ENVIRONMENT

Deirdre Forde; Chris Carstens; Cynthy K. Haihambo; Ulla Sivunen; Claire O'Neill; and Alessandra Galletti

Initial questions

In this chapter you will find the answers to the following questions:

1. Why are there perceived barriers in creating inclusive learning environments?
2. What needs to be addressed to make learning environments more inclusive?
3. What is the importance of culture in terms of linguistic minorities?
4. What is the importance of the curricular and sensory components of an inclusive learning environment?
5. Is it solely the teacher's responsibility to create an inclusive learning environment?

Introduction to the Inclusive Environment Framework

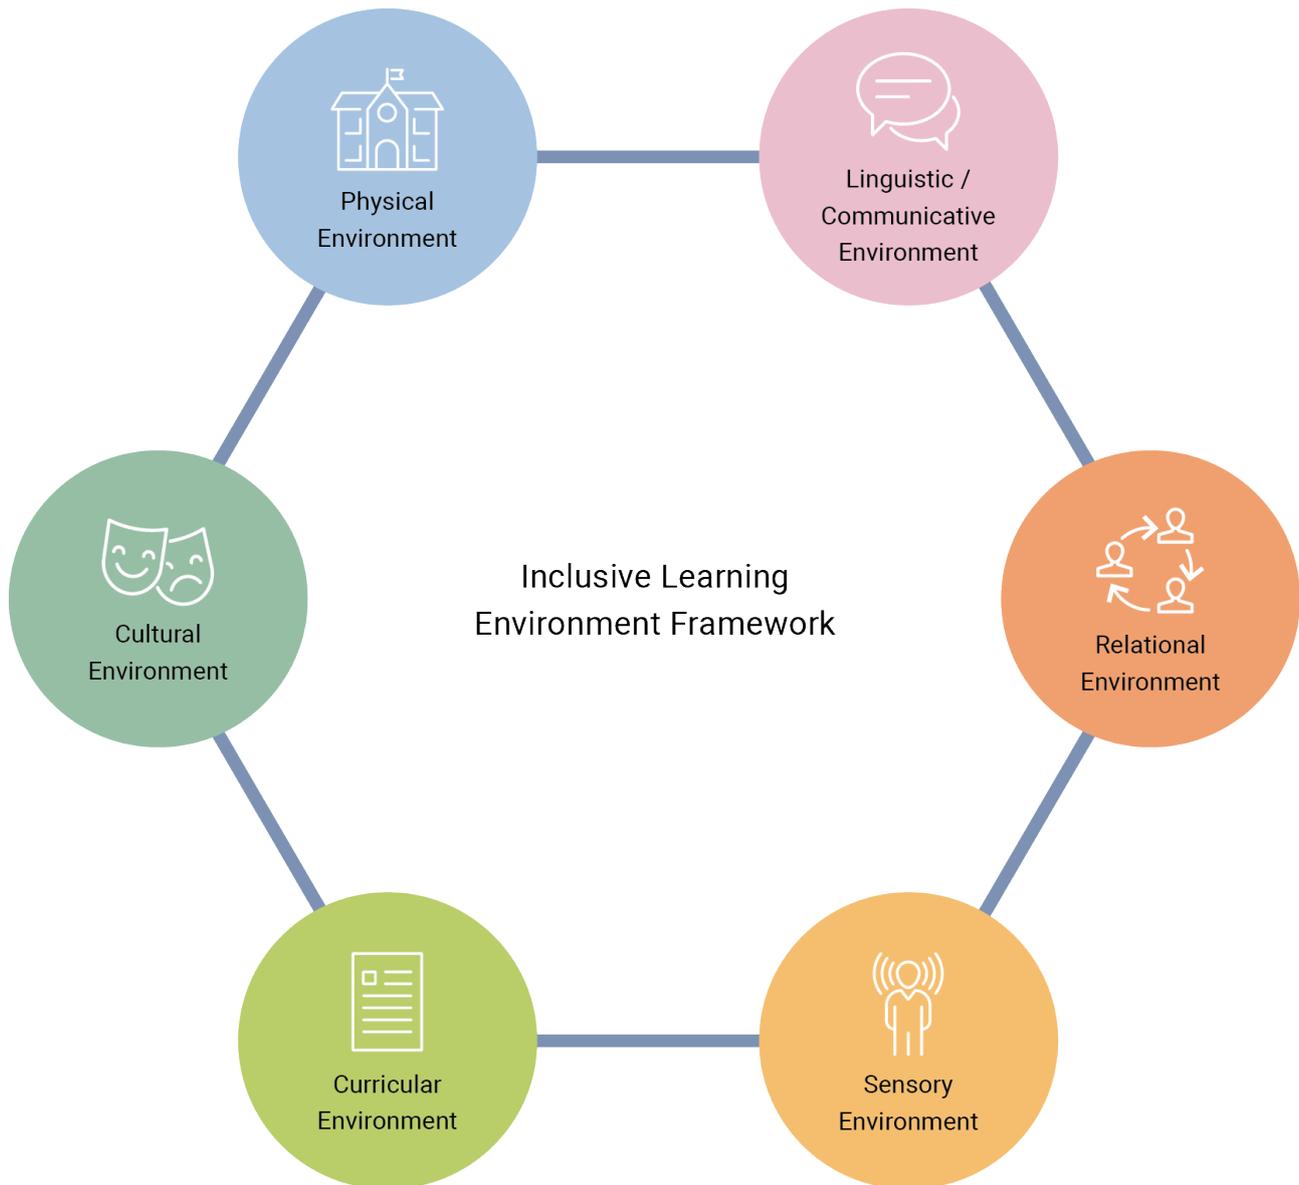
A group of teachers, advocates, researchers with diverse backgrounds, and other professionals worked collaboratively to design this chapter. It aims to answer some key questions about inclusive learning environments. The authors' varied backgrounds and experiences of different learning environments adds richness and complexity to the shared content.

In engaging with this chapter, the reader should be able to:

- Have an increased understanding of the dimensions of an inclusive learning environment.
- Identify some barriers and enablers to an inclusive learning environment.
- Consider an inclusive learning environment through the lens of the learner and, in particular, through the lens of a bilingual deaf learner and a neurodivergent learner.
- Identify ways in which the inclusive learning environment framework can be used to enhance professional practice and learner experiences.

This chapter follows a similar structure to other *All Means All Project* chapters, beginning with opening questions that set the stage for exploration. The main body then delves into core content, while closing questions prompt readers to engage in reflective practice and support their ongoing professional development.

While collaborating on this chapter, we each found that we needed different elements from our environment at different times, which made it challenging to decide what to prioritise. As we worked to condense the complexities of inclusive learning environments into a single chapter, the scope of our task became clear. Readers may notice some variations in the chapter's structure as we endeavoured to blend our perspectives on this multidimensional concept that lies at the heart of truly inclusive education. To simplify this complexity, we developed an inclusive environment framework, which we share here with the reader.

Figure 1. Inclusive Learning Environment Framework


(O' Neill, C; Carstens, C., Forde, D; Gambetti A., Haihambo,C. and Sivunen, U.)

When collaborating on this chapter, it became apparent that a framework was necessary to provide structure to this vast topic and the myriad ideas that we wanted to include. We share it with the intention for it to be a tool for teachers to plan, design, evaluate, collaborate, and reflect upon inclusive learning spaces. The components of the framework are physical, cultural, curricular, sensory, relational, and linguistic / communicative [Figure 1].

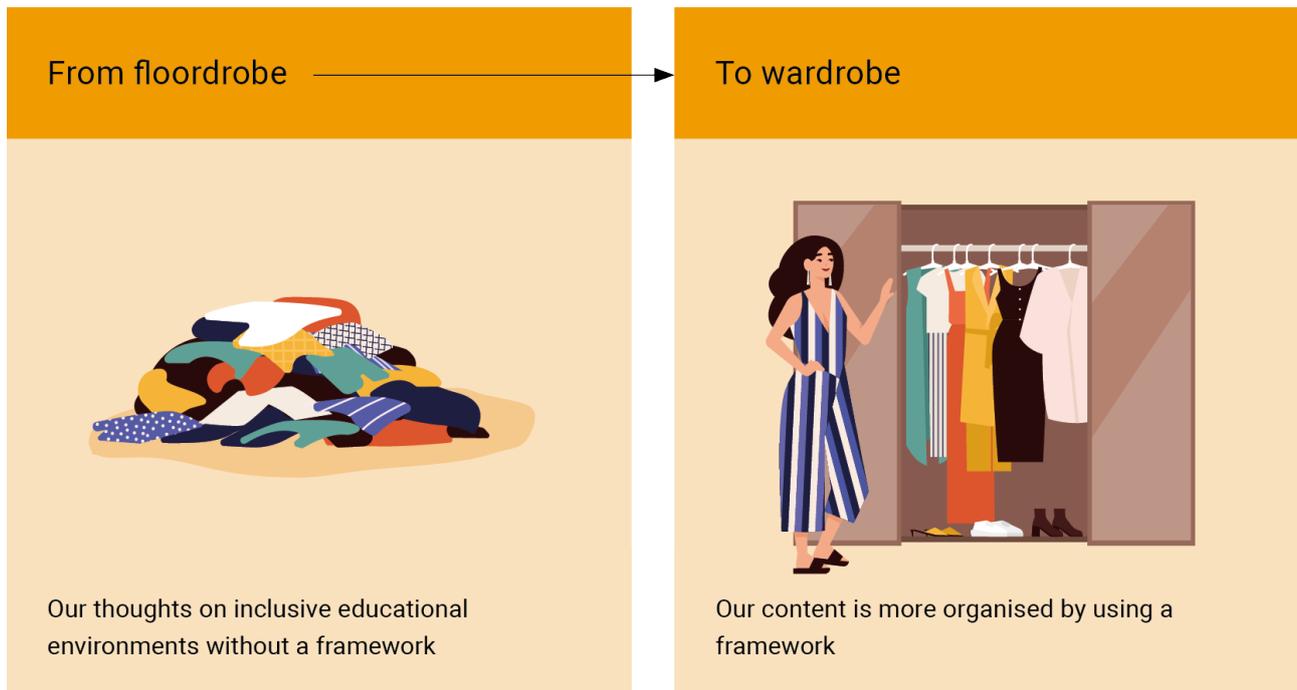
The analogy of a floordrobe or a chairdrobe [Figure 2] is helpful in explaining why to use a framework (Hargreaves, 2019). A framework can organise a work process into a streamlined, visually appealing, and organised "wardrobe"; the different framework components operating like hangers and shelves, organising ideas, and communicating written information in a structured way. Moreover, the visual representation communicates

the interconnectedness of the six components, thus further emphasising the importance of fluidity of thought when conceptualising inclusive learning environments.

Figure 2. Using a Framework

From floordrobe → To wardrobe

Our thoughts on inclusive educational environments without a framework

Our content is more organised by using a framework


(O' Neill, C; Carstens, C., Forde, D; Gambetti A., Haihambo,C. and Sivunen, U.)

Our diverse writing group needed to create a flexible space that accommodated each member's individual differences, making the process of building an inclusive environment a kind of real-life case study. For instance, one author, whose neurodivergent thinking style and multilingual background influenced their approach, found visual representations helpful in organising collaborative ideas and information. Additionally, the group embraced significant linguistic and communicative diversity. To ensure accessible communication, we used signed language interpretation services, facilitating effective collaboration between a deaf author who uses Finnish Sign Language and the rest of the team, who do not use signed language. By adapting to each member's needs—such as providing visual supports and sign language interpretation—the group embodied the principles of Universal Design for Learning and Inclusive Pedagogy. This collaborative approach provided multiple means of engagement, representation, and expression, resulting in an accessible, equitable, and inclusive working environment for all.

Frameworks are valuable tools that, like effective learning environments, help to clarify, organise, and support the learning process. Some alternative frameworks are included in the **resources section** of the chapter. The framework is offered here as a flexible tool to be adapted depending on the user, purpose, and context. Please make it your own.

We now turn to the six components of the framework. While the *All Means All Project* identifies thirteen dimensions of diversity, a detailed exploration of each is beyond the

scope of this chapter. Instead, we focus on selected components through our own unique perspectives. We encourage the reader to use dimensions of diversity applicable to one's context, learning environment or learners, as an opportunity to operationalise and individualise the framework.

1. The framework has six components:
   a. Physical
   b. Cultural
   c. Curricular
   d. Sensory
   e. Relational
   f. Linguistic / Communicative
2. Suggested Uses:
   a. Plan
   b. Design
   c. Evaluate
   d. Collaborate
   e. Reflect
3. The framework is a living example of an inclusive environment in action.
4. The components are interconnected and non-hierarchical.
5. The framework is adaptable and flexible.
6. Other frameworks are available and may suit the reader's needs better.

Six components of the Inclusive Education Framework

Physical

The physical environment is conceptualised as a space that is socially produced through the interplay of objects, structures and actions (Aristarchi & Venini, 1985). School space is often perceived as a void by those who occupy it, something inherited and difficult to change, whose function is almost taken for granted: the theatre of the lesson, the still scenery of school life. Instead, it can be inhabited, adapted, transformed and made more compatible with the activities that take place there (even without making particularly onerous interventions). We can perceive it through our senses and interaction with the people and the furniture there. It can be smelled, touched, heard, seen, written on, scratched, soiled, stained, painted, moved, opened, closed, dressed, occupied, washed and covered. It can make one feel safe or in danger, sheltered or exposed, comfortable or uncomfortable. How a physical school space is designed and used can determine the extent of levels of participation and how successful social interactions are. In considering the processes of

inclusion and exclusion, school spaces can exude a sense of welcoming and warmth where participation is a possibility for everyone.

It can indicate how to be used based on its conformation (Gibson, 1979). Space can increase levels of well-being based on how well it meets the needs of the people using it, thus it has the power to influence levels of inclusiveness (Kaplan, 1983). A clear pedagogical idea can be shaped through space design (Weyland & Attia, 2015) and therefore, the classroom environment is considered important in terms of influencing students learning and achievement and student attitudes (Vasquez & Oury, 2010).

Space can give information about itself, communicating where the resources one needs are located, through wayfinding (Lynch, 1960). Space, depending on its use, can enhance autonomous enjoyment and increase the perception of well-being. Perceived well-being provides a good basis for being able to increase inclusive practices (Cohen, 1980). In addition to providing equal use for all, it can be set up to serve as an interface for inclusive learning practices to make them more effective (Saffer, 2007).

The implication of space in the generation of exclusion is a topic in the international architectural, pedagogical, sociological and political debate (D'Alessio, 2012). The design and organisation of space can be elements that foster inclusion because accessibility can create inclusion or exclusion, and society is responsible for the exclusion of categories of people due to the presence of barriers within public space: it is society that makes people disabled, it is society that must adapt to people and not vice versa (Lettieri, 2008).

The awareness of school leaders is important in order to achieve the possibility of adaptive adjustments on the space, but the whole school community can also participate in this sense (Weyland & Galletti, 2016). If the whole school is conceived and designed to offer different opportunities for use – in compliance with inclusive teaching methodologies it could include places to work in small groups, places to work alone, places for meeting with the teacher, places dedicated to well-being and relaxation, spaces to be able to take different positions, informal spaces for discussion, open laboratories where one can try out what one has learnt directly, spaces to be used 'autonomously' by students (Caprino et al., 2022). Proposing a differentiated school environment can provide a good basis for responding to different needs, making the necessary adjustments according to individual situations, through the use of furniture. Alternatively, even small adjustments based on the organisation of the classroom and the outdoor environment can serve as a means to raise awareness throughout the school in the future (Weyland & Galletti, 2022).

To a large extent, the classroom environment is considered important in terms of influencing pupils' learning and achievement, learner attitudes and their sense of belonging. The use of space by a teacher to ensure a sense of belonging is cultivated and whether learners are participating with their peers and fully engaged in learning is central to whether a child is included in a school or not.

In conclusion, when considering the inclusiveness of space, it is important to refer to the features of the actual people for whom this space needs to be inclusive. For the school,

a Universal Design approach can help lay the foundations for an inclusive welcoming. The next step will be to adapt the space to individual needs, for which designers and teachers can define an intervention strategy with a multidisciplinary approach, where barriers to participation need to be removed. Spaces with glass partitions communicating to the classroom, bookshelves with wheels, whiteboards and movable screens, informal seating, shared and illustrated rules of use, orientation signs, furnished atriums for small group activities outside the classroom, are some of the elements that can positively influence the school's possibilities for inclusive uses.

Cultural

In this component of the framework, we discuss inclusive school culture and the teacher's role and responsibility in creating diverse and inclusive cultural environments. International mobility and digitalisation have increased linguistic and cultural diversity, and societal change (Blommaert & Rampton, 2011), which can be seen also in schools. UNESCO Universal Declaration on Cultural Diversity (Stenou, 2002) states, that we need cultural diversity, because it is a source of innovation, creativity and exchange. Cultural diversity is part of common heritage of humanity and we as educators should recognise and affirm it: "*As a source of exchange, innovation and creativity, cultural diversity is as necessary for humankind as biodiversity is for nature. In this sense, it is the common heritage of humanity and should be recognized and affirmed for the benefit of present and future generations*" (Stenou, 2002, p.4). For these reasons cultural diversity should be seen as an asset.

Inclusive school is about diversity of all people, including teachers and staff. When diverse learners see similar role models, they can identify with these adults and experience belonging to the school community as they are. All learners and adults get used to working with children and adults from a wide range of backgrounds. Diverse people create multicultural representations and cultural meanings that create a diverse and inclusive school culture with a sense of belonging.

The United Nations Convention on the Rights of people with Disabilities (2006) emphasises the importance of diversity amongst the staff of a school: It states that in order to help ensure the realisation of this right,

"*State Parties shall take appropriate measures to employ teachers, including teachers with disabilities, who are qualified in sign language and/or Braille, and to train professionals and staff who work at all levels of education. Such training shall incorporate disability awareness and the use of appropriate augmentative and alternative modes, means and formats of communication, educational techniques and materials to support persons with disabilities.*" (UNCRPD, Article 24)

An inclusive school reflects a democratic philosophy whereby all students are valued, educators normalise difference or diversity and a school culture reflects an ethic of caring and community (Baglieri & Knopf, 2004). Ideally, the school reflects the diversity of its

surrounding society, like a mirror. In moving towards inclusive education for neurodivergent children, the response to education requires stakeholders to address the deficit disability discourses which permeate the system. What is needed is a willingness to examine attitudes and to challenge the status quo and commitment to collaboration among all stakeholders (Forde, 2022). In order to address deficit-based cultures, schools must empower neurodivergent and other children with diverse background by accepting and celebrating their diversity in thinking, feeling and communicating rather than making them 'fit in' or shape them into meeting '*neuromajority*' or other majority norms. The Neurodiverse Paradigm, which is underpinned by a social model of disability is an alternative to deficit models of disability. It provides an inclusive and holistic world view that is welcoming of all kinds of minds and celebrates and values the differences inherent in humankind. Rooted in biodiversity and cultural diversity, the neurodiverse model recognises that different children need different support, and that society has a role to play in how 'disabling' a child's impairments are. In this domain, education is an essential catalyst for achieving change and representation of disability must be at the heart of transforming integrative approaches to more inclusive ones (Forde, 2022). There is no more powerful transformative force than education to build a better future for all (Baglieri & Knopf, 2004). With the mobilisation of a neurodiverse model of disability, which is a radically different model of practice and antidote to the medical model of disability, comes the possibility of disrupting the normative of the current system, to expand it and create social change for neurodivergent children, so that they can occupy the system as valued members (Forde, 2022). Indeed such activism could be expanded to include all difference in mankind and to disrupt the status quo, thus including not just neurodivergent children but all children who do not fit the 'norm'.

Curricular

As a student-teacher or a novice teacher, you probably have formed ideas about what a curriculum is. Most likely, you associate "curriculum" with the plan for academic content, including assessment. According to Stotsky (2012), *"a curriculum is a plan of action that is aimed at achieving desired goals and objectives. It is a set of learning activities meant to make the learner attain goals as prescribed by the educational system. Generally, it includes the subjects and activities that a given school system is responsible for. Moreover, it defines the environment where certain learning activities take place. Furthermore, curriculum defines what happens in any formal educational institution, and no school or university can exist without it. The concepts governing curriculum are dynamic in nature because of the changes that occur in everyday lives"* (p. XX).

The curriculum is broader than the formal document that comes from your education governing body and determines what to be taught and how it should be taught. It includes school cultures, the school spaces and approaches to teaching and learning. It includes

activism to address attitudes towards diversity and to address exclusion. It may also involve the active movements to decolonise curriculums so that children can see themselves reflected in its content. The curriculum in schools is supposed to enable all children to acquire knowledge and skills that will help them become independent, socially- and emotionally sound, adaptable and productive citizens of their communities and countries. Marsh and Willis (2009) view curricula as all the *"experiences in the classroom which are planned and enacted by the teacher, and also learned by the students" (p. XX)*. In this chapter, we describe curriculum as a plan of what should be learned and how it could be learned. It further entails who the learners are and how they can be enabled to learn through various means. We also consider who the facilitators of learning and socialization are and what values and attitudes they adopt to facilitate learning for all learners. The curriculum further entails the environment in which teaching and learning take place and how this environment is constructed and re-constructed to allow for creativity and diversity of learning and being.

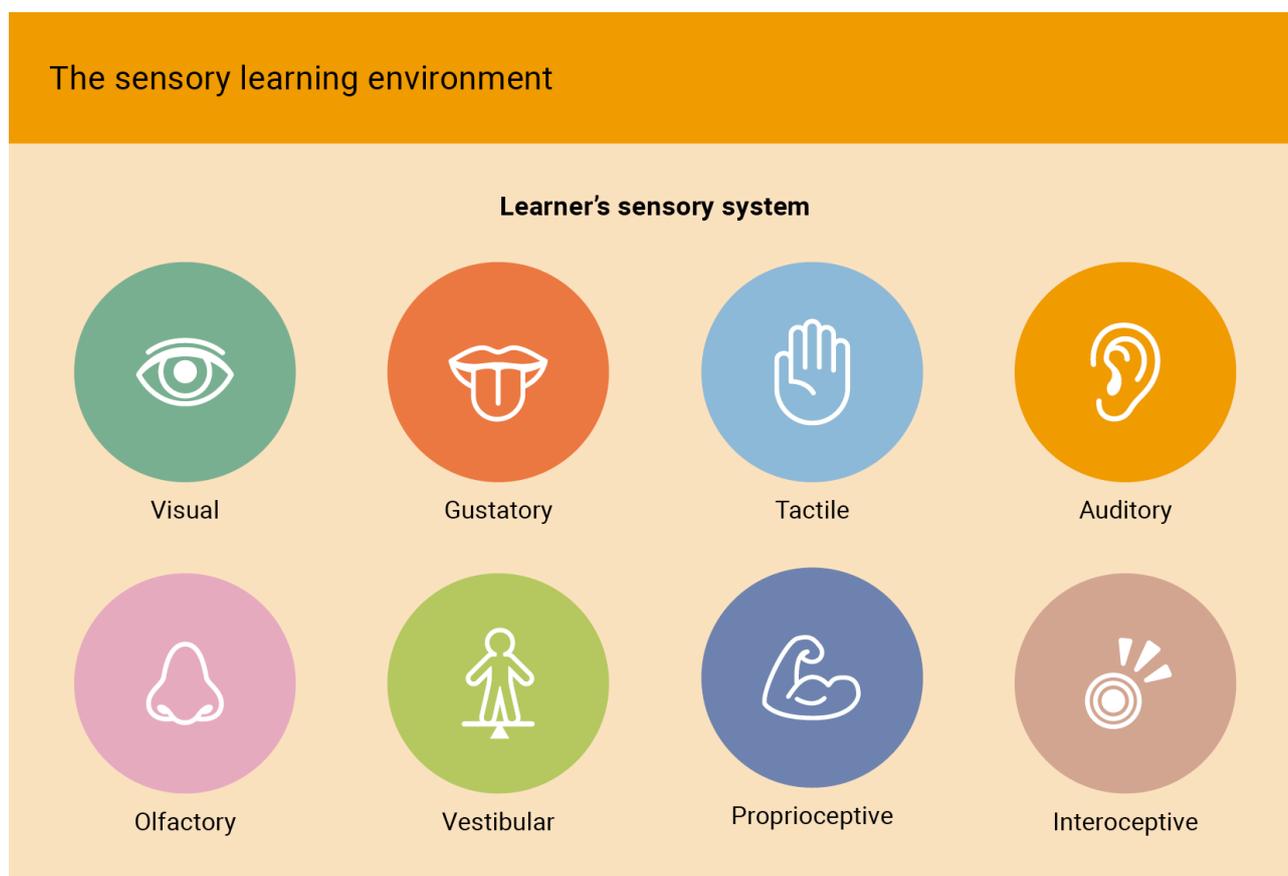
We are writing this chapter from the perspective of inclusive education, with a deep belief that all children and young people can learn and should be enabled to learn irrespective of their diversity. Societies are diverse and so are schools. Learners in schools are different and so are their teachers. Some learners have typical needs and can perhaps learn through any curriculum presented to them. Others might have neurodiverse conditions that will require the teaching and learning environments to be adapted to suit their learning styles. Others could have sensory difficulties, social-emotional and behavioural difficulties, physical and cognitive disabilities. Some learners are gifted or talented in specific areas while others are from under-resourced families in which their most basic needs are barely met. Learners with migration histories might have experienced trauma; those from racial and religious minority backgrounds might be stigmatised and suffer emotional trauma and rejection. Learners who identify as Lesbian, Gay, Bi-sexual, Transgender or Queer plus (LGBTQ plus) could experience repeated criticism, confrontation and labelling. Schools, through their curricula, have a responsibility to afford this diverse population of learners opportunities to experience belongingness, participate in learning and develop to their maximum potential, free from bias, ableism, prejudice, discrimination and stigmatisation. Please refer to the section on frameworks and ableism for a better understanding on the role of institutions of exclusion in schools and communities.

Most countries have adopted the learner-centered and competence-based curriculum models for their education systems. Unfortunately, academic achievement remains the most important measure and assessments remain rigid, without consideration for learner diversity. Learner-centeredness means child-centeredness. Child-centred means that the aspirations, potential and drive of each individual learner should be considered. Learners should be enabled to learn in the best way they can learn. An important part of learning is participation. We do know that learners are diverse with regard to physical, emotional, intellectual, linguistic, social, economic, sexual, racial, religious and personal development. Most curricular are developed for the typical learner and do not consider the diversity

of learners. Teaching and learning happen in average classrooms, based on the ideal assumptions of the conventional learner who, in accordance with typical development, lives in a family that loves them; have at least two nutritious meals a day; sleep on a relatively comfortable bed; come to school content and find happy classmates and teachers that are excited to engage the learners. We do know that this picture is flawed. Around the world, children are excluded from schools because of dis/ability, race, language, religion, gender, and poverty. It is the duty of the curriculum to reduce biases and inequities in education. This is despite various national and international legislation and conventions which suggest that education is a right of every child and that every child should receive education that is suitable to their needs. These include the United Nations Declaration of Human Rights (1948), Salamanca Declaration (1997), the Convention of the Rights of the Child (1990), the United Nations Convention on the Rights of Persons with Disabilities (2006) and many others. Globally, these international conventions have been domesticated and local policies developed to propel inclusive education and ensure that no child or young person shall forfeit their right to education by virtue of their diversity. However, millions of children across the world experience school as a hostile environment in which they are expected to fit in. Students can feel excluded in an education system when learning through a curriculum that is not friendly to diversity. While it is primarily the responsibility of school principals to create and oversee the implementation of inclusive learning environments, teachers have a key role to play as they deal with children and young people on a day-to-day basis and have deep insights into their classroom and school dynamics. Teachers should respond to diversity in a manner that shapes learners' attitudes and influence their behaviours by addressing negative attitudes such as racism, stigmatisation and prejudice and rewarding good attitudes and behaviours. While policies at all levels of the education system can support and help create diverse learner friendly environments, curricula should be developed and adapted to suit the strengths and interests of learners in your class (Wood & Haddon, 2020,). An inclusive curriculum helps learners from diverse backgrounds feel relevant and valued as they feel more connected to the course material.

Learners feel more included and develop a sense of belonging within the school community when the curriculum reflects and celebrates their diversity. Moreover, when students leave their comfort zones and step out into the real world outside the perceived protective environment of school, they should be prepared to deal with other cultures and people from diverse backgrounds. An inclusive curriculum prepares them for this by exposing them early on to the different viewpoints, cultures and identities of people. It instils in students values such as open-mindedness, empathy and cultural sensitivity so that they are better able to adjust to different working environments. An inclusive curriculum incorporates the social and cultural aspects of the community it serves and includes locally relevant themes and contributions by marginalised and minority groups. By ensuring an adapted accessible curriculum, learners are enabled to succeed and are motivated to learn in a welcoming and safe environment.

Sensory

Figure 3. The Sensory Learning Environment


The sensory component of a learning environment has a significant impact on all its inhabitants and not only the learners. That being so, some learners, including (but not limited to) neurodivergent learners, may experience significant differences in how they experience the sensory environment. This interaction between the person and the sensory environment can impact not only learning, but also wellbeing. In this brief introduction to sensory environments, we will focus on neurodivergent users of the learning environment. We will also use the principles of Universal Design for Learning (UDL) to represent this information visually in diagrams and tables throughout the section. In addition, the resources section of this chapter includes a video related to this topic. It is important to note that this section is not offered as a comprehensive overview of sensory systems, processing, integration or regulation. That being so, Continuing Professional Development (CPD) from an Occupational Therapist (OT) with a neurodiversity-affirmative approach and a specialist in supporting sensory differences is highly recommended.

A Brief Overview of Our Sensory Systems

With that caveat aside, when supporting neurodivergent learners, we consider how the

educational environment interacts with eight main sensory systems. Rather than describing these systems in a text-heavy way, we have instead used the table below to summarise some key points. The table can be used as an evaluative and planning tool to consider how the sensory learning environment can influence inclusion or exclusion in your learning space.

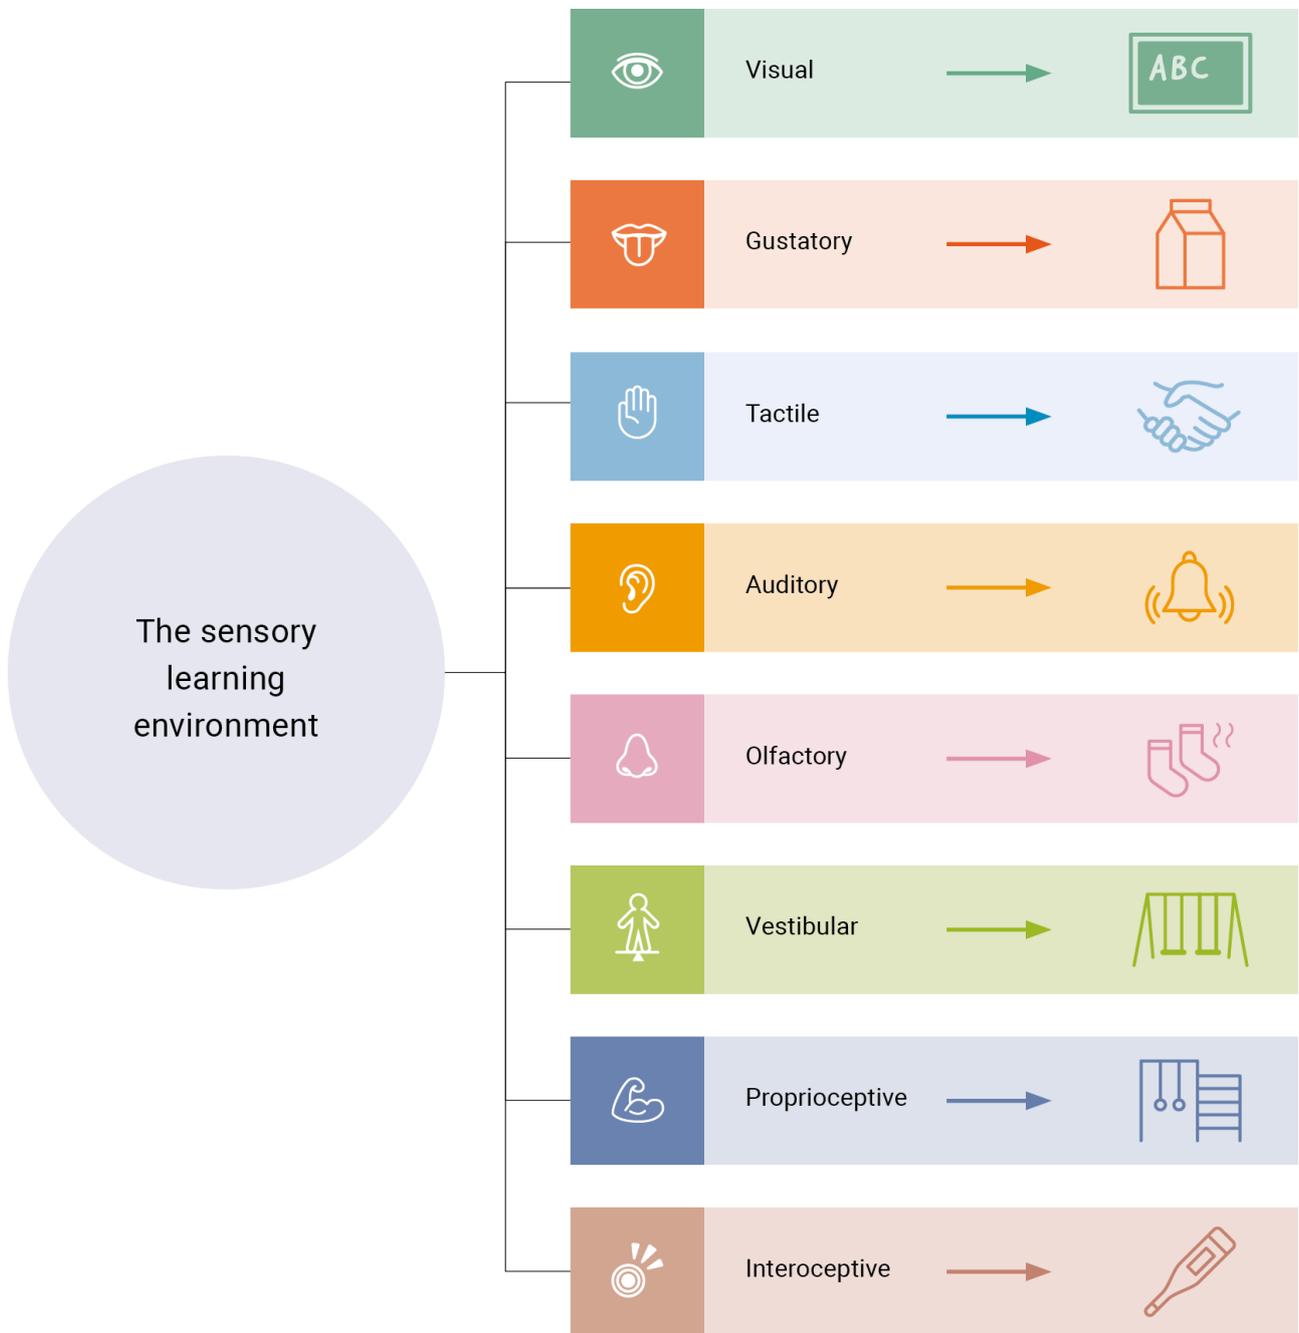
Figure 4. Making sense of the Sensory Learning Environment


Table 1. An explanation of Figure 4

Sense	Where in Body	Consider in the Learning Environment
Visual Sight	Eyes	· Lighting · Displays · Colours · Patterns
Gustatory Taste	Mouth, tongue and throat	· Healthy eating initiatives, especially when they reward tasting foods. · Lunch time.
Tactile Touch	Skin tongue mouth	· School uniform · Textures in hands-on lessons · Messy play
Auditory Hearing	Ears	· Space at desk · Crowded areas · Physical activity
Olfactory Smell	Nose	· Lunch time · Perfume/Aftershave · Air fresheners · Cleaning product
Vestibular Balance	Inner ear	· Seating options · Physical activity involving this system.
Proprioception Movement Sense of body in space	Muscles, tendons, ligaments, and joint receptors.	· Movement · Movement breaks · Chores involving heavy lifting
Interoception Internal	Nerve receptors inside and outside body	· Body sensations attached to emotions · Appetite · Thirst · Body temperature · Itching · Pain · Illness · Sleepiness · Toileting

In looking to theorise the interaction between the person and the sensory environment, there are many different avenues to explore. For instance, Merleau-Ponty (1962) considers the body as a key to understanding of our relationship to the environment that our bodies and sensory systems are immersed within. Overtime, the realm of theorising the individual's

interaction with their sensory environment has become a focus for Occupational Therapists (Ayres, 1972; Schoen et al., 2019). More recently a new wave of writing is emerging from neurodivergent individuals that explores the lived experiences of the users of these sensory environments (Milton, 2012; O'Neill & Kenny, 2023). What is clear from synthesising these different perspectives is that neurodivergent learners experience the educational environment in a highly embodied way. For example, challenging sensory experiences in the learning environment are frequently reported by autistic people (O'Neill & Kenny, 2023). The interaction between a poorly considered sensory learning environment and neurodivergent sensory systems can lead to overwhelm, distress, exhaustion, and significant health difficulties, including BIMS (burnout, inertia, meltdown, and shutdown) (Phung et al., 2021).

In order to provide balance and not be overly deficit-focused, it is vital for us to share that inclusive learning environments can also offer experiences of sensory joy for all learners, including those who are neurodivergent. There is satisfaction in experiencing these occasions with learners. This reference to sensory joy, although effectively marketed by companies offering sensory products, is not as well researched. However, this topic is active and live in the folk knowledge within neuro-minority communities. The following is a mind map from one of our group members that represents the neurodivergent sensory joy they experience and observe in their educational environment.

Figure 5. Sensory Joy and Inclusive Learning

In practical terms what can we do as teachers to support learners who may experience the sensory environment of school in a different way?

- Firstly, include a sensory checklist in when completing environmental audits of your school and classroom. Ideally, a neurodivergent individual with some knowledge in this area would help assess the environment too. There are many checklists available and Gareth Morewood has developed checklists that incorporate learner voice (http://www.gdmorewood.com/author/gduser/).
- Get to know your learners and their sensory preferences and aversions. Some

neurodivergent learners may have an occupational therapy report with recommendations. If you get the chance to collaborate with an occupational therapist in considering the sensory needs of learners in the educational environment, seize it!

- Be understanding of the fact that sensory preferences, aversions and sensitivities can change over time. Many factors both micro and macro affect these changes. Stress, rest and illness are but a few of these factors.

- If a learner is telling you (by their words or in another way, their behaviour for example) that there is something in the sensory environment distressing them, please believe them. Please do not invalidate their experience, for example, by saying *"you'll get used to it"*. This type of invalidation can lead to learners not trusting their own sensory and body signals and this neither inclusive nor healthy.

- Be cognisant to create a low arousal environment. This can offer a retreat for a learner who is over stimulated.

- Please be sensitive, responsive and adaptive to the sensory needs of learners. In keeping with the principles of UDL, offer different sensory options in your classroom in the form of sensory toys, seating options and adjustable lighting and acoustics. Do not be overly-prescriptive with scheduled sensory breaks and sensory diets are not as inclusive as a person-led and flexible approach. A sensory break should not be offered as a reward and never withheld as a consequence.

Relational

Good relationships can have a deep impact on a child's self-esteem, belonging, social functioning, academic success and resilience (Dooley et al., 2012). There is a plethora of research which shows that a high relationship quality between teachers and learners is one of the most important and effective ways to promote development, both socially and in terms of learning and achievement (Allen et al., 2018; Holzerberger et al., 2019; Pianta et al., 2012; Roorda et al., 2011). Two psychological theories are frequently used to explain the importance of high-quality teacher-student relationships: the attachment theory and the self-determination theory (see glossary) (Pianta et al., 2003; Roorda et al., 2011). In order to feel socially included, students should experience schools as reliable places of learning and support, which in turn is based on the quality of their relationships with teachers and peers. This is even more important for students with special educational needs (SEND), who are often more exposed to isolation and victimization (Murray & Pianta 2007). When good relationships at school are lacking, children can see themselves as outsiders, isolated from the school environment (Skinner et al., 2014). The fragility of student-teacher relationships has been brought into question now that many European countries are being influenced by neoliberal policy discourses and are dominated by the values of self-interest, individualism, competition and comparisons (Hall et al., 2019). With education coming to be more closely linked to economic growth and global competitiveness, there is an increasing emphasis

on standardisation and out-comes based assessment, test-based accountability as well as corporate forms of school management. Thus, the tensions produced by the clash of conflicting philosophies that underpin inclusive learning environments and schools that narrowly focus on academic achievement over relationships means that while education is meant to be for all, education is becoming a commodity, a private good to be consumed. Neoliberal policy discourses shift the focus of teachers care away from students, as performative pressures on pupils and teachers are contributing to rather than ameliorating the marginalisation of pupils who do not fit the normative homogenous group of learners. Therefore, now more than ever, educators have a responsibility of care to all students and in Nell Nodding's words *"we should want more from our educational efforts than academic achievement and second, we will not achieve even that meagre success, unless children believe that they themselves are cared for and learn to care for others"* (1984).

The concept of care refers to concern for others, responsibility for a relational caring (Noddings, 2002, 2012) and teacher care is defined as teacher behaviours which enhance or maintain the quality of positive interpersonal relationships among teachers and students (Bieg, Backes & Mittag, 2011). Teachers must put care at the core. Strong relationships with teachers and support staff create the foundation for inclusive education. Schools play an important role in providing a safe, caring environment for children and building connections and relationships with trusted adults. Relationships are central to children's sense of belonging and well-being (Treisman, 2016). Promoting positive school staff relationships and supporting emotional well-being is paramount for teachers working to build deep relationships with students. One of the strongest predictors of stability and well-being, in young people, is the existence of at least 'one good adult' in their lives. Crosby (2016) emphasises that teachers can be a significant attachment presence for vulnerable students, a connection, who is safe and available to a child in their time of need. This good relationship can have a deep impact on a child's self-esteem, belonging, social functioning, academic success and resilience (Dooley et al., 2012).

The role of the teacher in creating an inclusive learning environment is of key importance. Within the traditional systems of school culture and structure it is still widely believed that the role of the teacher within the school context is to teach and evaluate certain subjects as well as the pupil's performance. There can be a lot of pressure to achieve certain objectives from the curriculum within a given time frame and this in turn can impact on other vital elements of successful and inclusive teaching. That however is only a fraction of what we need to be doing in order to truly make our schools inclusive. We would strongly argue that creating a welcoming and safe learning environment, is the foundation of any successful learning experience, enabling a child to participate and learn.

As demanding as the task of educating and caring for young learners may be, fortunately educators often have a lot of freedom in choosing our working methods, modelling and preparing content, or making changes to our work environment. This not only requires the critical reflection of our own presuppositions and biases but also the willingness to make

an active effort in redefining teacher-student relationships and challenging the status quo in order to promote social change.

Elements of successful teaching and inclusive education

In order for us to gain a general understanding of what successful and inclusive education entails, we want to introduce the four elements which Naukkarinen (2018) proposes of successful teaching and inclusive education:

1. Addressing the basic needs of the students
2. Applying group dynamic skills
3. A learner-centred approach to learning
4. Striving for on-the-job learning and school improvement

Arguably, considering point one: ***addressing the basic needs of the students***, children need infinitely more than having merely their basic needs met. According to Maslow's (1970) hierarchy of needs apart from the basic needs such as physiological needs and safety, children also require a sense of belonging and love, self-esteem and self-actualisation for them to really thrive. Being one of the most important attachment figures to interact with students on a daily basis, it is up to us to fulfil these needs on various levels (Naukkarinen, 2018).

The nature of a group within a learning environment is an important factor in order for children to develop social skills and learning, motivate them and help them form their own concept of self. Understanding a group's specific dynamic, ***applying group dynamic skills, and*** assessing its emotional nature are responsibilities which ultimately fall to the teacher. The sense of home and belonging cannot solely stem from a space itself but also from the relationships, rules and boundaries of the people within it. Essentially home is where your heart is. Getting to know and respect the other group members with their individual needs, learning to take others' perspective for the sake of better understanding them and feeling seen and validated as an individual, are equally important factors to feeling at home and welcome in a learning environment.

Balancing a heterogeneous group of individuals can be very challenging and overwhelming at times and often requires a certain skillset and amount of leadership (Naukkarinen, 2018). This does not however have to indicate an authoritarian and more traditional approach but is more about fostering a culture of showing respect, giving responsibility and encouraging critical thinking within the group. Especially the feeling of being taken seriously and being validated are aspects which are of great importance to young learners and are experiences which many of them remember and apply to other situations in later life.

Being validated, respected and represented are also vital and overlapping elements of a ***learner-centred approach to learning***. We need to be representing the children's lived experiences, their family backgrounds and topics which are relevant to them in everyday life so that their identity is validated in an inclusive school environment. In order to achieve that we need to give learners more autonomy and responsibility concerning school culture and classroom environment, and curriculum and subject matters. Of course, there needs to be a framework for these choices, but it is still often the prevailing practice to exclude children from these decisions and processes completely when we should be letting them take ownership of their learning and develop learner agency. This frequently makes it difficult for children to relate and engage (Naukkarinen, 2018).

In the beginning it may feel unfamiliar to hand over responsibilities and control to the rest of the group, especially since the traditional perception of the role of the teacher is often associated with authority, working alone and being solely responsible for the wellbeing and development of a group of young learners. While we will admit that it takes relationship building, group work and practice, we can promise that relinquishing some of that control and collaborating with the students on relevant factors of school culture eventually does pay off.

Figure 6. Principles of learner-centred instruction

Learners' knowledge and experiences are validated.

Learners acquire strategies for learning inside and outside of the classroom.

Content of instruction is relevant to the learners' needs and interests.

Learner-centered instruction

Classroom tasks challenge learners and promote higher-order thinking skills.

Learners make choices about content and classroom activities.

Learners' first language and culture are viewed as a resource for learning.

Classroom interactions and tasks represent how language is used in the real world.

based on Parrish (2019)

For us to successfully fulfil the requirements of inclusive learning mentioned above, it is of primary importance that we are willing to **strive for on-the-job learning and school improvement** (Naukkarinen, 2018). Learning and improvement are terms which might suggest that there are workshops to be visited or scientific literature to be read in order to meet expectations and become better versions of ourselves. While those are of course valid approaches they are not always mandatory for moving towards our goal. A democratic school culture, collaborating with children and parents, cooperating with colleagues and actively reflecting upon our own belief systems are elements to incorporate into our everyday practice which can go a long way. Essentially, we invite you to reflect on and

question your belief systems, to be explorative and curious and ideally let others accompany you on that journey.

Importance of teachers to be reflective and reflexive

Many people would consider teaching as being a calling more than simply a job. It undoubtedly has a huge impact and might arguably be one of the professions with the most potential to actually enact change – offering young learners' inspiration, a positive outlook and encouragement to actively participate in society (Jones, 2009). Hansen (2001) indicates that it should be viewed as more of a 'moral practice' while Fullan (2013) additionally proposes that this moral purpose cannot go without "the skills of change agentry".

That being said, ironically, in most parts of the world, school culture still remains a traditional and somewhat hierarchical work environment in which people tend to hold on to their familiar belief systems and find it hard to free themselves from conventional perspectives to actively promote social change. We limit ourselves by preserving structural and cultural features of school organisation, frequently making school a very inflexible environment unable or unwilling to adjust to the individual's needs.

Reasons for this are possibly teacher's defensive routines, retaining prevailing practices because they offer a sense of safety and control and thus undermining critical evaluation and constructive discourse (Naukkarinen, 2018). Being responsible for a group of young learners can be daunting to say the least and it is understandable for us to gravitate towards authoritarian approaches at times – essentially often restaging our own childhood experiences in school. The thought of relinquishing control or even power can be very unnerving because notions such as classical reward-punishment solutions for example are something familiar for us to hold on to. If we want to strive to fulfil Naukkarinen's fourth element of successful teaching and inclusive education as mentioned above, it is imperative that we are inquisitive and willing to establish a new learning relationship between teachers and students since otherwise a constructive discourse becomes impossible.

So, how is it possible for us to implement Naukkarinen's fourth element to strive for improvement and become explorative and more open minded? A good aspect to start off with is critically reflecting upon our biases, our mindsets, values and belief systems. A task which is more complex than it might seem especially since reflection alone is not sufficient unless it is put into action. We need to be willing to make necessary changes and apply and incorporate them into our understanding of the world and our role within the microcosm of school. Mezirow (1991) suggests, that teachers need to be engaged in critical reflection of their experiences, which in turn leads to a perspective transformation: *"Perspective transformation is the process of becoming critically aware of how and why our assumptions have come to constrain the way we perceive, understand, and feel about our world; changing these structures of habitual expectations to make possible a more inclusive*

and integrated perspective; and, finally, making choices or otherwise acting upon these new understandings" (Mezirow, 1991, 167).

As heterogenous as our learners may be – due to the implementation of inclusive school systems all the more so – teachers are still more often than not part of a majority group. Being subconsciously biased and having prejudices or presuppositions about others is human even for the most open minded among us. Suttie (2016) suggests four steps to reflect upon and fight our own biases including **the cultivation of awareness**, **working to increase empathy and empathic communication**, **practicing mindfulness and loving-kindness** and **developing cross-group friendships in our own lives**.

Psychologically prejudices often serve the purpose of making quick judgement of a group or situation thus helping us make decisions and react accordingly. It is a part of human behaviour which we cannot simply shake. Our biases become a problem if we are not **aware** of them or their impact upon others: "*Teachers are human and therefore influenced by psychological biases, like the fundamental attribution error, when we assume that others who behave in a certain way do so because of their character (a fixed trait) rather than in response to environmental circumstances*" (Suttie, 2016). Especially learner's behaviours which are perceived as problematical or children who are frequently referred to as "difficult" are often sending a clear message and may be displaying a very rational reaction to very inappropriate circumstances.

Empathy in this case refers to our willingness to take another person's perspective. That itself is not always an easy matter and requires us to develop an understanding for our student's backgrounds, communities and their everyday life. We need to actively communicate and learn more about each other in order not to be blinded by our own stereotypical views. Not only does this help forge a more profound bond with our students but it certainly has a huge impact on school culture in general.

Practicing **mindfulness** in our job and everyday routines undoubtedly helps us better manage our own emotions and stress levels thus impacting our reactions to certain situations in the classroom. Suttie (2016) goes on to suggest that decreasing stress levels of teachers can also indirectly reduce their bias additionally to having a positive influence on their wellbeing.

Developing cross-group friendships outside the workplace does not only have a positive effect upon our relationships within the classroom but can also have a great effect upon a community as a whole. It is of vital importance for us to understand that neither our school nor our students exist within a vacuum but are closely linked to their surrounding environments and communities which makes it all the more important for us to reach out thus decreasing our prejudice towards outgroup members. Additionally, this is a major part of the teacher as a role model and can have contagion effects on our students and how they perceive the world since young learners are much more likely to do what we do than to do what we tell them to (Suttie, 2016).

As important as awareness and reflection on us may be, the positive changes that

teachers from minority cultures can bring to a school environment are well documented. Not only can teachers of minority groups serve as role models but also as advocates helping students identify and make a connection between their lived experiences in school and at home (Pellegrino, Bransford & Donovan,, 1999). Villegas and Irvines (2010) found that teachers from ethnic minority groups, for example, managed to successfully establish helpful bridges to learning for students who might have otherwise remained disengaged from schoolwork. Such culturally-relevant practices, if used widely in schools, hold potential for reversing the persistent racial/ethnic achievement gap. Here too the awareness and reflection however are not enough and the presence of teachers of minority groups alone is not sufficient to change a school's climate. They need to be willing to draw upon their own lived experiences working with and educating students and colleagues alike (Villegas, Strom, & Lucas, 2012).

Linguistic and Communicative

Inclusive multilingual education

In this chapter we discuss inclusive education from the view of linguistic and communicative environment, that consists of multilingual learners, linguistic minorities, and accessible communication, especially for the deaf and hard-of hearing (DHH) learners.

Every school is a rich language and communication environment with its diverse people, traditions, and cultures in a globalised world. Open discussions about the diversity of individuals and their diverse needs, the visibility of diverse people, among pupils and the staff, in the school environment is essential also from this point of view. Discussions about language awareness and linguistically responsive classroom pedagogy have become a permanent part of the normative framework of basic education (Piippo et al., 2021.). When we talk about minority and multilingual learners, we automatically approach the subject from the perspective of multilingual education in the field of pedagogy and language education. The school is a key institution for language socialisation (Ochs & Schieffelin, 2012), which gives teachers, educators and curriculum work a central role when building spaces for participation and language learning. Inclusive methods, materials, and digital environments in the learner's first or heritage language, especially in small minority languages, can support the development of individual's multiliteracies and well-being. Media, digital learning materials and interpreting services as examples of resources are good tools to promote multilingual learners and young people's linguistic agency, participation, and access to their first language(s).

A minority/heritage language speaker or signer must learn the majority language in order to succeed well in the society. Using the student's own linguistic resources contributes to the learning of other languages and multiliteracies. Inclusive multilingual education consists of managing learning environments in a way that supports learners' language learning and linguistic-cultural identity also in their first/heritage languages. It can mean,

for example, collaborative teaching, peers, and adults using the same minority/heritage language, translanguaging, using multilingual media materials, teaching each other and linguistically sensitive curriculum planning (more examples and solutions for teaching are described in the chapter "Language Learning for All").

Linguistic accessibility in learning environments and values for communication

There has been more awareness about accessible information and communication, especially during the COVID-crisis due to the visibility of signed language interpreting, and the growing number of subtitles and multilingual information in the media. Linguistic accessibility and linguistic-communicative environment are a kind of umbrella concepts that applies to many different groups of users. Below we give some examples of different user groups and solutions to apply also in learning environments.

Most people communicate through an auditory-oral-modality and traditionally services and education have been built around this way of communicating. For visually oriented people, such as deaf and hard of hearing (DHH) learners, as well other diverse learners' multiple use of semiotic resources is important for accessing information and communication. For example, deafblind people communicate in a tactile way and therefore information should also be carried in tactile mode.

Simplified language is useful for people with cognitive challenges or for immigrants and second language (L2) learners making language more readable. For DHH people, visual and multimodal communication, language concordant communication, signed language or text-based interpreting and translation services removes communication barriers, supports learner's multiliteracies and their participation.

There is plenty of normative expectations about a language and its norms. One example of norms concerns distantism, which constructs the ideal human being "*as a rational and literate being, whose sensual engagement with the world is through eyes and ears*" (Pennycook, 2018: 71). However, deaf, deafblind, and neurodivergent learners often use more semiotic resources and multimodal means creatively such as gestures, touch, and drawings in addition to language (De Meulder et al., 2019; Snoddon, 2022). Snoddon and Paul (2020) argues that access to a language should be framed as a health need especially with DHH learners in their early years, because language deprivation causes deleterious effects on cognition and emotional development. Language deprivation often occurs among those DHH children who were not offered a signed language (Snoddon & Paul 2020). Also, The United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) supports the recognition of DHH children's right to a signed language.

For hard of hearing learners who use spoken languages and benefit from hearing aids, learning environments can be designed in many ways to create a better listening environment. Sound-absorbing structures and many technical solutions make listening easier for these learners, and a better listening environment is more comfortable for all

other learners too. There are various hearing solutions that can build a better hearing environment in class or at school. Traditionally there have often been arrangements on optimal listening conditions, but constant dependency on the learner's weaker sense can be stressing for the DHH learner (Kiili & Pollari, 2012) causing hearing fatigue. Visual methods, speech-to-text, or national sign language interpreting services are very important and needed for the DHH learner but serve also peer-to-peer communication in a way which is not dependent on the degree of hearing.

Interpreting services are vital ways to make communicative situations more equal and accessible when thinking about the participation of all minority language speakers or signers, especially from the view of DHH people who use a signed language of their country. Interpreting service grants access to contents, gives diverse learners a chance to understand given information also in group level, express themselves with confidence and to build relationships with other people.

Access to interpreting services varies greatly from country to country. In the Nordic countries, for example, interpreting service is free of charge for users with disabilities. In Finland and Norway, public interpreting service for persons with disabilities is planned to be always available, both at school, at work, or in free time, and for studies or work abroad. Interpreting service can be delivered between a national sign language and national or other spoken language, or as speech-to-text-interpreting, and other more specified ways.

In an inclusive education and learning environment, both spoken and signed languages are seen as equal languages, as well all other diverse learner's use of appropriate means and formats of communication that diverse learners might use, which requires various measures.

When discussing linguistic and communicative environments in schools, all learners benefit from a learning environment where communication and interaction is multimodal. Educators should therefore explore the means and tools available to ensure accessibility of the environment and communication.

Conclusion

Often the focus in school lies on the perceived responsibility of changing the learner or the content and curriculum, not so much on modifying the learning environment or reflecting upon ourselves. Our approach to these situations often lacks reason, since we would hardly change, much less become irritated at a plant for failing to grow but would try to devise ways to adjust the environment in which it is growing. That responsibility ultimately falls to us as teachers being the primary attachment figures for our students and key figures within the school context as well as playing an important role in bridging the gap between school and society as a whole. Achieving that goal requires the willingness to question our values and belief systems, taking other's perspective and constantly striving to improve

school, making it a more welcoming and safer place for all of us. Teachers committed to fostering inclusive learning environments will listen to neurodivergent professionals and neurodivergent learner voices when conceptualising, designing, planning, using, and evaluating sensory spaces and places (Neilson, 2021). Actively building a school environment which provides a sense of belonging and feels like home is not only essential for our own wellbeing but also for that of our students. Meeting all those requirements is undoubtedly a major challenge, it is however one which we do not have to face alone. It is important for us to redefine teacher-student relationships and invite parents and other stakeholders to actively participate in the journey. School is often a microcosm which excludes the environment that surrounds it. If we manage to make schools more welcoming and open places for everybody that will not only have a positive impact on the learning environment itself but in turn can be an important factor in making a change in society altogether.

Closing questions to discuss or tasks

- What is your personal definition of an inclusive learning environment? In considering this question, think about the vital components of an inclusive learning environment.
- Please take one of the other 13 dimensions of diversity. Use this as a lens to explore the inclusive learning environment framework.
- Compare the framework used in the chapter with some other conceptual frameworks that you are familiar with.

About the authors

Deirdre Forde

Dr. Deirdre Forde is a distinguished lecturer in Inclusive Education at Maynooth University. With a background as a qualified primary teacher and a chartered child and educational psychologist, she brings extensive experience from various educational settings and psychological services to her role. Deirdre's research and teaching interests are diverse and encompass areas such as

disability and the dynamics of inclusion and exclusion within educational and societal contexts. She is particularly passionate about amplifying children's voices, advancing relational education, and shaping policies related to Equality, Diversity, and Inclusion (EDI). Her work is dedicated to fostering inclusive environments that acknowledge and celebrate diversity.

Christine Carstens

Chris Carstens, based in Bremerhaven, brings extensive experience in teaching English and German, alongside certification as a trauma educator with a specialization in supporting children and young adults facing social and emotional challenges.

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Ulla Sivunen

Ulla Sivunen is a doctoral researcher at the University of Jyva ̈ skyla ̈ (Finland), focusing on media use, multiliteracies, and linguistic agency among young deaf and hard-of-hearing individuals using signed languages, primarily Finnish Sign Language. Throughout her career, she has worked as a teacher, lecturer, in NGOs, and in the media. This diverse experience and being as a member of a minority group, the deaf community, has provided her with a broad perspective and deep expertise in her research areas.

Claire O'Neill

Claire O'Neill is a writer and researcher with a background in education. Her research focuses on Neurodiversity and Neurodivergence. Core principals of the Neurodiversity paradigm and Universal Design inform her research, writing and approach to education.

Alessandra Galletti

Alessandra Galletti is working as an educator in a secondary school, focusing on supporting students with learning difficulties. In addition to her

role in education, she founded an association on Autism in Südtirol, GRETA. Her broader work centers on rethinking school spaces to ensure they are functional and inclusive, fostering a sense of well-being for teachers and students alike. She collaborates with educators, administrators, and designers to promote a culture of inclusivity in schools. By adopting a multidisciplinary approach, she integrates diverse expertise to create solutions that address the needs of the majority of users effectively.

PARTICIPATION OF CHILDREN AND YOUTH IN LEARNING AND COMMUNITY DEVELOPMENT

Carlos Moreno-Romero; Ines Boban; Maryam Mohammadi; Shichong Li; and Silvia Dell'Anna

Imagine a learning experience where young people become interested and engaged in their community's nutritional well-being. Imagine a project where young people build a Zen Garden for their community to enjoy. Imagine a setting where young people make use of restorative to help their peers solve their conflicts through non-violent communication, active listening and restorative questions. These are some examples that point to the importance of involving young people in decision-making within their communities and their learning experiences.

Example Case

"As a student at the Participatory School, a humanistic, democratic school, we were always encouraged to explore new topics through a project-based learning method. From a young age, we undertook individual projects on subjects that interested us, examining them from multiple perspectives and deepening our understanding. During secondary school, we embarked on a collective project that involved community participation. The school proposed several topics, and we chose to focus on the issue of malnutrition among children in our country.
Our first step was to conduct thorough research on malnutrition and its significance. We discovered that the prevalent form of malnutrition in our country is due to a lack of essential vitamins and minerals. Understanding this, we recognised the need to learn about the effects

and consequences of vitamin deficiencies. Each of us researched one or two specific vitamins and shared our findings with the group. We knew that we needed to be well-informed to raise awareness and drive change.

To involve the community, the first step was to ask all students and their parents to participate in comprehensive blood tests to measure vitamin levels. Over two months, nearly 150 families took part, allowing us to analyse their blood tests and identify common deficiencies. Our research indicated that given the economic conditions, simple dietary changes like drinking a glass of milk and eating two eggs daily could help address these deficiencies.

Next, we needed to disseminate our findings to children, their families, and schools. We attempted to collaborate with the Ministry of Health and the Ministry of Education to implement new policies in schools, but not all efforts were successful. Therefore, our plans changed, and we had to develop a new initiative to raise awareness. Realising the importance of trust, we decided to engage well-known artists, actors, and singers in our awareness campaign. These public figures were photographed with a glass of milk, and their images were displayed in a large photo exhibition and shared on their social media, reaching a wide audience.

We also expanded our efforts by sharing our project with similar groups in other cities, aiming to raise awareness nationwide. The project has since grown into a larger online initiative where people across the country share nutritious recipes and food tips.

Currently, I have stepped back from direct participation in the project, allowing others to take over. What I have learned is that scaling a project does not require the original members to remain in control or be actively involved until its completion, and it was one of the principles that the school wanted us as students to learn. Stepping aside from a project that you have started and witnessing others continue allows the project to thrive and achieve its main objectives, such as the principle of participation, more effectively."

Baran Yousefi, former student of a democratic school in Tehran, Iran

The example above comes from the Participatory School in Tehran, Iran. It is important for readers to understand that, while this school provides an extraordinary and inspiring example of participatory education, it is not representative of the broader educational landscape in the country. The innovative practices and values at this school stand out as a unique model, differing significantly from the more conventional approaches found in many other schools in Iran.

The Iranian Ministry of Education does not recognise the Participatory School, although it has demonstrated significant achievements. It aims to promote a variety of educational methods, rather than endorsing a single official approach, across the country. It seeks to

inspire change by offering alternative models of education that prioritise participation and diversity in learning methods.

<div style="background:pink;">

Initial questions

In this chapter you will find the answers to the following questions:

1. What are the guiding principles/concepts for meaningful participation of children and youth in learning and community development?
2. What hinders the participation of children and youth in learning and community development?
3. How do we facilitate the participation of children and youth in learning and community?
4. What are the possible next steps for students and teachers?

</div>

Introduction to Topic

In today's rapidly changing world, children and youth are often positioned as passive recipients of education rather than active participants. However, there is growing recognition of the importance of engaging young people in both their learning and the development of their communities. This shift moves beyond traditional classroom boundaries, positioning children and youth as essential contributors to societal progress.

The United Nations Convention on the Rights of the Child (UNCRC) emphasises that young people have the right to participate meaningfully in decisions that affect them. Consisting of 54 articles and ratified by 196 countries, the UNCRC defines children's participation as an "ongoing process that includes information-sharing and dialogue between children and adults, based on mutual respect, where children learn how their views and those of adults are considered and shape the outcome of such processes" (Committee on the Rights of the Child, 2009).

This means fostering environments where their voices are not just heard but are actively considered and integrated into outcomes that shape their lives. In both educational settings and broader community contexts, participation is a robust process that empowers children and youth to take ownership of their learning, build leadership skills, and contribute to creating more equitable and just societies.

To see school as the ivory tower of learning would be limiting. The title of the chapter

contains the term 'community development', clarifying the importance of extending action to the whole society. Full and meaningful participation transcends the walls of a classroom. It reaches outward to integrate knowledge and other perspectives and contribute politically, socially, and culturally so that children and youth can truly assert themselves and perceive themselves as citizens.

In this chapter, we explore the guiding principles that promote meaningful participation of children and youth, examine the barriers that hinder their engagement, and discuss strategies to foster their active involvement in learning and community development. Through examples and case studies, we will illustrate how, when empowered to make decisions and engage in collaborative processes, young people can transform their roles from passive learners to active changemakers – active with full children's rights.

By drawing on theoretical frameworks and practical case studies, we aim to uncover the transformative potential of child and youth participation. This chapter seeks to challenge traditional power dynamics between adults and children, advocating for an egalitarian approach to education and community development. Whether through student-led initiatives, participation in decision-making, or collaborative community projects, we will highlight the many ways in which children and youth can be powerful agents of change when given the opportunity.

Participation in action: principles, power dynamics, and areas for development

What do we mean by "participation of children and youth in learning and community development"?

Baran's example highlights how children's roles can shift dramatically when given the opportunity to participate actively. No longer confined to the traditional role of a student passively absorbing information, Baran took part in a community research project, where she contributed her knowledge to address real-world issues. Through her involvement, Baran not only demonstrated her ability to acquire scientific knowledge but also played a crucial role in improving her local community. She became an active agent of her own learning, shaping the process and outcomes of her educational experience.

By examining Baran's story, we challenge the conventional stereotypes of children as passive learners. Instead, we emphasise that learning extends beyond the classroom and occurs wherever children are no longer restricted. Children like Baran can be active participants in both their education and community development, initiating projects and contributing meaningfully to societal change.

Addressing power imbalances and recognizing children's agency

The persistent power imbalance between adults and children has long limited the participation of young people in important decision-making processes (James, 2007). However, recent work in the sociology of childhood aims to dismantle these power dynamics. Scholars are now focusing on demystifying the relationships between children and adults, advocating for the recognition of children's capabilities and their right to participate actively in various settings (Mayall, 2013).

As awareness of children's potential continues to grow, it is crucial to adopt a balanced approach that neither underestimates or overestimates their abilities. Children and youth should be seen as competent individuals whose contributions deserve fair recognition and integration into broader social structures. By embracing this balanced perspective, we can create more equitable and inclusive environments where the voices of children and youth are not only heard but also valued. This shift paves the way for a more just and participatory society, where young people play a central role in shaping their communities and futures.

It is the responsibility of teachers, along with their broader network of stakeholders, to critically analyse potential risks and boundaries in any participatory process, ensuring that no harm is caused to students or their communities. This should be done collaboratively with students, as it is essential to equip them with the skills to identify and understand these risks. Teachers must be especially mindful of issues such as privacy and data protection, particularly when projects involve online presence or public platforms. For example, safeguarding personal information and implementing measures such as comment restrictions on social media platforms can help protect students from negative exposure. This process of risk assessment should be ongoing, responsive to the specific context, and always prioritise the well-being and safety of students, ensuring that participation remains a positive and empowering experience.

The rationale for promoting children's and youth's participation

There are numerous benefits to adopting a holistic approach to youth participation, which ultimately leads to stronger engagement in community development. Firstly, involving young people in decision-making and conflict resolution has enhanced their moral reasoning skills (Kohlberg, 1985). This process helps youth become more aware of their rights and responsibilities while also reducing school bullying – a behaviour often stemming from power imbalances both within and outside school settings (Gribble, 2016).

Furthermore, when children and youth are actively involved in creating agreements, it promotes the development of positive and functional boundaries, which are closely tied to inhibitory control (Juul, 2001). This involvement strengthens their sense of belonging to the school community (Hope, 2012), fostering a deeper commitment to their own learning, reducing anxiety, and facilitating autonomy and self-regulation (Anderman, 2002).

In addition, when young people are seen as key contributors to school management, their argumentative skills and academic performance tend to improve (Bouché Peris, 2003; Day et al., 2009). It further contributes to the establishment of a participatory leadership culture, where everyone – students, teachers, and community members – develop the tools needed to influence their surroundings positively (Louis et al., 2010). Such experiences encourage young people to value diversity and cultivate a sense of social responsibility (Bruyere, 2010), while providing practical lessons in rights and responsibilities (Danner & Jonyiene, 2012).

Youth participation also plays a critical role in fostering citizenship skills. Learners who advocate for individual and collective rights develop empathy, political literacy, and an increased sense of responsibility for their actions (Hope, 2012). Prud'homme (2014) supports this view, noting that involving young people in decision-making and conflict resolution related to their education can promote respect for diversity and encourage greater civic engagement. These experiences empower youth and enhance their critical thinking, preparing them to be thoughtful and engaged citizens.

Moreover, children and youth have demonstrated their capacity to be active citizens in various ways (Loader et al., 2016). In Scotland, for example, young people are granted the right to vote at 16, a rare policy that significantly increases their political engagement (Huebner, 2021). This reform has given Scottish youth the confidence to express themselves in traditionally adult-dominated spaces. Schooling plays a crucial role in shaping these early voting behaviours, enabling young people to challenge power imbalances and address social inequalities. Research shows that early voting experiences in Scotland have led to higher voter turnout in subsequent years (Dinas, 2012; Huebner, 2021), underscoring the importance of democratic education in fostering long-term political engagement.

In conclusion, engaging children and youth in their learning and community development lays the foundation for their future contributions to society. Starting with small, meaningful changes, youth can be empowered to take control of their lives and participate more actively in shaping the world around them.

Key areas of participation for children and youth in learning and community development

Children and youth can engage in various areas of participation that foster their role in learning and community development. These areas include:

- **Knowledge construction and critical reflection:** Youth participate in critical discussions and research, collaborating with adults or independently, as seen in movements like Philosophy for Children and Citizen Science for Kids.
- **Political power and decision-making:** Initiatives such as Children's Parliaments and lowering the voting age (e.g., in Ireland) empower children to influence local and

school-level governance.

- **Community contribution and social engagement:** Programmes like Self-Directed Service Learning and the Learning City Model promote the integration of learning with community service and engagement.
- **Tailoring education and learning participation:** In democratic schools like Freie Schule Leipzig (Germany) and Summerhill (UK), children shape their learning by negotiating timetables and curricula, using tools like Learning Contracts and peer tutoring.
- **Cultural initiatives and expression:** Youth-led projects, such as radio stations, journals, and intergenerational learning programs, provide platforms for self-expression and cultural collaboration.
- **Space design and environmental planning:** Children collaborate (if needed with architects and planners) to create spaces that meet their needs, such as designing playgrounds or reorganising classrooms.

In these areas, participation must be ethical and meaningful, ensuring that children's voices are respected and supported to engage effectively in issues affecting their lives.

Barriers to participation and strategies for empowering children and youth in learning and community development

Navigating power dynamics: ensuring equitable participation in education

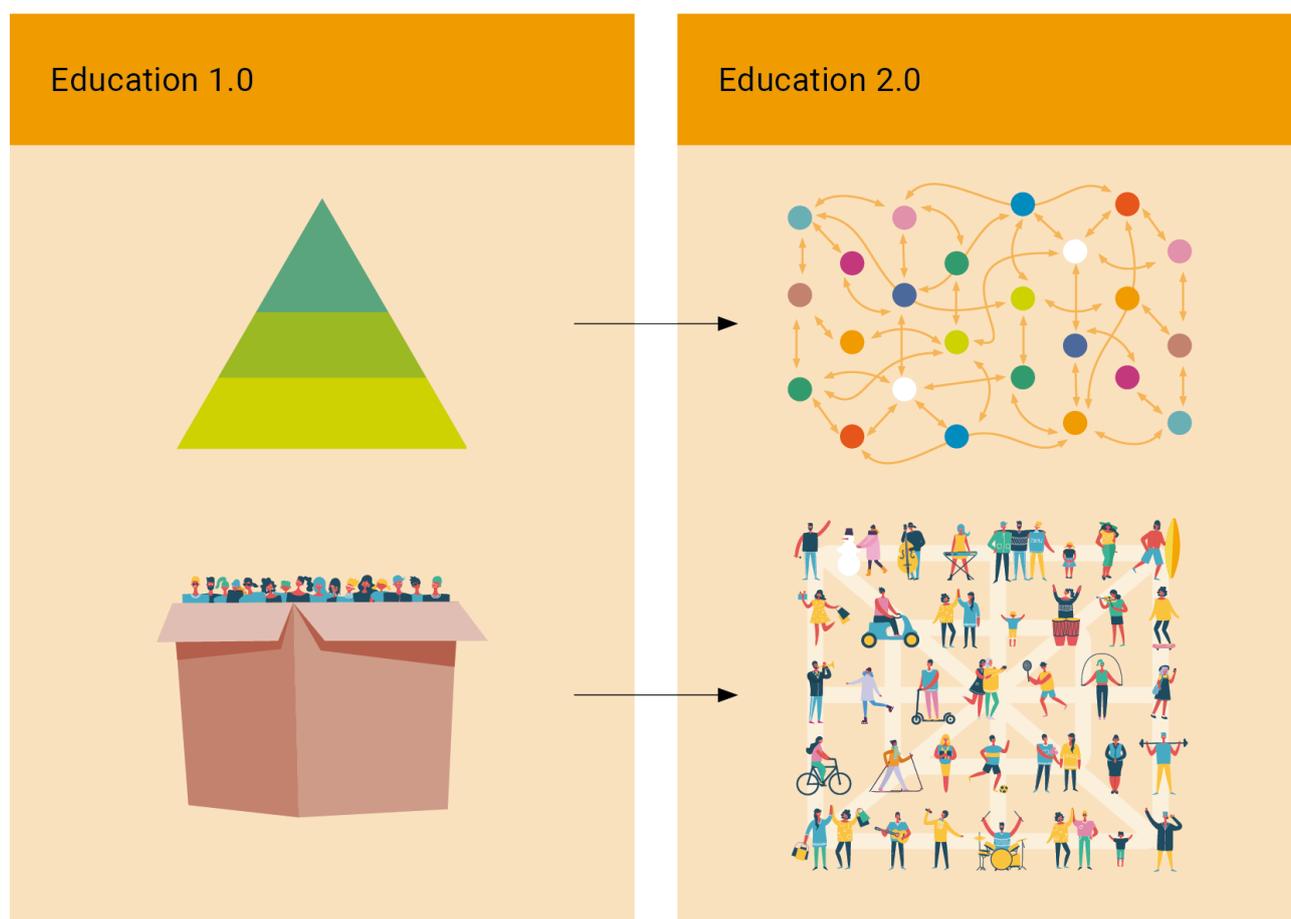
The relationship between teachers and students in traditional educational settings is often shaped by power imbalances. Teachers are typically seen as the sole bearers of knowledge, while students are viewed as passive recipients. This creates a hierarchical structure where students have little control over their learning experiences. In specific social contexts, teachers' knowledge, along with their embedded authoritarian positions, can appear oppressive to children as students, resonating with an inequality that manifests in the power dichotomy.

The philosopher Michel Foucault (1982) famously argued that "knowledge is power," a concept that applies to the teacher-student relationship. In many classrooms, teachers' control over knowledge reinforces their authority, limiting students' agency. Brazilian educator Paulo Freire (1970?) took this idea further, critiquing traditional education systems where teachers act as oppressors and students are merely passive learners. However, teachers represent the system and society as a whole and do not just act as oppressors on their own initiative.

Freire (1970) advocated for a "liberatory" approach to education – one that empowers students to recognise their own potential and make meaningful contributions. In this model, teachers act not as authoritarian figures, but as facilitators who guide students in shaping

their learning experiences. By shifting away from hierarchical structures, we can create a learning environment that fosters genuine participation and collaboration.

In democratic schools, learning is seen as a collaborative process. Rather than being arranged in a pyramid, where teachers sit at the top and students at the bottom, democratic schools operate more like interconnected circles (see Figure 1). Each "circle" consists of participants—students, teachers, and community members—working together as equals. This approach decentralises power and encourages shared responsibility in decision-making.

Figure 1: From traditional to democratic and inclusive education – or: from Power over to Power with


Based on: Hecht, 2017, slide 31

Similarly, starting with the identification of student-teacher power disparity, teachers and other practitioners can then tailor their strategies accordingly to empower children and youth through their learning in school and engagement in community development, which, in turn, can positively influence the ways learners become agents of learning, making changes to their learning in school alongside teachers. As children and youth are regarded as active participants in their own learning by taking part in curriculum decision-making,

teachers and other adults become facilitators, rather than superior or dominant leaders of children's and youth's participatory learning.

In addition to addressing the general power imbalance between teachers and students, educators must also be mindful of the power dynamics arising from differences in gender, sexual orientation, economic, social, and cultural background, class, dis/ability, race, languages, health, age, pregnancy and early parenthood, belief, religion (or lack thereof), biography, and appearance. These differences often intersect, shaping the way individual students experience education and access opportunities. It is crucial for educators to ensure that representation reflects this diversity, creating spaces where underrepresented minorities can express their voices without placing the burden on individual students to represent 'their' minority group. Schools must create an inclusive environment that promotes equitable participation by actively addressing these imbalances, ensuring that the experiences of marginalised students are acknowledged and valued, and that structures are in place to support their contributions to learning and community development.

Having real decision-making power

Involving learners in decision-making processes within conventional schools comes with certain risks, particularly when their participation is limited to surface-level involvement. Often, schools allow students to express their opinions on pre-determined topics, but these topics are carefully controlled, giving students little real power to influence decisions (Taylor & Percy-Smith, 2008). This creates a "passive participation" model, where young people are consulted or represented, but their ideas are easily manipulated or shaped by adults (I'Anson, 2013). In such models, students may feel they are being heard, but their contributions rarely result in meaningful changes. This can limit their ability to generate new ideas and force them to conform to decisions favoured by social pressure or the school's pre-existing agenda (Hecht, 2010; Thornberg, 2010).

On the other hand, Huang (2014) argues that schools need to address the contradictions between promoting a participatory approach and the societal structures they exist within. Many schools claim to encourage student involvement, but their practices often reflect the hierarchical and undemocratic structures of the larger society. This can either alienate students from participating in real decision-making or prompt them to question the inequities and power imbalances around them. When young people recognise these contradictions, it can empower them to challenge social hierarchies and outdated systems that limit their ability to fully engage as equal participants in both their schools and communities.

Ways of change – needs for (un)learning/changing the narrative to shape the future

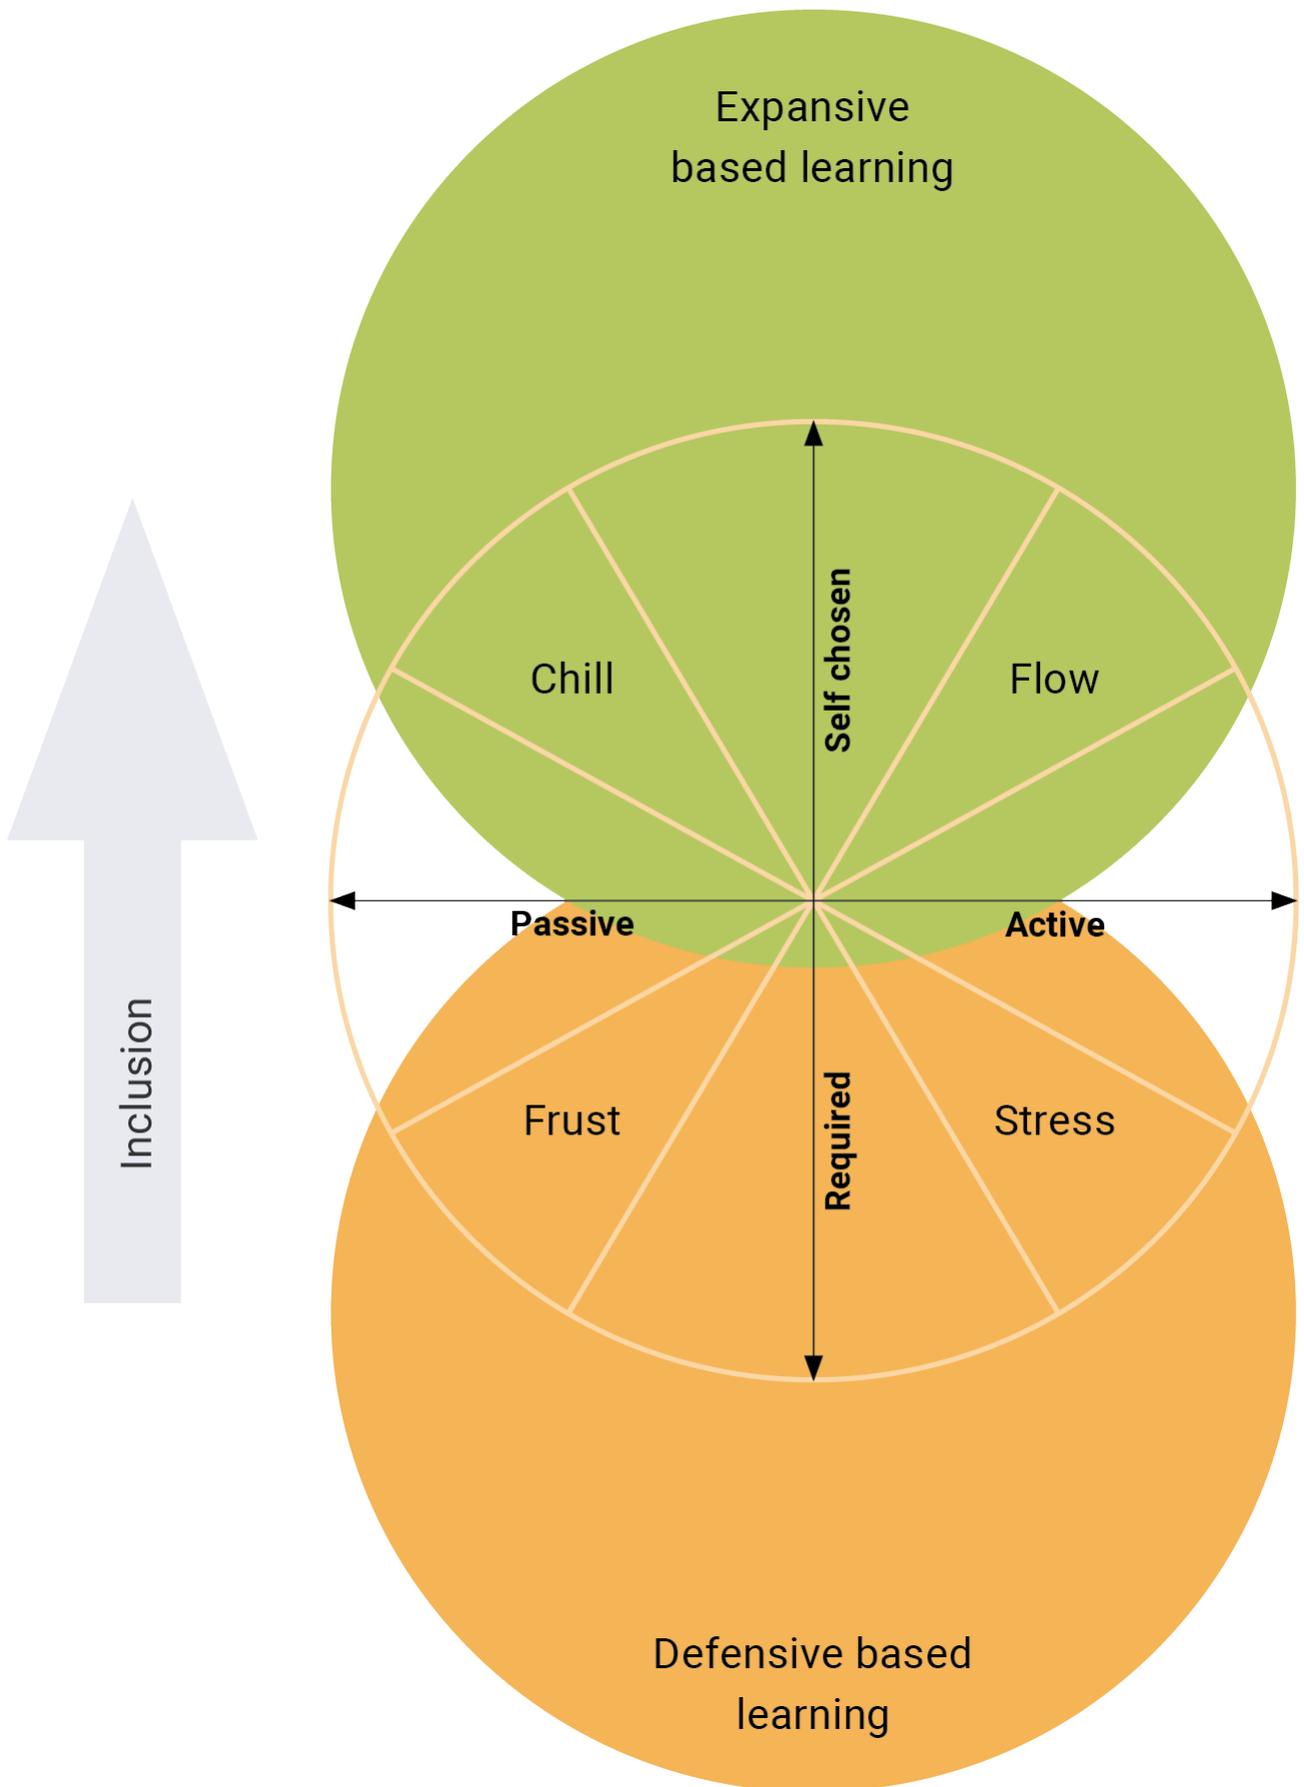
Changing the future requires changing the stories we tell ourselves, as these narratives shape and structure our mindsets (Korten, 2015). Many of the dominant narratives we encounter sound like: "Hurry up, be quick, and meet the standards!" or "Time is money, so be fast and efficient!". These narratives drive much of how we live our lives today. But by reflecting on their impact, we can begin to explore alternative stories, such as: "Time is life, and it's meant to be shared." This shift in thinking can transform how we structure our daily lives, marking the start of an unlearning process.

In education, this unlearning involves decolonising schools and moving away from serving the needs of corporations that position today's children as future workers (Black, 2010). It requires abandoning standardised curricula, hierarchical relationships, and training programmes focused on skills suited for the global economy rather than local or regional needs. Instead, education should emphasise community-driven, place-based learning, moving away from the idealised notions of "development" and urban consumer culture (Norberg-Hodge, 2019).

A critical step in this unlearning process can be found in concepts like "Deschooling Society" (Illich, 1999) and Freire's "Pedagogy of the Oppressed" (1970). These approaches emphasise recognising the structures that restrict participation and limit learning. Furthermore, critical psychology (Grotelüschen, 2005; Holzkamp, 1995) highlights two distinct modes of learning: defensive and expansive, both of which can be applied to inclusive education.

Defensive vs. expansive learning: A compass for education

The defensive mode is what many children and youth experience within conventional school systems, where they are focused on managing frustrations and stress, simply trying to survive within the institution (Figure 2). This type of learning, unfortunately, becomes their default as they leave school and enter the world. In contrast, the expansive mode – rare in most schools but a basic human right (as enshrined in Articles 12 and 24 of the UNCRC) – is characterised by moments of deep engagement and self-directed inquiry. Here, learners are free to explore self-chosen topics, allowing their curiosity to flourish. This process nurtures both the mind and the soul, offering opportunities to grow beyond the constraints of defensive learning.

Figure 2: Compass for inclusive education


Source: Boban & Hinz, 2012: 71; own translation

The future of inclusive education lies in expanding opportunities for this kind of expansive learning, while reducing defensive learning environments. It is essential that we reflect on how our own educational experiences have shaped our expectations – of ourselves and others – and recognise the importance of creating spaces for expansive learning, especially in schools.

The role of expansive learning in life and community

The contrast between defensive and expansive learning is not limited to schools – it is crucial throughout our lives. It begins in early childhood and continues through years of schooling. However, it needs to extend beyond the classroom, so that everyone can become active participants in their local and global communities. As shown in the earlier examples, engaging in expansive learning can lead to fundamental changes in how we interact with the world, particularly when addressing contemporary ecological, economic, and social challenges.

This shift in the narrative also requires rethinking the popular phrase "It takes a village to raise a child". In today's world, we need to transform this into "It takes children to raise the village (or community)". This means moving away from the adultist perspective (Flasher, 1978) that views children as incomplete or not yet capable, and instead recognises them as competent experts of life. Citizenship is not something to be earned, but a right every person is born with.

Unlearning ageism and embracing children's participation

One of the key elements in changing this narrative is to unlearn ageism – the belief that children are incomplete beings who need education to become "real" members of society. This mindset denies the inner potential of children and youth, limiting their ability to participate fully in decisions that affect their lives. In fact, research shows that even newborns are learners, filled with awareness and empathy (Wagenhofer, 2015). Therefore, it is time to recognise and nurture the inner richness of each child, ensuring that this potential is maintained as they grow into youth.

In a project to develop all-day schools in Germany (based on the Index for Inclusion; Booth & Ainscow, 2011), many adults initially doubted the capacity of younger children to participate in school development. While students in grade 4 of primary schools were seen as competent and capable, these same students were viewed as too young and overwhelmed when they transitioned to grade 5 in secondary schools. This inconsistency reveals a common logic in schools, where students are constantly seen as 'not yet competent' until they reach the next level (Hinz et al., 2013). However, this view is increasingly challenged, especially by the democratic participation of children, even in kindergartens.

Unlearn to have *power over* – change the story to other ways of being powerful

The means by which we view the idea of power hinders the participation of children and youth. Some alternatives such as those from the Global South (Brown, 2018; Just Associates, 2006; Ryland, 2024), create spaces by focusing on the 'inner power'. The example of the participatory school in Tehran describes the role of power in different contexts (see Figure 3):

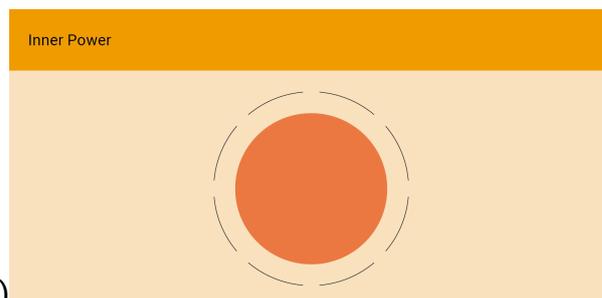
- inner power in all of the members; when they start to use it, it becomes synergistically a
- power with others, to think about the changes they need in the place, because it is obvious that something has to become better than it was. So, they create the
- power for specific processes, not changing everything, but raising awareness for and together with companions on key issues, taking over in situations that first seem to be quite powerless – especially where others try all the time to be dominant and have
- power over what is going on and keep it in their hands. This means that now we learn that it is possible to find ways to use power in a different way.


Figure 3: Four ways of power (own figure)
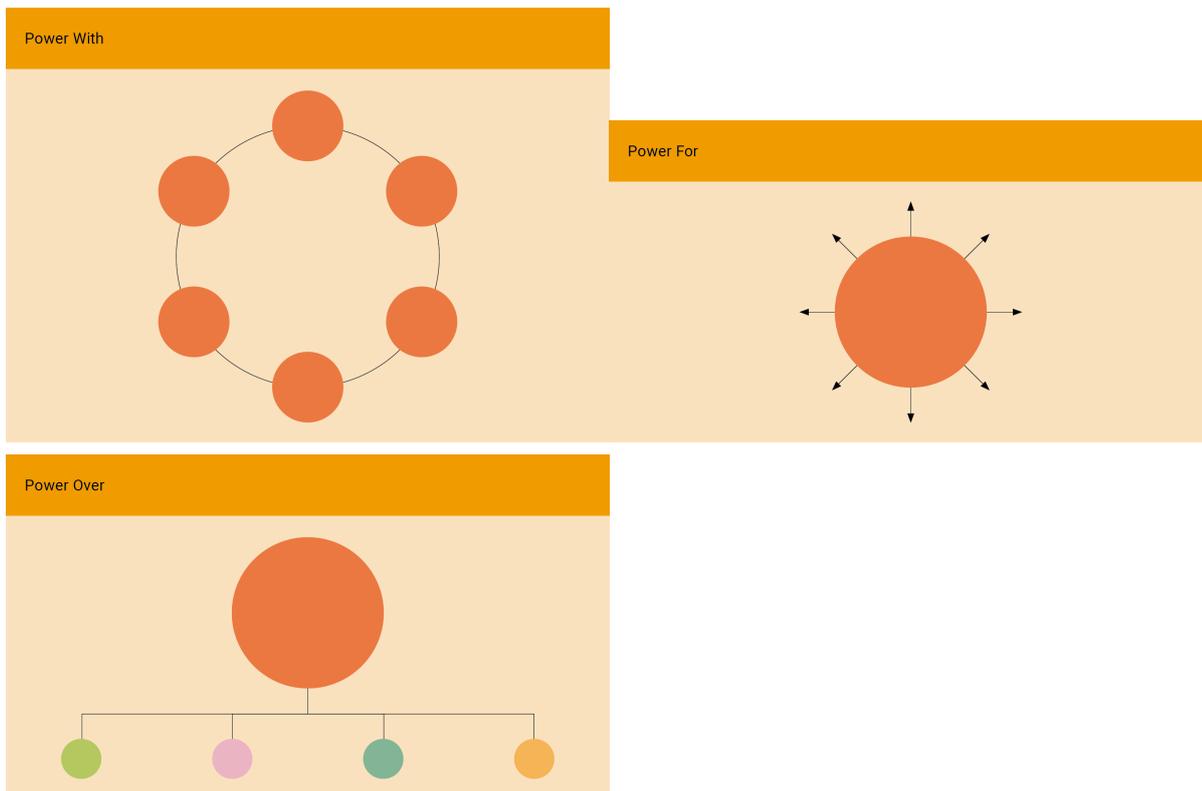


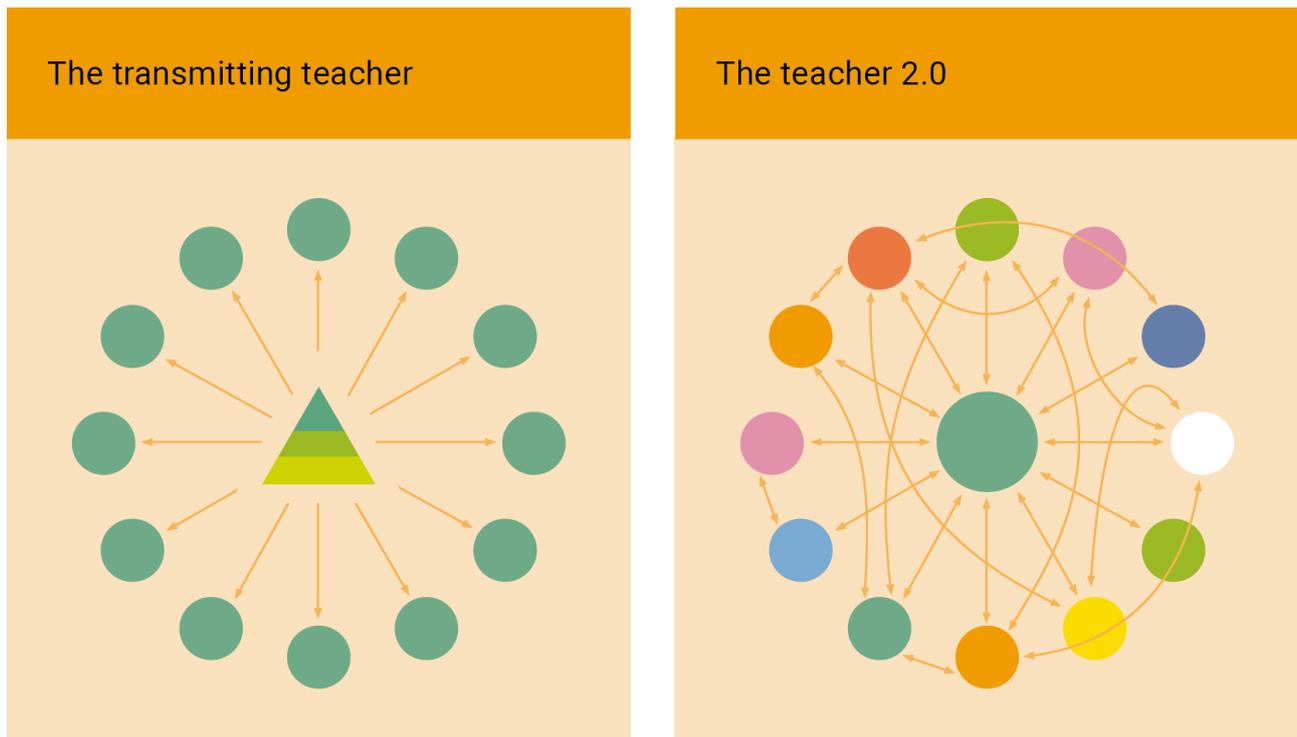
Everything begins with the aspect of the 'inner power' – something only individuals can minimise or maximise. Once this 'inner power' appears, and finds an expression, it can become a 'power for' others too, and when shared, it may become a 'power with' for common engagement purposes for a better future related to ecological and social topics of our time. Finally, there is a 'power to' realise essential changes.

In a democratic education model, children and youth are no longer seen as passive objects shaped by curriculum designers, architects, or city planners. Instead, they are active participants – subjects in their own right – who bring expertise and creativity to the table. This shift moves participation from being a "nice-to-have" opportunity granted by adults to a fundamental right guaranteed for everyone (Jörgensdóttir Rauterberg & Hinz, 2025). In democratic schools, such as those illustrated by Hecht (2017), the traditional power dynamic of "education 1.0" – where adults hold power over students – is replaced by "education 2.0", where students, teachers, and the community share power and work together for collective learning and development in a "partneristic" way (Eisler, 2001).

This approach is reflected in projects like the Inclusive Neighborhood Children's Parliaments in India (Kersting, 2018) and the Barefoot College in Rajasthan, where children and youth take on leadership roles in their communities. These examples demonstrate how shared power – power with – can lead to more inclusive and democratic processes in both education and community development. As we continue to explore ways to promote child and youth participation, these models provide a roadmap for moving away from hierarchical power structures toward more collaborative, empowering forms of engagement.

Unlearn hierarchical schooling – learn to develop learning places in a participative process

Janusz Korczak once said: "To repair the world is to repair education". In a time when schools face teacher shortages and solutions often involve increasing class sizes or cutting parts of the curriculum, it is more urgent now than ever to rethink the role of teachers. The traditional model, where teachers hold power over their students and simply transmit knowledge, must give way to a more participatory approach.

Figure 4: The transmitting and the connecting role of teachers


Based on Hecht, 2017, slide 51

In the old model (illustrated on the left side of Figure 4), teachers control the flow of knowledge and shape students to fit their own ideas, much like filling them with information to match a set standard. However, the right side of the diagram demonstrates a more inclusive role for teachers, where each person (teachers and students alike) become both a learner and a teacher. This shift marks the beginning of what Korczak described as the proper repair of education, where learning is not hierarchical but collaborative and shared.

This concept of shared learning is reflected in the idea of the "Four Teachers" (illustrated in Figure 6). These four learning forces—teachers, learners, peers, and the environment—need to be integrated into learning spaces to bridge the gap between education and democratic processes. By doing so, we create fertile ground for genuine learning in a humanistic and participatory way. In the face of today's global challenges—ranging from climate change to cultural erosion – this transformation is not just idealistic, but necessary.

To truly repair the world, we need to unlearn the models of corporate globalisation that have shaped education for the needs of the global market. These models prioritise standardisation, competition, and economic goals over the well-being of local communities. Instead, we must create spaces where people engage in addressing local issues and develop solutions that reflect the needs of their own environments. As Helena Norberg-Hodge (2019) argues, "local is our future", and empowering communities to take control of their own education systems is a key step in this direction.

A good example of how this can be achieved comes from the film "Power to the Children" by Anna Kersting (2018), which portrays children and youth in India taking control of their communities' future. By establishing children's parliaments and electing their own ministers, these young people are not only standing up for their rights, but they are also creating lasting change in their communities. They are addressing issues like environmental degradation, standing against social injustices, and implementing practical solutions—such as reducing plastic waste, conserving water, and promoting recycling.

This kind of participatory action demonstrates the transformative potential of empowering young people to take part in shaping their own futures. When children and youth are given real opportunities to engage with their communities, they are not just learners but leaders, activists, and agents of change.

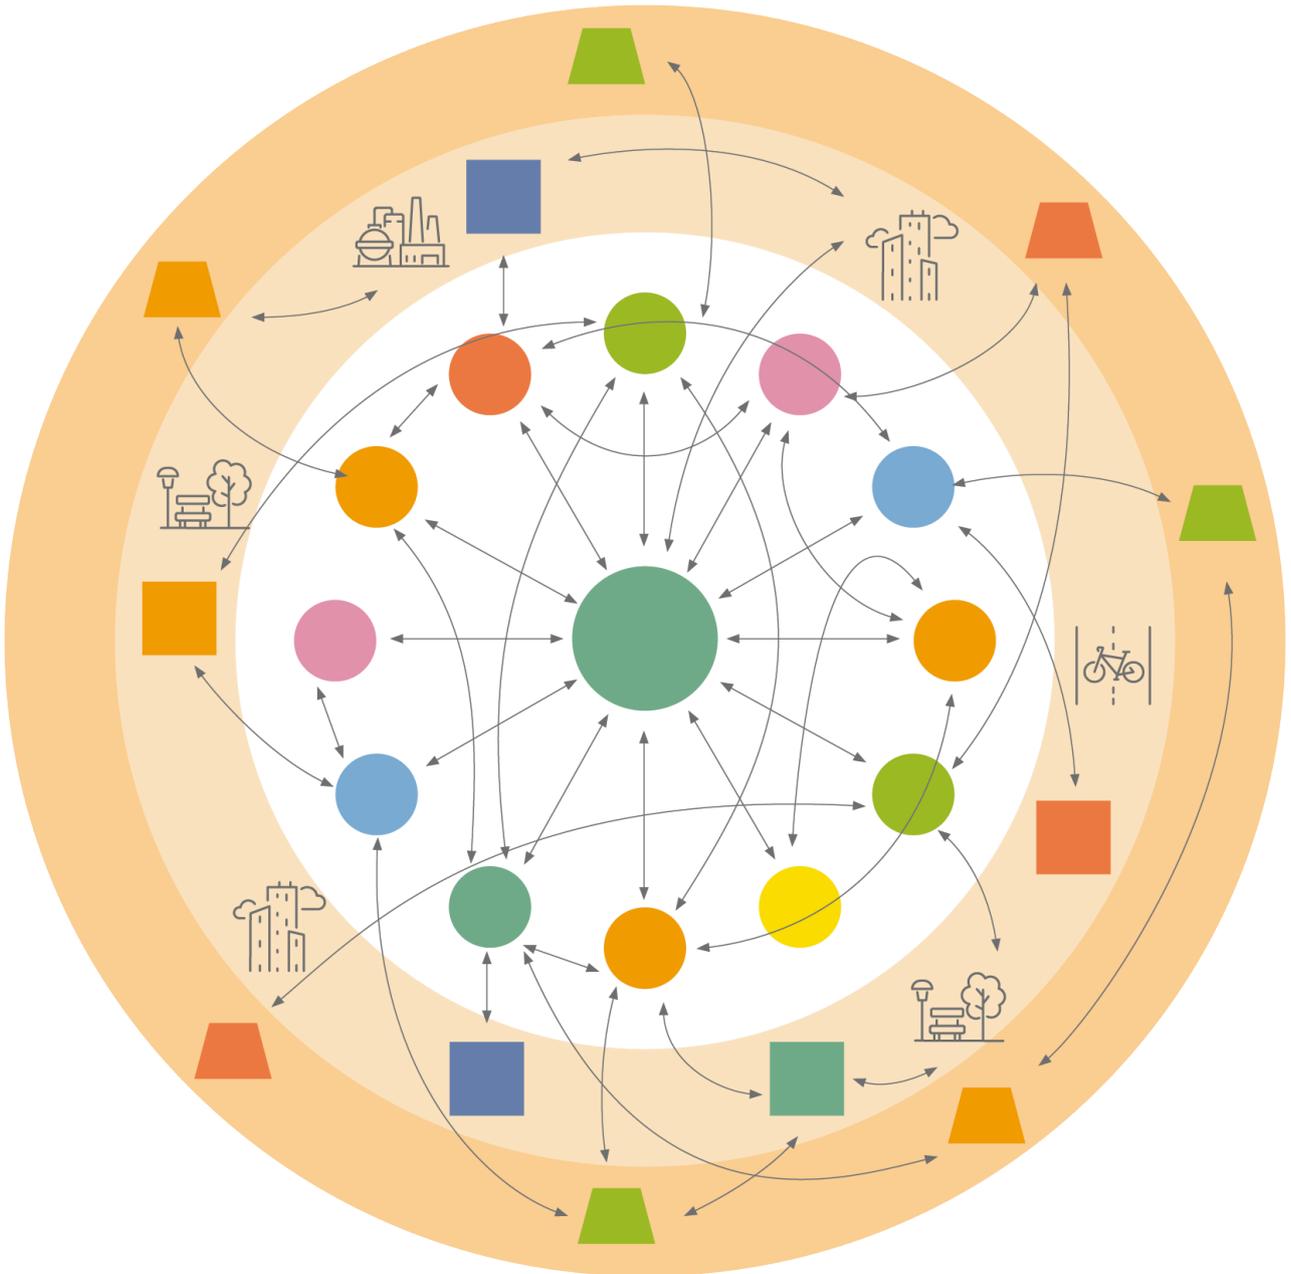
Unlearn the "boxes" of traditional education: embracing localities and place-based learning

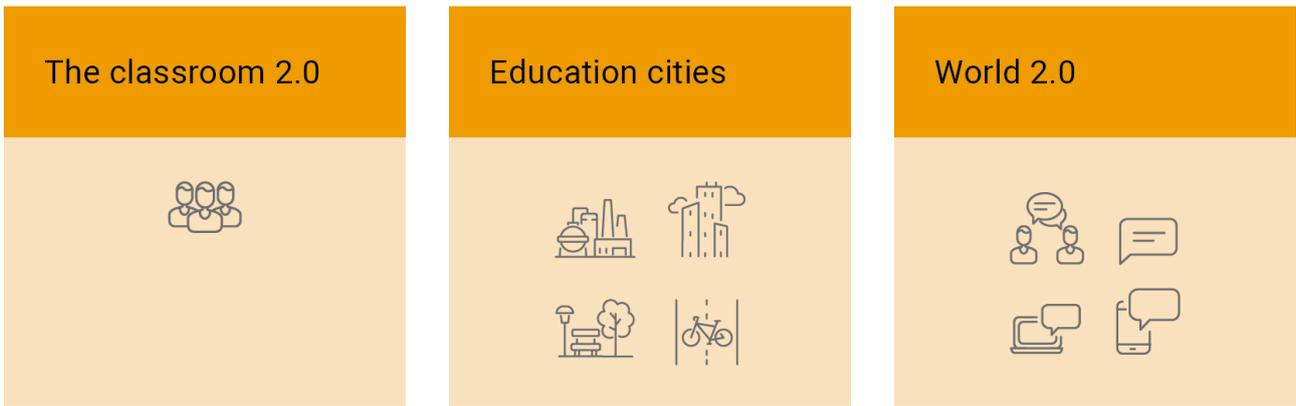
As Helena Norberg-Hodge (2019: 55) asserts, "Societies in both the Global North and South would benefit enormously from a shift away from corporate-tailored curricula towards diverse forms of place-based learning". Instead of adhering to outdated models that prepare students for a corporate-led, competitive economy, Education 2.0 must be tailored to the unique environments, cultures, and local economies of each region. This shift promotes local sustainability by emphasising regional agriculture, traditional architecture, and decentralised, low-tech solutions for meeting basic needs.

For years, community organising has been a key element of democratic engagement, and can serve as a powerful model for Education 2.0. Community organising teaches people how to bring about social justice and ecological sustainability – critical lessons that schools should also embrace (Meier, Penta & Richter, 2022; Penta, 2007). By adopting these principles, schools can become part of place-based learning circles, focusing on solving local challenges while fostering active student and community participation. This holistic approach would empower learners to move beyond seeing themselves as "victims of the market" (Kumar & Haworth, 2022) and instead become active agents in reshaping their environments.

The concept of the "Education City"

If a city chooses to adopt the model of an Education City, it first unlearns the traditional idea of separate, isolated "little boxes"—an idea that more fitting to the industrial age, when hierarchical structures reduced complexity. Instead of this old model, the Education City embraces interconnected circles of learning, encompassing the classroom, the community, and the world (see Figure 5).

Figure 5: Learning 2.0: Children and youth in classroom, community and the world




Based on Hecht, 2017b, slide 56

In an Education City, all members of the community – mayors, citizens, teachers, and

students – are responsible for fostering learning in these circles. As described by Schwartzberg and Dvir (2012), this concept introduces the idea of the Four Teachers as shown in Figure 6:

1. The first teacher is individuals' interaction with significant adults throughout their lives.
2. The second teacher is the experience gained through peer group interactions over time.
3. The third teacher is the environment itself, where learning happens through connection with the world.
4. The fourth teacher is the individual, who learns through the choices they make in their own life.

Figure 6: Four teachers ()

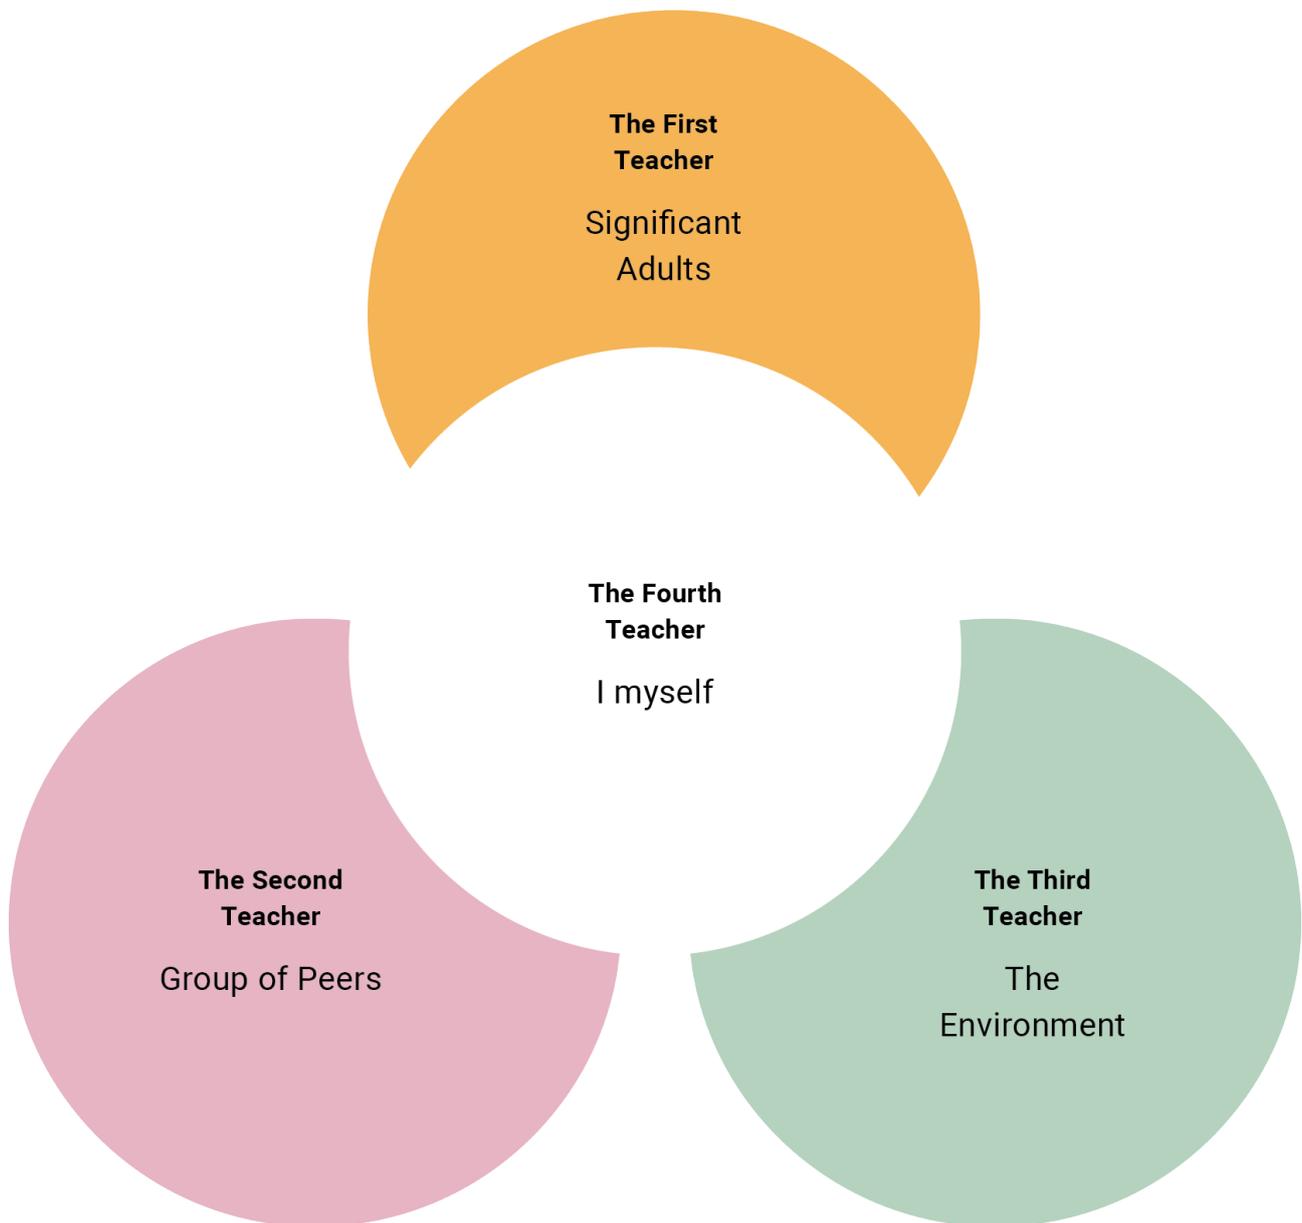
The Third Teacher

The Environment


Based on Schwartzberg & Dvir, 2012, 12

By embracing these Four Teachers, an Education City shares power in a participative way with children and youth, making learning a collective responsibility. But what does it mean for a city to "take responsibility" (Schwartberg & Dvir 2012: 12) for learning?

Taking responsibility for democratic education

In an Education City, the entire community takes responsibility for supporting democratic education and the development of all its residents in a humanistic and sustainable way. This means that all resources – whether educational, environmental, or social – are dedicated to the growth and well-being of everyone in the city. An ongoing dialogue about education is also be maintained, constantly evolving and adapting to promote twenty-first-century learning (Schwartzberg & Dvir, 2012).

Figure 7: The urban art of mixing colours

Such a city thrives on what can be called circle power. It moves away from the rigid, pyramidal structures of the past and embraces the dynamic, sometimes chaotic, processes of curiosity and creativity. This is not about simply reforming education by widening the traditional triangle into a neat square, rather the Education City unfolds like a flower, with multiple spheres of learning interwoven in a beautiful and complex system (see Figure 7).

In this model, citizens are encouraged to think and act outside the boxes of conventional

education. By reducing the old patterns of hierarchical power, the Education City makes room for a more inclusive and democratic Education 2.0, where everyone, students, teachers, and community members alike, work together to create a better future. As the examples in this chapter will illustrate, moving beyond the old educational models is essential if we are to repair both our minds and the world we live in.

Life, after all, is time—and that time should include moments of both flow and reflection.

Examples of participation of children and youth in learning and community development across countries

The transition of learning processes for children and youth to enhance their potential to participate as much as possible differs from place-based. Therefore, it makes sense to highlight some examples of ways in which more shared powers can be found in various countries.

Children and youth's participation in school management

The democratic participation of children must be considered from the viewpoint that all freedom is finite, and must also be viewed in relation to the coexistence and safety of everyone in the educational environment. Thus, in the global context of the lack of opportunities for student participation in school decisions, school self-government aims to fulfill the Convention on the Rights of the Child (UN, 1990), which highlights the urgency of supporting processes that allow children to develop and freely express their own opinions (Articles 12-15), and promoting spaces for children's participation in decision-making on matters that affect them (Articles 12, 23, and 31).

In this sense, overcoming the paradox of instructing about democracy within non-democratic school structures and practices (Bridges, 1997; Stevenson, 2010), free and democratic schools[1] implement regular meetings framed within the body of the Assembly or Parliament and involving the school community, to decide on relevant issues for their coexistence such as school agreements, curricular topics, workshops to offer, graduation requirements, field trips and travel, visits to the school by experts, etc.

The ground agreements that govern such meetings are respect towards each other and turn-taking, taking others seriously while trying to understand the degree of truth they hold, and defending one's own thinking without attacking others. Similarly, democratic schools share with Apple and Beane (1995) that "democratic planning is not about making

---

1. See the European Democratic Education Community for further examples of the implementation of democratic principles within learning environments www.eudec.org

use of the right to vote, but about the convergence of different points of view and the search for a balance between particular interests" (p. 25). In this regard, the role of the adult transforms from being a teacher (in charge of making learners learn something) to becoming a facilitator that scaffolds and supports young people's guided appropriation of democratic practices. Within this setting, young people participate in the Assembly on equal terms with adults; that is, they have the same rights and responsibilities, having a voice and a vote.

Additionally, two of them are elected by the school community or volunteer themselves to manage and implement the Assembly's agenda and note-taking. The recurring dynamic of these meetings is that someone makes a proposal or raises an issue and argues their reasons or motivations, and all voices are listened to and taken seriously, aiming at reaching an agreement or consent from the school community. In some cases, the adoption of a rule or decision is decided by voting, adopting the position of the majority; however, although the decision of the majority is assumed, what is actually discussed is a long-term consensus, as almost any rule can be revoked. From the perspective of school-culture building, the Assembly's role needs to be understood in terms of scaffolding and guided participation and appropriation (Rogoff, 2003), where "more competent participants" in school community meetings share with others appropriate discursive tools, such as how to participate, speak, request the floor, and listen actively to others.

Similarly, some schools have adopted the *sociocratic method* with the aim of being able to hear all voices and going beyond majority rule, emphasising the common good, responsibility, and the consequences of decisions made. In a nutshell, sociocracy has four main principles: consent, circle process, open election, and double-link. This democratic governance method is implemented mostly in Dutch democratic schools. Yet it has extended to other parts of the globe, promoting an "inclusive and equitable way of decision-making, as collective decisions are made through the consent of everyone involved" (Osorio & Shred, 2021: 3). Within this approach, each circle makes sure that every voice is heard, while being represented in wider circles by community-elected representatives (Plesman, 1961).

The negotiated integrated curriculum and the 20% proposal

A negotiated integrated curriculum invites teachers and curriculum developers to involve students by asking about their concerns and using these topics to shape learning possibilities and teaching methods (Beane, 1997). This approach is closely related to the "curriculum of life" (Portelli & Vibert, 2002), focused on the students' individual, social, cultural, and political contexts and concerns in education. According to O'Grady and

colleagues (2014), the concept and practice of curriculum negotiation/integration in learning lies on several key assumptions:

- Schools need to become true learning organisations, not merely obligatory societal institutions that view students from a deficit perspective.
- A negotiated/integrated curriculum should be holistic and flexible, and encourage collaboration between teachers and students to tackle various themes and issues, including local and specific concerns related to the student, school, and community.
- Students can gain empowerment through genuine learning opportunities they choose, helping them answer the universal questions: Who am I? And what is my place in society?
- Teachers shall be respected as professionals knowledgeable about their subjects, students, and teaching skills.

On the other hand, the 20% Proposal, which emerged from the Democracy and Education conference held in Strasbourg in 2016, suggests that 20% of a school's curriculum should be dedicated to learners-initiated learning activities based on their interests, concerns, and ideas. The main goal is to foster a more participatory, inclusive, and democratic learning environment by embedding democratic principles into the educational experience. For Hannam (2023), some of the key points of the proposal are:

- Student Participation: Allocate 20% of school time to activities that actively involve students in decision-making processes, including student councils, participatory budgeting, or class meetings where students can voice their opinions and help shape school policies and practices.
- Curriculum Content: Integrate democratic education into 20% of the curriculum by living core values such as civic education, human rights, social justice, and critical thinking.
- Teaching Methods: Implement pedagogical approaches that promote democratic values, including collaborative learning, project-based learning, and other methods that encourage student autonomy, critical inquiry, and respectful dialogue.
- School Culture: Foster a school environment that models democratic principles, creating a culture of respect, inclusion, and equity, where all members of the school community – students, teachers, and staff – are encouraged to participate and contribute.
- Community Involvement: Engage the broader community in the educational process, meaning that schools could partner with local organisations, parents, and community members to provide students with real-world democratic experiences and opportunities for civic engagement.

- Evaluation and Adaptation: Continuously evaluate the effectiveness of democratic education initiatives and adapt them as needed, involving gathering feedback from students and other stakeholders and using it to improve democratic practices within the school.

Some of the European experiences where learner-initiated projects have been accommodated (to flexible curricula, promoting autonomy and responsibility through independent research projects and personalised learning plans, and allowing them to focus on their interests and questions through self-directed learning, beyond the 20% of the timetable) are Summerhill School (UK), Escola da Ponte (Portugal), Ørestad Gymnasium (Denmark), Institut Beatenberg (Switzerland), Freie Schule Frankfurt (Germany), Evangelische Schule Berlin Zentrum (Germany), Big Picture Learning Schools (the Netherlands), and Pestalozzi School (Austria), among others.

In sum, the 20% proposal emphasises the importance of creating educational spaces where democratic values are not only taught but also practised. By dedicating a significant portion of the curriculum and school activities to learners' initiatives, the proposal aims to prepare them to become active, informed, and responsible citizens.

A case study: the Participatory School in Tehran

Since 2005, rooted in the principles of humanistic education, the Participatory School in Tehran stands as a unique and transformative example of how a democratic, child-centred approach can foster active participation in learning, despite the broader socio-political challenges within the country. Despite encountering numerous challenges, this school initiative has persevered, establishing itself as the largest independent research effort in the field of children's and adolescent education in Iran, operating autonomously from the Ministry of Education for nearly two decades.

Drawing on "Humanistic Education" (Yousefi & Yousefi 2014) the Participatory School places a particular emphasis on participation involving children, adolescents, families, and the broader community. Participation, in this context, refers to the active involvement of individuals in collective decision-making processes. It underscores the importance of collaboration and dialogue among students, teachers, families, educational planners, and the local community. Decisions within this framework are not imposed unilaterally but are instead the result of collective deliberation facilitated through active participation. (In the chapter on Utopias, there is more information about the Participation school in Tehran and the closely cooperating Peace school in Toronto).

The Travelling Educator project started among the middle class in the 13 Aban region.

It was initiated to address the need for a more inclusive approach to education. The focus was not only on children, but also on engaging the entire community.

The 13 Aban plan aimed to create a participatory process where men, women, children, and families could recognise their abilities, broaden their perspectives, and utilise available resources. This approach helped individuals break free from limitations, experience personal growth, and unlock their talents. The project's success continues because it empowered individuals to believe in themselves and actively participate in various areas. For example, women now hold weekly book reading sessions in public libraries, covering topics like psychology, education, family management, and parenting. Over time, their interests expanded to include poetry and literature.

As the 13 Aban project integrated education into people's lives, it sparked new connections, revealed aspirations, and helped individuals identify skills to meet their needs. There was an emphasis on independence for participants, ensuring sustainability. In a region with many needs, empowering community groups and fostering their independence is vital, contributing to the project's longevity of over two decades.

Supported by residents, various initiatives emerged, including the Local Kitchen Women's Cultural Association, the Fabric Book Cooperative, and youth and fathers' groups, sustained by a non-governmental organisation. The Local Kitchen promoted healthy eating patterns, providing nutritious snacks for children and encouraging plant-based foods. The Women's Cultural Association supported children's education through reading sessions, training courses, workshops, and kindergarten library support. After nearly 20 years, members saw themselves as responsible for children's well-being.

One of the project's most remarkable aspects was its continuity and growth. By adopting an open and inclusive approach to education, we learned that our work should extend beyond children alone. The project "Make a Wish for Our Land" aimed to prepare students for possible future migration (within or outside the country) by teaching them that life is organised differently in other communities than in their familiar environment. It thus facilitates later integration and participation. The project focused on fostering a sense of belonging and increasing awareness of cultural diversity within Iran. They aimed to explore the different ethnic groups in the country by organising trips to experience various cultures, foods, customs, and dialects across different regions. The belief was that understanding one's environment would lead to greater responsibility as a citizen.

The follow-up project, Khorshid Mardom involved travelling across the country, reading books, and exploring local capabilities and regional characteristics. Participants

documented their experiences through video and voice recordings and shared their findings about local foods and cultures on social media.

Rural and urban place-based community learning of young citizens

Aiming at changing the *rural* phenomenon of exodus to the slums of the cities, Sanjit Bunker Roy founded the Barefoot College in Tilonia (Rajasthan) in 1972, where one could become a "barefoot engineer," a "barefoot doctor" or a "barefoot teacher," meaning not to walk in shoes into the cities but to stay "barefoot" in the villages. Because of their success, 'Barefoot College International' now "was founded to address the needs of the most remote and marginalised communities around the world … by empowering rural women as agents of change, through a variety of localised education and skills development programmes" (Barefoot College, 2023: 14).

As these programmes address 14 of the 17 UN-SDGs, learners can integrate them in order to experience how collaboration works with underrepresented rural communities globally. Supporting learners "to sustainably address their most pressing challenges … including climate change, food insecurity, gender inequality, and lack of access to education and economic opportunity" (ibid.) as main issues, learners develop "tools (…) to redress the balance of power and shift it back to rural and indigenous people, (…) combating climate change, breaking gender barriers and protecting traditional ways of life" (). For instance, some training experiences included training women of the dalit caste to repair motors for water pumps or build sun-collecting lighters. Building knowledge and skills in the low technology sector is attractive to young learners, as well as being useful and relevant to their communities. Indigenous knowledge is no longer ignored but instead seen as valuable to build on 'ecoversity'.

The Green schools that started in Bali (Indonesia) and the 18 United World Colleges (UWC) with learners from 120 countries who engage in environmental sustainability and nature conservation, creating links between rural places and cities around the world. An exemplary urban learning setting is the UWC in the divided Bosnian city of Mostar, where 8th-grade learners can choose to take their music lessons as band sessions in the Mostar Rock School (MoRS), consolidating it as an example of community change to more peaceful resonance impulsed by children and youth (Boban & Božić, 2023). Furthermore, the "Education Cities" initiative defines their work as "a campus for all". In the words of Yasuaki Sakyo, Dean of Shibuya University (Tokyo), "when we looked down at the city from above, we imagined how exciting it would be if Shibuya became a university. We envisioned the entire city functioning as one university where everyone could enjoy campus life all their lives. It definitely fired our imaginations" (2012). Permaculture concepts like the 'eatable city' or the 'transitional towns' like in Sydney invite all living place members to share responsibilities and powers for more partnerism to be experienced.

What can be done? – Taking action when revolution seems out of reach

As the previous section has shown, many forms of participation by children and young people in learning and community development require fundamental changes in schools and society. As these changes are so profound, they may feel beyond the reach of an individual teacher or educator, often leading to a sense of inertia. The question, therefore, arises: if systemic revolution is not on the horizon, what can be done in the here and now?

Build networks

Change often starts small, like a plant that needs a seed to grow. A starting point can be forming networks with allies who share similar goals, for example, students, parents, fellow teachers, school administrators, local government officials, or community members. Together, you can amplify your efforts and push for change more effectively. Networking with other initiatives that align with your vision will also provide opportunities to exchange ideas, strategies, and support, allowing your efforts to align in the same direction.

Familiarise yourself with the legal framework

While it may seem tedious at first, having a solid understanding of your country's educational laws and policies can be a powerful tool. Knowledge of the legal framework allows you to navigate perceived limitations. For instance, when facing resistance from superiors or administrative bodies, you can ask for the legal basis of their objections and consult with legal experts if necessary. This approach ensures that your actions are grounded in law, providing you with the confidence to pursue innovative pedagogical practices.

Take calculated risks

In some social contexts, it might be more effective not to seek permission in advance but to act in accordance with the law and, when necessary, explain your actions retrospectively. If your initiatives are pedagogically sound and legally defensible, you can argue that your actions were justified within the framework of child-centred education. This approach empowers educators to take bold steps while staying within the boundaries of what is legally permissible. As mentioned above, ensure the safety of students and avoid online exposure of individuals.

Conclusion

The participation of children and youth in learning and community development can take

many forms and be influenced by varying degrees of freedom, depending on the context. As this chapter has illustrated, participation is not a one-size-fits-all concept but a multifaceted process that adapts to specific cultural, political, and social environments. For instance, promoting participation under authoritarian regimes may be more challenging and even subversive than in democratic settings. Yet, in every context, participation has the power to disrupt established power dynamics, shift hierarchies, and redistribute influence in a way that prioritises collective decision-making ("power with") over top-down control ("power over").

Empowering children and youth requires confronting not only the structural limitations imposed by conventional educational systems but also the deep-rooted beliefs and societal attitudes that view children as incomplete, immature, or incapable of contributing meaningfully. So, in any case there is a potential not to damage the "inner power" of children and youth by adultism (Flasher, 1978) so that they can express themselves their "power for" what they are longing for. In many schools, teachers, parents, and policymakers still uphold hierarchical power dynamics, assuming that asymmetry between adults and children provides protection and continuity. However, today's complex world demands an educational shift towards self-awareness, co-constructed learning, and shared leadership. By rethinking how we structure learning environments and redefining the roles of children and adults, we create spaces where young people can assert their agency and actively shape their futures.

As this chapter has shown, participation is both a deeply personal and collective process. It begins with the opportunity for self-expression, recognition of one's abilities, and the possibility to be heard and understood. Participation may be part of a more significant, radical transformation aimed at overturning the educational status quo – such as revising curricula, rethinking teacher training, or involving young people in political decision-making at higher levels. It may manifest in small yet meaningful acts of everyday engagement, such as giving children more autonomy in the classroom, allowing them to pursue projects of their own interest, or involving them in community decisions. These acts may seem minor, but they chip away at entrenched beliefs and gradually lay the foundation for more significant systemic change.

The examples throughout this chapter underscore the importance of networking and collaboration. Teachers, parents, local leaders, and community members can all serve as facilitators of change, providing the fertile ground where participation can take root and grow. However, the process of participation is reciprocal: it not only "takes a village to raise a child", but also "takes children to help develop the village". Their contributions – cultural, social, political, and intellectual – bring new perspectives that enrich the entire community.

Ultimately, to enable participation at all levels, it is necessary to engage in the revolutionary act of unlearning. This means letting go of tradition-oriented narratives that limit the potential of children and youth and embracing new, creative approaches to education and community building. By reimagining the role of young people as active

participants in their own learning and community development, we take an essential step towards creating more inclusive, democratic, and participatory societies.

Closing questions to discuss or tasks

- **Power dynamics in education:** Reflecting on the examples of democratic schools and participatory learning models, how do traditional power dynamics in schools (teacher-student relationships) inhibit meaningful participation? What steps can be taken to shift these dynamics toward more equitable power-sharing?
- **Cultural and contextual considerations:** How does the cultural and political context of a society influence the way participation of children and youth is approached? For example, how might efforts to promote participation in a democratic country differ from those in a more authoritarian regime?
- **Small and large-scale participation:** The chapter highlights both small acts of everyday participation and significant, systemic reforms. In your view, what could be a small step and a large-scale horizon in your situation?
- **Unlearning hierarchical structures:** The concept of "unlearning" traditional hierarchical structures was discussed in the chapter. What are some of the challenges educators and communities might face in "unlearning" these practices? How can they begin the process?
- **Legal frameworks and participation:** The chapter emphasises the importance of familiarising educators with legal frameworks to navigate barriers to participation. How can knowledge of the law empower teachers, students, and communities to push for greater participation in schools?
- **Participation beyond school walls:** How can participation in learning extend beyond

the classroom to foster community development? Can you think of any local or global examples where youth have successfully contributed to social, environmental, or political change in their communities?

About the authors

Carlos Moreno-Romero

Charlie's academic and professional journey spans across disciplines: philology (BA), anthropology (MA), and education (PhD). In 2019, he funded a democratic school (Suvemäe) within a public school (Tallinna Kunstigümnaasium) in Estonia, where he worked as head of studies until 2024. Furthermore, he has researched various topics (Educational Commons, Democratic Education and Social Justice, Nation-State Formation and Education) within the framework of Erasmus+ and Horizon 2020-funded projects. He currently works as a consultant on democratic education, self-directed learning, media literacy, and fostering social justice through education.

Ines Boban

Once teacher in so called Integration-Classes at a comprehensive school (Reformschule Hamburg Winterhude), from 2002 until 2017 researcher and lecturer for Inclusive Education at the Martin-Luther-University Halle-Wittenberg.

Maryam Mohammadi

Maryam Mohammadi holds a master's degree in painting and brings 17 years of teaching experience as the Executive Director of the Participatory School in Iran. The school fosters a humanistic approach to education, focusing on alternative methods that emphasise active participation from children, parents, and teachers to promote the holistic development of young learners.

For years, Maryam and her colleagues have worked to build an inclusive environment where all students, regardless of their background or abilities, can thrive. Addressing

individual needs, they help students cultivate self-awareness, confidence, empathy, and a deeper understanding of themselves and the world.

Shichong Li

Shichong Li is a PhD candidate at the University of Leeds, UK, with a research focus on the Left-behind Children (LBC) in China and their agency in peer relationships. Her work challenges the dominant narrative of LBC's vulnerability and emphasises the importance of LBC's relational agency in peer relationships within and beyond the school setting. Holding a master's degree in curriculum and instruction from Southwest University, China, she has contributed to research projects on teacher training, an experience that has significantly shaped her current PhD research. She advocates for incorporating children's perspectives into teacher training programs to support diverse learners better.

Silvia Dell'Anna

Silvia Dell'Anna is a postdoctoral researcher in inclusive education, working at the Free University of Bozen/Bolzano. Her primary research areas include the evaluation of the quality of school inclusion, the design of inclusive teaching strategies, and the prevention of educational poverty, underachievement, and early school leaving.

SELF-DETERMINATION IN LEARNING

Example Case

"Riverside Primary School prides itself on its long-standing teaching traditions, emphasising discipline and good grades in the national standardised exams. Isaac is an eight-year old student at Riverside, who is on the autism spectrum[1]. He is a bright and curious child, full of potential. However, his unique abilities are not recognised or nurtured. The classroom is

---

1. It is worth noting that discussions around language and terminology related to disability can be complex and at times controversial. One key aspect of this debate is the distinction between disability-first language and person-first language. Disability-first language refers to using terminology that places the disability or condition as the primary identifier, e.g. 'autistic boy'. Advocates of disability-first language argue that it acknowledges and embraces disability as an integral part of a person's identity and promotes a sense of pride and empowerment within the disabled community. On the other hand, person-first language emphasises the individual before the disability e.g. 'boy with autism' or 'boy on the autism spectrum', as is being used in this case study. Proponents of person-first language believe that it recognises the person beyond their disability, emphasising their humanity and individuality. It is essential to acknowledge that preferences regarding language and terminology can vary among individuals and communities. Some individuals and disability advocacy groups may strongly advocate for one approach over the other, while others may have different perspectives based on their personal experiences and cultural backgrounds. There is a growing recognition of the importance of centering the voices and perspectives of disabled individuals themselves in shaping the language used to describe and discuss disability. It is crucial to listen and respect their preferences and choices regarding how they wish to be referred to, as they are the experts of their own experiences. Ultimately, the goal should be to promote inclusivity, respect, and dignity when discussing disability-related topics. Engaging in ongoing dialogue, being receptive to diverse perspectives, and staying informed about evolving language norms can contribute to creating an inclusive and respectful environment for all individuals.

filled with rows of desks, and the teacher stands at the front, while students listen passively. For Isaac, this rigid structure poses numerous challenges, including issues with his need for movement. The lack of opportunities for independent decision-making leaves him feeling frustrated and disengaged. He desires to explore his unique interests, but the curriculum offers little flexibility or choice. Isaac's love for dinosaurs, for instance, is never acknowledged or incorporated into his learning experience. Such frustration is often translated into behaviour that is often labelled as problematic and disruptive."

If you put yourself in Isaac's shoes how does this affect the way you feel about school and how it is preparing you for your future?

Initial questions

In this chapter you will find the answers to the following questions:

1. What is self-determination in learning?
2. What are the three basic psychological needs that support self-determination in learning?
3. How can educators promote self-determination in their students?
4. How can educators facilitate more autonomous forms of motivation at schools?
5. What are the effects of rewards, feedback and other external events on intrinsic motivation?
6. How can we use rewards to support students` autonomy rather than undermining it?
7. Why is it important to provide our students the opportunity to make choices that enable them to partially determine their learning path?
8. What teaching and learning methods (or strategies) are best able to nurture the autonomy, competence and relatedness needs of a wide spectrum of human differences?
9. How can the conditions placed within the context enhance or hinder the self-determination process of our students? And how can they affect their well-being?

Introduction to Topic

Wehmeyer (1992) proposed that self-determination revolves around "the attitudes and abilities required to act as the primary causal agent in one's life and to make choices regarding one's actions free from undue external influence or interference" (p. 305). Exercising autonomy in decision-making is an important aspect of typical human development, fostering mutual benefits for both the individual and society at large. Ryan and Deci's (2017) Self-Determination Theory (SDT) posits that individuals possess an inherent inclination for personal development, the establishment of connections within their communities, making meaningful contributions to these communities, as well as overcoming obstacles within their surroundings.

Self-determination in learning regards learning as a personal journey for each individual. It recognises the learner as an active participant in their own learning process, driven by intrinsic motivation to actively engage in the learning experience. When self-determination is present, learners have the autonomy and capability to make choices regarding their learning and set their own learning objectives. They take initiative in acquiring the new knowledge and skills necessary to achieve their goals, and they possess the ability to self-assess their progress in relation to their set objectives.

In essence, self-determination in learning entails an individual's capacity to control and regulate their own learning process. This involves taking ownership of their learning goals, making informed decisions about learning strategies, and persevering in the face of challenges that may arise along the way. By embracing self-determination, learners become active agents in their own educational journeys, empowering themselves to shape their learning experiences and ultimately achieve their desired outcomes.

According to SDT, there are three basic psychological needs that support self-determination in learning and facilitate growth and include; autonomy, competence, and relatedness. These needs are termed basic because they are universal to human nature and transcend all cultures, age groups, and abilities.

The Three Basic Psychological Needs for Self-Determination

The need for autonomy

Autonomy as defined in SDT refers to voluntary behaviours, and the need for control and choice in the actions and decisions that individuals take in their lives, including the ability to take direct action in one's learning process (Ryan & Deci, 2017). Of the three basic psychological needs, the concept of autonomy is often the one that is most easily misinterpreted. It is important to clarify that autonomy does not imply a need to act independently and not rely on others for assistance or guidance. On the contrary, it emphasises the ability to willingly and autonomously seek help from others and engage in collaborative efforts (Deci & Ryan, 2000).

It is also important to acknowledge that being autonomous does not imply an absence of demands or rules. Rather, autonomy involves adhering to rules when they are personally endorsed and congruent with one's values and beliefs (Deci & Ryan, 2000). For example, in the context of physical education classes, students willingly wear training shoes because they understand the meaningful explanation behind the requirement – training shoes help to prevent injuries during sports activities.

Lastly, SDT argues that simply removing external constraints does not automatically grant individuals autonomy. In classroom settings, merely eliminating constraints without providing students with meaningful goals or missions would result in chaos. Therefore, being autonomous in SDT is about the legitimacy of the rules and the restraints as well as the internalisation of the values involved.

The need for competence

Competence refers to the need for mastery and achievement in learning tasks (Ryan & Deci, 2017). Humans are driven by a fundamental psychological need to seek effectiveness and capability in the activities that they are engaged in. However, the level of challenge presented by tasks plays a crucial role in determining one's sense of competence. When tasks are overly challenging, to the point where the student feels a sense of failure right from the beginning, their perception of competence decreases (Deci & Ryan, 2000). On the other hand, students can be disinclined to complete a task if this is too easy or lacks sufficient challenge.

SDT emphasises that competence is not just about achieving a desired outcome but also about experiencing growth and progress. Therefore, the feeling of competence is enhanced when the tasks are optimally challenging for students and match their existing skills (Ryan & Deci, 2017).

The need for relatedness

Relatedness refers to the need for social connectedness and support from others (Ryan & Deci, 2017). It refers to the deep-seated desire to establish meaningful connections and relationships with others. Humans thrive on a sense of belonging, a sense of being part of something bigger, of a community. One aspect of relatedness stems from the experience of being cared for and supported by others (Deci & Ryan, 2000). In the educational context, when students perceive genuine care and concern from their teachers about their well-being and academic progress, it fosters a sense of connection and trust. Such nurturing environments make students feel valued and appreciated, leading to enhanced motivation and engagement in their learning journey (Deci & Ryan, 2000). Thus, teachers who demonstrate empathy, understanding, and responsiveness to their students' needs create a conducive atmosphere where relatedness flourishes.

Relatedness is also fostered through opportunities for students to contribute and

collaborate within a group setting. Actively engaging in group tasks allows students to benefit from the diverse perspectives and expertise of their peers, and gain mutual support, promoting a sense of shared goals and cooperation. It is important to emphasise that relatedness is not solely limited to students. The extent to which teachers experience a sense of relatedness themselves is dependent upon the quality of relationships they cultivate with their students (Klassen et al., 2012).

Key aspects

The importance of self-determination in learning

Self-determination in learning is important for all students as it empowers them to take greater responsibility and control over their educational journey, leading to increased engagement and motivation. When students are actively involved in shaping their learning experiences, they invest more effort and persist more in the face of obstacles. The skills that they develop such as goal setting, problem-solving and decision making, enable students to be more independent and active in their learning (Agran et al., 2008). A number of studies in this field have highlighted various positive outcomes of fostering self-determination in learning such as enhanced self-esteem (Deci et al., 1981), improved student well-being (Cheon et al., 2014) and better academic performance (Van Lange et al., 2012).

In educational contexts with standardised curricula and high-stakes exams, teachers often perceive efforts to cultivate self-determination as a waste of time (Parrish et al., 2024). However, investing time in promoting students' autonomy pays off significantly. It leads to students setting more ambitious goals, demonstrating perseverance in the face of challenges, and acquiring essential self-regulation skills like time management. This increased self-directedness and autonomy in learning, results in a deeper understanding of the content, as learners start connecting new knowledge that they are acquiring at school with their prior experiences (Garrison, 1997). Thus, there is a shift in responsibility from the teacher to the learner, with regard to learning, where the teacher becomes more of a mentor who can support and guide the learner to improve academic performance.

Regrettably, individuals with intellectual and developmental disabilities often encounter limited opportunities for exercising personal choice and decision-making and may have limited control over the circumstances that significantly impact their day-to-day existence (Cottini, 2016; Wehmeyer, 1996). Nevertheless, various studies provide evidence of the importance of self-determination skills for such individuals. Such studies include, but are not limited to the following:

- When students with autism are provided with opportunities for choice-making, problem behaviours are reduced whilst adaptive behaviours increase (Reinhartsen et

al., 2002).

- Teaching a self-regulated problem-solving process to students with severe disabilities enables them to achieve various educationally relevant goals (Palmer et al., 2004).
- Students with learning disabilities but high self-determination were twice as likely to be employed than those with low self-determination (Wehmeyer & Schwartz, 1997).
- Students with cognitive disabilities and high self-determination were significantly more likely to live independently (Wehmeyer & Palmer, 2003).
- Providing choice opportunities as an intervention to reduce problem behaviour in students, resulted in significant reductions in such behaviour (Shogren et al., 2004).

Additionally, there is a positive correlation between self-determination and IQ, but IQ is not a predictive factor of the level of self-determination that a student can reach, particularly for students with disabilities (Wehmeyer & Garner, 2003).

Teaching which promotes self-determination can also benefit teachers. Educators who engage in workshops specifically designed to enhance their skills in promoting autonomy support (compared to teachers in a control group) not only demonstrate a higher level of autonomy-supportive teaching, but also report a greater sense of satisfaction in their teaching, a stronger passion for teaching, increased teaching efficacy, and reduced emotional and physical exhaustion after teaching (Cheon et al., 2014). This reinforces how teachers can experience significant professional advantages by embracing self-determination in learning.

Motivation in Self-Determination Theory

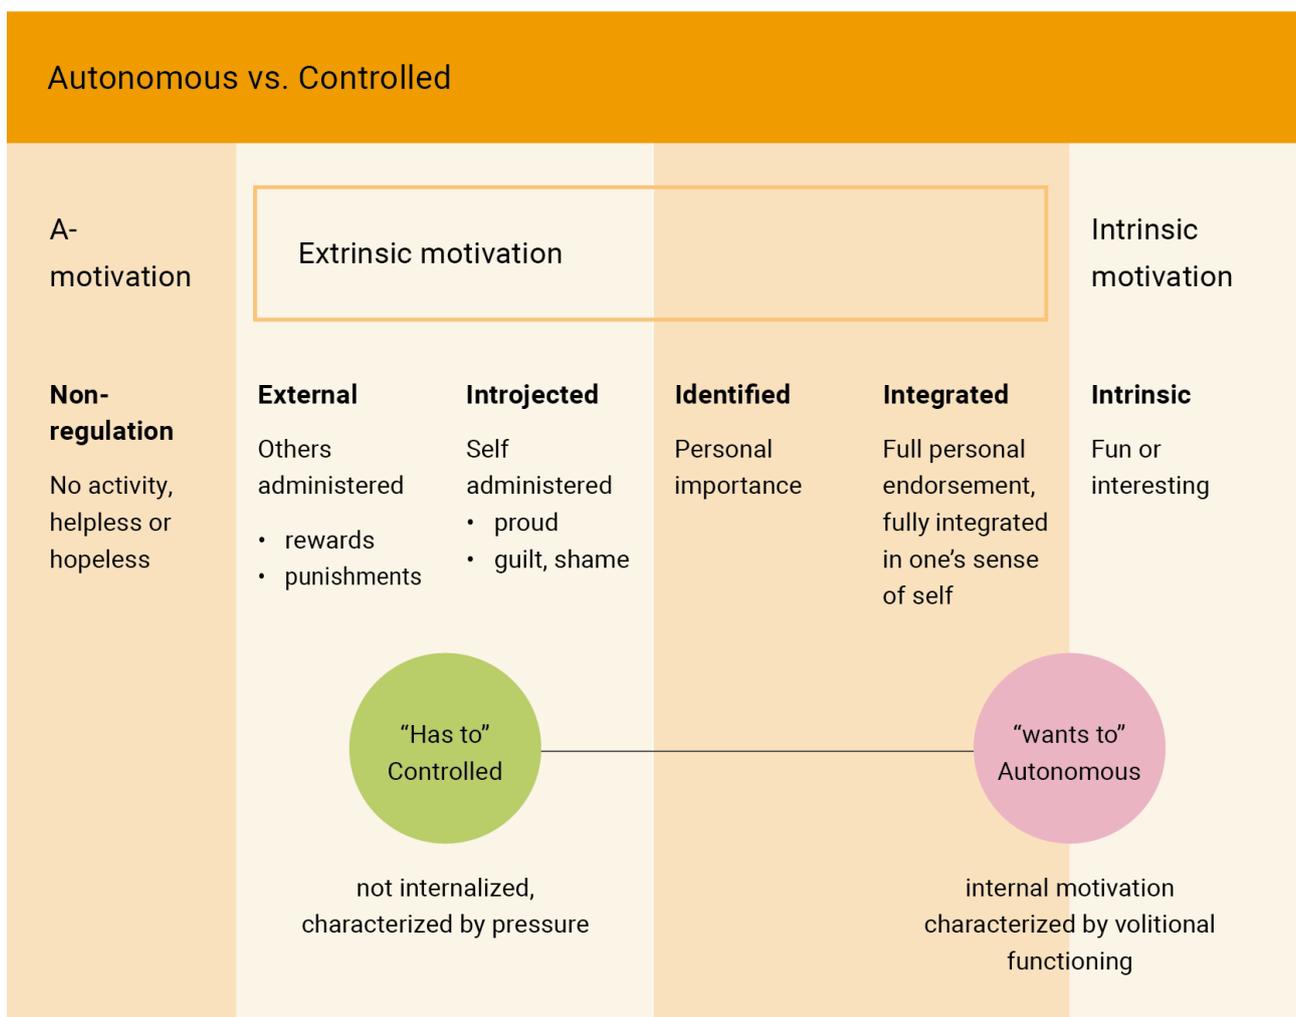
SDT defines motivation as the driving force behind human actions and the reasons why a person engages in specific behaviours. It also suggests that motivation can take different forms, depending on the level of self-determination involved (Deci & Ryan 2008). One of these forms is intrinsic motivation which arises from a genuine interest, or alignment with one's internal values. Conversely, extrinsic motivation represents a different type of motivation, one driven by external forces such as rewards and punishments.

When individuals with authentic or intrinsic motivation (self-authored or endorsed) are compared to those who are merely externally controlled, the former typically display more interest, excitement, and confidence. These qualities in turn manifest both as enhanced performance, persistence, and creativity (Deci & Ryan, 1991; Sheldon, Ryan, Rawsthorne & Ilardi, 1997), as well as heightened vitality (Nix, Ryan, Manly & Deci, 1999), self-esteem (Deci & Ryan, 1995), and overall well-being (Ryan, Deci & Grolnick, 1995). Remarkably, these positive effects persist even when individuals have the same level of perceived competence or self-efficacy for the particular activity (Deci & Ryan, 2000).

In SDT, intrinsic motivation represents the most self-determined form of motivation. When an activity is intrinsically motivating, students engage in it willingly, driven by genuine

interest and enjoyment, rather than engaging to receive some external reward or avoid punishment. While intrinsic and extrinsic motivation might seem diametrically opposed, there is another important distinction within these types of motivation. SDT differentiates, therefore, between autonomous and controlled motivation (Ryan & Deci, 2008).

Autonomous motivation stems from internal sources and can be subdivided into identified, integrated and intrinsic motivation. In this case, individuals are driven by a sense of personal relevance or integration of the activity with their core values and identity. On the other hand, controlled motivation, which can be subdivided into external and introjected motivation, is derived from feelings of pressure either from within oneself or the external environment. In controlled motivation, individuals engage in actions not because they genuinely want to, but because they feel obliged or coerced.

Figure 1: Autonomous vs. Controlled


Source: Adapted from Self-Determination Continuum by Ryan & Deci (2000)

Figure 1 illustrates the taxonomy of different forms of motivation in SDT. Ryan and Deci (2008) created the Self-Determination Continuum by dividing motivation into six categories of regulatory styles – from the least motivational to the most motivational. At the far left of the self-determination continuum is A-motivation which means not having the intention

to act. According to SDT, a-motivation results from not valuing an activity (Ryan, 1995), not feeling competent to do it (Bandura, 1986), or not expecting it to yield a desired outcome (Seligman, 1975). In a learning environment, therefore, we can assume that our students would be a-motivated to engage in an activity or a task when they are not convinced of the outcome of the activity/task or when it is too hard for them to achieve it.

Extrinsic motivation, on the other hand, covers the continuum between a-motivation and intrinsic motivation, varying in autonomous level. External regulation refers to the least autonomous form of extrinsic motivation and includes behaviours performed to meet and satisfy an external demand. A typical example would be a student who does their homework regularly to avoid punishment or studies hard to get good grades to get rewarded by their parents. Although the behaviour is intentional, it is still controlled and regulated by an external source. A second type of extrinsic motivation is introjected regulation which refers to taking in the cause of the action but not fully accepting it. This involves behaviours that are performed to avoid guilt and anxiety or to get recognition from others and maintain feelings of worth. A student who spends lots of time working on their classroom presentation in order to feel more respected, or avoid the risk of being laughed at by their classmates, could be an example of introjected motivation. Although it includes relative self-control and it is internally driven, introjected regulation is still considered as controlled by external sources and therefore is not autonomous. Thus, in some studies, external regulation (being interpersonally controlled) and introjected regulation (being intrapersonally controlled) have been combined to form a controlled motivation composite (e.g., Williams, Grow, Freedman, Ryan & Deci, 1996) (as cited in Ryan & Deci, 2000).

Identified regulation refers to the more autonomous and less controlling form of extrinsic motivation. Identification means when the person performs a behaviour because they consciously and personally value the goal of the action rather than doing it because they feel obliged to. For instance, a student studies hard for the SAT exam because gaining access to college is important to this student. In this example, gaining access to college is a personal and self-selected goal and is therefore relatively autonomous although the behaviour is extrinsically motivated. Alternatively, this differs to the student believing that their parents would be disappointed by not getting into a college (i.e., introjected regulation) or as a personal choice if their parents were pressuring them (i.e., external regulation). The most autonomous form of extrinsic motivation is integrated regulation, which refers to the congruence of behaviour with one's own values and needs. In other words, it is a form of motivation when a person has fully embraced the reason for action after examining the cause and necessity of it. While the behaviour is not performed because it is interesting or fun, integrated regulation is valued and experienced as autonomously motivating.

Lastly, at the far right of the continuum, intrinsic motivation is the act of doing something out of interest and is therefore considered to be highly autonomous. In some studies, identified, integrated, and intrinsic forms of regulation have been combined to form an autonomous motivation composite (Ryan & Deci, 2000).

Ryan and Connell (1989) tested the formulation that these different types of motivation, with their distinct properties, lie along a continuum of relative autonomy. They investigated achievement behaviours among school children and found that external, introjected, identified, and intrinsic regulatory styles were intercorrelated according to a quasi-simplex pattern, thus providing evidence for an underlying continuum. Furthermore, differences in the type of extrinsic motivation were associated with different experiences and outcomes. For example, the more students were externally regulated, the less they showed interest, value, and effort towards achievement and the more they tended to disown responsibility for negative outcomes, by blaming others such as the teacher. Introjected regulation was positively related to expending more effort, but it was also related to feeling more anxiety and coping more poorly with failures. In contrast, identified regulation was associated with more interest and enjoyment of school and with more positive coping styles, as well as with expending more effort (as cited in Ryan & Deci, 2000).

The attitudes and skills needed for self-determination in learning

Mithaug and colleagues (1998) describe self-determination as a set of abilities that empower individuals to:

- know and express their interests, needs and abilities;
- set their own expectations and goals in order to meet these interests and needs;
- make choices, decisions and plans;
- act to realise their projects;
- evaluate the consequences of their actions;
- modify their actions and plans in order to achieve their desired goals.

The cultivation of self-determined behaviour relies on personal skills – such as the capacity to make informed choices, set goals, and self-monitor one's actions. Additionally, the environment plays a crucial role in facilitating the implementation of these behaviours (Cottini, 2016). Therefore, a lack of self-determination may result from inadequate capacities to perform self-determination skills, either from inappropriate opportunities to develop, acquire or employ these skills, or both (Mithaug et al. 1998). This implies the need to address the causes of low levels of self-determination, attaining to define appropriate interventions to improve them. Taking this into account, the development of skills and attitudes for self-determination begins before children enter the school system and continues into adulthood (Sands & Doll, 1996), and it is essential to foster and enhance this process by creating a supportive school context.

To nurture self-determination, schools must devote attention and effort to the development of intrapersonal, metacognitive and social skills among students. By doing so, students can gain a deep mastery of these skills, ensuring that they have the tools to shape their own paths successfully. This investment in students' self-determination skills

will empower them to make meaningful choices, set purposeful goals and take charge of their own educational journey, and ultimately, their lives beyond the classroom.

Intrapersonal Skills

Intrapersonal skills play an important role in fostering and enhancing the self-determination of every student. In order to make informed and responsible decisions, and to navigate a self-directed learning journey, it is essential to develop a deeper understanding of oneself. This understanding encompasses knowing your true aspirations, identifying meaningful goals, recognising the strategies and resources at your disposal, and mastering the art of using them effectively. Self-awareness and self-management become the compass that guides students in building a harmonious relationship with the environment, and in turn, unlocks the full potential within each individual (Rose, 2016).

Accepting and valuing the self

Accepting and valuing the self is one of the basic components that provide a foundation for acting in a self-determined way. It involves acquiring awareness of one's internal states, preferences and resources, and recognising their value on a personal and community level. It is not limited to "I see myself and I like what I see", but also encompasses the feeling of possessing a "unique worth". Students' experiences in school have a strong impact on the image they possess of themselves, and the significance they attach to different aspects of themselves. Effective methods to foster self-acceptance may include discussing with pupils the meaning of the term, providing examples of how self-accepting self-talk can be applied in difficult situations, and designing activities that enable students to become more aware and appreciative of their own positive qualities (Bernard et al., 2013).

Awareness of personal learning strengths, weaknesses, preferences and needs

Evaluation of the self is another important competence that enables self-directed learning (Patterson et al., 2002). Students who develop self-awareness recognise their strengths and weaknesses, and use this understanding to effectively shape and direct their own learning journey, making informed choices. Students acquire this knowledge by interacting with the school environment (Jonassen and Land, 2012), therefore it is essential to provide them with the opportunity to discover different aspects of themselves, to explore several ways of learning and fields of interest, and to develop the ability to proactively act accordingly. It is essential to enable them to communicate their preferences and prioritise their needs, whilst also evaluating their current status in relation to learning goals.

Knowing options, supports and expectations

Individuals differ in the extent to which they act according to personal beliefs, values,

interests and abilities (McClelland, 1985). The degree to which learners act in behaviours that align with the perceived self depends on several factors. In addition to acquiring self-awareness, it is necessary to develop the abilities to read the context and identify available choices and opportunities for personal growth, as well as difficulties that may be encountered and sources from which one may seek support in times of uncertainty (Snowden, 2002).

Teachers, in addition to peers, play an important role in fostering resilience, supporting students on social and emotional issues for learning, helping them proactively manage the discomfort inherent in risky tasks, being reflective and moving forward in self-determined learning.

Knowing what is important on a personal level

Since self-determination is also defined as the process through which individuals manage and direct their lives towards meaningful goals for their existence, being aware of what is important on a personal level is one of the preliminary steps that enable them to pursue these goals (Deci & Ryan, 2012). This knowledge derives from an acquired deep awareness of one's potential, resources and aspirations – ascribed to a personal level – and from an analysis of the interaction with contextual factors, which can decline further paths of development based on how they hinder or facilitate the pursuing of the person's intentions and needs.

Risk-taking

Being willing to take risks plays an essential role in theories of motivation, and is a fundamental competence for actualising the process of self-determination. Risk-taking can be defined as engaging in adaptive learning behaviours (sharing tentative ideas, asking questions, trying to do and learn new things) that put the learner at risk of making mistakes or appearing less competent than others (Beghetto, 2009). Learning, like other areas of life, involves uncertainty and, therefore, a degree of risk (Byrnes, 1998). Students are often reluctant to jump into the learning process because they fear failure, a bad grade, negative teacher judgement, or devaluation by peers.

In a school system based on the one-size-fits-all approach, students generally tend to converge on one right way to complete a task or master a skill, thereby reducing overall achievement (Magableh & Abdullah, 2020). However, taking risks and accepting challenges, especially when these arise from personal inclinations and aspirations, motivates the student to not only engage more in the learning process, but also to perform better. A continuous recalibration of learning goals is necessary to overcome any knowledge gaps, acquire new thinking tools, define what is important to the individual, and develop metacognitive skills that will also serve well to self-direct one's own education (Bembenutty et al., 2013).

Persistence

One of the competencies closely related to self-determination is perseverance, defined as the ability to maintain commitment to a goal despite challenges. This skill represents a fundamental component in the development of adequate resources aimed at ensuring the achievement of long-term educational and formative goals.

Like resilience, perseverance depends on both internal and external resources and emerges through a dynamic interaction between the individual and their environment (Malaguti, 2016; Swanson et al., 2013). Consequently, analysing environmental contexts is crucial to identifying and addressing factors that can either foster or hinder the development of this skill. This reflection is particularly significant within the framework of self-determination. Contexts that satisfy the three basic psychological needs proposed by the Self-Determination Theory (SDT) — autonomy, competence, and relatedness — exert a substantial positive influence on perseverance (Vansteenkiste et al., 2004).

The pursuit of intrinsic rather than extrinsic goals in learning facilitates a deeper understanding of content, stronger concept acquisition, and greater long-term persistence (Vansteenkiste et al., 2006). Conversely, the introduction of rewards for activities that are already intrinsically motivating, such as the use of controlling language, or the presence of external factors such as rigid deadlines or surveillance, can undermine the need for autonomy, leading to reduced persistence and enjoyment of the activity (Vansteenkiste et al., 2006).

Self-determination and perseverance are deeply interconnected. When students are empowered to act in alignment with their authentic selves, pursue their own interests, values, and goals, and feel competent, they are more likely to overcome academic challenges and exhibit greater perseverance in achieving their objectives.

Emotional control

Emotional control and self-determination are also closely interconnected. Firstly, emotional control represents an essential metacognitive skill that plays a crucial role in the self-determination process. The ability to manage one's emotions and regulate behavior allows students to effectively channel the available resources towards achieving their set goals.

In parallel, self-determination enables an autonomous path of emotional self-regulation, particularly when individuals freely choose goals that align with their personal values. Unlike controlled situations, this approach enhances positive outcomes, including personal growth, the fulfillment of psychological needs, well-being, healthy relationships, and prosocial behaviours (Benita, 2020). Moreover, providing students with opportunities for choice enhances dopamine release, which not only encourages positive emotional responses but also boosts focus, memory, and motivation (Sousa, 2010).

Planning and metacognition

One crucial aspect of self-determination is effective planning and metacognition, which involves setting educational goals based on personal interests, abilities, and needs, as well as effectively monitoring progress. This section explores the key abilities and skills needed for successful planning and metacognition in the pursuit of self-determination.

Setting and modifying educational goals

To begin the process of setting educational goals, individuals need to embark on a two-step journey. Firstly, it is essential to engage in self-reflection, recognising personal interests, passions, strengths and talents as outlined in the previous section. This self-reflection helps in identifying specific educational needs and areas for growth (Travers, et al., 2015). Secondly, armed with this self-awareness, individuals can translate their interests, abilities, and needs into concrete and achievable educational goals. These goals should be measurable, realistic, and aligned with long-term aspirations. By following this process, individuals can effectively set educational goals that are meaningful and conducive to their personal development. Moreover, individuals need to eventually be able to demonstrate dedication and ownership towards their chosen educational goals, understanding the importance of personal investment in goal attainment. Cultivating a sense of responsibility for one's own learning journey further empowers individuals to take control of their education and shape their own educational path (Baxter, 2007).

Flexibility in goal setting is also an important aspect of self-determination. Individuals must recognise that goals need to be reassessed as circumstances change. Personal growth, shifting interests and unforeseen challenges may necessitate the modification or refinement of goals to align with the new reality. Seeking feedback from mentors or educators can provide valuable guidance in the process of goal modification, ensuring that adjustments are made in a strategic and informed manner. Embracing flexibility in goal setting, allows individuals to adapt to evolving circumstances and maintain relevance in their pursuits (Wrosch, et al., 2003).

Breaking down goals into small steps, tracking progress and modifying action plans

Breaking down goals into manageable small steps is a fundamental strategy for achieving self-determination. This approach helps individuals avoid feeling overwhelmed and enables them to maintain focus on making consistent progress. Prioritising tasks and setting timelines for completion further aids in effective goal management. Utilising tools such as to-do lists, planners, or digital apps provides a structured approach to organise and track progress, fostering a sense of accomplishment and motivation throughout the journey.

Engaging in self-reflection, self-assessment and tracking progress are important for pursuing self-determination as it allows for identification of areas for improvement and

the necessary adjustments to strategies and actions (Loman, et al., 2010). Additionally, celebrating achievements along the way serves as positive reinforcement, fuelling motivation to continue striving towards set goals (Geller, 2016). Identifying areas for further growth empowers individuals to set new goals and continuously challenge themselves. Proactively revising action plans in response to unexpected deviations ensures that learners maintain focus, stay motivated, and confidently navigate through challenges, ultimately propelling them closer to their goals and fostering self-determination.

Active participation in decision-making and accessing resources and support

Active involvement in decision-making related to educational goals and advocating for personal preferences and needs is a fundamental aspect of self-determination (Deci & Ryan, 2012). Identifying and accessing resources such as textbooks and online materials to enhance the learning experience is equally crucial for fostering self-determination. Moreover, seeking guidance and support from teachers, mentors, family members or peers becomes essential when facing important decisions or challenges. Developing effective communication skills plays a vital role in expressing needs and seeking assistance effectively. By actively engaging with resources and seeking support, individuals can maximise their opportunities for learning, growth and success (Barron, 2006).

Knowledge and adaptation of learning strategies

Possessing knowledge of various learning strategies not only enhances understanding and retention of information, but is also a key driver of self-determination. This is due to the ability to make use of different strategies based on the specific task at hand and allows individuals to optimise their approach for better learning outcomes (Schmeck, 2013). Reflecting on the effectiveness of these strategies and being open to making adjustments when necessary fosters continuous improvement and skill development. By possessing a repertoire of learning strategies and actively evaluating their efficacy, individuals can become more efficient and effective learners (Hattie & Donoghue, 2016).

Willingness to attempt challenging tasks

The willingness to attempt challenging tasks involves embracing a growth mindset by recognising that taking on difficult tasks can lead to personal and skill development (Dweck, et al., 2014). Such a mindset allows the learner to adopt a positive attitude towards learning and overcome the fear of failure. By stepping out of their comfort zones and pushing their boundaries, individuals cultivate resilience, perseverance, and a sense of achievement. This willingness to embrace challenges ultimately empowers them to expand their capabilities and enhance their self-determination (Ryan & Niemiec, 2009).

Interpersonal skills

Interpersonal skills are ways of interacting with others which make it easier to communicate effectively, both verbally and non-verbally. Interpersonal skills are essential for self-determination. They help learners cooperate and work with other learners while engaging in goal-directed and autonomous behaviour (McCornack, 2019). These skills include but are not limited to:

- Establishing and maintaining relationships with others involves building connections with peers, teachers, and others in the learning environment. It requires effective communication, active listening, empathy, and understanding of different perspectives.
- Seeking or offering support and help when necessary involves recognising when assistance is needed and being willing to seek or offer help. It fosters a culture of support and collaboration.
- Conveying information and expressing oneself clearly and effectively involves communicating thoughts, ideas, and information clearly and concisely by using appropriate language, tone, and non-verbal cues.

- Working collaboratively with other learners toward a common goal involves effectively working as part of a team, contributing ideas, listening to others, and collaborating towards a shared objective.
- Being able to negotiate to reach an agreement or compromise with others involves engaging in constructive dialogue and negotiation to find common ground and reach agreements or compromises.
- Actively listening to others and understanding their perspectives involves giving full attention to others, focusing on understanding their message, and demonstrating empathy.
- Resolving conflicts constructively involves addressing conflicts or disagreements in a positive and constructive manner. It includes active listening, empathy, and finding mutually agreeable solutions.
- Identifying social cues (both verbal and nonverbal) to understand how others feel involves recognising and interpreting social cues to understand others' emotions. It requires empathy and sensitivity.
- Demonstrating empathy and compassion involves understanding and sharing the feelings of others, and showing care and support.

Promotion of self-determination in learning in the classroom

Teachers, as the primary adults who interact with learners in school settings, play a significant role in fostering self-determined motivation. Teachers who support autonomy

can foster self-determined motivation in their students (Reeve, 2006). This conclusion has been reached across various educational levels, including primary school (Ryan & Grolnick, 1986), high school (Trouilloud et al., 2006), and university (Williams & Deci, 1996). This equally applies to students with severe behavioural problems (Savard et al., 2013). Regardless of the level of education or the difficulties students encounter, teachers adopting an autonomy-supportive teaching style significantly contribute to cultivating greater self-determined motivation in their students. Furthermore, these benefits appear to be consistent across cultures, as similar findings have been observed in non-Western cultures such as Russia (Chirkov & Ryan, 2001) and China (Hardré et al., 2006).

Educators can promote self-determination in their students by fostering an environment that supports autonomy, competence, and relatedness. This can be achieved through various strategies as will be shown in the following subsections. These include, but are not limited to, offering choices and flexibility in learning tasks, providing opportunities for students to engage in self-reflection and goal-setting, and creating a supportive and collaborative learning community. Additionally, educators can also provide feedback and praise that supports students' sense of competence and progress towards their learning goals. All of this requires the provision of space and time for the teacher to engage in continuous self-reflection.

Wehmeyer et al. (2012) provided evidence that using the Self-Determined Learning Model of Instruction over two years significantly improved the self-determination of high school students with cognitive disabilities when compared to a one-year intervention. This highlights the importance of more sustained efforts to promote self-determination as opposed to time-limited interventions.

Autonomy

Autonomy refers to the need to feel that one is acting out of a sense of volition and self-endorsement (Vansteenkiste & Ryan, 2013). As we have discussed above, autonomy in SDT does not mean that there are no rules, constraints or requirements for students in their learning environment. Chaos will be inevitable in such a classroom setting where all the constraints and rules are taken away. Students need legitimate commands and restraints that they can internalise. Involving our students in the process and allowing them to take ownership of their learning environment can be a way to create a set of rules that students will autonomously and willingly follow.

SDT argues that the way teachers engage with their students (autonomy-supportive vs. controlling) is one of the most decisive factors affecting the classroom climate. In classrooms, where autonomy is supported, teachers provide students with opportunities, choices and options to encourage them to take initiative and responsibility for directing aspects of their own learning. It is important to underline that these opportunities should align with, and be relevant to, students´ needs, interests and assignments. On the other

hand, controlling teachers tend to monopolise learning materials, and pressure students to think and behave in a particular way without considering the needs of the students (Deci, Vallerand, Pelletier, & Ryan, 1991).

Table 1:Teacher Behaviours Shown Empirically to Be Autonomy-Supportive, and Those Shown to Be Controlling

Teacher behaviors that promote autonomous motivation	Teacher behaviors that promote controlled motivation
• Listening to students • Making time for students' independent work • Giving students an opportunity to talk • Acknowledging signs of improvement and mastery • Encouraging students' effort • Offering progress-enabling hints when students seem stuck • Being responsive to students' comments and questions • Acknowledging students' experiences and perspectives	• Monopolizing the learning materials • Providing students too little time to work independently on solving problems • Telling students answers without giving them an opportunity to formulate them • Making demands and directives • Using controlling words such as should and have to Using directed questions as a way of controlling the flow of conversation

Source: Based on: Reeve, J., & Jang, H. (2006) Self Determination Theory, Basic Psychological Needs, in Motivation, Development, and Wellness (Ryan & Deci, 2017)

According to SDT, students with disabilities have the same basic psychological needs (autonomy, competence, relatedness) as all other students. Therefore, teacher involvement in learning or behaviour change, although it might be well intended, must respect and foster students' autonomy. Focusing merely on the outcome and putting on more pressure can be especially strong when it comes to students with disabilities. This can lead to a risk of disengagement. Instead, promoting autonomy and self-determination rather than training and management based on external control, ultimately brings more adaptive developmental outcomes.

It is also important to mention that when teachers are autonomy-supportive, they understand students' needs and perspectives. In this way, teachers can realise when their students need relational and competence support. Therefore, autonomy-supportive teachers typically support the other two basic psychological needs.

Providing choice

To effectively instil choice-making skills, it is necessary to integrate systematic and

structured opportunities for students to select options that align with their individual preferences in their daily routines (Lohrmann-O'Rourke & Gomez, 2001).

Lohrmann-O'Rourke and Browder (1998) provided recommendations for conducting preference assessments for students with disabilities, which include the following elements:

- Offering repeated opportunities for students to make choices.
- Conducting trial assessments in the actual environment where the choices are available, combined with careful observation of the students.
- Administering repeated assessments over multiple days to gauge consistency in preferences.
- Periodically assessing preferences over time to capture any potential changes.
- Presenting choice stimuli in a format that students can easily understand, such as using pictures or actual items.
- Allowing students to directly select their choices by touching, picking up, or pointing to the desired option.
- Presenting choices in a paired format, limiting the options available for selection.

In their article on choice-making, Shevin and Klein (1984) emphasised the importance of integrating choice-making opportunities throughout the school day. They identified five key factors for maintaining a balance between student choice and professional responsibility:

1. Integrating student choices as an initial step in the instructional process.
2. Increasing the number of decisions the student can make within a given activity.
3. Expanding the range of domains in which students can make decisions.
4. Increasing the significance of the choices made by students in terms of risk and long-term consequences.
5. Maintaining clear communication with students about areas where choices can be made and the boundaries within which those choices can be exercised.

According to Kohn (1993), schools have the potential to offer students meaningful choices in academic areas, such as involving them in decisions regarding what, how, and why they learn. Although offering students choices in learning demands additional commitment and effort from teachers, it is justifiable to do so, such as allowing students to work individually, in small groups, or as a whole class, and providing alternatives for seating arrangements during their work (Kohn, 1993).

Using appropriate language and demonstrating patience

The language used to promote autonomous choice-making should be informative, non-

pressuring, and supportive. Threats, rewards, or punishment should not be used to motivate self-determining behaviour.

Demonstrating patience is a vital aspect of fostering student autonomy. It involves maintaining a calm demeanour while waiting for students' input, initiative, and willingness to participate in learning activities. Patience allows students the necessary time and freedom to overcome any initial barriers, explore and manipulate learning materials, ask questions, retrieve information, set goals, evaluate feedback, formulate and test hypotheses, monitor and revise their work, recognise the need to start afresh, adjust problem-solving strategies, revise their thinking, monitor progress, pursue their own direction, reflect on their learning and progress, and work at their own pace and natural rhythm (Reeve, 2016).

It is understandable why teachers may find it challenging to maintain patience due to factors such as time limitations and high-stakes testing. However, the importance of patience from a motivational standpoint stems from a genuine appreciation for student autonomy and an acknowledgement that cognitive engagement and learning processes require time to unfold effectively.

Providing rationales for tasks

Engaging students in a dialogue about the purpose of their learning and the rationales behind certain tasks is often overlooked when implementing choice in the classroom. Simply telling students that they must learn something for their own benefit or for reasons centred around the teacher is likely to restrict student self-determination. According to Deci and Chandler (1986), offering learners a rationale for their activities enhances motivation and engagement.

Responding to students' needs and interests

It may seem evident, but it is often observed that teachers deliver the curriculum content in a way that lacks stimulation and thus fails to nurture children's innate curiosity. This includes an overreliance on rote learning instead of engaging in enriching educational tasks. Consequently, teachers are encouraged to design educational activities that are authentic and meaningful to children, fostering their natural desire to learn. It thus becomes important to inquire more about students' interests and preferences.

Considering the students' perspective is crucial for self-determination in learning. By engaging in perspective-taking, teachers develop increased empathy and a deeper understanding of students' motivational strengths, leading to classroom environments where students' internal motivations guide their engagement. When lesson planning overlooks students' perspectives, educational outcomes become less optimal.

Teachers can start lessons with a conversation that fosters perspective-taking, demonstrating openness and a genuine willingness to invite, seek, and incorporate

students' input and suggestions into the lesson plan and its execution. Naturally, the teacher's responsiveness to students' input and suggestions is crucial. Therefore, the teacher should be prepared to integrate their ideas, provided they align with the learning objectives.

Fostering curiosity and intrinsic motivation

Curiosity emerges when students encounter an unexpected gap in their knowledge (Silvia, 2008). It is fulfilled when students engage in exploratory behaviour to acquire the necessary information to bridge that knowledge gap. This process of exploration, often referred to as engagement, leads to knowledge expansion, learning, and increased expertise. In the classroom, teachers can nurture students' curiosity through various approaches, such as posing thought-provoking questions, creating suspense regarding upcoming content (Abuhamdeh et al., 2015), and encouraging students to explore new activities (Proyer et al., 2013). In addition, teachers can foster students' intrinsic motivation by presenting the learning activity as a chance for personal growth, skill enhancement, building closer relationships with others, or making constructive contributions to their community (Vansteenkiste et al., 2006).

Dealing with barriers and negative emotions

It is important for teachers to be attentive when they sense something is amiss with a student, keeping an eye out for the various internal and external barriers to motivation. When negative feelings arise, they should be acknowledged, and when the right moment arises, teachers should enquire about the student's experiences in a supportive and non-judgmental manner so that the student does not feel defensive. By actively listening, teachers can gain a deep understanding of the challenges the student may be facing and more effective collaboration.

While the significance of learning and organisational skills is widely recognised, teachers often overlook the potential impact of emotion-management skills. Failures, particularly those perceived as unjust, often trigger intense emotions such as anger, envy, sadness, or anxiety. In their attempt to cope with these emotions, students may employ strategies that provide temporary relief but are detrimental in the long run, such as devaluing the importance of the subject they failed in, denying the failure and its implications, unjustly blaming others for their failure, or disregard helpful feedback from teachers (Skinner & Wellborn, 1997).

In such situations, teachers can help students develop more constructive coping strategies by drawing from cognitive-behavioural approaches like acceptance and commitment and mindfulness training (Greenberg & Harris, 2012). These approaches can help students cultivate resilience, acceptance of failure, and a mindful awareness of their emotions, leading to healthier and more productive responses to setbacks.

Addressing negative emotions in the classroom, especially anger and resentment, can be a challenging task. However, teachers who recognise and validate students' negative emotions have a better chance of diffusing them (Reeve, 2016). This approach not only helps in achieving the immediate goal of alleviating negative emotions but also contributes to the long-term goal of establishing a stronger connection with students.

Competence

Providing appropriately challenging activities and ongoing scaffolding

Teachers can enhance students' need for competence by presenting them with appropriate challenges to pursue within a supportive and accepting environment that allows for mistakes and failures (Keller & Bless, 2008).

Scaffolding, which refers to the support and guidance provided by teachers to help students in the learning process, is also powerful. Through clear and explicit instructions, modelling desired behaviours and skills, and gradually reducing support, teachers enable students to gain competence and confidence in independent learning. This gradual release of responsibility fosters a sense of mastery and self-efficacy.

Providing informative feedback

To further promote students' sense of competence and autonomous motivation, it is essential to provide them with frequent informational feedback as they work towards their objectives. According to Hattie and Timperley (2007), the primary objective of feedback is to minimise the gap between students' current performance and their expected performance. Tangible information about their current performance, coupled with guidance towards achieving their goals, can bridge this gap effectively. Research suggests that such feedback should be specific, non-comparative, focusing primarily on positive aspects, and aligned with a constructive success theory (Hattie & Timperley, 2007). It is preferable for some of this feedback to be informal and verbal, rather than formal or written, occurring naturally as the teacher moves around the classroom or briefly checks in with students (Assor, 2016).

Relatedness and Collaborative Learning

Teachers play a pivotal role in addressing students' need for relatedness by providing them with opportunities to engage in communal social interactions. They can provide the space for learning within groups and for planning, implementing, and evaluating collective actions. In such groups, students engage in socially responsible forms of regulation as the other members of the group model various learning strategies and provide motivational support.

Peer support

Peer support is an essential aspect of creating a supportive learning environment. Teachers can teach students how to provide and receive feedback effectively, recognise appropriate moments to seek feedback, and understand how to offer feedback that supports and enhances the learning process without diminishing the recipient's self-esteem or social status (Assor, 2016).

Relatedness between students and teacher

Establishing positive relationships between students and teachers is equally important. One effective approach is scheduling individual meetings with students, which becomes feasible during cooperative work since teachers are not required to divide their attention among other students. During these meetings, the teacher can dedicate time to discussing students' values, needs, and interests. In this context, students feel a strong connection with their teacher because the focus is on their preferences and emotional well-being, rather than solely on their grades.

Interestingly, teachers who report higher levels of relatedness with students are more likely to experience positive outcomes, such as improved emotional well-being, compared to those whose connections are primarily with their colleagues (Klassen et al., 2012). This highlights the importance of establishing positive relationships with students and the significant impact they can have on both teachers and students. There is a chapter on Relationships in inclusive education in this book for those seeking further information on this topic.

Factors beyond teaching that influence self-determination

School curricula or materials are often not prepared to be intrinsically motivating or made to be particularly meaningful or relevant to students' daily lives or purposes. Many educational systems and schools have become extremely focused on a very narrow set of cognitive goals that neglect students' different interests, talents, and psychological and intellectual needs.

Student motivation is also closely linked to teacher motivation and well-being. When teachers face limited professional autonomy and pressure to achieve specific outcomes, they may resort to more controlling motivational strategies. Teachers worldwide often face considerable pressure within school systems, which can restrict their ability to foster self-determination in the classroom. When teachers themselves lack the necessary autonomy, competence, and sense of relatedness in their profession, their capacity to promote student autonomy and effective learning is diminished. Through a combination of research findings, Brenner (2022) revealed that by fulfilling teachers' autonomy needs they are more likely to be more motivated, provide meaningful reasons for tasks, use less controlling methods in

the classroom, involve students more, provide opportunities for student choice, and offer support. This highlights the significance of supporting teachers' autonomy to encourage practices that enhance students' self-determined motivation.

Additionally, it is also important to always keep in mind that schools are not isolated and that children come to school already with a baggage of experiences and factors that are affecting them. One key factor relates to the family and home setting. If families embrace values of self-determination, such as openness and discussion, students are more likely to be receptive to self-determination in the classroom. On the other hand, if home life and parenting are controlling, students may struggle when encountering opposing beliefs and values at school (Grolnick et al., 1997). Families also exist within the larger context of culture and society, and sometimes also microcultures. These shape their belief systems and values, particularly regarding the roles of specific groups of people. For example in many societies, children are seen as having a much lower expertise than adults, leading to their voices being perceived as less important.

Example case revisited

Riverside Primary School has undergone a remarkable transformation in its approach to education, placing a profound emphasis on fostering self-determination in learning. Among the thriving students in this new environment is eight-year-old Isaac, who is on the autism spectrum. This forward-thinking school has veered away from traditional teaching methods that focused solely on discipline and standardised exam scores.

The classroom at Riverside has been completely redesigned to promote active engagement and individualised learning. Isaac now finds himself in a vibrant and flexible learning space that accommodates his need for movement, enabling him to fully participate in classroom activities. This small but crucial adjustment has made an immense difference in Isaac's learning experience.

One of the pivotal changes at Riverside is the integration of student autonomy and choice. Isaac is now empowered to make decisions about his learning journey, allowing him to delve deeply into his passionate interest in dinosaurs while also learning core subjects like mathematics. This autonomy has sparked a newfound enthusiasm in Isaac, and his eagerness to learn and explore is now understood and appreciated.

Previously, Isaac's behaviour was often labelled as problematic and disruptive. However, with the shift in approach at Riverside, it has become evident that his behaviour was merely a sign of his intense curiosity and yearning for knowledge. The school now recognises and nurtures his unique abilities, celebrating his individuality rather than suppressing it.

If you put yourself in Isaac's shoes how does this affect the way you feel about school and how it is preparing you for your future?

Conclusion

This chapter has delved into the concept of self-determination in learning, exploring the three basic psychological needs of autonomy, competence, and relatedness. The attitudes and skills needed for fostering autonomy and motivation in students' learning journey have also been uncovered, whilst also acknowledging that factors beyond teaching, such as students' home environment and cultural influences, can impact self-determination.

Self-determination in learning considers learning as a personal journey and argues that learners should take ownership of their own learning process and take initiative in shaping their learning experiences. This involves being an active participant in setting their learning goals, making informed decisions about their own learning strategies and being determined to achieve their desired outcomes despite the challenges that may occur during the learning process.

Incorporating the principles and strategies discussed in this section can lead to transformative experiences for students, igniting their intrinsic motivation and passion for learning. Empowering students to take ownership of their learning journey ultimately prepares them to navigate challenges and thrive in their educational pursuits and beyond. Isaac's experience at Riverside Primary School, for instance, is a good example highlighting the transformative power of fostering self-determination in learning. By creating an environment that values autonomy, competence, and relatedness, Riverside has enabled Isaac to thrive and embrace his unique interests and abilities. The school's emphasis on student choice, flexible learning spaces, and supportive relationships has empowered Isaac to take ownership of his education and shape his own learning journey. This shift in approach has not only improved Isaac's engagement and motivation but has also challenged traditional notions of teaching and learning. The example case serves as a powerful reminder of the importance of self-determination in education and its potential to unlock the full potential of every student.

In conclusion, self-determination in learning is a crucial aspect of education that empowers learners to take control of their own learning process. It involves the fulfilment of three basic psychological needs: autonomy, competence, and relatedness. By promoting self-determination in the classroom, educators can create an environment that nurtures students' intrinsic motivation, engagement, and overall well-being. It is important for teachers to provide opportunities for students to make choices, set goals, and engage in self-reflection. This fosters students' intrapersonal, metacognitive, and interpersonal skills, enabling them to make meaningful choices, set purposeful goals, and take charge of their own education. Ultimately, self-determination in learning benefits both students and teachers, leading to increased engagement, motivation, and satisfaction in the educational journey.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

https://book.all-means-all.education/ama-2025-en/?p=447#h5p-4

Closing questions to discuss or tasks

- Think about a time when you were highly motivated to learn something. What factors contributed to your motivation?
- What do you think self-determination means in the context of learning, and why might it be important for students to have control over their learning process?
- In what ways do you think providing choices to students can impact their learning and engagement?
- How do you think different learning needs (e.g., those of students with autism) should be accommodated to promote self-determination in the classroom?

Pick three to four of the following tasks:

Reflecting on the Example Case:

- If you were a teacher at Riverside Primary School, what strategies would you implement to further support Isaac's self-determination in learning?
- How would you handle a situation where a student's interests, like Isaac's passion for dinosaurs, are not part of the standard curriculum?

Personal Application:

- Reflect on a recent learning experience. How did autonomy, competence, and relatedness play a role in your engagement and success?
- Identify one area in your learning or teaching where you can apply the principles of self-determination. What specific actions will you take to enhance autonomy, competence, or relatedness?

Strategies for Teachers:

- What are some practical ways teachers can provide meaningful choices to students in their daily routines?
- Discuss how you can use positive and informative feedback to boost students' sense of competence and motivation.

Overcoming Barriers:

- Think about potential barriers to promoting self-determination in the classroom. What strategies can you use to address these barriers?
- How can teachers manage and respond to students' negative emotions effectively to

support their self-determination?

Evaluating Impact:

- How do you think fostering self-determination in learning impacts long-term student outcomes, such as their career choices and personal development?
- Discuss how self-determination theory can be applied beyond the classroom, in real-world situations and lifelong learning.

About the authors

Karen Buttigieg

As a science educator, Karen Buttigieg is committed to advancing *Bildung*-oriented, transformative, and inclusive pedagogies within neoliberal contexts through research and practice. She believes in inclusion and the provision of quality education to every child and young person and strive to develop educational practices that are not only effective but also accessible to all learners. This conviction guides her approach to teaching and academic research. Karen is also an activist for women's rights and disability issues, trying to raise awareness, influence policy, and implement practices that bring about positive change towards equality and inclusion.

Zeynep Karaosman

Zeynep Karaosman is a Palestinian-Syrian queer, feminist and peace activist and a teacher. She was born and grew up in Turkey. She studied English Language Teaching(BA) at Anadolu University and English Language&Literature at Istanbul Aydin University. After 8 years of teaching English in Turkey, she moved to Germany in 2020. She is currently a student in the Turkish language teaching department at the University of Essen and has been working as an Inclusion Assistant at a secondary school for 3 years. Apart from her teaching profession, she has been doing queer, feminist activism. She is also one of the founders of *Palestinian and Jews for Peace* activist group. Considering teaching as a political act, she advocates for anti-bias education for everyone.

Ludovica Rizzo

https://orcid.org/
0009-0009-2371-5870

Ludovica Rizzo holds a Master's Degree in Primary Teacher Education from the University of Salento (Italy). She has been awarded a scholarship for a PhD Programme of National Interest in Teaching & Learning Sciences: Inclusion, Technologies, Educational Research and Evaluation. Her research field is twice-exceptionality, differentiated instruction for gifted and twice-exceptional students, personalisation of teaching and learning processes and educational technologies.

DEMOCRATIC SCHOOLS: HOW THEY WORK AND WHY THEY ARE COOL

Example Case

The backbone of Democratic schools

"This is an example of our experience from a democratic School in Hadera. When the school was established in 1987, there was no clear educational programme. We came with 'a stomach-ache and ideas.' It was clear from the beginning that there was no obligation for the students to participate in anything. Everything is free and they can choose whatever they want to do. There were some lessons that we offered, but they were not compulsory. There were playgrounds with a football field and a basketball court, and there were Art Centres, where they could go and draw. There were also areas where the students could complete an internship, for example, with a blacksmith or a hairdresser.

Then we also said, okay, we offer the students all of this, but what else can we do? So, then we said, okay, we'll help them obtain the tools they need to do whatever they want to do. We noticed that the power dynamic between us and the students really decreased because we were not in charge of lessons that are part of a compulsory program, we were not in charge of the overall discipline, but there was a discipline committee. So, what else can we do?

Then the students began to verbalise their thoughts and feelings about certain scenarios that were happening in their lives. For example, a five-year-old comes and says, "my friend, he always wants to decide what we're playing, and he's calling me bad names. And I'm not sure I want to be his friend." Another example is, let's say an eight-year-old will come and say, "My

parents told me that it's very important to learn maths and English. And if I don't take these classes, they will take me out of the school. I don't want to go to those classes." Also, a 12-year-old comes and says, "I have a boyfriend and he wants us to kiss and I don't know if I want to kiss. I'm not sure." Finally, some kids might say, "I really like computers and I'm good at computers and my father works with computers. However, I started playing guitar and maybe I would like to be a musician, and not work with computers."

Then we understood that it's not just about doing whatever you want, it's your choice; choose your friend, you're free to choose. It's not as simple to decide what you want to do for the rest of your life. There's a whole big range of questions here, and that's the place we are needed because before you understand what you want to do and enjoy it, you must build an inner self and understanding of what your values are, not moral values. What is important for me when I make decisions? Then I decide what things are most important to me, for example, friendship, play whatever I want to play, be connected to my boyfriend because I like him, or to say, okay, I don't want to kiss you. Also, what is the most important thing for me to build my point of view about the person instead of only listening to what's around me. A point of view that considers my parents, my culture, my neighbourhood, and not just what's popular with my friends. This is a large inner piece that needs to be built and it's not easy to build it. That is where mentoring came in and this is why mentoring began to be the most essential part of our work.

This is why mentoring became the backbone of our practice. However, there was also another layer in mentoring. Mentoring is one of the best ways to apply human rights. If we want to apply human rights then mentoring is the best place where you say whatever you think is important, you think about the main areas to you and then we discuss it. I really want to listen to it. I really want to see what is important to you. I also want to see and listen not just to what you say or do, but to what's behind it and what's under it. I really want to make your existence visible. I want you to be safe. I want you to feel sure. I want you to be open. These are your human rights. That's children's rights. This can all occur through mentoring. This is why mentoring, in my opinion, is the backbone of democratic education."

Dror Simri, teacher, psychologist, mentor and mentoring supervisor in Hadera Democratic School and at Kibbutzim College for Education Tel Aviv, Israel

The need for more democratic schools

Traditional systems of education and schools are linked to the idea of measuring and grading children[1] by more or less the same standards. Therefore, it tends to divide young

---

1. In this chapter, we use the term "children" in the sense of the Convention for the Rights of Children (UN 1989), which contains children up to the age of 18. Alternatives would have been to say "students", "pupils" or "learners" but we prefer a term which has a holistic view on the whole person and is not fixed on a specific role, being in danger of ignoring other

people into groups of successful, or unsuccessful, based on predetermined definitions, and associates these statements with chances in their future life. These decisions are not fair and not grounded on their actual performance, highlighting the misleading nature of neoliberal output-oriented (meritocratic) orientation. They are, in fact, more linked to socio-economic backgrounds, structures of discrimination, and societal power relations. Therefore, they can't be inclusive. Most of the time, traditional systems of education and schools are also defining what and how to learn through fixed curricula. Those fixed standards are defined by experts, influenced by societal power relations, and linked to dominant wisdom. Therefore, marginalised wisdom, individual interests, needs, and desires are likely to be ignored. Prescribed curricula therefore stand against the ideas of inclusion and anti-discrimination. It is not by accident that the lyric 'We don't need no education' from Pink Floyd's 'Another Brick in the Wall' has widespread and enduring appeal among young people across various generations.

Initial questions

- How to overthrow structural disadvantages for inclusive education?
- How do democratic schools solve those structural problems?
- How could traditional education be influenced by democratic schools to work on those disadvantages?

Introduction to Topic: what idea could stand behind democratic schools?

Imagine a school where everyone can decide what to learn, when to learn, where to learn, how to learn, and with whom to learn. That's very close to the definition of democratic education from the European Democratic Education Community (EUDEC, 2005). These schools exist in many countries, and they are quite successful.

Imagine a school which has no classes, no grades, no fixed timetable, no fixed curricula,

---

aspects. The only exceptions are students at university or when the traditional role of students is in focus. The same way the term "teachers" could be problematised – and replaced by "learning assistants", "learning supporters" or others. A wide field of reflection…

no fixed subjects. However, this school has a space for activities. It has lots of ateliers, maybe for music, for art, for theatre, for languages, for anything you could imagine.

There, children have the chance to be subjects of learning instead of objects of teaching. Or in the words of the German critical psychologist Klaus Holzkamp (1995, p. 558): It's leaving the "defensiver Lernweisen" (defensive mode of learning) where you primarily react to the impulses of others, mostly adults, building strategies to survive in school. Instead, it is moving to an "expansive mode of learning" where you can go delve as deeply or as broadly as you want into a subject matter. So, you become responsible for your own learning and you get support from others.

Some time ago, I saw a video from the famous jazz bass player Avishai Cohen and his new trio. There was a woman, born in 2000 playing the drums, her name is Roni Kaspi.

She played the drums in such a fascinating, virtuosos, and complex way that I immediately thought she must have been in a democratic school and have been able to learn and practice drums during her whole school time. I was right; she grew up in a democratic school, and later she attended a conservatory and went on to learn the drums.

So, reflecting the vision of such a different school – maybe this vision could be a dream school, or it also could be a nightmare school – it depends on your perspective.

Key aspects

What are the basic principles of Democratic Schools?

Following Yaacov Hecht (2017), one of the international pioneers for democratic education, it is clear that every democratic school, of course, is different. If there are two the same, one of them has stopped thinking! However, there are four basic principles, and we will give you an overview of these four principles (see Fig. 1). Later in this chapter, we will discuss these in more detail.

Dialogic Relations

Dialogic relations are the basis of everything in Democratic schools. There are practices of a partnership culture instead of a domination culture (Eisler, 2000democratic; Eisler & Fry, 2019). There are no people – traditionally mostly adults – who tell others what to do and how to do it. Instead of that, there is a culture of talking on the same eye-to-eye level. So, they try to reduce or to eliminate adultist tendencies. They practise what Martin Buber (1999) called a "ich-du-Beziehung" (me-you-relationship). In this, there is a holistic view of the whole child. It's not just focused on some 'mathematics problems' as the exclusive

aspect. So, in dialogic relations the whole person is in focus, and how the whole person thinks about who he or she is.

In this context, we see the heart of dialogic relations in mentoring (see the chapter about mentoring). Every child chooses a mentor, usually for a year. It is not the task of the mentor to say what the child should do or how they should behave. This understanding is not about case-management or strategic support for carriers. Instead, it is about thinking together with the child about who the child is, and in many situations, there are some "unconscious backstages" (Goffman, 2010), that are bringing the child to some decisions and the child doesn't realise it – and here the task of the mentor is to ask if the child wants to think about it, always showing respect for the child. Of course, the decisions still belong to the child. It is not about taking away the decision or taking away the power of the child. This task is quite challenging, especially for pedagogues, because many of them are used to taking over, to guide children and teach them something. Therefore, dialogic relations has mentoring at the heart of it.

Personalized Learning: Individual and collective learning

From our perspective, personalised learning is based on a balance of individual freedom on the one hand and the formation of a common social space on the other. Personalised learning doesn't mean that every child gets an individual programme of work for the next week or month, like in an open-plan office where no collaboration is needed. There is a lot of space for collaboration with others. So, the idea is a connected combination of collective learning and individual learning based on the free will of everyone.

For example, a 15-year-old boy could be extremely interested in black holes, and maybe there is an eight-year-old girl who hears about that and says: Oh, that's also interesting for me. Then maybe there is someone 17 years old who also joins the group. So, there is a constant change and supplementation of autonomous and common interdependent situations. That's what personalised learning means.

By collective learning, we don't mean to learn in a collective; we mean learning as a collective. A common misconception about collective learning is that everybody should learn the same things at the same time, in a uniform way. Learning as a collective is not just about collaboration between individuals to explore and learn about specific topics. It is more or less learning as a group, for example, to solve conflicts or to support someone or something as a group. If you learn how to solve a conflict as a group, it is not just through collaboration, you have to learn how to inquire about a solution as a group also. Therefore, the solution changes, if members change and the group – the collective – has to find new solutions that fit all. Therefore, you grow not just as individuals, but also as a collective. Another example would be if a group of children learns how to support members and assures this support not just through some other group members but as a collective.

Democratic community

Almost every democratic school has a school assembly, and it works under the principle of "one person, one vote," based on the equality for everyone, like in the former motto of the ANC in South Africa: "one man, one vote." The school assembly makes every important decision connected to the school. Also, before collective decision-making, there will be a lot of dialogue, or controversial discussion, paying attention to diversity with different perspectives, different opinions, and different interests. One thing is very clear to us: the majority in the school assembly are children. That changes the power structures. However, there is the question of how to decide democratically – by majority, by consensus, or maybe by "sociocratic consent" (Owen & Buck, 2020 , p. 11) which means 'good enough for now, safe enough to try'.

The school assembly is supported by some committees. There are a lot of different committees. Most democratic schools have a financial committee, some may have a committee for journeys, a committee about juridical questions, a committee about staff, and some may have more. Children make up the majority within these committees, supported by adults as facilitators. The role of the adults is to make sure that every child – even the young ones – understand what's going on. It's not about taking the power away from children.

For example, if one child is extremely interested in the finances of a school and learns a lot about that in mathematics, they also get an opportunity to learn about it through life experiences in the school. Whereas in most state schools, children must learn some mathematical techniques without the connection of life experiences. However, here it is really connected to life in the school. This creates a wonderful opportunity to learn so much in mathematics. Another example is, in the committee about staff, one big question is about hiring and firing adults. Children also make up the majority in this committee. So, in many democratic schools the question of 'is it true that children could decide about hiring and firing of adults?' The answered is 'Yes, of course.' However, it never happens because if there is an adult who offers something for learning and nobody chooses it, this adult will start to reflect about what's going wrong. So, there is no need to fire someone.

Another aspect of the democratic community is that there is no fixed timetable. Every child decides their own timetable. They decide how many lessons per week they want to take (often around ten), and which lesson they want to have. Indeed, the cliché of boys playing football for years (and "doing nothing all day," a documentary film by Hentze, 2015) can be a reality in some cases. So, a big question could arise about the patience of parents: How long are they able and/or willing to wait until, for example, a child starts to learn how to write. Mentoring is also an important part of this.

There is also another aspect that we believe is important: boring time. At a conference, children from democratic schools shared their experiences: *Oh, it was always interesting, there were always interesting things going on*. A former student of a democratic school

reacted with the question: *Really? So, something went wrong. If you never had a boring time, you never had the chance to find out what's really really important for you. And what's really really interesting to you. You need boring times.* To make it a bit clearer: It was not about being bored like in many state schools, where every Tuesday at 10.30 you have to be interested in biology – and if you are not, that's boring, one could say 'cold boredom', because you are forced to be there. Boring time in a 'warm' sense is a time where you wait to find out what's really important to you. It is 'warm' because you can finish it when you have found out what is really, really interesting to you for the next time(Boban & Hinz, 2016).

Content based in Human rights

The fourth basic principle is that the content is based on human rights and especially on children's rights. They are formulated in the Convention of the Rights of the Child (CRC; UN, 1989) which is based on the Universal Declaration of Human Rights (1948) that children are human beings, having human dignity, and human rights.

There are three aspects in human rights education (Gerber, 2011; CoE, 2018; CoE 2020, 19; Tibbits & Sirota, 2023, 54; UN, 2011). One is "learning about human rights" which involves acquiring information and knowledge. The second is about "learning through human rights" which aims at learning processes themselves by accepting and basing them on human rights – for example, the right for leisure or the right to play, also in secondary school age children. The third is "learning for human rights," which is about attitudes and actions. This could be a tricky one because it could be a starting point for being influenced in a manipulative way by adults: *You have to do something for human rights*. Also, of course, that would be dangerous because manipulation is an excellent adultist strategy.

The consensus behind this topic is that it is not only about information and knowledge about democracy, but also about the preparation for life in society following school. A lot of questions arise from this. One of them is, how far the influence of parents and their idea for a *'good future' of* their child can be accepted (Macleod, 2023: 355). Another is about how to be critically aware of any discrimination considering the *"long and ugly history of racist and sexist discrimination in the provision of education to children"* (Macleod, 2023: 354), additionally questions about classist and other aspects of discrimination (Haruna-Oelker, 2022) – and no one is free from these.

There is also another important discussion – different human rights can be in conflict with each other. For example, is it a violation of children's rights to force them to go to school? Or is it a human right to go to school? Or both? The answers to these questions are quite different (Graner, 2023).

Interim conclusion – core aspects of democratic and inclusive schools

From our perspective, it would be functional that schools become places with such a high

potential and attractiveness that everyone loves to be there and has the chance to fall in love with learning.

At this point it makes sense to think about the connection between democratic and inclusive schools. Both seem to be highly linked:

- Both are based on children's rights.
- Both are radical approaches, so – despite the all-inclusive and democratic rhetoric – they are not part of the mainstream.
- Both are fighting against discrimination, marginalisation, and othering.
- Both highlight the "beauty of difference" (Haruna-Oelker, 2022).
- Both build on participation.
- Both aim on a balance of individual learning and a common creation of a social space.
- Both try to make children – or better – keep children as subjects of learning.

Democratic education without inclusive education stays selective, inclusive education without democratic education stays hierarchical (Simri & Hinz, 2021; Hinz, 2023). Therefore, one without the other is neither democratic nor inclusive. They are linked inseparably if they have any transformative claim.

Why Democratic schools now?

Why do we need democratic schools now? Although the answer might sound theoretical, it addresses concrete and interconnected difficulties where both democracy and education find themselves. We think that democratic schools have the potential to keep democratic and educational projects alive and vivid.

Regarding the crisis of democracy, political debates seem to be replaced by market calculations and planning. According to this logic, political contestations are useless, and thus we should only focus on practical and realistic financial economics (Mouffe, 2013). Words such as, critic, revolt, change or progress that have drawn the democratic horizon of Europe for the last centuries seem to be replaced by one word, which is: consensus and conflict foreclosure (Mouffe, 2005). The promise behind that is a foreclosure of political (often labelled as violent) discourse. However, an attentive look at this may be able to show its hidden politics and uncover the damaging results it may have for the democratic project inside and outside of schools (Atif, 2021).

We can see this concretely in the context of our interest here, the one of schools. Many right-wing parties seem to use this logic of the market to introduce politics under the excuse of being politically neutral and end up being very political against many groups. Take for instance the refusal of sexuality education in Ontario under the slogan *Maths not masturbation!* (Bialystok et al., 2020) or the refusal of teaching the history of slavery in Brazil by the movement that its name represents its claims, School Without a Party

(Oliveira, 2022), or how in Germany the right-wing party 'Alternative for Germany' could not find a better way to present its position towards education than a movement called *Neutral schools*. Such movements use this logic of political neutrality to negate the rights of many social groups that find themselves in unjust situations. According to this, populist movements argue that schools should abandon the emancipatory project and aim at schools that are exclusively interested in the development of productive skills, lifelong learning, and productivity.

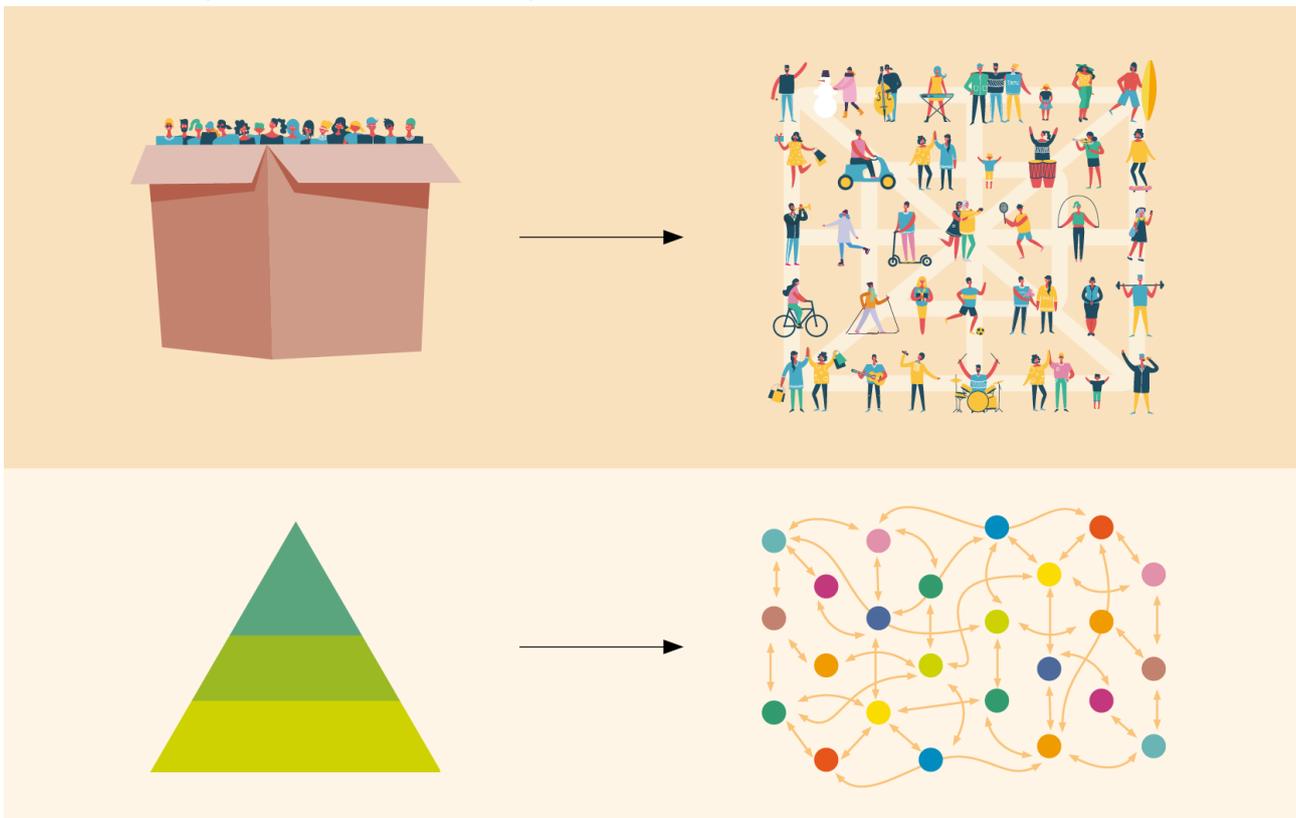
We consider that democracy, as the current rise of authoritarianism in several countries shows, is not a guaranteed state. Instead, it is a project that needs to be protected and defended (Hinz, Jahr, & Kruschel, 2023). The protection of democracy can be done through democracy, which reveals and keeps the core of democracy alive. This core is the assumption that once we move from our private spaces to those of living together, our projects are meant to be different and contrasting, and that this is not a limit for democracy but the reason why it is needed. By accepting this situation and trying to deal with it, we can keep the democratic horizon possible. In such moments of being able to dialogue, decide, contrast, argue, and articulate, we can be at the heart of democracy rather than closing it with projects that present themselves as post-political.

It is in these contemporary elements and factual characteristics of the relation of schools with their economic and political context that we look at democratic schools as an emergent necessity to both defend the democratic and educational projects. As presented before, democratic schools are built on the principles of democracy, equality and they are primarily concerned with leveraging them. Democratic schools function through an encouragement of questioning, debating, and articulating. While in traditional schools these may seem like only ideals that are not constantly pursued, democratic schools put them at the centre, from the very format of classroom setting until assessment and evaluation are organised around the principle of debate and freedom. Hence, children in schools have the right to choose what and how they want to learn, and for democratic purposes, they are even encouraged to think about their needs to articulate the demands of their communities.

In an age where the ultra-prioritisation of learning is an input-output process, the reasons for the existence of democratic schools may seem alien to what schools should be. Nevertheless, a closer look at recent developments in educational theory shows how much the principles of democratic schools are making their way back to the conception of how traditional classrooms should function. Theoreticians such as Snir (2017), Ruitenberg (2010), and Atif (2023) argue for schools open to the acceptance of a state of contingency where every social activity finds itself and that reflectively, schools should offer spaces where children and adults can articulate political and identitarian differences instead of preaching them.

In the discourse about democratic education, there are two main aspects of fundamental criticism of the international democratic community on traditional education, which both

constitute structural violence (Ram, 2009). They can contribute to sharpening the understanding of democratic education (see Fig. 2).

Figure 2: Two main changes from traditional to democratic education


Source: Hecht 2017

First, there is the construction of two parts of constantly changing and expanding world knowledge, symbolised as a flexible bubble. In traditional education, experts put a box in it by defining a fixed curriculum. This makes knowledge important, which is included and makes excluded knowledge unimportant[2]. So, it does not accommodate the individual areas of strength of every individual person. If an individual is extremely interested in windsurfing, traditional education will exclude this from the 'important knowledge' into leisure time. In contrast, a democratic school will fully accept this as part of the uniqueness and the areas of strength of this person. So, the knowledge of the whole world is potentially important for individuals as well as for society in general.

Second, in the box of the fixed curriculum, there isn't just a box but a pyramid. This means that traditional education constructs a few excellent, many mediocre, and even more weak students by measuring them all with the same hurdles. Students have to climb over them for the next level of education – with all the well-known organisational procedures. Democratic education criticises this logic of pyramids fundamentally and replaces it by a system of

---

2. These decisions are highly linked to power relations in society and thereby tend to exclude marginalised knowledge, for example from wisdom from minorities or about discrimination (Kress, 2022).

connected circles on the same level which – again – contain individual and collaborative learning processes in the sense of personalised learning (see above).

These two main criticisms of traditional education get even more importance since nowadays, education is increasingly being approached with a market-oriented view, undergoing a commodification process where economic outputs in education are preferred over the holistic development of individuals due to the influence of neoliberal ideologies (Apple, 2004; Hill & Kumar, 2008). Standardised tests and accountability measures, which are used to discriminate among students to reach these economic outputs and are assumed to enhance efficiency, are being criticised for transforming education into a test preparation process. As such, education is reduced to measurable outputs and productivity through a reductive approach, stripping it of creativity and broad societal, cultural, and ethical dimensions. It seems that structural violence in traditional education is being increased by neoliberal approaches.

How do democratic schools function?

In this part we focus on the four basic principles from mentioned earlier in this chapter, again by deepening, concretising, and making them more specific.

How to build dialogical relationships in democratic schools?

To understand how a democratic school operates, it is helpful to begin with the concept of dialogical relationships in these schools and how they are established. By 'dialogical relationships', we refer to interactions where both parties engage directly with each other, communicate face to face, eye to eye, knee to knee, and meet on equal grounds (Freire, 2005; Rietmulder & Marjanovic-Shane, 2023). From this viewpoint, the first step is recognising children as genuine parts of school communities. This can be initiated by offering positive channels of communication and showing genuine respect to all members actively participating in the school. The goal is to shape a space where everyone's voice is valued. This means building learning environments that emphasise these principles, and turning schools into places where collective and inclusive decision-making processes thrive, thus giving the authorial agency to children for their learning (Neill, 1960).

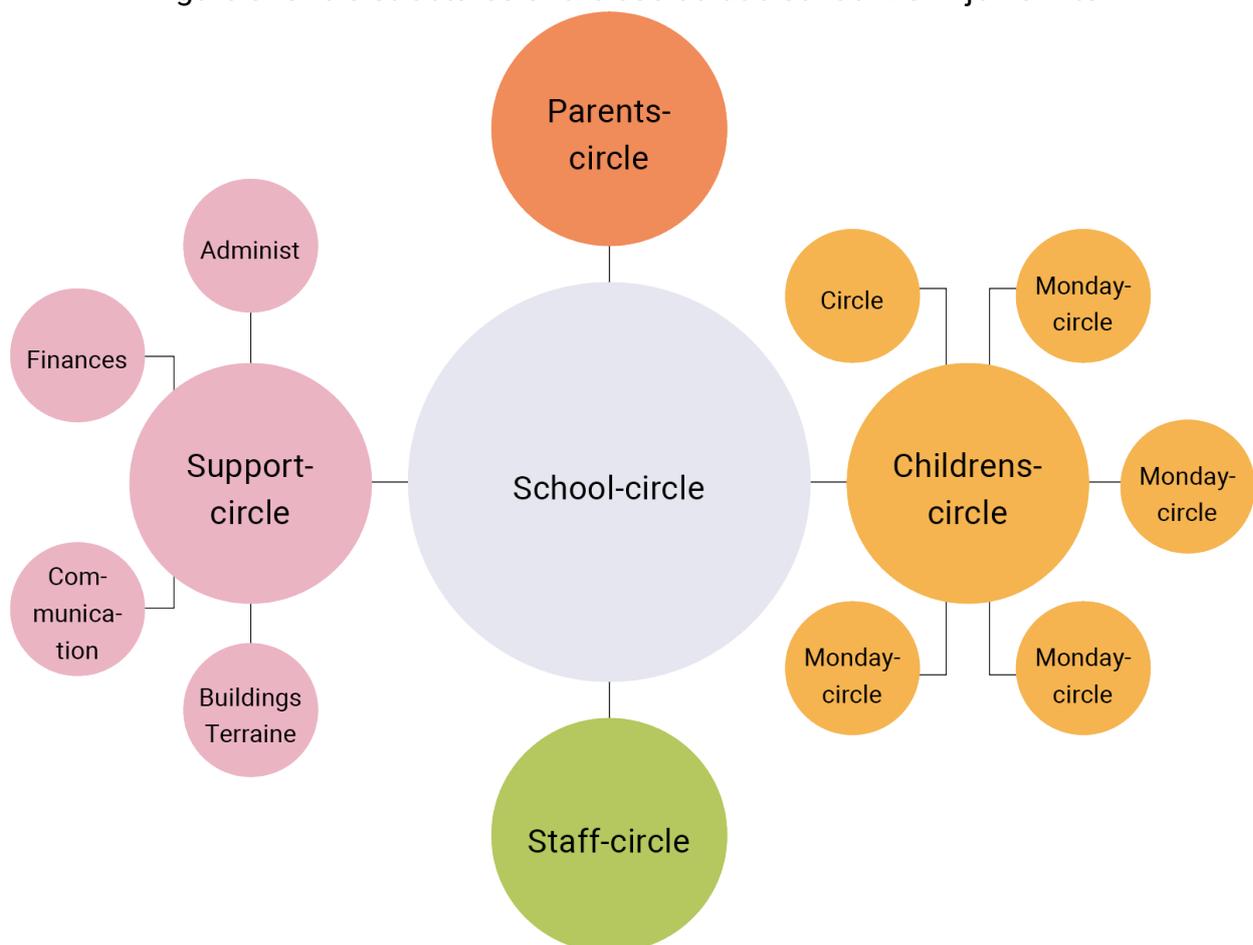
A practical example of this is 'sociocratic circles.' These are essentially self-directed, voluntarily formed, semi-autonomous groups that come together for decision-making (Strauch & Reijmer, 2018; as showcased in the documentary "school circles" by Osório & Shread, 2018). Imagine a scenario where a group of children voluntarily assembles because they have identified a challenge within the school and want to address it together.

Here is an example from a particular democratic school in Turkey.

The adults posited that fostering children's participatory skills might be enhanced by offering them hands-on experiences in settings akin to school councils. Consequently, a platform was established where these young minds met weekly to deliberate on pertinent

school matters. However, as time passed, these elementary-aged pupils felt the weekly gatherings to be excessively recurrent. They began to find these sessions monotonous, often engaging in discussions devoid of any accompanying activities to enliven the experience. This sentiment led them to initiate a sociocratic circle dedicated to evaluating the structure and frequency of the school council meetings. Within this circle, many questions and suggestions surfaced: "Could we possibly reduce the frequency of these meetings? What if we incorporated engaging games at the onset of each session?" After these deliberations, they envisioned a reformed model of the school council and proceeded to present their proposals to the broader school council. Upon careful consideration and discussions, the collective consensus emerged: "Indeed, a shift is required. Let's change it to bi-weekly meetings and infuse a gaming element at the start. The objective would be to foster warmth and enjoyment before transitioning to the more serious discussions." Implementing this revised approach proved successful, resonating well with the children.

This entire excerpt epitomises a scenario where children, by amalgamating diverse perspectives, actively shaped their school life. Another option could be to organise the whole school in sociocratic circles. In the documentary, there is an example from the Netherlands (see fig. 3).

Figure 3: Circle-structures of the sociocratic school De Frije Ruimte


Source: Boban & Hinz, 2020a, 189, taken from the film of Osório & Shread, 2018

The central school circle with members of all groups in this school is connected to other circles: the children's circle (connected to age-oriented group circles every Monday), the staff circle (called the learning facilitator-circle), and the support circle (again connected to circles about administration, finances, buildings and terrains, and communication). Children have access to most of the circles except those for parents and staff. All circles are connected by two (children by three) members who care about the flow of information between them all. Also, they all have specific procedures and roles for talking and decision-making.

For democratic schools to thrive, it is vital to embrace dialectical thinking. Essentially, when we reflect on schools, we are looking at diverse communities brimming with varied beliefs, interests, needs, and viewpoints. If we solely rely on the premise that one person should guide the school's direction, we risk overlooking these rich differences. Rather than that narrow approach, it is beneficial to adopt a dialogical mindset. This means understanding and valuing the range of voices and perspectives present in our school communities. Instead of sidestepping challenges or disagreements, it is about creating a safe environment for children in school to freely participate in decision-making and collaboratively address issues (McDonnel, 2014).

To foster such an open environment, it is essential to factor in the social and emotional aspects of learning (Cohen, 2006). For example, before any productive discussion can take place, there is a need for trust among participants. When trust exists, it paves the way for mutual respect. We also need to create rooms and opportunities for children to actively listen to their peers. Active listening allows for constructive conversations, fosters collaboration, and recognises diverse viewpoints. For these dialogues to truly resonate, participants need to feel confident in themselves, be in touch with their emotions, and be equipped to share their thoughts and listen to others in group settings (Read, 2021).

Another key point is the importance of joyful learning (Waterworth, 2020). For learning to be truly engaging, children need to have the autonomy to shape their educational journey (Freire, 2005; Griffiths, 2012). To successfully do this, children also need certain skills and attitudes, like critical thinking, setting goals, regulating their own progress, and taking initiative. These attributes empower children to steer their educational path. Moreover, when disagreements arise, it is these very skills that enable children to articulate their ideas, present alternate views, or stand up for their beliefs (Dobozy, 2007; Slater, 1994). These social and emotional elements are crucial in democratic schools. Without them, any rights or opportunities we offer children might only be symbolic, appearing good on paper but not truly realised in the actual school environment.

How to organise learning in democratic schools?

Delving into the etymological roots of certain concepts can illuminate the potential pathways that can be adopted in democratic schools. The term "democracy" is borrowed

from the Greek, consisting of 'demos'—representing the people of a shared territory, although in ancient Greece, this did not include women, children, or slaves—and 'kratos,' which signifies the power or capacity to govern. Bringing these together, democracy encompasses a collective of individuals striving for individual and mutual growth. When examining the term "curriculum," its origin traces back to the Latin word 'currere,' suggesting a journey or perhaps an individual's unique trajectory. The curriculum, at times, is perceived as rigid and predetermined; yet, it can be approached with flexibility – for example the National Curriculum of Iceland – which permits learners to engage with it selectively or even bypass it entirely (Carr, 1998; Hinz, 2024). For instance, instead of being accepted as a predetermined blueprint of the experiences to take place at the school, curriculum can be defined as "a set of events, either proposed, occurring, or having occurred, which has the potential for reconstructing human experience" (Duncan & Frymier, 1967:183). Merging these ideas, a democratic curriculum embodies the spirit of communal living, emphasising collective progress by elevating each member's individual growth. These concepts can be viewed as complementary. An offer-based curriculum, influenced by members of the school community can be designed and implemented in democratic schools.

When planning learning in democratic schools, it is beneficial to start with the childrens' previous experiences by considering child-centred curriculum perspectives (Brough, 2012). Why? When we bring these children together, our goal is to foster connections among them. To do this effectively, we need to be familiar with their past experiences, interests, and needs. By using this knowledge as our foundation, we can shape the learning in democratic schools, focusing on integration as a key element of curriculum design (Beane, 1997). This approach is what gives these schools their unique and meaningful learning atmosphere. In such environments, the individual benefits and collective well-being are aimed to merge seamlessly. As children achieve their personal social-emotional goals, they naturally become more cooperative, understanding, and respectful — qualities at the heart of democratic schools. Keeping these factors in mind is invaluable when organising learning in such settings.

In democratic schools, it is also essential to blend both the humanities and science for a well-rounded education. This is not just about broadening knowledge; it is about nurturing both intellect and empathy in children (Dewey, 1930). Democratic schools are not just about academic growth. They are communities where children are encouraged to connect and thrive harmoniously together. Of course, the social and emotional learning components of these schools are vital. To genuinely prepare children for the broader democratic society, we need diverse activities that nurture a range of skills. In a democratic school, the goal is to grow individuals who can keenly observe and analyse their surroundings and, using that understanding, offer fresh insights to their community; thus, a holistic approach touches on both their emotional and intellectual capacities (Ricci & Pritscher, 2015). Therefore, a "curriculum" in democratic schools should give equal weight to the humanities, arts and sciences. It is about fostering a complete, balanced learning experience for every child.

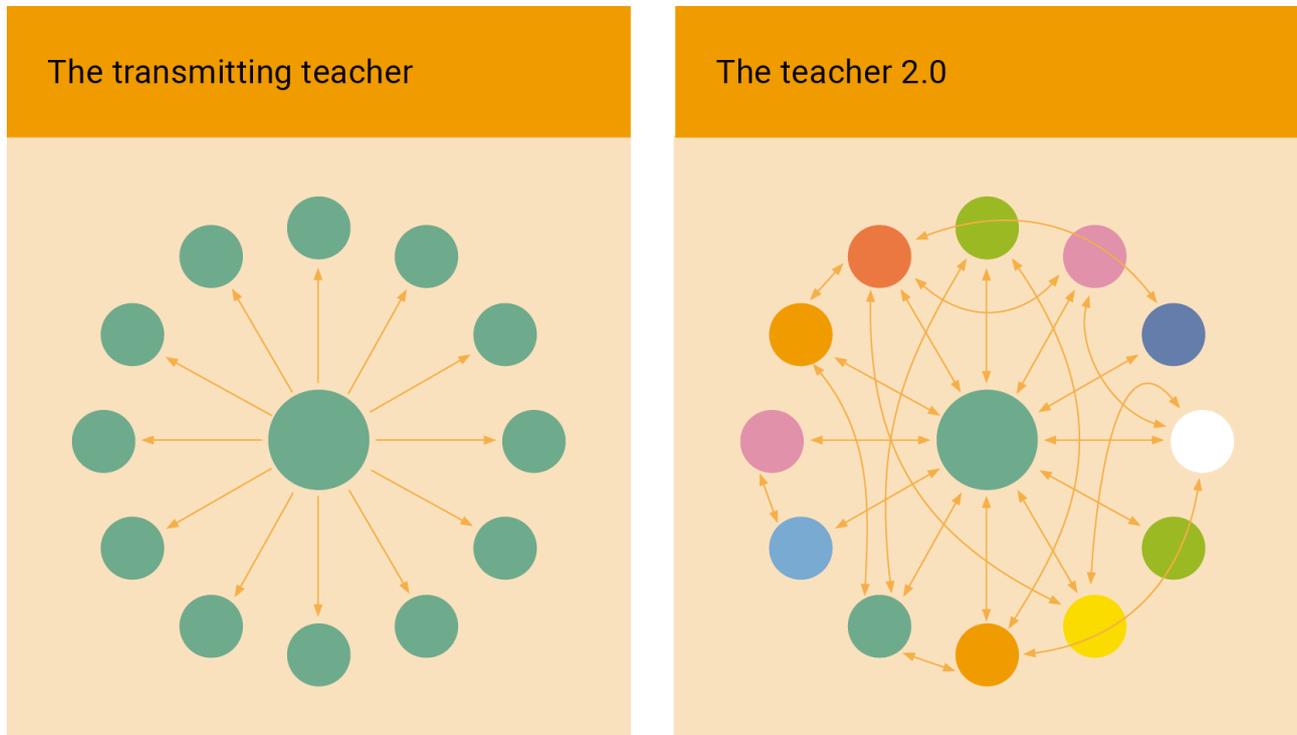
However, it is worth noting that the way democratic schools handle the curriculum may change in their own contexts, and there are democratic schools that do not employ a specific curriculum intentionally.

In planning lessons for democratic schools, using tools like mind maps or curriculum matrices can be beneficial to allow us to visualise the links between academic subjects and the effects of how we handle them on both a child's intellect and emotions. Unlike traditional schools, where the primary focus may be a teacher passing on knowledge, in democratic settings, we recognise that everything we do elicits reactions in children, both mentally and emotionally. So, it is essential to be conscious of our teaching actions and their broader impacts on children. By understanding this, we can tailor our approach to nurture not just academic skills, but also emotional and social well-being.

In democratic schools, valuing diverse viewpoints is essential, reflecting our unique experiences and backgrounds. It is not just about harmony; disagreements, or dissent, have a place too (Matusov & Marjanovic-Shane, 2015). These varied experiences can often become powerful learning moments. So, while mutual respect is crucial, so is acknowledging the importance of dissent. However, as adults, we have a task to ensure children feel safe when expressing their opinions. If we are not careful, disagreements can become destructive. It is our responsibility as adults to create a safe space where children can discuss differing views openly and without harm, with the help of support and guidance (Orzel, 2013).

In traditional schools, students often find themselves sitting and listening to teachers, essentially in a state of stillness. They do not actively engage or decide their learning path; they are mostly passive, enduring what might feel like a "cold boredom." However, a democratic school offers a different approach. Instead of this passive learning, children are given opportunities to navigate their school experiences, whether they be joyous or filled with conflict, and they learn from these lived experiences (Davids & Waghid, 2019). It is about allowing them to voice their views and actively participate in the school environment. Drawing from the German educational approach, 'arbeitsplan' or weekly planning tools can illustrate how children can be given autonomy over their learning. By implementing such behavioural-contract tools that encourage self-assessments, we can empower children to shape their educational journey as active participants and organise learning democratically (Pass, 2007). Without such mechanisms, our aspirations for democratic education might fall short. Simply telling kids, "you decide your learning," can be overwhelming if they lack the tools or understanding of how to go about it. However, by creating semi-structured methods, we may assist them, much like mentoring. Importantly, this reshapes the teacher's role. Instead of being mere information dispensers, teachers in democratic schools become connectors, linking children in a myriad of ways, a significant shift in role (fig. 4). Plus, children get the unique opportunity to reflect on their learning since they have played a pivotal role in it. Engaging with adults about these processes becomes more meaningful

because children can draw on their direct experiences. They can witness their growth and navigate learning using these benchmarks.

Figure 4: Transmitting and connecting role of the teacher


Source: Hecht, 2017

Also, portfolios or learning progress reports are effective tools to organise learning and create democratic spaces for dialogic assessments and feedback in democratic schools (McDonnell & Curtis, 2014). These documents making progress visible for children, they can check what they have learned, and how they learnt it. They can reflect on whether it was difficult or simple. Otherwise, it is just a task to be completed for grading. However, by using this strategy we can enrich evaluation through authentic feedback that strengthens learning. Therefore, it is important to give them a chance to reflect on their learning progress. Also, strategies like the "black market of knowledge" are good examples (Boban & Kruschel, 2015).

The black market of knowledge is a social space in which ideas, topics, and children's learning are exchanged. They present whatever they want. It may be something they worked on, or they have experienced. This was an idea that some children, brought to the school assembly, and later it was used by student teachers within teacher education (in the Kibbutzim College Tel Aviv, where foreign visitors practised it together with the students).

Such experiences inherently foster a deeper alignment between individual and collective learning endeavours. For instance, following an event like the "black market of knowledge", some children might gravitate towards the presenter, forming a cohesive group. This group might then pursue diverse learning pathways originating from their own interactions. In this

context, the children's own interests, skills, and needs naturally shape the trajectory of the learning journey, encompassing all facets such as activities and topics. Importantly, this dynamic is not dictated by an external force determining the worthiness of knowledge.

How to develop a democratic school community?

Schools function as complex social entities. They are far from being uniform spaces; instead, they welcome diverse people groups. Thus, for the establishment of a democratic community, it is essential that we recognise and address the varied needs of children. By crafting mechanisms that highlight these diverse needs and cater to them, we lay the foundational aspect of democratic schools.

Moreover, the essence of democratic schools is to offer room for children, educators, and the entire school community to foster autonomy (Taylor, 2017). A common misconception is that autonomy is something that can simply be handed from one individual to another. However, in reality, it is an attribute that grows through lived experiences and social interactions (De Jaegher & Froese, 2009). When children engage in activities, the culmination of those experiences contributes to their cognitive, emotional, and social growth. This engagement and growth through experiences stand central to forming a democratic ethos within the school environment. Committees, for instance, showcase an effective way of distributing power amongst members and collaboratively experiencing it in the school setting.

For instance, the Alpha School in Toronto (Canada) practises a juridical committee. The meetings are organised like a court if there are some children breaking a rule. So, a group of, most of them quite young, children sit together, and just one adult acts as a facilitator, making sure that each and every child is able to understand what was said before and what the case is about. The adult doesn't influence the content of the meeting or the verdict of the court. In almost every case the verdict is not about punishment but about restorative actions.

Consequently, the objective is to allocate roles to individuals, specifically allowing children to assume responsibility for their surroundings. Integrating the broader community, or the vicinity in which the school is situated, is pivotal. This might involve inviting external individuals to the school or planning outings for the school community. Such initiatives are vital because they facilitate the transference of outside experiences into the school setting. Furthermore, they aid children in understanding the societal norms and codes prevalent in their communities. Ultimately, our goal is to cultivate individuals who are deeply cognisant of the societal fabric they inhabit and reflect on it. Thus, facilitating experiences beyond the school's boundaries can be quite beneficial.

Another example is from some state schools in the eastern part of Germany during the implementation of the all-day school; though it is not explicitly a democratic school, they were on the way to democratisation. The facilitators from the university asked them to include one person from outside of the school on to the steering group for school development, in

addition to children, parents, teachers and other staff. Some of these people had wonderful ideas and practices. One school thought about inviting the mayor, maybe also for strategic reasons, and some had real difficulties in finding someone whom they could include in the steering group. However, in general, it is a good example showing that the connection between the school and the environment or the community around the school is much more intensified. At the end of the day, children are individuals, some of whom might be the mayor in the future. Therefore, supporting them to observe these environments is important.

Concluding on the topic of participation within school environments, the concept "participation" can sometimes be elusive. To clarify, we might consider specific examples of how participation manifests in these settings. For example, when a collective of children take on a decision-making role in school, this is a clear indication of participation. Similarly, if a group of children, perhaps through a school council framework, independently resolve an issue, that too is a form of participation. Another instance might be when children proactively set discussion topics for future council meetings, or initiate new ideas, or even voice their disagreement on a proposed idea, saying "this doesn't resonate with us." All of these scenarios exemplify participation.

We can envision participation through these lenses. Feedback mechanisms are equally vital, whether it is from children to teachers, teachers reciprocating, parents to teachers, or even children giving feedback to parents. This significance stems from the fact that it represents mutual observation, active listening, and ongoing communication, establishing a dialogue-centric relationship. Keeping such modes of participation in the forefront can offer clarity on the essence of participation and its implementation in democratic schools.

Here is a final example, from a school in Iceland which is not an explicitly democratic school, but one with a strong democratic tradition and continuous developments over the years (Jörgensdóttir Rauterberg & Hauksdóttir, 2024). Some children had this idea: "Oh, we don't have enough space and time to talk about some social things. So, we need a new subject in the plan for the next school year." They brought it to the children's council and later to the school council. During a visit, the vice principal said: "Yes, they asked for that and we will give it. But we didn't tell them until the end of this school year. In the next school year, there will be a new subject in the plan."

So, that's an example that includes flexibility in curriculum and a huge influence of children in it (Jörgensdóttir & Hinz, 2024).

How to define common goals based on human rights education?

Democratic schools are based on human rights essentially; therefore, they have the common goal to strengthen Human Rights Education (HRE). HRE focuses on the realisation of human and especially children's rights and has been a growing field since the 1990's with a big growth in publications (Tibbitts & Sirota, 2023: 56). The most widespread definition is given by the UN in the Declaration on Human Rights Education and Training, Art. 2 (1)

(UN, 2011: 3): "Human rights education and training comprises of all educational, training, information, awareness-raising and learning activities aimed at promoting universal respect for and observance of all human rights and fundamental freedoms and thus contributing, among other things, to the prevention of human rights violations and abuses by providing persons with knowledge, skills and understanding, and developing their attitudes and behaviour, to empower them to contribute to the building and promotion of a universal culture of human rights." As said earlier, three aspects are included: Learning about, through, and for human rights (UN, 2011, Art. 2, 2) and they have an immense impact on learning and teaching.

Internationally, HRE is linked to diverse efforts "to overcome colonialism, the aftereffects of authoritarian governments, structural problems related to poverty, gender inequality, discrimination and interethnic conflict" (Tibbitts & Fritzsche, 2006: 5). In some countries it is also linked "with local and national efforts to fight racism, xenophobia, anti-Semitism and the extreme right" (Tibbitts & Fritzsche, 2006: 6). Critical comments, from the Global South, say, there is an "unacknowledged conceptual diversity and ambiguity" (Keet, 2006:1).

Following Bajaj's (2011: 491) analysis, three main ideological backgrounds can be differentiated:

- HRE for Global Citizenship – aiming for a new global political order with more equality,
- HRE for Coexistence – aiming for healing and reconciliation after brutal oppression and crimes against specific groups, like indigenous peoples in Canada or elsewhere, and
- HRE for Transformational Action – with "radical politics of inclusion and social justice" (ibid.).

This picture of approach does not mean that HRE is in practice everywhere. On the contrary, HRE is still only partially implemented. As the research by UNICEF (2015) shows, 11 out of 26 countries have implemented HRE (more specifically: children's rights) into their school curricula. In seven countries, implementation only took place in parts, and in 15 countries not at all (UNICEF 2015: 8). There is still no international entitlement for HRE, and therefore, there is no linear connection from signing the convention on children's rights to the implementation in classrooms. Also, the implementation in teacher education is important, but it is not realised systematically anywhere (UNICEF 2015: 9). Therefore, it is not surprising that in 2010 "HRE is still not widespread, especially in schools" (Gerber, 2011: 247). Nevertheless, good examples exist, for example, in Iceland, "human rights and democracy" are one of six pillars in the National Curriculum (MESC, 2011: 14-22; Hinz, 2024).

One interesting aspect of this field is that almost every literature emphasises the growth of democratic practices and ideas. This begins "in small places, close to home – in the neighbourhood, school, college, factory, farm, or office" (CoE 2020: 403). Some good examples of this are in India where more than 500,000 "inclusive neighbourhood children's

parliaments" are in place where all children of the neighbourhood automatically belong; they themselves decide about the topics and the actions, and they are supported by an adult facilitator (Boban & Hinz, 2020b). This is more than being asked to tell the parliament of the city or the state about needs and wishes once a year, as in many countries.

It is very often stated that this is a long-term process, and it is never finished, and never perfect. Sometimes it is criticised that it needs changes because it is "western-centred and 'top-down'" (Tibbitts & Sirota, 2023: 58). For example, the role of teachers must change from a declarationist approach to a dialogical approach (2023: 58). However, a reflection of the existing power relations in schools is hard to find, except when a transformational action approach is used with its "radical politics of inclusion and social justice" (Bajaj, 2011: 491). Bajaj writes that with this approach, which is a "critique of power and unequal power relations (local, national, global)," is needed (2011: 491). Otherwise, the research results regarding the very low expectations of children about their influence in school could be validated. With this approach, HRE is quite close to any other transformative and emancipatory learning, "associated with critical pedagogy and Paulo Freire" (Tibbitts & Sirota, 2023: 57). The methodologies can be described as "justice-oriented, decolonising, experiential & activity-centred, problem-posing, participative, dialectical, analytical, healing, strategic thinking-oriented, goal-and action-oriented" (Tibbitts & Sirota, 2023: 57).

It is obvious that the understanding of HRE as a call for transformative actions is very close to the approach we stand for. Schools practising democratic education consequently have a much easier task ahead to abide by children's rights. For schools on the way to more democratic practices, it is much more contradictory to practise democratic processes in a hierarchical system without balanced power relations. Nevertheless, connecting learning to human rights is a continuing challenge for every school.

One material for the support of HRE is Compass, published by the Council of Europe (CoE, 2002, 2020) and translated into 30 languages, supplemented by Compasito for children from 7 to 13 with 40 activities (CoE, 2007, 2009). These materials want to support accessibility to HRE (CoE, 2020: 26) with a European perspective (CoE, 2020: 29). The heart of the material are 58 activities in 20 global themes for the reflection of human rights and taking action, surrounded by introductions about human rights and approaches to HRE. The "pedagogical basis" is explained in detail (CoE, 2020: 32-36). This includes, among others, "HRE must let young people decide, when, how, and what topics they wish to work on" (CoE, 2020: 33), and the role of teachers has to change to a "facilitator, guide, friend, or mentor, not one of an instructor" (CoE, 2020: 33). Nevertheless, there is no reflection about power relations in school. Instead, you, as a facilitator, friend, or mentor (see above) "need to be very clear in your own mind about what it is you want to achieve; you need to set your aims. Then you can go on to choose an activity that is relevant to the topic you wish to address, and which uses a method that you and the young people will feel comfortable with" (CoE, 2020: 48). Friend, facilitator, mentor? This sounds quite contradictory, here the teacher still seems to be the instructor, setting the frame – and within that frame children are more

or less free to decide about their learning, and about human rights. Is this democracy? It seems to be not less than or more than a step towards democracy in a structurally non-democratic institution.

All the content in schools based on human rights is, of course, connected with an anti-discrimination and inclusion approach. It is no coincidence that a lot of democratic schools are part of social movements for peace, for reasonable living, for ecological survival, and/or for a better future. Democratic schools are, in most cases, no idyllic bubbles far away and at the margins of society. Power structures might recreate themselves in democratic schools, so it requires investing time and effort to prevent it (Wilson, 2015).

Therefore, as a final comment on this principle, there is a big need for reflection of power relations. There will always be a big difference between the principles and the realities of societies, and of course, democratic schools are part of society. Hence, it is important to reflect again and again on what a school, or a group, can decide autonomously and what is already decided by others.

What are the specific challenges for democratic schools?

You might think that democratic schools are perfect, but we don't think that. They are not perfect at all. There are some specific challenges for democratic schools.

In the realm of educational discourse, there is a palpable debate concerning the children's composition in certain democratic schools, which might show **elitist and exclusive children's body** characteristics. Central to this debate is the representation of varying social groups within these institutions. Sometimes it is observed that children from more privileged backgrounds often have a heightened presence in these schools. Intriguingly, some of these institutions took shape during what is known as the 'second wave' of democratic schools, a period intertwined with the aspiration to craft 'islands' within the broader conventional school framework (Hecht, 2011). These 'islands', in certain cases, are cited as practising what some term 'elitist democratic education'; essentially, they impart democratic values and practices predominantly to children stemming from affluent socioeconomic strata (Sant, 2019). However, it is crucial to note that not all schools fall under this critique. For some, the demographic characteristics of their geographic location play a defining role. Yet, for others, it is the predispositions and financial capabilities of the parents that is changing the situation. Such parents, with more substantial means to invest in their children's education, exhibit a proclivity towards enrolling their children in private institutions, which sometimes includes democratic schools. This trend has roots in the 'school choice' philosophy—a perspective that may compartmentalise education into distinct categories like 'good' and 'bad' schools, offering the liberty of choice to a select demographic, undermining the ethos of fostering educational establishments that champion democratic values for the collective welfare.

Furthermore, the broader structural landscape of the state's educational system holds

influence. In general, it depends on the rigidity of the state school system. If there is a high rigidity and state schools have big problems with a lot of children, there will be a high percentage of children in democratic schools who have been in state schools, and they changed to democratic schools (Hecht, 2011). Hence, democratic schools could be seen as a good place for children, who had some difficulties in a traditional learning environment or in state schools. For these children, democratic schools could be islands that they can feel secure, that they can feel comfortable in.

There can also be some **parents of children with disabilities** who may have doubts about democratic schools. Some of them may fear their child could get lost due to the 'big freedom' in democratic schools. They may assume the responsive structures their child may need are not there and, therefore democratic schools are not a good solution or perspective for their children. However, democratic schools of course are very able to put structures around a child, for example, they could start with a group of children who are close to that child, and they could think together about how they can establish a good situation for this child through dialogic relations. So, it is not about getting lost in freedom but about creating structures through democratic communities.

There might also be challenges about the **diverse cultural backgrounds** of teachers, children, and parents linked to the exclusivity of the children's body. Especially, if these backgrounds affect the way of the 'right' and 'common way' of communication. As communication is so important for democratic schools, it is a special issue. There are rules of communication that are different in different cultures. Therefore, there are also different understandings of democratic ways to solve conflicts and interact with each other. For instance, most Germans find it disrespectful if they are interrupted. Therefore, they believe, in a 'good' and 'democratic' conversation, no one interrupts each other. To understand this, you must first know about it. In the German language some important words, mostly the verb, are located at the end of the sentence. So, you must listen to the end of the sentence to understand each other. However, this is not the case for many other languages. The structure of sentences is different, and therefore it is not disrespectful to skip the end of the sentence and jump right to the important subject. That's one example of how the way of communicating interferes with the way of understanding how 'good democracy' works. Another example is, in Turkish, it is a practice to overlap when speaking, and it is considered normal and polite to do this. What we want to show with these examples are that we don't want to reproduce the dominant use of language and the discrimination within it. However, instead to practise cultural sensitivity in democratic schools, there has to be a precise look at the practice of communication and reflection about it. Practices of talking are so deeply anchored inside us, it is difficult to question and reflect on their roots. This is highly demanding for democratic schools, because dialogic relations are so much the basis for all that is happening inside these schools.

As we can see, democratic schools are not the perfect way to deal with every problem, but they have one big advantage, democratic schools are always in a mode of change.

They are more likely to find the challenges of exclusive children's bodies, diverse cultural backgrounds, and establishing special structures for children who need them easier. They can handle it within their ritualised way of changing instead of first creating change management.

There are many different models of democratic schools and their view of the **role of adults and the wider community**. Some might argue that adults are just there to wait for the children to come up to them and want to learn or get something, like in the Sudbury Model. Others argue they should offer specific things and be more interactive with the children about what could be learned, like in a common social space. We don't want to judge which way is better, we just want to highlight there are different ways to practise that aspect in democratic schools. What's important is the knowledge about the different connections to the community that are implied by different views of adults. Sometimes schools really benefit from the experience of parents. They might transfer their knowledge to the school settings and share their expertise. Through this, they may support children to find their interests and what to learn, but this may also cause some difficulties if not handled well.

In a particular instance from Turkey, a school was established through the initiative of a group of parents. This co-operative school had a foundational ethos: the incorporation of democratic governance. The intent was clear: children should actively engage in the decision-making processes within the school. However, having been the driving force behind the establishment of this institution, parents viewed themselves as the primary stakeholders or the owners of this educational establishment from time to time. As such, they felt entitled to influence areas like the instructional methods, curriculum, and other core aspects of the educational process. This proactive involvement sometimes took on a domineering tone, leading to challenges. The underlying issue was a presumption among some parents that their insights were superior to those of trained teachers.

In discussions surrounding such situations, it is important to remember the professional background of teachers. Teachers undergo specific training and possess extensive expertise in their domain. Regrettably, there are times when this expertise is overlooked or underestimated. However, it is also heartening to acknowledge instances where their contributions are recognised and valued. Regardless, it remains undeniable that they are hands-on professionals in their field. Their role, therefore, requires respect. As efforts intensify to embed democratic values in school environments, it is crucial to emphasise inclusivity. This encompasses the well-being and participation of **all of the members** of the school community, from the children to the teachers and parents and other staff. Thus, fostering respectful and considerate relationships becomes integral. To foster an enriched learning environment, it is necessary to carve out spaces and opportunities for educators to engage in mutual learning, thereby cultivating a tradition of continuous professional enhancement (Blick über den Zaun, 2011). Such initiatives not only augment teachers' competencies but also chart a progressive trajectory for their professional journeys. Equally vital is the role of educational institutions in enlightening their surrounding communities

about the intricate nature of quality education. By doing so, they can nurture an informed community, fostering greater understanding and support for the educational process (Kim & Bryan, 2017). To encapsulate it, the essence of dialogic relationships is not confined solely to the dynamic between children and educators. It extends to encompass all stakeholders – be it parents, teachers, or children, essentially every individual, both young and old, involved in the educational journey.

Democratic schools may also face criticism for potentially embodying **neoliberal and individualistic values** in their educational approach. It is worth noting that in numerous democratic societies, neoliberalism either dominates or is steadily gaining ground in the education sector. While some democratic schools push back against this trend, others seem to embrace it. From an analytical standpoint, there are two core challenges with neoliberalism when viewed through the lens of inclusivity. The first issue stems from how neoliberalism conflicts with the ethos of greater participation and self-expression as envisioned by democratic schools. In the neoliberal paradigm, self-expression is geared towards optimising individual productivity within society and its economic structure. This angle risks misinterpreting the personalised learning ideal, aligning it more with the development of individual human capital than with genuine personal and civic growth. The second concern revolves around the neoliberal perspective on democracy and its seeming indifference to the principle of inclusion. Under this model, one's inclusion hinges on their economic productivity. Take, for instance, the realm of human resources, where there is a belief that diverse teams boost creativity and productivity. Here, inclusion appears to be a byproduct of economic benefit — you're included because of the added value you bring, not necessarily because it's a fundamental right (Boban & Hinz, 2017).

What can we do then?

While a multitude of concepts and examples surrounding democratic schools exist, one might wonder, "What steps should I take?" Amidst the plethora of ideas and seemingly flawless models, it is crucial not to be daunted. Remember, no democratic school sprang into existence instantly. This underscores that there is a role for you to play, even if it begins as a modest stride, always keeping the grand vision in sight. A pivotal point to embrace is the understanding of democracy not as a static ideal to replicate but as an ongoing journey of democratisation. It is about amplifying participation, championing inclusion, and continuously challenging societal norms and conventional boundaries.

Diving deeper, consider the dynamics among the three neighbouring households. They, like any close-knit community, might encounter disputes. Confronting these differences, they might engage in intense dialogue, but eventually, harmony is restored. Just as with democracies or our daily interactions, the essence is not an external facade but lies in our interpersonal exchanges. It is not a plateau you achieve and then rest; it is a continuous endeavour.

Crafting a democratic school is essentially a journey where community members actively shape and redefine themselves and their collective identity through their shared experiences over time. The fruits of this journey manifest as more deliberate decisions, practices, and engagement within the community occurs. Central to this idea is the belief that autonomy is not just handed over; it emerges from experiences and in turn, shapes them. These experiences are deeply intertwined with the other core principles of a democratic school. Emphasising the foundation for such experiences, growth involves immersing individuals in certain experiences consistently. Moreover, this growth thrives in relationships guided by specific frameworks. Within the democratic school framework, growth is perceived holistically. Such growth takes root in a community engaged in continuous self-reflection, utilising tools and methods that prompt particular experiences at just the right moments. This suggests growth is a timely process, underscoring the need for patience within the community. This understanding stresses a step-by-step learning evolution and highlights the importance of diverse learning avenues vital for holistic skill development. From this vantage point, the sustainability of these shared experiences is pivotal for genuine growth. As these structured experiences accumulate, paired with guided relationships, it paves the way for the evolution of both individual members and the larger community, and their autonomy and heteronomy.

Every educator, each institution, and perhaps each human being has the potential to embark on the path toward a more democratic educational setting. Democratic schools across the globe did not just appear; they were crafted and continue to evolve. For those aspiring to absorb insights from these schools and integrate aspects into their conventional settings, initiating change could be as straightforward as addressing an existing minor challenge, something already recognised as an inconvenience by peers. The thought could be, "This has become bothersome. Why not rectify it democratically?" An excellent starting point might be the 'index for inclusion' (Booth & Ainscow, 2002, 2011). This index presents an expansive list of questions, beginning with hundreds and escalating to thousands, none of which have a single answer. The purpose is to foster collective introspection and dialogue within the educational community, offering a plethora of queries related to the school's culture, policies, and practices. The emphasis is not on seeking perfect solutions, but rather on discerning beneficial and manageable subsequent steps. At the heart of the index lies the dual aim of diminishing obstacles to both participation and learning, seamlessly intertwining the ideals of inclusion and democracy.

In wrapping up, numerous entry points exist for embarking on this journey. Regrettably, a universal, one-size-fits-all approach remains elusive. The solution should align harmoniously with the unique attributes of each school, the educational milieu, and the encompassing community.

That said, structured methods to foster school growth and professional evolution for educators do exist. For instance, the chapter on continuing personal development offers guidance on collaboratively addressing prevalent inclusion challenges alongside

colleagues. Should personal growth be your focus, the chapter discussing diverse teaching staff and role models might serve as an insightful foundation. For those inclined towards initiating more extensive transformations within their institutions, there are two chapters about school administration and about implementation of a democratic policy in different parts of this open access material.

Closing questions to discuss or tasks

To teacher-candidates/students

- Which teaching style of your professors/lecturers do you like? Why? How do they interact with you and your fellow students? Which element is dialogic?
- Which method of learning fits for you and which doesn't? Why? Which form of learning is this? Individual, collaborative, in a group, etc.
- In which situation did you learn the most about inclusion / about democracy? Who (teacher, peers, yourself) had which role there? Why was that situation possible? What would have made it impossible? Identify the specific aspect that made it impossible and turn it upside down!

To teachers

- What is a problem you and your colleagues could easily face?
- Which question of the index for inclusion surprised you?
- What really annoys you at your school?
- What is the most attractive aspect of a democratic school for you?
- What aspects of human rights education are already part of your practice? What aspects do you wish would be a part of it?
- Where do you give your children space for change in your school?
- How and where are parents and other community members involved in your school?
- How do you give feedback to your children about their learning process? How do children give feedback to you?

About the authors

Halil Han Aktaş

Han is a researcher in the Curriculum and Instruction field. He has completed Ph. D. in the Curriculum and Instruction program at Middle East Technical University, in Ankara-Turkey with the dissertation titled "Constructing a democratic school community: A grounded theory study". He participated in the project "Increasing Participatory and Democratic Processes in Schools" funded by Friedrich Ebert Stiftung in Ankara. His scholarly and personal research interests include curriculum as a generative and generated force of cognition, reciprocality of culture and education, democratic education and alternative education.

Abdellatif Atif

Abdellatif Atif is a postdoctoral researcher at Galway University specializing in the intersections of political and educational theory. He is particularly passionate about exploring the instrumentality of education in general and within populist

discourses in specific. Rather than dismissing populism and instrumentality as mere pathologies to be condemned, Abdellatif adopts a nuanced approach that examines their complex relationship with education. His work seeks to advance democratic education by offering updated and constructive responses to the challenges posed by populism.

Andreas Hinz

Andreas Hinz was a teacher. From 1999 to 2020 professor for Inclusive Education at Martin-Luther-University Halle-Wittenberg in Eastern Germany, from 1986 to 1999 member of a research team on 'integrative' school experiments in primary schools in Hamburg. Co-founder of a small inclusive hotel (barrier-free and with a mixed team of employees) in Hamburg, working since 1993. Active in Democratic Education since 2008, ten years cooperating with the Institute for Democratic Education at the Kibbutzim College for Education in Tel Aviv, joining lots of European and worldwide conferences of the Democratic Education movement. E-Mail: andreas.hinz@paedagogik.uni-halle.de.

Konstantin Korn

Konstantin Korn is interested in subjects around critical political and civic education (in German schools). He wants to highlight overheard student-voices in educational settings and research about didactics. In particular, through participatory action research. His aim is to democratise education and society towards anti-discrimination and against neoliberalism.

SOCIAL SPACE ORIENTATION AND INCLUSION

Example Case

"Example quote"

who, Institution, Country

Initial questions

Agenda 2030 for Sustainable Development (UNESCO, 2023), highlights the importance of social space in fostering the inclusion and well-being of humans, irrespective of their individual and socio-cultural characteristics. Where inclusion promotes peaceful and happier societies, social exclusion proves detrimental to social well-being and contributes to loneliness, unhappiness, and isolation. Given the abstract and expansive of the concept, we

will approach the term context by defining social spaces as the space where interaction occurs. In this chapter, we use case scenarios to invite readers to reimagine the social space and elements that act out in it. Our perspective is that inclusion is a natural process that can benefit everyone. In this chapter, we will answer the following questions:

1. What is social space orientation and inclusion?
2. How do social actors influence the inclusivity of social spaces?
3. How can diverse voices be heard and accounted for in inclusive social spaces?

Introduction to Topic

Social space is a complex concept which encompasses space, dynamic interactions and relationships, and shapes how individuals experience and navigate their social surroundings . Social spaces can take the form of any physical space such as school, playgrounds , parks, libraries, shopping centres, restaurants, sports fields, and entertainment centres. Castells (2020) noted how our conception of "space" changes with the development of technology, where the speed of communication and information soliciting is becoming instantaneous (LeGates & Stout, 2020). Such changes redefine the context of physical spaces in architecture and urbanism and consequently, spaces, and their engagement, become less defined. Rather than define it within physical spaces only, we approach the concept with a more reflexive concept of social space as a 'space' where people have opportunities to come together to interact. This is not to suggest that they lack contextual boundaries, rather the spaces are more reflexive in how interactions are observed. Inclusion and inclusivity in the social space are reflected in how people engage, interact, and relate with others and, the environment, and relate to broader societal structures.

Maybe add some basic information on what is meant with "social space" ? Maybe not all readers have heard about the concept of "social space" before?

For me, this would be a perfect introductory explanation of what social spaces can be.

Key aspects

The chapter addresses social spaces through the main elements presented with consideration to interaction with centrality to the self : such as the lifespan, power dynamics and structural disadvantage. The central theme focuses on the aspect of relativity, where the individual is the main component? Critics of social spaces often fail to be inclusive even when attempts have been made to make a space inclusive. Literature on cognitive

studies draws focus heavily on the relativity of interaction and with it, the spaces (Raven, 2020). When considerations of space solely focus on physical attributes, the people and interactions that make, and give space meaning, are often forgotten (Kusch, 2019). In the case studies presented, we intentionally choose to represent individuals across different life stages, highlighting the benefits and challenging the myths of inclusion. Each aspect is further illustrated through vignettes and case studies as a means to invite readers to engage with the concepts personally. The role of inclusive social spaces, and how interactions exist in that space, cannot be underestimated.

Lifespan Development

Erikson outlined eight stages of development from cradle to grave (*Overstreet, 2023*), and while these stages were widely used, pre-natal development was added to the nature/ nurture discourse in date? (*Newman & Newman, 2012; Overstreet, 2023*). The development stages included:

- Prenatal; prenatal development and birth
- Infancy; up to 24 months,
- Early childhood; 2 to 6 years
- Middle childhood; 6 to 11 year
- Adolescence; 12 to 20 years
- Early adulthood; 21 to 34 years
- Middle adulthood; 34 to 50 years
- Late adulthood; 51 to 60 years
- Death and Dying; 61 to death

It is important to note that these stages are approximate and subject to different experiential elements within each construct (*Newman & Newman, 2012; Overstreet, 2023*). Nevertheless, they are informative of the social spaces that one will encounter as they develop over a normative life course. In infancy, one would encounter caregivers as the primary engagement elements while in early childhood one will be exposed to others like themselves. In middle childhood, one would be exposed to a schooling environment while in early adulthood one would engage with the work environment, and so on. Recognising the developmental needs of an individual in the life space determines the format and types of interaction that will take place. Interactions and spaces exist that individuals can choose to engage in, but there are also interactions and spaces that are imposed on individuals in everyday social situations. In childcare (at the infant stage), we play with other individuals who may, or may not, have similar interests. In a school setting (at the adolescent stage), we may have to work with peers we do not like, and we encounter the wider online digital spaces. When we reach adulthood, we behave in work environments where our moral

stance may be challenged. In old age, we seek control where, if a lack of control occurs, we may withdraw from interactions.

Raven (2020) focuses on how individuals form awareness and make meaning of a space, which is very much grounded in the purpose and engagement of the space. As humans develop over our lifespan, the meaning and engagement of space change (Fingerman, 2011). A school may be an educational space for students, but it is an employment space for teachers. While space may be bounded and defined physically, in a relative context, its attributes and purpose are interaction-vested (Kusch, 2019). In discussions where space is subjectively contextualised, any discussion of space quickly retracts back into subjectivity. Any subjective discussion of space in this regard may be too theoretical? as even in identical spaces, interactions will not happen in the same manner due to a variety of conditions/elements? Rather than restrict discussion at the physical spatial level, perhaps attention should be focused on the most constant element of any human mechanism: the people.

Life span Development and the Social Space

As individuals develop across their lifespans, their social space grows and shrinks in tandem (*Lerner et al., 2010; Fingerman, 2011*). Human beings live in social and cultural contexts where behaviour and cognition are formed through interactional exchanges. These interactional exchanges enable individuals to learn mechanisms of behaviours that either foster or dissuade the connections we seek. In infancy, we seek attachment with others in our immediate surroundings, while in adolescence we seek affirmation from peers. When we reach adulthood, we seek intimate relations which continue through to old age, where often what we seek is the culmination of our experiences accumulated over our life course (*Lang & Fingerman, 2004*; *Lerner et al., 2010; Qualter et al., 2015*). Our need for social interaction changes the context of social space in that we enmesh ourselves in, and with, spaces in which we are the most engaged . The neurological feedback generated as a result of purposeful engagement informs whether a foster or dissuade approach is taken: foster when we like it, dissuade when we do not (*Lerner et al., 2010*). The consideration of social space thus becomes a concern as a multitude of elements combine to form a defined space in the ever-evolving society. These elements include not just the physical space but also the actors within each space: the people.

Purposeful Engagement

The working definition of space now includes a focus on interactions as the primary identifier. We intentionally moved away from the physical attribution of space and suggest that interaction occurs beyond the physical context of social space in a modern-day context, to one where different elements require consideration. In other words, the contextual elements involved in inclusion emphasise the role of purposeful inclusion, rather

than functional inclusion, which only engages at a more superficial level. In the '*The Street Life Project'* directed by *Whyte* between 1969 and 1975, it was shown that neither the size or shape of a park or plaza explained why people chose to use it but seating space, water, sunlight, food vendors, and easy access made a substantial difference (*in LeGates & Stout, 2020*). This was largely based on the purpose of utilisation rather than aesthetics. True *inclusion* should account for *purposeful* engagement rather than superficial physical providence which can create exclusion even in an inclusive space.

Drawing from the following vignette of a 60-year-old semi-retired elderly lady, the context of control and purpose is particularly evident.

> As a 60-year-old semi-retired lady, Huang Kieu, first heard about the communal garden from cikgu (teacher) Farhan who lived down the road. He introduced to her the concept of the communal garden, a council initiative, where they can choose a plot for a very minimal fee and do what they want with it. The space wasn't large, two simple two-by-five-metre plots amongst the 14 other plots owned by other growers. It was a space where growers in the community, and their families in tow sometimes, often gather daily to discuss not just gardening, but also daily affairs from work to dinner. Her children had previously objected to her gardening under the hot sun for no apparent purpose but eventually gave in when they saw how happy she was. To her, the communal garden was a space where she could interact with others and yet be purposefully engaged unlike just sitting or strolling in the park where she had nothing to do. In her words, she liked that the garden was a 'space of her own where she could decide on what to grow'. She had even contributed to the local community at her first harvest, giving her a sense of satisfaction unlike anything she felt in the past few years.
>
> ~An elderly's experience with communal gardening in Malaysia

Research on purposeful engagement highlights the associations between psychological well-being and health which implies a mind-body connection mediated via the neural circuits in the brain (*Ryff et al., 2016*). Such research highlights the importance of purposeful engagement and their contribution to acute and sustained neural responses which are essential to well-   being . Even when a physical space is only designed for a specific purpose, an interactionist aspect to the space gives its more meaning. Bruin (2020) drew upon this concept in education policies (where?) in understanding the need to consider the perspective of all learners. No matter how inclusive we design a space to be, it must take into account the users' needs or else risks being arbitrarily delegatory . Carpentier (2016) also noted how education management must understand that participation, interaction, and access are very different concepts. Meaningless participation not only does not contribute to inclusion, but it also creates a false sense of inclusion that instead expands exclusion at an unconscious level. Much of these invisible exclusions over time become normative and taken for granted.

Invisible Exclusion

Aligning the concept with inclusion means considering countless different perspectives. While inclusion and exclusion are measured and defined differently across contexts, many agree on concepts of rejection and   ostracism . In terms of ostracism, the context of

being ignored in an inclusive space is an increasing concern. Research notes how reframing and re-imagination of exclusion with more expansive sociological indicators better accounts for its address. This context engages with the notion of exclusion even in inclusive spaces, where if an individual may not be directly ignored, any type of social exclusion increases the feelings of being ignored (*Wesselmann et al., 2016*). The context of invisible exclusion is more well-developed in subjects of gender and intersectionality studies (*Settles et al., 2020; Tan & DeFrank-Cole, 2023*). While inclusive practices are often conscious decisions and attempts to create a safer environment, an often-unconscious result is the creation of exclusion in less aware domains. A simple example could be observed in how teachers conduct group work in a classroom. Are all individuals in the group contributing or is any individual not meaningfully involved? How can task design better create an environment where everyone is engaged meaningfully? Teachers need to be aware of the hidden, or unconscious, creation of exclusion in the classroom.

- How can dynamics of interaction be both inclusive and exclusive at the same time in the classroom?

Resistance to Inclusion

Another hurdle to inclusion is the resistance that is encountered by existing users of the space in which changes are often accorded (*Settles et al., 2020*). The following presents an interview with *Ms Jacelyn Lim, Executive Director of Autism Resource Centre, Singapore,* on engaging with the Enabling Village:

Example – The Enabling Village

Working for people with disabilities, we were very intentional in that the challenge in most social spaces is about how to include people's special needs. When we were looking at this space, because it's largely going to be occupied or be filled with people with special needs, we had to make it very intentional to be to have to include people without special needs. So in what we call a reverse inclusion.

…..

So on the hardware aspect we wanted to make sure that it's fenced less, you know it doesn't have fence and all so that people will look at it and say it's welcoming because in our Asian culture, there's still a lot of ,a lot of , you know, considerations a lot of taboo around coming

to a space where people with special needs you. It's still very institutionalised in that sense. So we were very intentional that we must not make it closed, we need to open up the space. We wanted to provide services. Not losing the employment and training mandate, but to provide services where people in typical the neighbourhood , the community will come into this space, have reasons to come in. So I think this was very intentional. We wanted to make sure that people have reasons to come to shop ,and when they come to shop , they will see that . So the interaction becomes as normalised as possible through provision of services such as retail F&B, Professor Brawn (restaurant) is here, run by us. So when there is more of that common community kind of services, you find that the neighbourhood will be more inclined to come, so we kind of created the place, created a space for them to come in and they are served by people with disabilities. The best way to actually show at the end of the day is to show the public that they can coexist with us in our communities in a very normal fashion. I don't have to deliberately create a special workshop and interact with them, but they interact things through services provided by them and all.

.....

Yeah, I think it's very powerful that it's a natural space, it's not a space or not interaction that is forced because we want to be included, but it's a space that is naturally occurring. So, I think inclusion in the larger sense. To drive inclusion is sometimes hard to just go and pitch, you know, just tell people, drive inclusion. I think in that sense, we try to show how we do it. You are including a message you know of seeing abilities and also in that sense we are already slowly including them into our social fabric. Yeah. So I think I might see it and from multi-prong approach. This space has gone beyond the space like to be able to drive the message of social inclusion because with this space that's created awareness, it has also given rise to opportunity for us to share.

~Interview with Jacelyn on the Enabling Village (Singapore)

*The Enabling Village is an initiative by the Ministry of Social and Family Development and SG Enable Ltd which combines retail, lifestyle and training for disabled members of the community in an all-accessible public space

(More can be found The Enabling Village – Enabling Village).

The concept that the Enabling Village engages and explores natural and purposeful engagement rather than the traditional approach to inclusion . While traditional approaches to inclusion seek to 'make' a physical space inclusive, the enabling village adopts the working principle that 'purpose' is in nature, neither inclusive nor exclusive, but rather met or not. From this outlook, the purpose is normative and natural regardless of the attributes of all involved (e.g. buying coffee ~ I came to buy coffee ~ coffee is sold). In both organisational and educational research, resistance to inclusion is often met when systems

are required to change unnaturally (*Gallegos et al., 2008; Bruin, 2020*). Unnatural in the sense that changes or interventions do not serve a functional purpose but instead create another layer of considerations. While it may be more basic in less complex systems, interventions in complex systems may require too many operational mechanics to change to adapt to inclusion (*Gallegos et al., 2008*). In purposeful engagement, the consideration should not be that of only individuals with needs but also other / all individuals included in the interaction. Where interactions are natural and value-added, not only will less resistance be met, but success factors will also increase . Teachers need to capture and illuminate the value of inclusion to dispel the myths and misconceptions of inclusion.

Power Dynamics

In discussions about inclusivity within social spaces, the orientation and organisation of the physical space is often the focus of attention. While physical accessibility is important, the power dynamics between social actors frequently exert a more profound influence on the inclusivity of a space. Understanding these power dynamics is crucial for creating social spaces where all individuals feel a sense of belonging. In this section, we will look at how inclusion within social spaces depends not just on the physical accessibility and design of an environment, but on the power dynamics at play.

Power dynamics refer to the ways in which power is distributed and exercised within social interactions. According to Foucault (1980) , power is not merely held but is relational and pervasive, embedded within social norms, practices, and institutions. In any given social setting, such as educational, professional, or familial, power dynamics shape the nature and accessibility of interactions for participation. Power can be clearly visible, such as through formal authority, or it can be subtle, generated through informal social norms and expectations (Giddens, 1984) . In a classroom, for example, power dynamics are visible in the authority held by the teacher and the varying dominant and passive positionings of students. Teachers typically hold significant influence over classroom activities, decision-making and the establishment of social norms. This authority can impact on the students' feelings of inclusion or exclusion, depending on how the teacher interacts with and values their voice.

Power dynamics are pivotal in determining the inclusivity of a social space. The influence of these dynamics travel beyond the design of the physical space by affecting the interpersonal interactions and decision-making processes of social actors. For instance, decision-making power often rests with individuals or groups who hold formal or informal authority. These decision-makers have the ability to set rules, distribute resources, and shape social norms. When those in power prioritise their own interests or the interests of a dominant group over others, they may indirectly marginalise others as being less powerful. This dynamic can lead to systemic exclusion, where certain voices and needs are consistently overlooked. For instance, research on educational settings by Ball (2012)

highlights how institutional power can influence which students' needs are addressed and which are ignored, thereby affecting the overall inclusivity of the environment. According to Bourdieu (1986), those with more power often control the flow of information and the validation of ideas. If powerful individuals, such as educators or managers, do not actively listen to and engage with the perceived less dominant voices of social spaces, it can create an environment where only certain contributions are recognised and valued, reinforcing feelings of exclusion among those who are marginalised. These feelings of exclusion and isolation then become socially normalised for social actors who may perceive their power positioning as something that is permanent within a social space or structure. As Giddens (1984) notes, social structures are both constraining and empowering, shaping individuals' interactions and their access to resources. Social norms that favour certain groups or perspectives can create a hierarchical social structure where some individuals are systematically privileged while others are marginalised, impacting the perceived value of the groups and their level of inclusivity overall. This is particularly relevant in educational settings, where research by Cohen and Lotan (2014) demonstrates how group dynamics and classroom norms can affect students' participation and inclusion. They reveal that the roles and hierarchies established within social groups can either encourage or hinder a person's engagement, depending on how dominant or passive students are recognised, positioned and responded to.

The empowerment of marginalised individuals is intrinsically linked to power dynamics in fostering genuine inclusion in a social space. According to Arnstein (1969) , effective participation involves not just symbolic inclusion, but also the redistribution of power to ensure that marginalised voices can influence decisions and social spaces. Tokenism, where marginalised groups are superficially included without real impact, reflects a power dynamic where the position of the powerful remains within the dominant group. As a result, the dominant group retains control over decision-making processes and resource allocation, while marginalised voices have limited influence on meaningful outcomes. In this context, power is defined by a social actor's ability to affect decisions and outcomes within their social spaces. Arnstein's model illustrates that real empowerment requires a shift in power relations, allowing marginalised individuals to not only be present, but also to have a purposeful role in decision-making processes. This redistribution of power involves creating structures that support meaningful engagement, such as ensuring that marginalised groups have the resources, authority and support to influence decisions. Dewey (1916) f urther links power to the inclusivity of a social space through his advocacy for democratic education. Dewey emphasised that education should be a participatory process where students and other stakeholders share power in shaping their learning experiences. By involving students in curriculum design, policy development and classroom management, educators can alter the power dynamics within educational settings and improve upon the inclusivity of the social space. This participatory approach helps to

dismantle traditional power hierarchies and fosters a more inclusive environment where diverse perspectives are acknowledged, considered and valued.

Finally, inclusion within social spaces hinges not only on the physical accessibility and design of an environment, but on the power dynamics at play. While the orientation of physical spaces is crucial for accessibility, it is the distribution and exercise of power among social actors that profoundly influence the sense of belonging and inclusion within these spaces. Power is relational and embedded in social norms and institutions, shaping how interactions and participation occur. Power dynamics manifest in visible forms, such as formal authority, and in subtle forms, such as informal social norms, all which impact the inclusivity of any environment. Ultimately, fostering genuine inclusion requires addressing power dynamics and ensuring that marginalised individuals have purposeful roles in decision-making processes. This involves creating structures that support meaningful engagement, challenging tokenistic practices and promoting a participatory approach that recognises and values diverse perspectives. Through these efforts of reflecting upon existing power dynamics, social spaces can be an inclusive place for all individuals, mitigating against feelings of isolation or social exclusion, thereby enhancing the sense of belonging and active participation of social actors within the social space.

Consider the following:

Ben is four years old living in Dublin, Ireland with his father, mother and two older siblings. Ben wakes up on a typical Thursday morning to the voice of his mother telling him he has to come downstairs to eat his breakfast before he gets ready to go to preschool. Ben doesn't feel hungry but goes downstairs to the kitchen because his mother said so. If he does not do as his mother says, his mother gets angrier and shouts louder until Ben does as he is told. Ben knows there is no point in telling his mother that he is not hungry, so he stays quiet. Ben sits down at the table eating cereal. He hated sitting at the table in the morning because he was always surrounded by empty chairs. He looks forward to dinner time later because that's the only part of the day where he can spend some time with his family altogether. Ben wishes he was in preschool. At least there he could play outside with his best friend Adam.

In preschool, Ben is part of the Flying Bees classroom. His favourite part of the day is playing outside because he can play with his best friend Adam who is part of the Butterfly classroom. Just as Ben and Adam begin to plan their chasing game, it begins to rain and their educators shout "Okay everyone, time to come inside!". Ben feels frustrated. He has been waiting all day to play with Adam and does not want to stop just because his educators said so. He knows Adam doesn't go to school on Fridays because his parents work from home. Adam has told Ben how boring Fridays are because he spends the day waiting for his parents to finish working. He will have to wait longer before he can see Adam again. He feels angry towards the rain. If it wasn't raining he could play with Adam. He then feels angry towards his educators. If they wore a raincoat like his they would love playing in the rain too. Ben feels he should ask to stay outside longer. If his educators know that he wants to play with Adam, maybe they will let him. He walks over to his educator and asks "Can I stay outside with Adam? It's Saturday tomorrow so we won't see each other for ages!" His educator walks away, ignoring Ben. Ben runs behind her shouting "Can we please stay outside?" His educator replies "No, it's raining. Maybe later." Ben knew whenever his educator said "Maybe later" it meant no. He sadly waves goodbye to Adam who goes to the other end of the building. Ben wishes for a large roof to cover their playground. At least then if it rained, he could still play with Adam.

When home, Ben sees his older siblings have already returned from school and are playing a board game. He runs over "Can I play too?" His siblings, focused on the game, barely look at him and say, "No Ben, you're just a baby, you can't play this game." The siblings laugh together. After being dismissed by his siblings, Ben turns to his parents who are sitting on the couch scrolling their phones. "Mam, Dad, can we play a game together?" he asks, trying to get their attention. His mother sighs, "Maybe later Ben. We're busy." His father adds "Why don't you go play with your toys?" Hearing "Maybe later" reminds him of his educators in preschool. Feeling ignored and invisible, Ben wanders into the kitchen. He picks up his toy car and starts to play by himself. Ben wishes he had his own house and garden so he could play with Adam all the time. At least then he would have someone who listens to him.

Reflection
Think about a time when you or someone you know felt ignored or dismissed in a social space during your childhood. What actions or change in behaviour could you have engaged with to improve on your feelings of isolation? What actions or changes in behaviour by those around could have improved that experience into one of inclusion and validation for you? How can you apply these insights to improve the social environments for children like Ben?

Points to think about:
● Times when you felt you could not voice your opinion – why was this the case, relating to the people around you?
● What body language did you experience from others that signalled you could not express your voice? What body language were you expressing at the time and how would this be perceived?
● What could you and others have done differently to make the social space experience more inclusive?

Example Case – Intergenerational Learning Initiatives

In the Netherlands , intergenerational activities have been integrated into community

programmes in local libraries, community centres and care homes. Activities like storytelling and joint gardening sessions were facilitated , giving a purposeful shared meaning for children and older adults to socially connect together, resulting in a reduction in age-related stereotypes (Groot and van Gils, 2016). The generational approach to structured activities generated ongoing opportunities for children and older adults to build mutual respect and shared understanding on a regular basis. Initiating these intergenerational activities into common spaces created environments where social inclusion thrived, demonstrating that inclusion is not merely about the physical design of a space, but about creating opportunities for meaningful social interaction.

Similar to the Netherlands, in Italy, art workshops and cooking classes were also delivered to generate inclusivity between the different age groups. By making the activities culturally relevant, Italy fostered a sense of community belonging among children and older adults (Bertolini and Luppi, 2017). Not only were children and older people socially engaged collectively, but cultural ties across generations were also reinforced. This approach highlighted how inclusion can be achieved through the recognition of shared cultural heritage and family traditions, creating a social space where generational bonds are strengthened through cultural experiences and knowledge.

In Portugal, the main focus was on outdoor activities and environmental education, such as nature walks and community gardening, creating a common shared purpose between children and older adults. By engaging together in activities with a shared goal of improving their environment, participants from both groups demonstrated better understanding of environmental issues as well as strengthening intergenerational collaboration (Coelho and Pinto, 2018). These inclusive practices encouraged a sense of ecological responsibility and environmental stewardship. The approach demonstrated that inclusion can be improved by identifying shared community goals and facilitating opportunities for collaboration that promotes the environmental well-being of communities strengthened by intergenerational engagement.

In Slovenia, intergenerational activities were implemented into established local festivals and cultural events. According to Pahor and Kump (2018), by utilising cultural festivals as a social space where people participated, this proved to be an effective tool to implement intergenerational activities as part of the festival schedule by delivering art workshops, storytelling and traditional games and encouraging diverse social engagement. This approach highlights the benefits of integrating inclusive practices into a country's existing cultural frameworks, where intergenerational interactions can become an intrinsic part of a country's community and social life.

The Impact of Intergenerational Learning

1. **Reduction of Social Isolation**

- **Netherlands:** In line with findings from other countries, the Netherlands saw a 25% decrease in social isolation among older adults who engaged in intergenerational activities such as gardening and storytelling, driven by the meaningful engagement and shared experiences with children and their peers (Groot and van Gils, 2016).
- **Italy:** Older adults participating in intergenerational activities experienced a 20% reduction in social isolation in the Italian context. The shared activities with younger generations helped build strong interpersonal connections and reduced feelings of loneliness (Rossi and Ferrari, 2019).
- **Portugal:** Intergenerational programmes that focused on environmental activities led to a notable 25% reduction in feelings of loneliness among older adults. These programmes provided meaningful interactions through shared environmental projects and fostered connections between generations (Coelho and Pinto, 2018).
- **Slovenia:** In Slovenia, older adults reported a 30% reduction in loneliness when intergenerational activities were integrated into their local cultural events (Pahor and Kump, 2018).

2. **Enhanced Cognitive and Emotional Development in Children**

- **Netherlands:** Children benefited from a 20% increase in cognitive skills and a 15% improvement in social-emotional skills as a result of intergenerational activities like storytelling and shared learning projects (Groot and van Gils, 2016).
- **Italy:** Significant improvements were observed, with children showing a 25% increase in social skills and a 20% enhancement in emotional resilience. These gains were attributed to the rich, interactive experiences with older adults (Bertolini and Luppi, 2017).
- **Portugal:** Children participating in intergenerational activities showed a 15% improvement in social-emotional skills and a 20% increase in cognitive development. These activities helped children develop a broader perspective and better emotional resilience through interactions with older adults (Coelho and Pinto, 2018).
- **Slovenia:** Children involved in intergenerational programmes reported a 20% increase in both cognitive and social-emotional skills. These programmes facilitated meaningful exchanges with older generations, contributing to enhanced development (Pahor and Kump, 2018).

3. **Increased Community Cohesion**

- **Netherlands:** The implementation of intergenerational activities like gardening and storytelling resulted in a 35% improvement in social inclusion and community cohesion, driven by the collective efforts of different age groups working together (Groot and van Gils, 2016).

- **Italy:** Community cohesion saw a 30% improvement due to intergenerational programmes. These initiatives helped foster a stronger sense of community by encouraging collaboration between generations on various projects (Rossi and Ferrari, 2019).
- **Portugal:** The focus on intergenerational environmental projects led to a 40% increase in community engagement and collective responsibility. Both children and older adults collaborated on shared goals, which strengthened community ties (Coelho and Pinto, 2018).
- **Slovenia:** There was a remarkable 45% increase in social inclusion and a heightened sense of belonging due to the integration of intergenerational activities into cultural events. This approach effectively leveraged existing social structures to enhance community cohesion (Pahor and Kump, 2018).

Intergenerational learning initiatives highlight the profound benefits of social inclusion across diverse cultural contexts, as evidenced by the positive outcomes in countries like Portugal, Italy, Slovenia, and the Netherlands. By fostering meaningful interactions between generations, these programmes not only reduce social isolation among older adults, but also enhance cognitive and emotional development in children. When tailored to the unique cultural contexts of each country, whether through environmental projects in Portugal, local cultural events in Slovenia, cooking traditional food in Italy or storytelling and gardening in the Netherlands, these initiatives create shared experiences that bridge generational gaps and strengthen social inclusion regardless of the physical space of the initiative. Ultimately, intergenerational learning serves as a powerful tool, demonstrating the power of social dynamics in enhancing the inclusivity of physical space and generating social spaces that are underpinned by collective meaning and a shared purpose.

This case study examines the implementation and impact of intergenerational learning initiatives in various countries and demonstrates the power of the physical accessibility *and* social dynamics of a space in enhancing the inclusivity of the environment. Schools, for example, are distinct social spaces in themselves. In many instances, schools are the first introduction of a social context to an individual (see *Lifespan Development and the Social Space*). Schools should be safe spaces where learners can disclose their experiences to teachers and other school staff, who, in turn, should promote inclusion for all learners. Schools should encourage inclusive practices that originate from one's ability to act (or participation?), whether that means to leave or to stay. Ultimately, teachers who reflect on their practice have the capacity to create inclusion through their actions and engagement with students, and by recognising how physical space in itself does not make an environment inclusive, rather it is the individuals in the space that makes the difference.

Consider the prompts below to reflect on your personal experiences within social spaces:

- What are your memorable moments of feeling included in certain social spaces?

(prompt: who were there? what did they do? what did you do?)
- What are your memorable moments of feeling excluded in certain social spaces? (prompt: who were there? what did they do? what did you do?)

Structural Disadvantage

The ability to participate in a space is often contrasted with structural factors such as social class, religion, gender, ethnicity, race etc. that can be used to limit people's opportunities to access their rights (Drew C, 2023). They thrive in spaces that are aligned to their diverse needs, and empower, and enable them to interact with the environment and others. In some cases, however, humans face various limitations that inhibit their possibility to participate in social interactions with their peers and other members of their communities. For example, a young teen mother who juggles parenthood, schooling, and being a young person might not have the time to join other young people in social spaces and may therefore feel isolated. The situation will worsen if she lacks the digital devices to connect with others, or the financial means to go to places where she can socialise with other young people. Many local authorities provide parks and green spaces where people of all ages can spend time relaxing and meet friends. However, underprivileged and marginalised people rarely make use of such spaces for various reasons (such as?). Most people presenting with diversity and disadvantage are often met with negative attitudes and prejudice (Francis and Muthukrishna, 2018). While the latter elaborated on subtle forms of exclusion in the curriculum in primary and secondary education, Adair (2014) emphasises inclusive policies (Booth and Ainscow, 2011) to ensure inclusive spaces for preschoolers from migration backgrounds.

Let's look at this picture of a social space

Picture taken by C. K. Haihambo Ya-Otto with consent for inclusion in educational material

The picture above represents a social space at a higher education institution in Namibia.

A.   Think about various age groups of people that may interact in this space (intergenerational conversations; persons with disabilities and other barriers; ethnic minorities and socio-economic backgrounds). Do you think any person will feel safe or comfortable in this space?

B. What would you add to or remove from this space to make it more inclusive to a wider social group, for example to people from marginalised backgrounds including persons with disabilities or those who speak a minority language?

Educational institutions should be constantly aware of diversity in their school settings and create cultures of inclusion in schools and communities (Ainscow 2000). If schools model inclusion of for young people who are different, children and young people will learn to respect diversity and reach out to those who do not blend in easily due to their unique characteristics. These could be an immigrant who does not know the dominant language, a child who has a disability and the playground makes no provision for their needs; a child or young person who has limited access to food; or a teen parent who wishes s/he could go out and hang out with others but fears to be mocked for being a parent.

   How can schools and communities ensure that everyone has access to inclusive social

spaces in which no one feels left out? Firstly, it is important to understand the school as a social space. Social spaces can perpetuate exclusion through covert and overt forms. Covert factors include the physical infrastructure of the social environment in terms of how the physical environment is organised, the accessibility and safety considerations. Overt factors to consider will be psychological or emotional symbols with relation to cultures, values and norms. Booth and Ainscow (2000) identified three key indicators as part of their Index for Inclusion. These are Inclusive Cultures, Inclusive Policies and Inclusive Practices. For this chapter, we focus on inclusive cultures as key indicators of inclusive schools. Under the dimension of Creating Inclusive Cultures, there are specific indicators that schools need to consider such as:

Building community with sub-indicators: ● Everyone is made to feel welcome. ● Students help each other. ● Staff collaborate with each other. ● Staff and students treat one another with respect. ● There is a partnership between staff and parents/carers. ● Staff and governors work well together. ● All local communities are involved in the school.	Establishing inclusive values ● There are high expectations for all students. ● Staff, governors, students and parents/carers share a philosophy of inclusion. ● Students are equally valued. ● Staff and students treat one another as human beings as well as occupants of a 'role'. ● Staff seek to remove barriers to learning and participation in all aspects of the school. ● The school strives to minimise discriminatory practices
Source: Booth and Ainscow in Centre for Studies on Inclusive Education (2011)	

Educational institutions that are intentionally reflective, and prioritise these values, will create a socially inclusive learning and socialisation environment. Sabahat et al (2014) explored the role of the social environment on the quality of intercultural friendships and found that efforts should focus on ensuring schools become enablers of positive and quality relationships.

In this section, we provided reflections on structural limitations and how these impacts social space inclusion or exclusion. We encourage teachers to address issues in schools and communities that have the potential to threaten peace, harmony, and social cohesion. Using the following case study, try to apply the concepts covered to explore issues both superficial and invisible.

Consider the following:

Oscar is a 14-year-old boy who moved from a rural to an urban area in East Africa. Oscar moved with his mother to an urban area when their land could no longer sustain them due to repeated drought episodes. He finds almost everything in the city strange. He used to walk to school with his peers, whom he knows. All he needed to do was to whistle, and everyone would come out of their houses. Everyone would share whatever happened in their family, and if they needed advice, everyone would add to the pool of solutions. Also, he lived in an extended family setup, where there were older cousins who already had gone through body changes due to puberty and they would give him tips. Nobody needed to tell him to attend to the goats or cows, as he knew exactly what to do and when to do it. He can recognise each cow by its voice. He knew exactly what to do after school and had friends to explain the homework where he didn't understand.

Now, where he lives, he does not relate to anyone. The other children say they do not understand his English when he talks. Yet, back in the village, Oscar used to be among the best learners in English. Oscar finds it difficult to make friends at school. The only time he experiences friendship is when he is in the taxi that takes him to and from school with three other children. He even considered running away and finding his way back to the village, but the thought of leaving his mother alone to do all the work at home and go to work deters him.

It was one of the girls in the taxi that told him about a place where young people meet after school to do homework, but also talk about their dreams and challenges. This social space changed his life. He was added to a WhatsApp group for this centre and because he was too shy to say that he doesn't have a smartphone, he agreed with his uncle to use his phone during weekends. One day he made a big mistake by sending the message that was meant for his aunt, to this WhatsApp group and he was embarrassed because he asked his aunt to send them food products from the village. He thought everybody will laugh at him, but only a few people were gossiping about him and laughing at him. A number of his peers came to him and encouraged him, with some sharing that they also depend on food from the village.

He longs for the break to just go back to his village to do things he enjoys, but for now, he is focused on completing school and supporting his family.

Reflection

Think about a time you had to move from a place you were used to. It could be when you moved from one school to another; one family to another for example when your parents had to move for purposes of work or if one of them had died as was the case during the COVID-19 pandemic, or like Oscar, from a rural to an urban setting or from an urban to a rural area.

- What were the things you missed from your original place of residence?
- What were your new social spaces like (the playground at school or college, the park, the spaces of entertainment)?
- Did you ever feel excluded or included in those social spaces? What could have/ made you feel more included?
- As a teacher, what would you do to ensure that new learners/ students feel more included in the school or community?

Conclusion

The chapter discussed how to raise awareness regarding social space orientation and inclusion, not as an intrusive concept, but as a natural consideration for transition over the life course. Rather than adopting a disruptive approach and changing for the sake of inclusion, this chapter outlines that inclusion is beneficial for any individual in the social space. We also challenged teacher-education students to expand inclusive education discourse beyond academic competencies by focusing on the way social spaces can vary throughout an individual's lifespan. The case scenario provided discusses a broad range of contexts, rather than the teacher's perspective, to intentionally capture how teachers contribute to the dynamics that occur within a social space as a crucial element amongst the range of different social actors. Social space from our perspective presents as an

interactional aspect rather than a physically defined domain. The expansive nature of social spaces requires an element of self-reflection to allow for an in-depth understanding of the influence and dynamics that exist within any social context. The case studies given throughout this chapter have been specifically designed for readers to develop a relative sense of engagement rather than a prescriptive approach to inclusion. We hope that readers can adopt the same ethos in how we see inclusive education, that it is of itself, a holistic discourse for social development that goes beyond the physical boundaries of an environment.

Closing questions to discuss or tasks

Social spaces can take the form of any physical space such as schools, playgrounds , parks, libraries, shopping centres, restaurants, sports fields, and entertainment centres, among others. Social spaces can also be invisible, virtual or emotional environments that have an impact on how individuals feel accepted or rejected; safe or unsafe. Rather than the space itself, think of the people most likely to interact with the space in access and use. It could be something as simple as *'Are there ramps for persons with disabilities and grandparents who come to the school?'* or more complex considerations of *'Are there hygiene facilities to support girls at school?' Are there support platforms for learners identifying as queer, transgender or any other non-conventional sexual orientations? How about non-conventional beliefs or religions?* The answers to these questions may in some way explain why some children watch others play from a distance even though they have the choice to actively and freely participate. It is important for teachers to be conscious of social space orientation and the role it plays in social inclusion, especially in the ever-increasing diverse school and community populations.

About the authors

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Chloë Keegan

https://orcid.org/
0000-0001-9759-6370

Dr. Chloë Keegan is a Lecturer in the Froebel Department of Primary Education and Early Childhood in Maynooth University. With over a decade of experience in the early childhood sector as a researcher, lecturer, educator, content developer, and early childhood specialist, Chloë's passion lies in conducting qualitative research directly with young children and advocating for children's voices to be heard and reflected in policy and legislation. Her research has explored how power dynamics, educational structures, and shared environments between adults and children shape children's participation through her Doctor in Philosophy (Ph.D) in Education entitled "It's Like a Baby Jail!' The impact of regimented daily routines on children's participation in early childhood education". Chloë has led national and international campaigns and initiatives as an outdoor and nature specialist in early childhood education, contributed to Ireland's alignment with international practices, particularly for outdoor play, policy and provision, and is conducting research to inform national Irish policy and guidance for children and adults with disabilities.

Chee Shien Tan

Victor Tan Chee Shien has over ten years of experience in special education and is a trained counsellor and educational psychologist. He recently received his Associate Fellowship in higher education from the University of Stirling. His research interests include special education, higher education, and international mobility (ORCID: 0009-0006-3403-4649).

INCLUSIVE PLAY: NORM CREATIVE APPROACHES TO TRANSFORM INTEGRATIVE PLAY TO INCLUSIVE PLAY

Example Case

This is an example from a Danish school:

"It is a regular school day in a school-class for children between 8 – 9 years old. Thilde, one of the children, has just started in the class, as she moved from another school. After having their lunch, they are all sent out to the playground. Thilde asks her new classroom teacher if she (the teacher) is also joining the class outside. The classroom teacher replies "No, but Helle (another teacher) is outside at the school playground."

Thilde makes it out the door and not that long after, another child approaches the classroom teacher while holding Thilde's hand. Thilde is visibly crying. The classroom teacher asks Thilde "Why are you crying?" and Thilde explains that she couldn't find any adults and it was very noisy outside. The classroom teacher reaches for Thilde's hand and takes her, outside to the playground. Here on the other side of the building, in the shade of canopies, a few of the adults are standing. The classroom teacher explains: "There's always an adult present here." And Thilde nods. Helle, one of the other adults, goes to the playground with Thilde and participates in a free play-activity by the sandpit. The bell rings and Thilde goes back inside.

The next break Thilde is outside again, and she is looking around for an adult. The adults outside have changed to another group and there is no one she recognizes. A few minutes later, one of the children comes into the teacher's room with Thilde, looking for her classroom

teacher. Thilde is crying and the classroom teacher once again shows her where the adults are standing, then tells her, that there's always adults around here, and no one is leaving her alone. Then the classroom teacher leaves Thilde at the playground. After this, Thilde is no longer observed participating in play at the playground, she walks around the corner of the play-area and for a few weeks has little to no interaction with any of the adults."

Initial questions

There are several questions that we pose to unpack what is happening within the scenario above.

1. What is play?
2. What is inclusive play?
3. How might a teacher foster inclusive play?
4. How can we create a culture of inclusion and participation?
5. What are the effects of exclusion from play on children?

Introduction to Topic

Play has been at the heart of children's learning for many years and the learning potential rooted within play in terms of social and cognitive abilities is routinely recognised by scholars and theorists from around the world (Ginsburg, 2007; Hayes, 2013; Hayes & Filipovic, 2018; Moore & Lynch, 2018). Understanding that children have individual needs, views, cultures, and beliefs that deserve to be listened too (UNCRC, 1989), is imperative to ensure children develop positive self-identities (NCCA, 2009).

The notion of inclusion should not be viewed in isolation, but together with autonomy, participation, rights and listening to the voice of children (Clark & Moss, 2005; Lundy, 2007). The concept that knowledge is socially constructed is integral to the notion of a children's rights-informed approach to participation (Lundy & McEvoy, 2012). Children's meaningful and authentic participation is fostered through the implementation of rights-based approaches (Byrne & Lundy, 2019) that are responsive to the increasingly diverse cultural and social worlds we live in (French & McKenna, 2023; O'Toole, Walsh & Kerrins, 2023). Teachers are constantly adapting to the ever-changing landscape of their classroom

and the needs of each diverse group they teach (Brennan, 2012; French & McKenna, 2023). Children learn these skills through a playful environment (Hayes, 2013; Hayes & Filipovic, 2018; NCCA, 2009). Play, and especially inclusive play, is a vehicle to meaningful participation for children (Hayes, 2013).

Key aspects

What is play?

Play is the highest stage of the child's development at this time; for it is a freely active representation of the inner . . . It produces, therefore joy, freedom, satisfaction, repose within and without . . . (Froebel, 1885: 30)

Anthropologists have studied play throughout the centuries and there has been evidence of children telling stories, playing games, and dancing in the most primitive of eras (Flood & Hardy, 2013). Plato was a big believer in the value of children's play and even offered advice to mother's on promoting playful approaches at home (Flood & Hardy, 2013). Plato also believed that the experiences children had in early childhood have a lasting impact on their final development leading into adulthood. Friedrich Wilhelm Froebel and his philosophies have not only contributed to the development of many play-based programmes globally but through his gifts and theoretical workings he exemplifies investigative and experiential play opportunities while maintaining the theme of unity within his philosophy (Bruce et al, 2019). Unity in the sense of play practices that cater for the wide variety of needs within our education settings (Bruce et al, 2019; Froebel, 1885).

Defining Play

There are several definitions and understandings of play. Play has been at the heart of children's learning for years and open to interpretation and scrutiny from many theorists' perspectives (French, 2018; Pyle & Danniels, 2017). Therefore, it is extremely difficult to narrow the philosophy of 'play' into one succinct definition.

Play-based learning has been described as a teaching approach involving playful, child-directed elements along with some degree of adult guidance, and scaffolded learning objectives (Weisberg, Hirsh-Pasek & Golinkoff, 2013). It is moulded in Vygotskian and Froebelian theory where a socialist approach to teaching and learning is encouraged and teachers facilitate new ideas and knowledge within a modelled and purposeful framework of play (Vygotsky, 1987). Rather than offering a universal definition, contemporary literature on play and play-based learning draws on multiple perspectives regarding its complexity (Bubikova-Moan, Hjetland & Wollscheid, 2019), which includes, but is not limited to: play and whether play-based approaches translate into meaningful learning for children (Brooker, Blaise & Edwards, 2014), the content within play and distinguishing between different play types (Vorkapić & Katić, 2015), the importance of role-play (Bonilla-Sánchaz et al., 2022),

the role of the adult during play (Hayes, 2013; Loizou & Loizou, 2022; Pyle & Danniels, 2017), compatible assessments (Pyle & DeLuca, 2017; Pyle et al, 2022) and what we will explore throughout this chapter; inclusive play (Danniels & Pyle, 2022).

For the purpose of this chapter, we are looking at inclusive play through the lens of the classroom and the school community. What does inclusive play look like in the classroom and how can we promote it within our teaching pedagogy?

Inclusive Play

When inclusion is being considered within a classroom there are two main schools of thought: academic inclusion and community inclusion (Goransson & Nilholm, 2014). That is how we, as teachers and educators, support the inclusion of children with diverse needs on an academic level and on a community level. Viewpoints and understandings of this differ greatly within the teaching communities (Danniels & Pyle, 2021). Kruse and Dedering (2018) posit that differing views of the conceptualisation of inclusion leads to the implementation of alternate inclusive teaching strategies. Now, with more and more children with diverse needs attending mainstream school (Gottfried & Kirksey, 2019) teachers need to unpack what their understanding of inclusion means.

Play is espoused as a sacred right of childhood, as a way in which young human beings learn to be happy, mentally healthy human beings (Cannella, 2008). Inclusion refers to the social justice principle that all children, including children with disabilities, belong to the school community and are entitled to share in all the social and academic opportunities a school has to offer (Fleisher & Zames, 2001). An inclusive environment where equality is upheld and diversity respected is fundamental to supporting children to build positive identities, develop a sense of belonging and realise their full potential (DCYA, 2016).

There is a necessity to provide opportunities for all children to thrive through the promotion of positive identities and abilities, the celebration of diversity and difference and the provision of a participative culture and environment (Ministry of Education, 2017; NCCA, 2009). Thus, research shows that it is imperative that play, as a social opportunity afforded to children, underlines the right of every child, regardless of their ability or culture, to participate, in a way which ensures that their sense of identity is affirmed, so that all children can be happy and healthy mentally (Bruce et al, 2019; Flood & Hardy, 2013; French, 2018; Moore & Lynch, 2018). There are three fundamental components that we believe need to be present within an inclusive classroom: a desire to ensure children's rights are upheld (UNCRC, 1989), the need for children's voices and agency to be central to the curriculum (Ministry for Education, 2017; NCCA, 2009) and the culture of the classroom to be one that embodies inclusivity (DCYA, 2016).

Frameworks that support inclusivity in the classroom

A dialogical framework

Throughout this chapter we will dissect different frameworks. We will begin by reviewing inclusive play through the lens of a dialogical framework (Alexander, 2020) while placing children's voices, right, and agency at the centre of their learning (NCCA, 2009; UNCRC, 1989). A dialogic framework utilises the power of talk to allow children and teachers to unpack and make sense of the topic they are discussing (Mercer & Hodgkinson, 2008). Through dialogue and communication, the children are making sense of the world around them (Alexander, 2020; NCCA, 2009) and the teachers are learning how the children understand and disseminate the information (Alexander, 2020). This sparks an interest in learning (Mercer & Hodgkinson, 2008), higher-order thinking (NCCA, 2009), encourages social and emotional skills through democratic engagement (Alexander, 2020) and empowers life-long learning (Mercer & Hodgkinson, 2008). This coupled with the use of a multimodal curriculum allows for jointly constructed knowledge within a classroom setting (Alexander, 2020; Mercer & Hodgkinson, 2008).

Play can be self-directed, child-led, child-centred or guided by an adult, but the critical importance of these approaches is that the child is at the centre of the learning experience (Baker, Le Courtois & Eberhart, 2023). Teaching, especially in early years education has shifted from a traditional didactic form of teaching where the teacher stands at the top of the classroom to a more holistic and inclusive dialogical approach where children's agency is respected and valued (Tovey, 2016). Dialogical perspectives originate from the idea that knowledge can be co-created, ideas developed, and misunderstandings overcome through teacher and student collaboration (Alexander, 2020). Developing this agency in a learning context fosters important attitudes and values towards learning such as motivation and self-regulation (McClelland & Cameron, 2011). Play allows children to experience agency in their learning through "participation, willingness, and endorsement" (Baker, Le Courtois & Eberhart, 2023:373). Learning through a dialogical framework is a playful process where children have agency to be active participants in their learning journey (Hirsh-Pasek & Golinkoff, 2011).

We argue, for the purposes of meaningful inclusion, this dialogical framework needs to be expanded to include the parents/guardians of the children. Their funds of knowledge will allow for a deeper understanding of the needs of their child and could, therefore, enhance the child's learning. We also believe, for the purposes of inclusion, that dialogue could be interpreted as communication. The spoken or written word are not the only vehicles through which children communicate their thoughts and understandings to us (Clark & Moss, 2011). Children also communicate through drawings, facial cues, and expressions. Therefore, for the purposes of this chapter, to conceptualise the concept of 'dialogue' and reframe it to meaning 'communication' would be more inclusive.

The capabilities approach

The capabilities approach highlights people's capabilities and functioning's (Nussbaum and Comim, 2014). It emphasises differences and builds on the understanding that difference is part of human diversity (Reindal, 2009; Reindal, 2016). Difference is not something to ignore, instead it is something to highlight through a capabilities lens. By acknowledging what children are capable of, ensures that strategies can be put in place to support these developing capabilities with human dignity (Unterhalter & Walker, 2007). This allows teachers to provide inclusion within their classroom. By acknowledging capabilities, and using this knowledge to implement strategies, teachers can support inclusion within the classroom. The capabilities approach encourages teachers to look beyond merely the physical capabilities but also uncover the broader holistic diverse needs of the children (van Engelen, 2021). Inclusive play involves children meaningfully participating socially, emotionally, and physically in all activities undertaken within the classroom (van Engelen et al., 2021). The necessity to focus on a broader holistic view of children with diverse needs in play is pivotal for teachers to look beyond the physical environment as the only barrier to inclusive play (van Engelen et al., 2021).

Making play inclusive can provide enhanced opportunities to build upon sensory, motor, language, relationships, coping and emotional skills (Fjøftoft, 2001). Through the exploration of social situations and self-expression children learn to understand the world around them (NCCA, 2009). Ensuring all children are included in these play activities helps children to unpack feelings and emotions and understand social norms (van Engelen et al., 2021), thus encouraging children to connect on an emotional level (French, 2018; Hayes, 2007). When play is made inclusive it encourages a social play culture to exist. The capabilities approach encourages teachers to highlight that social and attitudinal barriers can impact on inclusivity in spaces where physical inclusion exists (Barron et al., 2017). Being aware of these dynamics means that teachers can question the normative culture of their classroom on a structural level (Nussbaum & Comim, 2014).

There are tensions between inclusion strategies and marginalisation strategies and the prevalent strategy tends to be one that is deemed the cultural norm within the school (Berg, 2013). Berg (2013) uncovered another tension when examining teachers' narratives on inclusion. This is the variance between the individual beliefs of teachers and the collective 'agreed' response to inclusion within a school.

According to Nussbaum and Comim (2014), capabilities are the actual possibilities to realise and gain access to functionalities in life. Capabilities within our approach in inclusive play refer to the actualised possibilities for accessing and participating freely and fully in play.

By viewing a child's position through a capabilities lens, helps to identify how the child can be supported through play within the classroom, ensuring that no child becomes marginalised or misdirected from the normative playfield. Not because they are not invited

into play, but perhaps because they do not have access to the capabilities, that are required from the structures formed around the normative playfield.

Children's right to play

The elusive nature of play makes it difficult to conceptualise succinctly (Bonilla-Sánchez et al, 2022; Danniels & Pyle, 2022; Hayes, 2013; Loizou & Loizou, 2022; Pyle & Danniels, 2017; Pyle & DeLuca, 2017; Pyle et al., 2022). What is agreed upon however, is the learning potential rooted within playful approaches in quality educational settings (French, 2023; Hayes, 2013). Even at a young age, children have a pre-dispositioned preparedness to learn (NCCA, 2009) and this cognitive cycle and learning stems from generating knowledge from the world around them and experimenting with various ideas and concepts that allow children to explore their own identity (Tovey, 2016).

Children have a right to play and explore the world around them (Brooker & Woodhead, 2013; Lester & Russell, 2010; Paya Rico & Bantula Janot, 2021). Article 31 of the United Nations Convention on the Rights of the child (UNCRC) states that every child has the right to *"rest, leisure, to engage in play and recreational activities appropriate to the age of the child and to participate freely in cultural life and the arts"* (CRA, 2010: 29). Play has transitioned from an informal activity to pass the time to an educational mechanism through which to drive meaningful learning (Tovey, 2016).

There is a direct correlation between Article 31 of the UNCRC, the right to play, and the general comment on the rights of children with diverse needs issued by the United Nations (UN) where it highlights full inclusion and playful approaches as a means of children with disabilities to feel included and respected no matter what the setting (CRA, 2010).

Lundy's (2007) model of participation for conceptualising Article 12 includes four key elements: space, voice, audience, and influence. Bae (2012) posits that to ensure Article 12 is upheld teachers need to provide more than the tokenistic choice for children. Instead, they need to create relationships through deep and meaningful communication strategies for and with the children. She believes that this transparent communication between the teacher and the children will create a "democratic atmosphere that will enhance participation" (Bae, 2012: 66). We argue that this *'transparent communication'* needs to continue to the wider community of the classroom and include the main stakeholders that advocate for the child (their parents/guardians).

We propose that the main outcomes of inclusive play for children are an increase in their autonomy, agency, rights, and participation. Therefore, increasing an inclusive culture within the group, and elevating the sense of belonging, and well-being through peer-to-peer relationships and genuine involvement within a group can support inclusion. Hence, the need for inclusion to be viewed through an academic lens and a community lens are imperative for inclusive teaching strategies to have a genuine impact.

This leads to unravelling another layer of inclusion: children's right *in* play. There is a

plethora of literature relating to children's rights to play and the need for play within an educational setting as a vehicle to enhance learning and meaning making for children (CRA, 2010; Lester & Russell, 2010; Lundy & McEvoy, 2012). However, we argue that for children to have the right to inclusive play the discourse on children's rights *in* play needs to be explored.

Children's rights *in* play

Play is publicised as being an optimal learning context for typically developing children, however, discussions around play and our more diverse learners are progressively negative (Danniels & Pyle, 2021). Some children with more diverse needs may choose to engage in more solitary play and less cooperative play than their peers (Lagerlöf, Wallerstedtand & Pramling, 2022; Olsen et al., 2019). If children do not have the capabilities to engage in more co-operative play, then their right *to* play is still upheld but their right *in* play is not.

Children who exhibit social isolation, may not be as accepted into peer-to-peer friend groups within the classroom (Kasari et al., 2011). Furthermore, children with English as an additional language tend to make fewer friendships in native English classes when not afforded the opportunity to engage *in* playful 'children's talk' (Lagerlöf, Wallerstedtand & Pramling, 2022). The way some children with diverse needs play may differ from a typically developing child and these needs should be noticed, discussed, and utilised as funds of knowledge to further support all children (Barton, 2016; Messier, Ferland & Majnemer, 2008). The capabilities of children to interact, make friends, and socialise with their peers may be hindered due to their diverse needs. Therefore, the opportunity *to* play may be available to them, but their experience *in* play is not inclusive.

They may not understand the concepts of some imaginative play games, they may not be able to comprehend the dialogue within the play scenario they are embarking on. The role of the teacher is imperative here to investigate the capabilities and emergent capabilities of the children and to scaffold them. This scaffolding will encourage the inclusion (not just integration) of children with diverse needs on both an academic and a community level (Goransson & Nilholm, 2014; Olsen et al., 2019). The role of the teacher will be explored later in this chapter.

We advocate that at a classroom and practical level, teachers and educators who consider the rights of children *to* play and*in* play will provide a more inclusive classroom environment.

Factors affecting inclusivity

Social norms and power dynamics *in* play

In examining play through the lens of ableism (capabilities) often social inequalities develop unconsciously and most people have the privilege of benefiting from ableist systems

that have evolved of and for the majority (Goodley, 2014). In the early childhood setting 'friendship play' is positioned as a possibility for everyone (Watson, 2018). Friendship and playing with friends are considered phenomena that naturally take place when children gather. It takes for granted the coming together of children so that play often develops unconsciously as a social opportunity for those who are able (have the capabilities) to participate without any barriers.

Young children actively draw on normalising discourses around their own and others' identities and the homogenous group (Watson, 2018). They adjust their behaviours and observe the behaviour of others around them and can decide whether or not they might be the same (Watson, 2018). According to Watson, sanctioned discourses in the classroom contribute powerfully to the way children come to understand themselves. They also assist them in identifying differences in the classroom.

There are many power relations visible within children's friendship play, this can sometimes go unnoticed, as friendship play is often uninterrupted and seen as 'innocent' (Grieshaber and McArdle, 2010). Power dynamics are often at play as children negotiate where they belong within a group. Leaders will emerge, some more able to take other children's opinions and suggestions on board than others. Children make sense of the world through play and their competencies become visible as they engage in friendship play. Thus, children who are in the normative group are at an advantage and thus friendship play can work to conceal how children use play to position themselves more powerfully, often to the unconscious detriment of others (Watson, 2018).

The role of the educator is extremely important in friendship play to ensure that exclusionary practices do not go unnoticed (Weisberg et al., 2013). The notion of a teacher intervening is often at odds with the concept of children being able to navigate their own play. We totally acknowledge that there is a fine line here. We are not suggesting that teachers dominate friendship play, instead however monitor it to ensure that any unconscious exclusionary practices do not become the norm within the culture of a class.

Children may also need support to join a group and build those peer-to-peer friendships. Teachers can monitor and support those children to enable them to build these emerging competencies through role modelling, and by being their partner in play. When a child is partnered with a teacher, this is seen as a coveted position, and more of his/her peers may be interested in joining in their play then. This elevates the image of the child, builds social connections and enhances inclusivity in play (NCCA, 2009).

The social, emotional, and physical environments influence inclusivity within play

Inclusive classrooms have demonstrated positive learning outcomes for children, including high levels of academic performance, social skills, language competency, and a greater acceptance towards children with diverse needs (McDonnell & Hunt, 2014). However, as mentioned earlier in this chapter, typically developing children and more diverse learners

have different needs that must be met (Watson, 2018). The social and physical environment of the play area have been highlighted as influential factors in catering for a more inclusive environment. It is important that although play areas are typically created with developing children in mind, consideration must be given to these aspects to promote inclusion within the classroom (Danniels & Pyle, 2022). The physical mobility and accessibility of all students is imperative. Access to all learning materials and areas within the room is a primary concern, from a physical aspect. However, if the social and emotional environment is not inclusive and meeting the needs of the children, accessibility is immaterial. This is evident in the example at the beginning of the chapter.

Thilde had access to the playground, but she did not engage in play within the playground environment. That is why it is so important to review the social and emotional aspects of the environment before the physical one. If the other elements are not there then inclusion may not exist at all.

Before creating a space for inclusive play to flourish, we must consider how we are going to first create a culture of participation that is crucial in the implementation of inclusive play (Casey, 2010). Practitioners of play can create vibrant playful environments that are visually stunning and encompass key learning centres for play to happen. However, we must always consider the needs of individual children in our settings.

Teachers' skills, knowledge, attitude, and understanding of inclusive play environments

The landscape of classrooms has altered dramatically since the 1990's, as discourses, policies and social attitudes changed and the inclusion of students with additional needs in education began. A number of key events accelerated these discourses: the Salamanca Statement and Framework for Action on Special Needs Education (UNESCO, 1994) which encouraged governments to review how they respond to the diverse needs of students; the Education for All movement (UN, 2000) as it attempted to overcome inequalities within the educational systems, and the UN Convention on the Rights of Persons with Disabilities (UN, 2006) as it recognised the rights of all children to be included and receive the individual support they may require throughout their education. These not only altered the landscape of the classroom but also the competencies, skills, and knowledge that teachers needed to ensure their diverse students progressed within their classes. The notion of inclusive play as a vehicle to achieve the necessary learning outcomes for their students became well documented (Grieshaber & McArdle, 2010).

The European Agency for Development in Special Needs Education specifies that teachers not only need to have the appropriate understanding, knowledge and skill set, but they also need to have certain values and attitudes to effectively work within inclusive settings (Borg et al., 2011). Also, the diverse range of students' needs alter year on year. Thus, teacher training is still evolving to incorporate new skills and competencies that teachers need to succeed in the ever-changing diverse environment.

We posit that there are several elements that inclusive environments require to ensure they thrive. These include teachers who are willing to embrace collegiality and collaboration to enhance their knowledge and understanding of diverse learning abilities, nurture an inclusive school culture, and a willingness to reflect on and review our biases to ensure they are grounded in research.

Embrace collegiality and collaboration to enhance their knowledge and understanding of diverse learning abilities:

The word collaboration has its origin in "colabre or co-labor," which refers to working together (Welch, 1998: 121). That notion of pooling resources together among professionals who have shared values and where a positive interdependence exists allows for inclusive learning environments (Snell, Janney and Elliot, 2005).

Nurture an inclusive school culture:

A school culture is a set of collective understandings (Carrington & Elkins, 2002), based on shared values (Noddings, 1992), with a common goal (Welch, 1998). A school culture that also embodies inclusivity ensures that biases are unpacked ethically (Palaiologou, 2014), diversity is celebrated (Kruse & Dedering, 2018), and collegiality and collaboration are inclusive and valued (Carrington & Elkins, 2002).

Why inclusion is so important

When inclusive strategies are not enforced the negative outcomes can be detrimental to all children. Therefore, inclusive strategies promote a positive self-image for all children and increase the self-efficacy for all children (Carrington & Elkins, 2002; Noddings, 1992). It creates a community that accepts and celebrates differences and ensures that developing and emergent capabilities are scaffolded (van Engelen et al., 2021). Noticing and acknowledging the signs of stress and anxiety in children is imperative to supporting them to accomplish a task they are concerned about. Children learn at an early age how to attract the attention of an adult. This tends to involve loud noises or gestures, signalling the need for support. However, stress and anxiety are not always visible through these gestures (French, 2018). Ensuring that children can self-express, and if they remain in control this does not hold less value or not get a response from teachers.

If Thilde, in our example at the beginning, had been expressing herself and her experience with abandonment through crying it would garner the attention of a teacher. This is a response that needs to be dealt with as it is challenging the normative play. However, in this scenario Thilde does not respond in that manner but she is in a position of stress and anxiety. However, it is not disturbing the normative play scenario and Thilde does not get any support to help her bridge the gap to socially participate within the play scenarios in the playground.

Thilde has no practice with these social norms, and she is not given any 'training wheels' or support to help her develop these capabilities.

Putting on the training wheels

For a more inclusive play environment to exist, and for children to step into the field of play confidently and competently, we argue that there might be an incentive to put on the '*training wheels,*' and design didactical and pedagogical approaches towards play-competence. As the teacher creates a safe community (Lundy, 2007) and co-constructs a culture with the children, important relationships are formed (French, 2018; Hayes, 2007). This allows the teacher the perspective of resonating with the child and encouraging them to experience a connection with the world around them, by putting themselves into or stepping into the world around them (Pope, 2017). Those steps resonate with the field the person wishes to practice, transforming both the field as well as the person's experience and skills in some way. These steps into play require engagement from the teacher who is teaching the child, but it also requires a spark, an engagement, a willingness to resonate with the rest of the playgroup from the child's perspective (Baker, 2018). If the child sees no way into this culture or if they cannot mirror themselves even slightly within the activity at hand, the educator's planning failed to create that spark.

Prior to the child putting on the training wheels there is a requirement that there is trust and safety between the child and the teacher. The experience, and reflection on the experience, is dependent on both the trust between the teacher and the child and also the trust the child has in his/her owns experience. Once this trusting collegial and honest community is established the continuity of this becomes central for inclusion to thrive and competency levels to increase.

Didactic and pedagogical strategies towards creating environments where inclusive play can thrive

Teacher Observation and Reflection as a vehicle to creating inclusive play environments

To create a collaborative and inclusive play environment we must first observe children at play. A distinctive feature of observations is the ability to obtain 'live' data on the spot, so teachers are not trying to remind themselves what had happened after the event occurred (Merriam & Grenier, 2019). The ability to observe and reflect on the observations is a skill all teachers need to acquire. Through observation teachers can create a holistic view of the child's habits, social interactions, needs and capabilities, to inform a collaborative, collegial, transparent, dialogue between the whole team of teachers, outside agencies, parents, and the children themselves (Conn, 2014).

This skill allows teachers to pause and process their observations. Through reflection teachers can theorise and create strategies, environments, and play scenarios to support competencies recognised and scaffold emergent competencies (Moon, 2006).

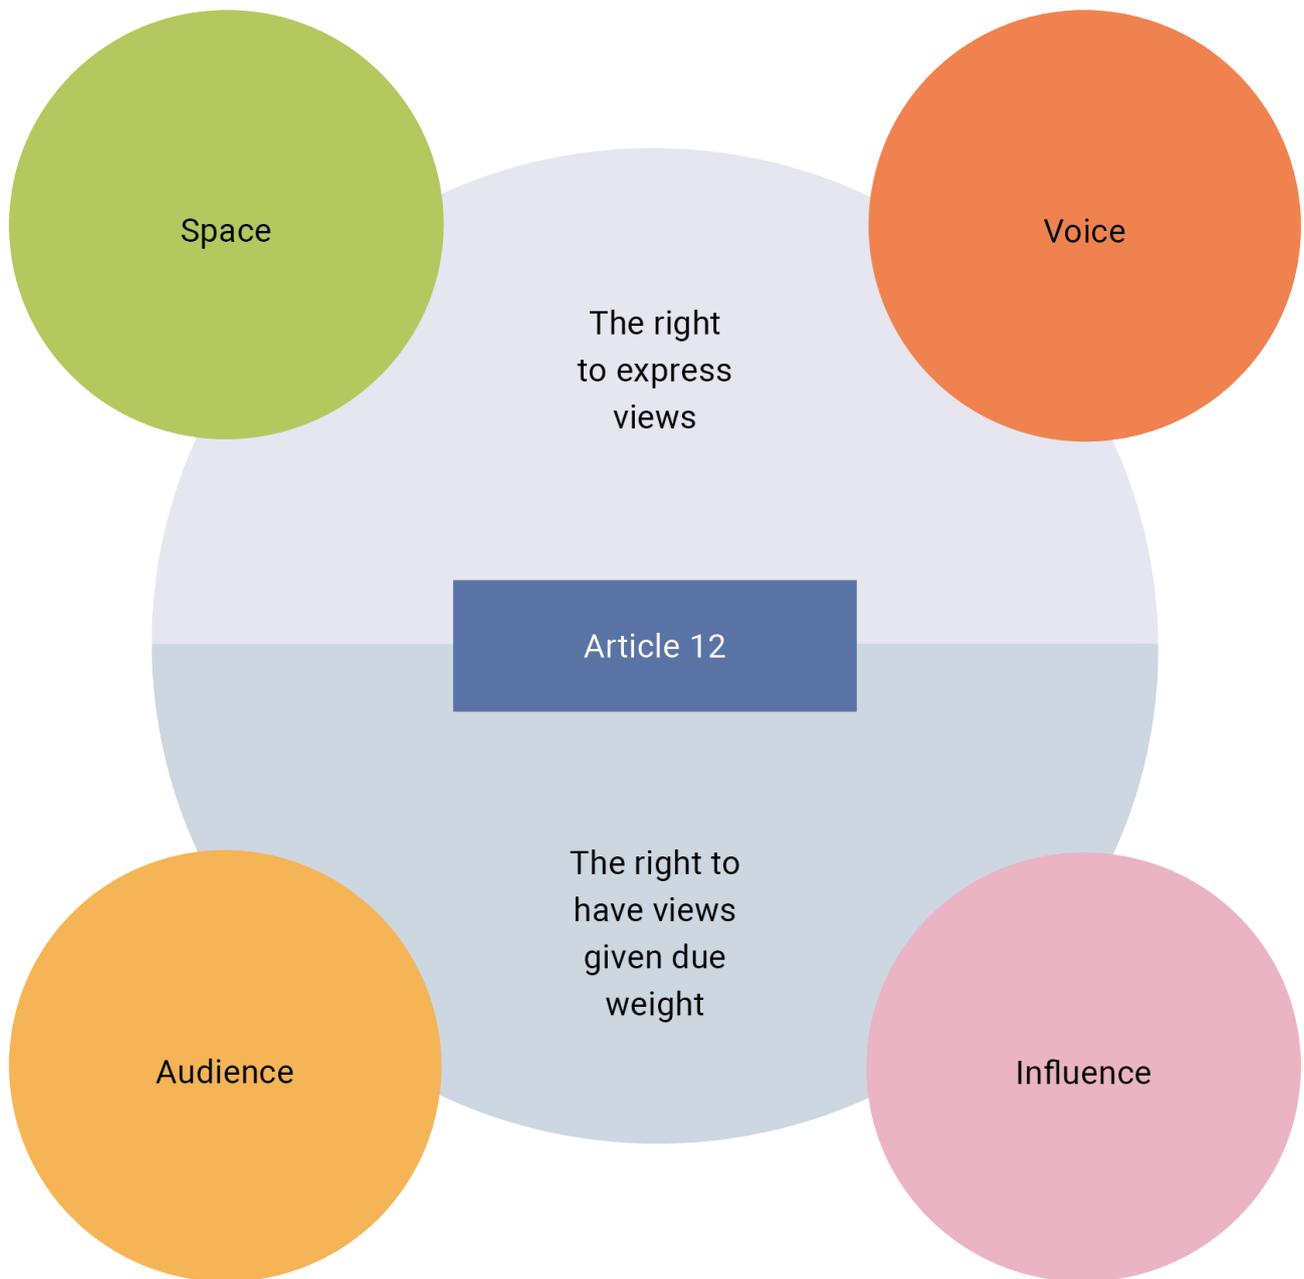
This can only happen when teachers are frequently acting on their observations and

amending the play environment in a meaningful way to suit the children. Creating a classroom environment that is fluid and changes to suit the needs of the child allows their voices and interests to be visible within their classroom. Applying these simple strategies of observation and reflection ensures our practice is informed by 'live' data that creates positive play scenarios for children and ensures their competencies are central to the environments they play in.

Accessing children's voices to inform inclusivity within the classroom

For the purposes of inclusive play, we propose that two participation models be used in conjunction with one another to improve inclusivity within the classroom: Lundy's model of participation (Lundy, 2007) and Clark and Moss's mosaic approach (2005).

Lundy's (2007) model provides a way of conceptualising a child's right to participation, as laid down in Article 12 of the UN Convention on the Rights of the Child (UNCRC, 1989). Lundy explores participation through four lenses that have a rational chronological order: space, voice, audience, and influence.

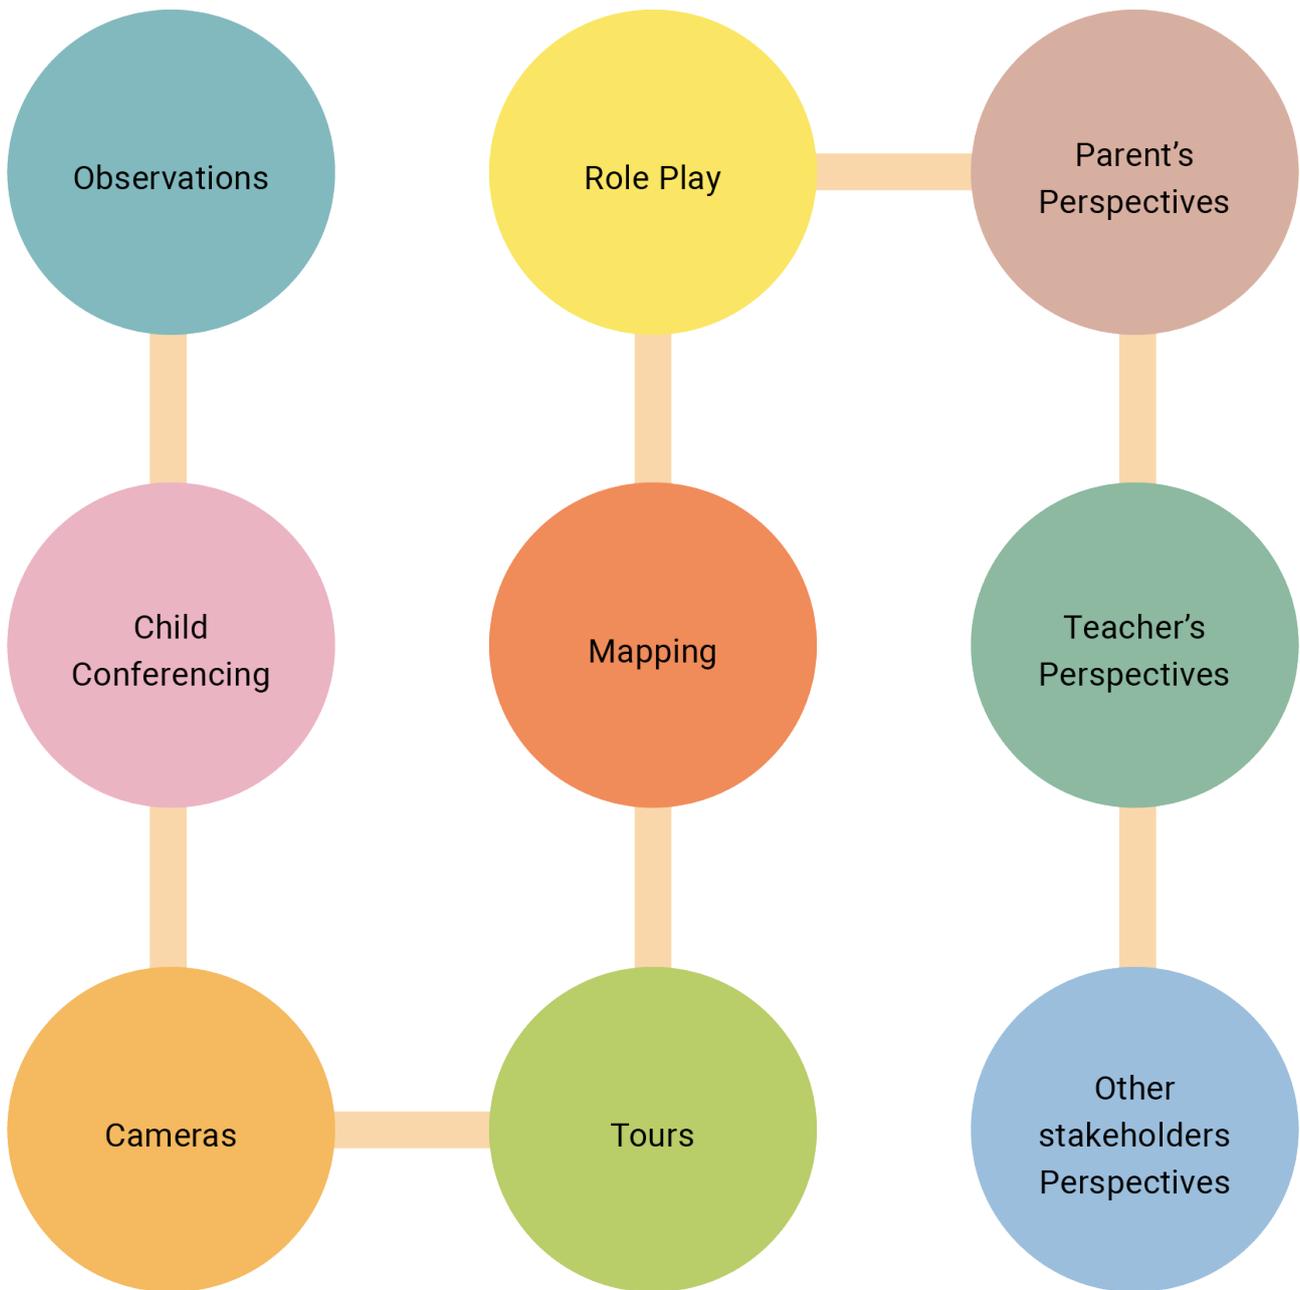
Figure 1: Lundy's Model of Participation (2007).


Source: Lundy (2007)

Here she is proposing that teachers give children safe, inclusive opportunities to form and express their views and opinions. This 'space' allows their opinions to be formed. Children then must be facilitated to express these views. The children's 'voice' needs to be heard. These opinions and views then need to be listened to. This is where the 'audience' (the teachers) listen to these views. Then, finally the views and opinions must influence change.

The 'space' is created to form opinions. Then the 'voices' of the children are accessed. The 'audience' listens with a view to allowing change in practice to occur. The opinions of the children 'influence' changes in practice (Lundy, 2007).

Clark and Moss's (2005) mosaic approach fits nicely into Lundy's (2007) accessing the voices of children section.

Figure 2: A depiction of Clark and Moss's Mosaic Approach (2005).


Source: Clark and Moss (2005)

Clark and Moss (2005) use multiple mediums to access children's voices. We discussed earlier in their chapter about broadening the term 'dialogue' to include other forms of communication. This Mosaic approach fits directly into this concept.

Observations are used, as mentioned earlier in this chapter. Child conferencing is gathering a small number of children together to talk to them about a particular topic. There are some key points to note: a place that is familiar to the children will ensure they are relaxed, there are some strategies that can be used to ensure all voices are heard (the use of a puppet, ask each child a different question), and where possible record it so that it can be used as a reflection tool (Clark & Moss, 2005).

Using cameras as a tool to access children's voices explores giving the children cameras and asking them to take photos of (whatever the topic you want to explore), for example,

'What do you like playing with in the classroom?' Then you can use the photos as a tool of reflection and dialogue with the children (Clark & Moss, 2005).

By creating role play scenarios for the children this allows them to act out real-life experiences. This encourages problem solving and higher order thinking and creates a safe space for children to give their opinions and feelings about a situation (Clark & Moss, 2005).

Tours and mapping both afford children the opportunity to express their thoughts and opinions through art and drawing. Children can go on a 'tour' of their room or their school or community and take pictures or draw areas that mean something to them. The children can create a 'map' of something using their drawings or photographs they took to express their opinion about an area in the room or how they feel in a space. Drawing can be considered as being in the same field of expression as play and speech (Bland, 2012). Children can learn to communicate through drawing, build a sense of trust, and develop fundamental skills for learning which help them feel included (Anning & Ring, 2004). This can be an important tool for those children who have limited or poor language skills as it is inviting and draws on the emotional side of a child's wellbeing (Pope, 2017). Children can use drawings as a map through which to build on their own narratives of what is included in their drawings. In essence, it serves as a medium for emotion, where words, thoughts, and opinions can be expressed in a way other than words.

Clark and Moss (2005) also discuss reviewing parents, teachers, and other stakeholders' perspectives. We discussed the importance of this open, honest, collegial, relationship earlier in this chapter and the relevance of the 'funds of knowledge' (Velez-Ibanes & Greenberg, 1992) that all parties can bring to ensure that a holistic image of the children is established.

We propose that the integration of these strategies into a classroom environment increases children's rights, autonomy, and participation. It creates a framework for inclusive play and inclusive learning to exist.

Reflecting on our original example at the beginning of the chapter:

If these frameworks were explored with Thilde the teachers could gain valuable insights from Thilde about how she felt in the outdoor yard during play time. This information could inform their actions and would have afforded them the opportunity to support Thilde to have a more inclusive experience in the outside play spaces in the school. This would also support the teachers to highlight some of her capabilities and work on supporting her emergent capabilities.

Implementing the capabilities approach within a classroom

In our opinion, the capabilities approach can be used as a framework to support inclusion in play within the classroom. It is rights-based, holds the dignity of the child as a cornerstone and values difference.

Information gathering and relationship building:

To utilise the capabilities approach through a communicative framework within a classroom the starting point would be collaborative, transparent dialogues between the teacher and the parents/guardians. These reciprocally respectful conversations would be a vehicle to share relevant information for the good of the child. This becomes the foundation of a meaningful relationship, where the rights and dignity of the child are at the centre. Then the teacher would use a multimodal technique to gather information about the capabilities and needs of the child, with the child. This can be done through the use of the mosaic approach (Clark & Moss, 2005) and Lundy's model of participation (2007). Collaboration with other professionals and colleagues would further enhance the knowledge base and ensure a holistic view of the child was used to inform inclusive strategies.

Capabilities of the child:

When the information is gathered, a holistic picture of the child is visible to the teachers. A child's developing capabilities can be used to support inclusion into peer groups and meaningful play.

Supports to be put in place:

Support systems to ensure capabilities are utilised and can be put in place.

Reflect and review:

Remembering that this is a snapshot in time and these capabilities may be developing capabilities and may alter over time. New supports will be necessary as the supports in place work.

The role of the teacher

The importance of questioning the 'norm'

Within this chapter we have used the word '*normative*' frequently. We discussed normative playing fields, and normative culture. We looked at inclusive play through a '*normative*' lens to unpack what this looks like for more diverse learners. We argue that a major role of the teacher is to question '*normative*' ways of doing, thinking and being. We argue that by questioning the 'norm' teachers are saying they are willing to change and alter their practices. Reviewing Lundy's model (2007) suggests the audience needs to want change to occur for the child's '*voice*' to '*influence*' their learning environment. Therefore, an important role of the teacher is to question '*normative*' practices and advocate for change. We posit that the ability to constantly alter our environment, practices, and approaches to suit the needs of our ever-changing diverse students is paramount to the composition of a good teacher.

When we reflect on our example at the beginning of the chapter, we saw Thilde putting her faith in the teacher's ability to alter '*normative*' practice. We saw the negative impact it had on Thilde when the teacher did not do this. Thilde was creating her own '*space*', for her '*voice*' to be heard, then Thilde's '*audience*' did not listen and therefore her voice did not

'*influence*' change. This meant that Thilde's experience in the yard was not one of inclusion and the teachers missed an opportunity to support inclusive play.

Another important point is that for Thilde, in this example, to find help required that she had the capability of even asking for help when expressing her position of stress. Thilde found a way to voice her concern, in part through another, possiblymore communicative child, but her concerns were not met directly. Thilde was expressing that her developing or emerging capabilities were not strong enough yet and she needed help to step into this '*normative*' playground. Had the Lundy model and the mosaic approach been used here in conjunction with the capabilities approach then these developing capabilities would have been acknowledged, and strategies could have been put in place.

Finally, this throws up another nuance that we discussed at length within this chapter. Teachers' attitude to play and what their role is within play. We discussed the difference between children's rights *to* play and children's rights *in* play and how the role of the teacher becomes one of observer, facilitator, and sometimes a participant of play with the children to ensure that children's rights *in* play are met.

In the example at the beginning of this chapter the teachers stood separately in a particular spot in the yard. They did not engage in play with the children and did not step in to support play with the children. It would be fair to assume that their view of their role was within a supervisory capacity. The children's rights *in* play were not reviewed nor did they appear to be a concern for them. Therefore, we argue that for teachers to support children's rights *in* play they need to review their position and impact on play. The value of play should be paramount for teachers to ensure they support these rights for children.

Had the teacher's questioned this '*normative*' role within the playground then the lack of inclusive play could have been addressed and Thilde's experience in the yard may have altered dramatically. Play as a position to explore the normative, to challenge what the child already knows and to push boundaries, values, and practice as an attempt to work into and reproduce the normative is an important part of the role of a teacher. Sommer et al (2020) argue that the kind of pedagogy that favours guiding children's imaginative play and negotiating while playing, in kindergarten helps them to step into the school system, and in this chapter the argument is, that this kind of play encourages the children to practice social skills. This also supports children within primary school to include each other and gain access to a broader collection of social capabilities (Sommer et al., 2020).

The reconceptualisation of the role of the teacher

As teachers we have an innate desire to help children learn. To learn through exploration, reflection and presenting broad horizons. To learn math, languages, and science; why the world is the way it is, to learn about morals and ethics. However, for children to learn there needs to be a trusting and collegial relationship between them and the teachers in their class.

Therefore, we posit that we as teachers implement the strategies put forward in this

chapter to encompass inclusive play into our practice and to reinforce play as both a formal and informal learning possibility acknowledging the capabilities, and developing capabilities, of each child.

We believe the conceptualisation of the role of the teacher should be viewed through four lenses:

- The lens of an entrepreneur. The entrepreneur is constantly questioning the 'norm' by consistently creating and recreating new ideas, practices, and methods of doing things.
- The lens of a detective, constantly observing and working out the children's capabilities and competencies. A detective who questions the experiences of every child in every play scenario, accessing their voices and identifies clues to highlight participation, inclusion whilst recognising marginalisation and exclusion.
- The lens of a coach who values the structure and elements of inclusive play. A coach who is willing to participate in play, to ensure that children's rights *to* play and *in* play are met. A coach who encourages relationships between social skills and play skills, in a safe and trusting environment to elevate all children's capabilities to encourage participation in all activities.
- The lens of an active participant. Looking at a classroom as an active participant instead of a facilitator allows you to see the classroom as the children see it. By being an active participant, it allows you to co-construct a play culture, participate in play scenarios, and therefore co-create the values of inclusive play within the classroom. Active participants can encourage all voices to be heard, to be valued and to influence change.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=367#h5p-15

Closing questions to discuss or tasks

Reviewing the example at the beginning of the chapter. How do you think you would answer the following questions?

- By implementing the capabilities approach in our example above with Thilde heading out to the classroom what would you have done differently?
- What do you think her capabilities were?
- What supports do you think she needed to scaffold her integration into play in the yard?

Reviewing your practice and pedagogy:

- What methods would you use to access your students' voices through the mosaic approach?
- How would you implement Lundy's model of participation within your classroom?
- How would you ascertain your students' capabilities?

Creating a collegial and inclusive culture in the classroom:

- What is your view of inclusive play?
- How do you value inclusive play?
- What 'normative' behaviour could you question within your school?
- How could you bring other teachers on this journey with you?

Inclusive play and your part in it:

- What is your understanding of inclusive play?
- How can you participate in play to ensure your student's rights *to* play and their rights *in* play are met?

About the authors

Deirdre Forde

Dr. Deirdre Forde is a distinguished lecturer in Inclusive Education at Maynooth University. With a background as a qualified primary teacher and a chartered child and educational psychologist, she brings extensive experience from various educational settings and psychological services to her role. Deirdre's research and teaching interests are diverse and encompass areas such as disability and the dynamics of inclusion and exclusion within educational and societal contexts. She is particularly passionate about amplifying children's voices, advancing relational education, and shaping policies related to Equality, Diversity, and Inclusion (EDI). Her work is dedicated to fostering inclusive environments that acknowledge and celebrate diversity.

Sebastian Nemeth

Sebastian Nemeth teaches social education at VIA University College in Denmark. With a specialization in the philosophy of social education, he is actively involved in the Research Centre for Management, Organisation, and Social Sciences. Sebastian's work focuses on norm-critical perspectives in youth pedagogy, demonstrating his passion for exploring and addressing issues of diversity and inclusion. Beyond his academic pursuits, he enjoys engaging in creative projects and sharing his insights through various publications and podcasts, he has been involved with the LGBT+ in Denmark and is reward-winning for creating safe and meaningful spaces for youths and women in boardgame and roleplay communities across Denmark.

Dean Vaughan

Dean Vaughan is an experienced primary school teacher in Ireland. He holds a Bachelor of Education, Master of Education and Postgraduate Diploma in Leadership & Management. Dean has spent most of his teaching career in the infant classroom where he is passionate about playful approaches to teaching and learning and works closely with student teachers as a research supervisor and part time lecturer in teaching training colleges. Throughout his M.Ed, he recognised a communication for all approach which focused on inclusive practices through Play in the classroom.

Georga Dowling

Georga Dowling is a Lecturer in Early Childhood Education in the Froebel Department in Maynooth University, Ireland and an experienced practising Early Childhood Educator. Her research interests include accessing the voices of young children from birth, examining their participation within their learning journey, inclusive teaching practices and innovative qualitative research designs. She is an advocate for children's rights, quality early childhood education and children's participation in their education. She has co-authored several chapters on these research topics.

INCLUSIVITY IN OUTDOOR EDUCATION

Beausetha Juhetha Bruwer; Victor Tan Chee Shien; and Maria Moscato

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ama-2025-en/?p=635#oembed-1

Example Cases

"When my grandfather passed away a few years ago, he was nearly 100 years old. When he shared stories about his childhood, I was amazed and thought, "Really? You did that? That's unbelievable."

Ellen Beate Hansen Sandseter, Queen Maud University College of Early Childhood Education, Norway

"I remember how we played on my grandfather's farm as a child. We used to jump off huge rocks and land in a dry riverbed, I can still feel the soft sand under my feet. We would climb on huge rocks and pretend they were the aeroplanes we saw above us, taking us to a strange land where we could play all day."

Beausetha Bruwer, University of Namibia, Namibia

"Growing up in the concrete jungle of Singapore, my connection with the outdoors was very much associated with a sense of adventure. I caught spiders at the cemetery, the few places that actually had greeneries, and fishes in the drainage in my own little adventures. Those little 'adventures' led my curiosity in understanding the world around me even now."

Victor Tan Chee Shien, University of Stirling, UK

In this chapter you will find the answers to the following questions:

1. What is the purpose of Outdoor Education?
2. How can Outdoor Education be inclusive?
3. What to prepare for Outdoor Education?

Introduction to Topic

Reflecting on Outdoor Education (OE) reveals its significance as a fundamental educational necessity, rooted in the philosophies of influential thinkers like Locke, Rousseau, Pestalozzi, Fröbel, Montessori, and Dewey, who advocated for fostering individual autonomy from early childhood (Bortolotti, 2014). Extensive national and international literature supports OE as a multifaceted approach, recognising the outdoor environment as an active and essential component of the educational experience (Farné, Bortolotti, Terrusi, 2018).

Outdoor activities can be understood at multiple levels. At its most basic, it involves teaching activities typically done in a classroom but conducted outside with minimal environmental interaction. At a deeper level, they enhance learners' understanding of their environment through direct engagement. At its most profound, it is a pedagogical approach that uses the outdoors as a rich, experiential setting for authentic learning across various domains (Kelly et al., 2022). Learning outside the classroom significantly benefits learners' overall curriculum learning. Learners who struggle in traditional indoor classrooms often thrive in outdoor settings, as they tend to be less distracted and more focused. The hands-on and interactive nature of outdoor activities, combined with regular breaks, helps maintain learners' engagement (Kelly et al., 2022). This stimulates both emotional and cognitive processes, creating ideal conditions for the development of metacognition.

Inclusion remains a central aspect of OE, with outdoor settings being particularly effective in fostering welcoming, cooperative, and supportive environments, thus promoting positive social interactions. Being in natural settings helps build a sense of community, strengthens feelings of belonging and respect, and deepens connections to life and the environment, nurturing an ecological mindset (Bortolotti, Schenetti & Telese, 2020; Brodin, 2009). However, inclusion in OE presents significant challenges, such as ensuring that

activities are appropriate for the diverse needs of learners and balancing adventure and unpredictability with safety (Rickinson et al., 2004). In this regard, research highlights the crucial role of educational intentionality in obtaining positive results from OE programmes. In this context, teacher training is vital: teachers must acquire both an open and flexible professional posture and specialised skills to design and manage outdoor activities to guarantee that educational practices are impactful, inclusive and secure. Additionally, parental involvement is crucial for the success of outdoor educational experiences. Parents need to be well-informed and engaged in the educational processes, recognising the benefits and opportunities these experiences can offer their children (Epstein, 2018).

Considering these foundational principles and the intricacies involved, this chapter will explore key aspects that underscore the wide-ranging benefits of OE in shaping well-rounded, environmentally aware, and socially responsible individuals. These key aspects highlight the teacher's vital role in fostering a safe, inclusive, and enriching outdoor learning environment that promotes the holistic development of learners.

Key aspects

Purpose of Outdoor Education and Why It is Inclusive

John Dewey (1916/2004) particularly advocated for education as a liberating and democratic process, rather than a passive activity controlled by authority figures. Dewey posited that human adaptation to the environment is characterised by active engagement rather than simplistic conformity. He argued that just as 'life' is not a passive existence but a mode of action, the 'environment' either stimulates or inhibits this activity. Consequently, education occurs indirectly through environmental interaction. Hunt (1995) elaborates on Dewey's distinction between 'primary experience' – the initial, unprocessed encounter – and 'secondary experience', which emerges from reflection, lending clarity and meaning to these encounters. These principles form the foundation of OE, which posits that meaningful learning begins with the bodily engagement of the learner in an environment. This involves practical activities and reflective moments, during which learners, often guided by a teacher, strive to comprehend and derive meaning from their experiences.

This approach delineates the distinction between Outdoor Learning (OL) (synonymous with Experiential Learning) and OE (equivalent to Experiential Education). OL primarily focuses on acquiring practical skills and knowledge, often tied to specific objectives. While all learning is experiential to some degree, it is not always intentionally designed as such. Conversely, OE involves deliberate learning design through two key elements: crafting experiences for learners and facilitating these experiences through reflective practices. Dahlgren and Szczepanski (2005) observe that whilst experiences are inherently specific and contextual, reflection is crucial for transmuting these experiences into knowledge. They assert that OE, with its unique characteristics and identity, possesses significant potential

to enhance meaningful learning. This potential is realised when there is a conscious educational awareness guiding the process. Consequently, OE centres on targeted educational interventions that explore both learning and individual identity formation. These interventions assist individuals in discovering and developing their personalities, transcending mere participation in activities. Additionally, OE fosters an environment where living and growing are intertwined, facilitating learning through a dialectical process in which each moment contributes to the whole. By taking education beyond the confines of traditional school walls, OE promotes a holistic vision of learning. In this paradigm, direct environmental experiences play a pivotal role in personal development. OE aids individuals in forming a worldview that informs their interpretation of both their own lives and the world at large (Chistolini, 2016; Wattchow & Brown, 2011).

Mortlock (1987) and Loynes (2002) emphasise the importance of the "inner journey" in OE. The inherent unpredictability of outdoor experiences cultivates adaptability and enables learners to uncover their personal capabilities. OE should be viewed holistically, integrating not only rational, functional, and practical elements but also perceptual experiences that foster personal growth. Hopkins and Putnam (1994) identify three key elements in OE: 'self', 'others', and the 'natural environment'. The **self** focuses on individual development through adventurous activities. The **others** concern the cultivation of group cooperation and effective social structures. The **natural environment** presents myriad challenges, enabling participants to augment their knowledge and understanding of nature. Brodin (2009: 100-101) notes that the authors "highly stress the value of OE primarily as a learning resource. They emphasise leadership, team-building and problem-solving as some of the benefits. Knowledge and awareness of nature will grow at the same time as the participants get physical challenges." In essence, OE transcends the mere act of venturing outdoors; it primarily concerns an openness to perceptions and sensations that 'exceed the threshold' (Mazza, 2018). This facilitates new connections between self, others, and the world (both organic and inorganic), delineating a learner-centred educational model of a highly relational nature, in which environmental and social contexts play crucial roles (Waite, Bølling, & Bentsen, 2016).

Once again, the crucial distinction between **Experiential Learning** and **Experiential Education** within the realm of OE comes to the fore: Experiential Learning, on the other hand, encompasses processes where the individual internally assimilates and reflects upon experiences. In this paradigm, learning and debriefing can occur within the learner's mind, without necessarily requiring external articulation or shared discourse. Experiential Education, on the other hand, with which OE is more closely aligned, necessitates that learning be externally expressed and collectively shared (Joplin, 1995). This public dimension is paramount in OE: what constitutes 'experience' is not merely the isolated event itself, but rather the synthesis of personal cognitive processes with public acknowledgement and validation of the experience. This distinction is pivotal, as it underscores a core tenet of OE: the emphasis on collective learning and shared meaning-

making. In OE, experiences are not solely processed individually but are brought into a communal space for discussion, analysis, and integration into a broader understanding.

In essence, the alignment of OE with Experiential Education highlights its commitment to collaborative learning, shared reflection, and the development of collective understanding. This approach not only enriches individual learning experiences but also contributes to building a more inclusive and interconnected educational environment, moving beyond mere individual competitiveness towards a more holistic and socially conscious form of education. OE, therefore, represents education in, about, and for the environment, aiming to ensure learners' autonomy of action and relationships, capable of attributing meaning to both their context and the role played by individuals and communities within it (Quay & Seaman, 2013).

Immersive engagement with the real world and the strategic utilisation of the environment as an educational resource foster a continuous learning process rooted in mutual support. This approach is facilitated by innovative methodologies, such as Problem-based Learning (PBL) and Collaborative Teamwork. Consequently, it broadens educational horizons and cultivates essential skills for addressing global challenges, thereby shaping informed citizens and resilient communities. In this context, OE transcends the boundaries of a mere educational method, evolving into a life philosophy that actively promotes authentic participation. Open spaces emerge as powerful catalysts for nurturing a sense of belonging, fostering cooperative relationships, and encouraging mutual assistance. These elements collectively contribute to positive socialisation among individuals and groups (Brodin & Lindstrand, 2006; Gair, 1997; Magnusson, 2006). It represents a paradigm shift in educational philosophy, recognising the intrinsic link between personal growth, community development, and environmental engagement. This approach in OE addresses the need to transcend what Biesta (2006) terms **learnification** – the tendency to view learning and education as predominantly individualistic processes aimed at creating high-performing actors in a competitive system. Instead, OE, through its emphasis on shared experiences and public reflection, promotes education as a process of mutual construction and recognition, fostering holistic human development. Thus, OE not only enhances the learning experience but also contributes to the development of a more inclusive and interconnected society.

Recent evidence-based studies (Mitchell, 2013) elucidate the intrinsic connection between inclusive education and OE. Both paradigms emphasise the crucial relationship between individuals and their environmental context, aiming to promote environmental, relational, and social sustainability. In this framework, inclusion is conceptualised not as an end goal but as an ongoing process that permeates various spheres of an individual's life, including educational institutions, family environments, and broader social contexts (Booth & Ainscow, 2011). Inclusive education extends beyond the mere removal of learning barriers and anti-discrimination efforts. It actively seeks to engage all learners, valuing and enhancing diversity. This perspective transcends the traditional dichotomy between

'normal' and 'special', adopting a holistic approach that promotes full, active participation of all individuals in authentic contexts (Florian & Beaton, 2017; Pedone, 2021).

These principles seamlessly align with the 2030 Agenda for Sustainable Development (UN, 2015), which underscores the importance of harmonising economic growth, environmental conservation, and social inclusion. This approach aims to meet present needs without compromising the ability of future generations to meet their own (WCED, 1987). Implementing these principles necessitates a profound cultural shift in educational contexts, requiring continuous reflection and intentional transformation (Bufalino & D'Aprile, 2021). OE can play a pivotal role in facilitating this transformation through its emphasis on environmental connection and interaction.

Let us pause and reflect

- What is your idea of Outdoor Education?
- What role can local communities and natural environments play in education?
- How do you think the surrounding environment can influence learning?

Engagement with the Environment

Example

"I remember a cool spring morning when our Civics teacher announced we'd be going on a tour around the town. I thought to myself, "Wow, no school!"… and happily went home. The day after, the adventure began with a visit to the Poggiodiana Castle. As we approached the ruins, our teacher told us stories of Saracens and Spaniards landing in Sicily, making us imagine what life was centuries ago. Then we moved to the orange groves just outside town (oranges are really important to us!). Tasting an orange straight from the tree, with its sweet juice refreshing me, was pure joy. One of the most fascinating experiences was visiting a historic print shop, where we watched traditional printing and understood the importance of spreading written culture. We joined an urban botany workshop at the municipal Villa, surrounded by the scents of Mediterranean plants. We learned to identify different plant

species and their role in the local ecosystem. Each discovery was a small victory. I went home with a deep sense of belonging to my land and joy for the wonders I had discovered. Thinking back, I can still feel the profound gratitude for where I grew up".

Maria Moscato, Italy

In essence, OE aims to foster learning through concrete experiences and reflections in authentic contexts. This approach extends beyond the mere transfer of learning to natural, cultural, and social environments, encompassing several key aspects:

- The concept of extending the learning space beyond traditional boundaries.
- The construction of connections between sensory experiences and theoretical content.
- A focused attention on context, viewed as both place and space, serving as both object and subject of the educational process (Center for Environmental and OE, 2004, cited in Szczepanski, Malmer, Nelson & Dahlgren, 2006).

Higgins and Nicol (2002) emphasise that spaces outside the school can serve as invaluable educational environments, promoting cooperative and personalised learning. This is achieved through the intentionality of teachers who adapt training opportunities to local specificities and diverse learning styles. OE does not simply relocate the classroom outdoors; rather, it aims to create a dynamic interaction between emotions, actions, and thoughts. This approach fosters learning that values curiosity and continuous discovery, creating a holistic framework that guides the teacher's intentional action toward leveraging the unique characteristics of the surrounding environment. It avoids the fragmentation of information, instead promoting an integrated and in-depth exploration of themes. Utilising outdoor educational experiences, mediated by relationships and shared reflection, stimulates the use of all senses and creates a learning climate particularly suited to content best assimilated outside school walls. This facilitates the integration and enrichment of the curriculum in an interdisciplinary and multidisciplinary manner, supporting both individual and community, personal and social development (Zanato Orlandini, 2020).

OE firmly links the learning process with real experiences, relationships, events, and conditions provided by the environment. This approach aligns with the intrinsic values of Place-based Education (PBE), which allows for the exploration and appreciation of the cultural and natural characteristics of territories, transforming them into laboratories for personal and social growth (Brown, 2008). As Sobel (2004) highlights, PBE emerges as a response to the lack of attention to local environments in many schools. It underscores

the importance of local communities and natural environments in encouraging practical and respectful learning and forming responsible citizens and democratic communities. This involves identifying learning contexts within one's local geography – be it a portion of nature, a part of the city, a park, or a square – that are proximate, accessible, practicable, and generally free and available (Perfetti, 2023). Through the active engagement of local citizens, community organisations, and environmental resources in school life, it activates a generative dialectic that brings education back into the community and involves the community in education.

In summary, rather than being confined to studies of distant places, this approach utilises the community and its surroundings as a starting point for teaching subjects such as language, mathematics, social studies, and science. This helps to enhance academic performance, strengthen learners' bonds with their community, increase appreciation for the world, and encourage active engagement in society. Ultimately, it promotes the improvement of community and environmental quality (Gruenenwald & Smith, 2008).

Let us pause and reflect

- How can a place-based educational approach affect the development of values and skills related to responsible citizenship and active social participation?

Benefits of Outdoor Education

Example

At the school camp conducted annually, learners are split into fixed mixed-gender teams of 8 for the week long event. At age fourteen, the physical difference between males and females was becoming increasingly obvious. A few teams started to express concerns that having more girls on their team would put them at a disadvantage. While I usually encourage learners to manage group dynamics on their own, I recognised this as an important teaching moment. I brought the class together for an open discussion about the possible tasks they might encounter during the camp, emphasising that the camp's goal is to develop

interpersonal skills like teamwork, leadership, and situational problem-solving, which require a diverse set of skills and aptitude rather than a bulldozing mentality.

"It's crucial to have a diverse set of skills for any task, rather than assuming that having all boys or all girls on a team offers any advantage. Just like in real-life situations, we won't always have all the answers, and that's okay. We should recognise this, not as a weakness, but as an opportunity to seek help from others, regardless of who they are. Everyone has different abilities and strengths, regardless of height or gender. After all, I don't see Gal Gadot (Wonder Woman) or Henry Cavill (Superman) here, do you?"

Following this discussion, the group were asked to break out and reflect on their individual and collective strengths.

Victor Tan Chee Shien, University of Stirling, UK

The scenario above captures how outdoor spaces can serve as an effective teaching context by offering authentic and critical learning opportunities. The teacher in the scenario used the annual outdoor school camp to create awareness among his intermediate group of learners about gender diversity and sensitivity. Thus, OE is more than just imparting knowledge outside of traditional in-class learning, it is all-encompassing in promoting growth and development on many levels. Learners who participate in outdoor activities improve their problem-solving skills, gain useful knowledge through real-world experiences, and become more resilient in the face of adversity (Cenić et al., 2023). Through OE, learners get a unique opportunity to deepen their knowledge and comprehension through hands-on experiences outside of the classroom. These outdoor experiences allow learners to understand concepts in diverse ways, such as through listening, taste, touch, sight, and smell, as well as through aesthetic, emotional, intellectual, physical, and spiritual experiences (Neville et al., 2023; Stavrianos & Pratt-Adams, 2022). When classrooms or outdoor play areas are designed to meet each learner's sensory, motor, behavioural, social, and emotional needs, they enhance and broaden growth opportunities (Brodin, 2009).

Play activities are crucial for learners of all ages to explore and understand themselves while developing essential physical traits for overall health and well-being. Risky play, for example, is a novel approach to introducing OE. According to E. Sandseter (personal interview, March, 2024), risky play involves learners intentionally taking risks to challenge themselves, test their limits, and explore their capabilities. This type of play is often physical and exciting due to its unpredictability, though it carries the risk of injury or accidents. The benefits include the thrill and range of emotions it provides, from exhilaration and fear to sadness if hurt. Learners are naturally drawn to risky play because it elicits positive, thrilling emotions. Successfully managing these risks can lead to a strong sense of mastery

(Sandseter, 2009). Risky play greatly benefits learners' learning and development, offering valuable experiences and fostering emotional growth.

The learner must always be prioritised as the central focus. Therefore, understanding their backgrounds, as well as the conceptions and misconceptions they bring to the learning environment, is essential for optimising OE outcomes (Neville et al., 2023). The same as in classroom teaching, not all learners will participate in the same activities during OE. Thus, the teachers will need to use their knowledge of the learners to tailor tasks, promote inclusion, and encourage learner autonomy. According to Neville et al. (2023), this approach will enable learners to make and act on choices that positively impact their lives, helping them independently recognise the benefits of OL.

Parker (2022) identifies several key benefits of integrating OE for learners. Recognising these benefits in relation to individual learners' needs can help teachers choose the most suitable outdoor activities for their learners. These benefits include Health and Well-being, Children's Physical Development; Mental Health; Social-Emotional and Cognitive Development; Academic Benefits; Behavioral Improvements; and Enhanced Memory.

Health, Wellbeing and Children's Physical Development

According to Parker (2022), OE can generate numerous health benefits for learners participating in outdoor programmes. These benefits include improved air circulation, higher oxygen levels, better sleep, and increased Vit D exposure to sunlight. Increased vitamin D levels are also linked to improved bone health, cardiovascular health, and more effective insulin regulation. Harper (2017) agrees that time spent in natural environments provides substantial health benefits, such as physiological improvements, quicker recovery from mental fatigue, injury, and illness, increased life satisfaction, and improved stress management. To counteract the growing prevalence of hypokinetic diseases like obesity and diabetes and address sedentary habits caused by increased screen time, it is advisable to encourage active outdoor activities in children.

Mental Health

Parker (2022) notes that children with access to greener environments display lower aggression and violence and experience less mental stress. Simply viewing nature has been found to reduce physiological stress responses, increase interest and attention, and decrease feelings of fear, anger, or aggression. Accordingly, Harper (2017) reports that, through the incorporation of outdoor activities, children from vulnerable backgrounds, such as those from disadvantaged neighbourhoods or who have experienced homelessness, abuse, or substance use, also showed improvements in well-being and resilience.

Social-emotional and Cognitive development

In addition to physical benefits, OE supports learners' social, emotional, and cognitive development by enhancing creativity, problem-solving skills, independence, and confidence. Regular exposure to natural environments boosts children's cognitive abilities, and children with, for example, Attention-Deficit/Hyperactivity Disorder (ADHD) show better concentration and rate their experiences more positively outdoors compared to traditional classroom settings (Parker, 2022). Additionally, OE promotes inclusion, teamwork, and social skills development among learners by fostering high levels of participation and collaboration. It is particularly beneficial for learners with learning difficulties, enhancing their community presence, active participation, and competence. Group work in outdoor settings encourages intimate interactions, team building, and collective goal achievement (Stavrianos & Pratt-Adams, 2022). Furthermore, outdoor environments provide diverse learning opportunities that help children form ideas, values, and environmental consciousness from a young age. Activities like environmental games can motivate learning by sparking interest and addressing knowledge gaps (Stavrianos & Pratt-Adams, 2022).

Academic Benefits

Parker (2022) finds that learners who engage in OE programmes outperform their peers in various assessments, including math and science. Furthermore, these learners exhibit higher attendance rates compared to those not involved in OE. Cenić et al. (2023) also highlight research suggesting that spending time in nature positively influences learners' cognitive functions and their interest in learning. Interaction with nature enhances collaboration and problem-solving skills while simultaneously boosting learners' happiness, well-being, and motivation. These benefits can lead to increased classroom engagement, potentially improving overall learning achievements. This evidence underscores the importance of integrating natural elements into the educational process as a valuable factor in supporting cognitive development and learner education.

Behavioural Improvements

OE can significantly improve school attendance and provide a sense of achievement for children with emotional or behavioural disabilities, counteracting the negative effects of repeated failure in traditional educational settings. Its strength lies in creating inclusive activities that accommodate all children, allowing them to participate at their own pace (Stavrianos & Pratt-Adams, 2022). Learners who find traditional classroom settings challenging may greatly benefit from personalised OE experiences. Instead of struggling with motivation, confidence, attention, or social skills in the classroom, these learners can

develop these skills through OE. They often thrive and even take on leadership roles during hands-on outdoor activities (Parker, 2022).

Enhanced memory

The memory of the context and experience of OE can be more impactful than the specific educational content intended to be taught. According to Parker (2022), for some learners, the memorable aspects of the visit, such as the sounds, sights, or even objects like pebbles, are as significant as the factual details learned at the location.

Teachers can adapt their methods to be more inclusive by using natural contexts and local places in their teaching. This approach incorporates a variety of skills, equipment, and experiences, ensuring that all learners, regardless of their differences and abilities, can participate and benefit from outdoor learning.

Challenges in Outdoor Education

Despite the advantages of OE, several challenges impede its implementation. A significant obstacle is the stigma that OE is not considered "real" teaching, which affects its adoption (Parker, 2022; Stavrianos & Pratt-Adams, 2022). Effective implementation of OE necessitates extensive planning and coordination to meet educational objectives. Teachers play a crucial role in shaping and evaluating the effectiveness of educational methods, including OE. From the teacher's perspective, this involves planning and organising field activities, adapting teaching strategies and resources, and managing learner groups. Teachers are essential for the successful execution of OE, as they must ensure learner safety, motivate learning, and maximise the benefits of the outdoor experience. They need to be knowledgeable in their subject areas while being adaptable to changing conditions and learner needs during outdoor activities (Cenić et al., 2023).

An interdisciplinary approach to education supports the holistic development of learners by fostering creativity, curiosity, and self-confidence, with the integration of various fields of knowledge being a central aim of holistic learning. Outdoor activities play a pivotal role in this process by allowing learners to connect theoretical knowledge with practical experiences in a natural or urban setting. Thus, incorporating these activities into the teaching process is essential but challenging (Cenić et al., 2023).

Parker (2022) notes that teachers may lack confidence in outdoor teaching due to limited experience and knowledge. They encounter challenges such as restrictive curriculum demands, insufficient time, and a lack of inspiration or structure. Broader issues, including work pressure, excessive responsibilities, and fatigue from frequent educational changes, also impede OE. Additional barriers include concerns about losing control, health and safety issues, inadequate administrative support, traditional teaching perspectives, and inflexible schedules. Furthermore, parents may resist OE, particularly for children with special needs,

due to concerns about external judgments regarding parenting and fears about potential harm to their children (Harper, 2017).

Neville et al. (2023) further note that opportunities for OE are often limited by an emphasis on evidence-based outcomes and standardised testing, which narrows the curriculum and prioritises test preparation. Its implementation is also influenced by school interests, teacher expertise, and the quality of pre-service teacher training, but is constrained by time limits, strict learning objectives, and unfamiliarity with outdoor teaching.

To address these challenges, OE should be recognised by all stakeholders as a legitimate method to expand curriculum resources. Clear examples of curriculum integration are essential to encourage teachers to adopt this approach and promote learner success. The recognition would increase institutional support and drive teachers' training.

Preparation for Outdoor Education

Teacher training

As Wolf, Kunz and Robin (2022) point out, OE is becoming increasingly relevant in formal school education due to the benefits found in terms of teaching practice and the well-being of teachers and learners. However, the effective implementation of this approach is hampered by the lack of specific training for teachers.

An interdisciplinary curriculum, on which OE is based, requires a systematic dialogue between different disciplines and methodologies, which cannot be improvised in a purely experiential context. In this regard, Zanato Orlandini (2020) highlights the importance of an intentional educational approach rather than mere casual exposure to the natural environment as the main source of learning. The author warns against considering the outdoor experience alone as a guarantee of meaningful learning since mere contact with the external environment is not enough to gain an in-depth understanding of natural and cultural phenomena. The design of quality OE experiences must be carefully planned, taking into account the specificities of the environmental context and the needs of the learners.

From an operational point of view, OE is expressed through the action of the teacher, who translates into practice their intentionality, vision, values and implicit curriculum. By doing this, the teacher creates a mix of skills and personal traits that do not consist of a simple sum of disconnected elements but must be understood in holistic and global terms, forming a structured and multidimensional whole of effectiveness. The teacher must not only use knowledge and skills but also take responsibility for their work to adapt, innovate, integrate different knowledge and manage complexity. Educational action goes beyond technique: it is a meeting point where theory, practice and reflection illuminate each other and find concrete application. A holistic model of professional competencies

therefore includes not only knowledge and skills but also attitudes and values essential for the development of professional identity (Pedone, 2021).

For these reasons, teacher training for OE must be characterised in a holistic and multidimensional way, including an in-depth preparation that covers the pedagogical, value, and practical attributes of outdoor teaching.

Let us examine some of its aspects:

- **Importance of beliefs and training needs**: Farnè and collaborators (2018) state that the difficulties in achieving quality education are not always linked to structural limitations, but often derive from the lack of adequate tools or skills. It is therefore crucial to focus on teachers' primary training needs, which may be hidden behind secondary training needs. If, for example, teachers experience difficulties in integrating OE with standard curricular requirements or in adapting outdoor activities to learners' different skill levels, these secondary needs may reflect a lack of training in instructional differentiation strategies. This suggests a primary training need: adequate preparation in the design and personalisation of outdoor educational activities. It is critical that OE training includes not only specific techniques for outdoor teaching but also ways to integrate these experiences with the curriculum and tailor them to the needs of learners, ensuring inclusive and effective activities.

- **Developing Positive Attitudes and Personal Outdoor Experiences**: Teachers' attitudes towards OE play a crucial role in the success of training, as their dispositions and perspectives significantly influence their approach and willingness to adopt innovative educational methods (Nicol, Higgins, Ross, Hamish & Mannion, 2007). The literature highlights that teachers who demonstrate greater openness to OE often have significant and positive personal experiences outdoors. These experiences can help develop an 'outdoor dimension' that is essential for effective OE implementation. Positive outdoor experiences help teachers:

  - Understand and appreciate the value of OE.
  - Assess risks more effectively.
  - Build confidence in their abilities to meet challenges.

These factors are fundamental for developing a positive attitude towards OE, as they allow teachers to recognise and value the pedagogical sense of adventure and risk-taking (Farnè et al., 2018; Wolf et al., 2022). To convey a positive attitude towards the environment to learners, teachers need to feel comfortable outdoors. They must be able to assess and manage risks, ensuring safe and positive experiences. One effective way to develop these skills is to include training courses in external environments in both the initial and ongoing preparation of teachers. This approach allows teachers to directly experience the activities they will propose to learners, thereby:

- Enhancing their comfort level in outdoor settings.
- Improving their risk assessment and management skills.
- Developing a deeper appreciation for the educational potential of outdoor spaces.

Moreover, this hands-on approach to teacher training can also support education for sustainable development, which should integrate outdoor experiential techniques (Nicol, Rae, Murray, Higgins & Smith, 2019). By experiencing OE firsthand, teachers are better equipped to:

- Design and implement effective OE experiences.
- Integrate OE principles into their overall teaching practice.
- Foster a sense of environmental stewardship in their learners.

Fostering positive attitudes towards OE through personal outdoor experiences should be a core component of teacher training programmes. This approach not only enhances teachers' skills and confidence but also contributes to the broader goals of environmental education and sustainable development.

- **Integration of Pedagogical and Content Skills**: Training for OE must combine in-depth knowledge of pedagogical content with specific skills for outdoor teaching. Dyment, Chick, Walker and Macqueen (2018) emphasise that it is essential to be able to translate disciplinary knowledge into effective teaching practices. In this context, the 'knowledge quartet', which includes the transformation of knowledge into teaching modalities, the connection between themes and the coherence of lessons (Rowland, Huckstep & Thwaites, 2005), is particularly relevant. In the context of teaching, specialist professional knowledge must include not only the domain of the subject (a fundamental element) but also a general understanding of teaching and learning methodologies (general pedagogical knowledge). In addition, as described by Shulman (1987), it is crucial to possess what is called 'knowledge of pedagogical content' – i.e., the competence to convey content effectively to learners. This model implies that teacher training for OE must not be limited to mastery and transmission of content, but must instead also include skills in the design and management of outdoor educational experiences, along with a wide range of knowledge regarding curricular structures, teachers' legal responsibilities and other related issues.

- **Development of Flexibility and Adaptation Skills**: Outdoor teaching requires a level of flexibility and adaptation that goes far beyond that required in traditional educational settings. Outdoor environments, with their variable and unpredictable conditions, pose unique challenges that require teachers to adapt quickly and effectively. This ability to

adapt is crucial to take advantage of learning opportunities that may emerge unexpectedly and to respond appropriately to environmental changes and learners' needs (Greenwood, 2013). To prepare teachers for these challenges, OE training must include hands-on exercises and simulations that reflect the real-world conditions in which they will operate. Through such experiences, teachers can exercise their ability to handle unexpected situations, make quick decisions, and take advantage of the learning opportunities that the external context offers. These exercises should be designed to simulate various scenarios, from adverse weather conditions to the need to adapt activities to different group dynamics, allowing teachers to develop strategies for dealing with uncertainty and change.

- **Reflective Skills and Critical Approach to Teaching Practice**: To build a professional profile of this type, it is essential to approach training as a shared journey of discovery, where each teacher is encouraged to adopt a research perspective on their professionalism, embracing reflective thinking. This reflection is not an end in itself but arises from the continuous dialogue between theory and practice, enriched by the comparison with colleagues (Clayton, Smith & Dyment, 2014). Reflective practice is a dominant concept in teacher education and is widely applied in initial education programmes (McGarr & McCormack, 2016) and in-service teachers in many parts of the world (Harford & McRuaric 2008; Nizet, 2016). During the training process, teachers must be guided to critically reflect on their experiences, evaluate the effectiveness of their teaching strategies and identify areas for improvement. Critical reflection is not just an occasional practice, but an ongoing process that involves analysing the feedback received, self-analysing one's practices, and modifying strategies in response to experiences in the field. Such reflection helps teachers develop a deeper understanding of the dynamics of outdoor teaching and improve their ability to respond effectively to daily challenges. To integrate critical reflection into initial training, it is helpful to include activities such as guided discussions, reflective journals, and peer feedback sessions. These tools help teachers explore their experiences and draw meaningful lessons that can be applied in the future. In addition, the support of experienced mentors and participation in communities of practice can provide additional opportunities for reflection and professional growth.

Blenkinsop, Telford and Morse (2016) have identified five key areas of reflexivity that are particularly useful when thinking about OE:

- The **teacher's self-analysis**: Questions such as "How am I improving my understanding of this context?" or "Why do I choose to do X instead of Y right now?" help to explore personal motivations.
- **Focus on learners**: Both as individuals and as a group, with reflections such as "What did I notice today?" or "What is the next logical step for their learning?".

- **Co-reflection**: Involving learners, parents and other teachers to obtain different perspectives.
- **The role of the environment**: Considering questions like "How has the place influenced our practices?" or "Have I been able to integrate the natural environment?".
- **The broader learning community**: Assessing how school infrastructure and cultural systems support or hinder outdoor work and what traditions or metaphors are emerging.

To get the most out of OE experiences, reflection should go beyond simply checking lesson results. Exploring these areas helps teachers improve their practice with a deeper, more mindful approach (Neville, Petrass & Ben, 2023). Effective teacher training for OE requires a comprehensive approach that addresses not only practical skills but also pedagogical knowledge, attitudes, and reflective practices. This holistic approach ensures that teachers are well-equipped to deliver meaningful and impactful outdoor educational experiences, fostering both their professional growth and the holistic development of their learners.

Let us pause and reflect

- What do you think would be the main benefits of Outdoor Education for teachers?
- What is the importance of critical reflection for a teacher practicing Outdoor Education?
- How can a holistic approach to teacher training improve the quality of Outdoor Education?

Risk management

For any educational activity, planning and preparation are necessary to make the best of the lesson. Lessons outdoor, or OE are no different for risk management. As with any lesson preparation, the learning objective and the learner's needs are the focus. Where an authentic experience carries with it some level of risk, thus, preparations to control the risk are inevitable, similar to any form of material or planning preparation required for any type of lesson. A common misunderstanding with outdoor lessons is that they are high-risk activities disregarding learners' safety. These misunderstandings do not account for the purpose of the learning and the value that these experiences can bring to maximise learning. Risk is a real concern, but research has shown that risk aversion has negative

consequences in development across all stages (Dickson & Gray, 2012; Paulsen et al., 2012). While not promoting risk-taking in itself, it is important to consider the value of the learning experience in which omission of all risk is simply impossible.

Example

It is a warm day, too hot to sit in a kindergarten class for deaf and hard-of-hearing learners. The teacher took the learners to a nearby park from the school premises. Before the walk to the park, the teacher showed the learners pictures of different local transport, discussed the signs with the learners, and asked them to spot how many different transports they saw on the walk. Learners were taught to recognise signs and make use of available traffic infrastructures to ensure their own safety. The key to the lesson is to build an able learner that can traverse the environment safely in a controlled activity.

Beausetha Bruwer, University of Namibia, Namibia

The scenario presented above highlights the value of the experience over the risk involved. While there are inherent risks to a guided walk to the park, the value of the learning experience presents in that learners cannot avoid the risk associated with transit forever. There is value in risk, which must be controlled by the teacher, similar to any lesson preparation. Teachers employing OE concepts must engage with risk management as part of their lesson preparation to reduce risk. These preparations usually comprise a risk assessment document and an eventual consent form for participants. Clear and specific risk management documentation can be used to convince stakeholders, such as school management and policymakers, of the value of the outdoor lesson despite the risk involved (if any). Parents and participants are important stakeholders in education that need to be engaged as part of education. Not only are parents custodians of their child's participation, but youth-adult participants can also be engaged in pre-activity through a well-designed consent form (David et al., 2001).

Risk is often an obstacle and an element prevalent in any form of outdoor activity. In risk management, Attarian (2012) identified different types of risk: in 'risk', 'inherent risk', and 'perceived risk'. Risk in this context refers to the possible degree of harm or danger that may be encountered during an activity (may not be specific to only outdoor lessons). Inherent risks are risks that are unavoidable as part of the learning activity (e.g. running activity and falling). Perceived risk used here refers to the awareness of the activity conductor

in spotting the possibilities and dangers associated with the activity. The challenge with teachers then, is to strike a balance between risk and inherent risk to not compromise any aspects excessively, while being aware enough to spot perceived risk to conduct the activity safely. Taking risk management seriously involves keeping perceived risk high and reducing risk factors via a variety of methods.

Risk and Perceived Risk

Risk, or risk factors, are factors of instances where some form of harm may be present in an activity. As different regions and sources define and work with terms and explanations differently, the chapter refers to ISO (the International Organization for Standardization) as the base reference for ease of discussion. ISO 31000 defined risk in risk management as "the effect of uncertainty on objectives, whether positive or negative" (ISO, 2018; p. 2). In their working definition, Risk is expressed in terms of risk sources, potential events, their consequences and their likelihood. When preparing for a lesson outdoors, teachers need to be conscious of the risk (source and event) and the severity of the risk (consequence). The frequency or likelihood of it occurring is another factor for consideration in the scope of the matter. Where risk factors are controlled by managing source, event, and likelihood, perceived risk engages with the awareness of risk that may otherwise not be prepared for. The ISO statement specifically included the phrasing of uncertainty in their statement to capture the emphasis of preparation and awareness to avoid, as much as possible, the degree of uncertainty in any learning activities. Attarian (2012) specifically noted that risk and risk factors should be lowered where possible but the perceived risk of the teachers should be kept high so as to maintain the reflexivity to assess variables related to changing circumstances that are in the nature of outdoor lessons.

Inherent risk

The context of inherent risk refers to risks that are inherent to specific activities. Any activity comes with its own set of inherent risks that may sometimes be severe and unavoidable. In activities where there are water elements or take place close to water bodies, risk will be present and would be something to plan for. In cases, however, where swim/water literacy is the learning objective, removing the element of water defeats the practical consideration of swim/water literacy. Drawing from Kolb (1984), Harris and Bilton (2018) highlighted the affective benefits of active experimentation even in abstract subjects like history. Where the risk element is part of the learning experience, teachers then have to balance the merit of the activity with the learning objectives. It is important, however, not to mistake complacency with the acceptance of inherent risk. Using the same example of swim/water literacy, risk reduction actions or considerations of the depth of water compared to the learner's height, a lifeguard being present, or teachers/learner's ratio are just some considerations that could be set in place that do not affect the learning experience.

The use of a risk assessment form is often used as documentation to demonstrate the risk assessment, the risk reduction, and the personnel responsible are communicated and set in place. The purpose of the form is an important piece of communication for teachers and anyone involved in the activity to clearly communicate the task, the risk involved, and the individual responsible for supervising the risk. A well-prepared form can also be used for beginning teachers, who might have limited experience with the activity, to identify risks that they might have otherwise not been able to. Due to the nature of activities conducted outdoors, there may be times when an immediate decision needs to be made. At such times, rather than rely on human response, which may vary with emotional and contextual elements, it would be more effective to trigger prepared protocols as indicated on risk forms to ensure safety plans are followed.

Risk Analysis

There are several ways that risk assessment can be conducted. The most common would be through a systematic approach followed by a well-crafted risk form.

Look at the example[1] below that demonstrates how the risk form should contain key addresses and information.

The following risk form was used for a science lesson in a general education school in Singapore. The lesson was crafted for learners to experiment with the growth of cucumbers, watermelon, and lady fingers under different controlled conditions to determine the best conditions for growing these plants.

Learning Objectives include:

− Recognising that the different mixtures of oil and fertilisers have different effects.
− Different types of plants require different conditions to allow for the best conditions.
− Pathway of growth following natural weather conditions (sunlight, rain, plot size).

---

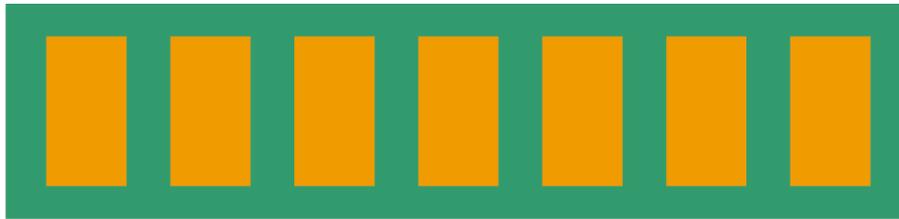
1. No risk form will be able to cover all considerations and contexts, teachers should adapt and use any tools reflectively to best meet your needs and considerations.

*Be specific. Dates are important to indicate how recent the risk assessment was done and if any risk factors changed

*Be specific. A rough image is used here for reference. Having an actual picture of the venue would provide greater clarity

Document number: **********	Evaluator: **********	Date: DD/MM/YY
Risk Assessment Area: (specific name and location of the identified venue)		

Step 1: Identity the Location / activity

Describe location:
school garden


Describe activity:
Comparing growth rate of different types of plants by controlling soil composition Students to mix different amount of regular soil and fertilizers in ratios to determine the most optimal ratio for plant growth. Watering for plants will also be controlled using beakers.

Step 2: Identify WHO may be at risk by activities within this area

Participants:
2E4 - 32 students
Other Relevant personnel:
******** Teacher Assistant (Name the person instead of indicating the title)

*Be specific. Describe the task with details instead of being generic

*Be specific. Number of participants and the name of the staff so that the staff knows its him/her

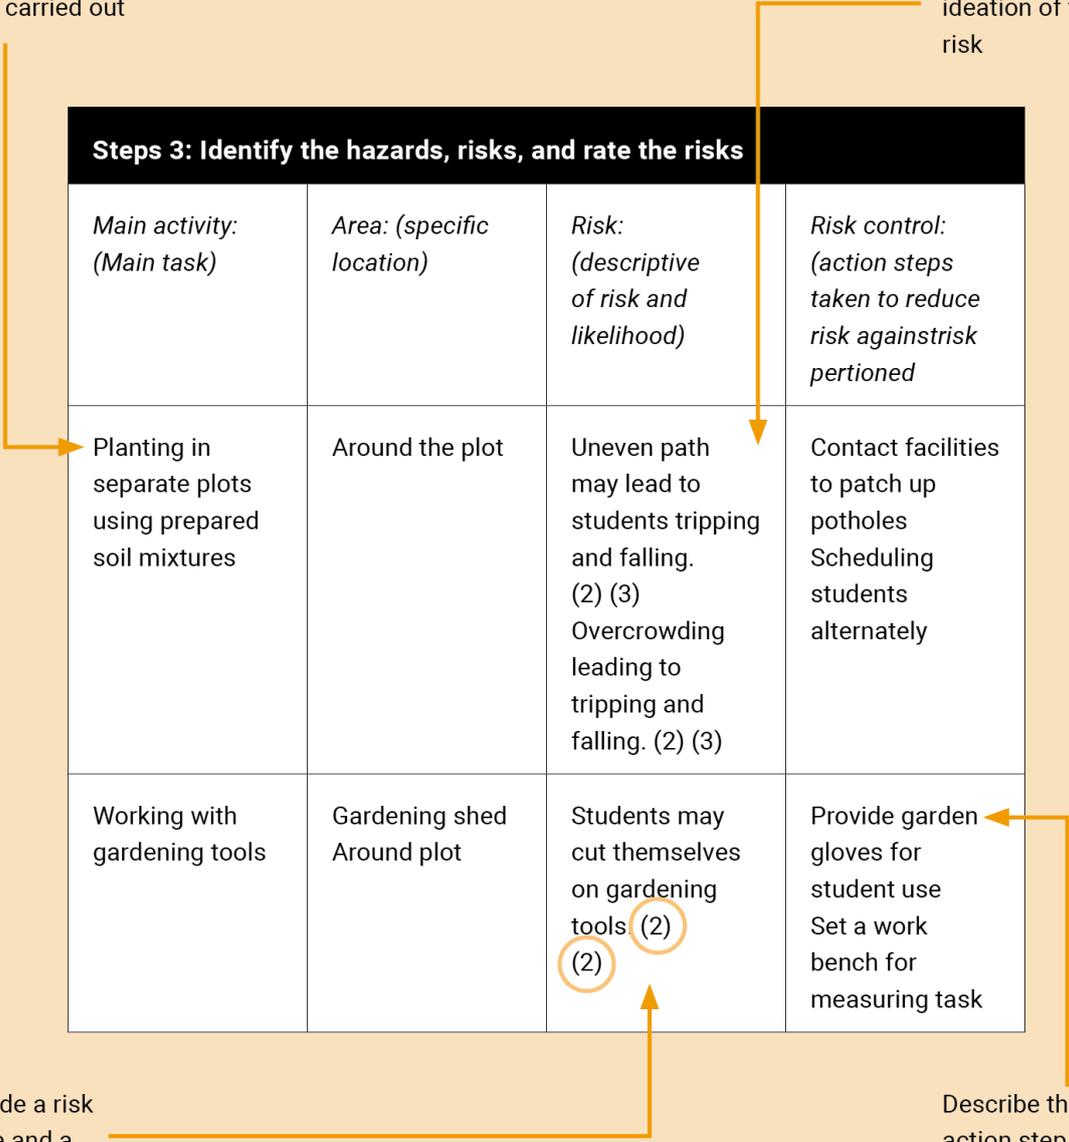
*in case you have not got the point yet... be specific

Describe the task
to be carried out

Describe the
ideation of the
risk

Steps 3: Identify the hazards, risks, and rate the risks			
Main activity: (Main task)	Area: (specific location)	Risk: (descriptive of risk and likelihood)	Risk control: (action steps taken to reduce risk againstrisk pertioned
Planting in separate plots using prepared soil mixtures	Around the plot	Uneven path may lead to students tripping and falling. (2) (3) Overcrowding leading to tripping and falling. (2) (3)	Contact facilities to patch up potholes Scheduling students alternately
Working with gardening tools	Gardening shed Around plot	Students may cut themselves on gardening tools (2) (2)	Provide garden gloves for student use Set a work bench for measuring task

Provide a risk
score and a
frequency score

Describe the
action step to be
taken to reduce
risk


For a reviewer to acknowledge the
risk assessment (optional but highly
recommended)

Step 4 Documentation Review by Supervisor

Reviewer: John
Reviewer signature: John C
Date: dd/mm/yy

Step 5: Implement RECOMMENDATIONS

If any: (who, what, where)
Inform the gardener the start and end date of the activity FYI basis.

Step 6: Monitor and review the risk controls/Physical structure

Next review date: dd/mm/yy
(It is important to monitor risk controls and review risk assessments regularly.
If the venue or activity substantially changes a new risk assessment may be
needed.)

Indicate the next date of
review where necessary

Any other
recommendation
by the reviewer.

It is important for the form to be as easy to read as possible for others to understand it. A definition of the indexes used will clarify the matrix used.

Severity Risk Score Description	
Insignificant 1	No injuries, incur low financial loss, low environmental impact
Minor 2	Injuries requiring first aid treatment, incur low financial loss, low environmental impact.
Moderate 3	Injuries require medical treatment or may lead to disability (e.g. lacerations, burns, stains, minor fractures, dermatitis, deafness, work - related upper limb disorders), incur high financial loss, high environmental impact.
Major 4	Serious / intensive injury (e.g. amputation, major fractures, multiple injuries, acute poisoning and fatal disease), incur major financial loss, severe environmental damage.
Catastrophic 5	May result in death or large number of serious injuries, incur huge financial loss, environmental disaster.

Particularly quantitative index such as risk and likelihood.

Likelihood	
Unlikely (1)	Unlike to occur but possible
Seldom (2)	Not likely to occur but possible
Occasional (3)	May occur in time
Likely (4)	Quite likely to occur in time
Catastrophic 5	Expected to occur frequently

Risk level Tabulation		
9-10	Extremely High Risk	Terminate the activity if additional control measures do not lower the Risk Level.
7-8	High Risk	High-risk levels must be reduced to at least Moderate Risk before activity commences.
5-6	Moderate Risk	Risk control measures should not be overly dependent on personal protective equipment or appliances.

The risk assessment was carried out systematically, following a pre-designed risk form. There are different ways that risk assessment can be carried out, including even more advanced forms of risk assessment that can include learners in a reflective exercise or co-assessor. Salmon et al. (2014) analysed 1014 leading outdoor activity injuries and near-miss incidents and found that the elements most frequently involved in incidents were hazardous terrain (50.20% of all incidents), participant unsafe acts (29.78%) and teachers' judgement errors (29.59%). In the activities that they identified, the greatest number of injuries occurred in activities such as Free time (90.3% of all injuries), Ball sports (90.0%), Initiatives (91.1%) and Weapons (100%). The value of educating participants carries with it a level of risk prevention as they were noted as the second largest risk contributors, at the level almost even with instructors. It could also be observed that although Boating accounted for 53.9% of injuries, fatalities were recorded at 4, indicating that low injuries are not necessarily associated with severity. In that sense, responsibility for risk is not just for instructors or designers. It would be noted, however, that participants need to be at a relatively high cognitive level to engage in the activity.

Let us pause and reflect

- How can learners be involved in a risk assessment process?
- What value or perspective can they bring to a risk assessment?

Parent Engagement

Consent

Consent forms are another important preparation that teachers need to prepare to effectively engage important stakeholders, such as parents. We previously discussed the context of risk aversion, which carries with it a whole host of developmental issues for learners in their developmental years to adulthood (Paulsen et al., 2012). Parents are gatekeepers of participation, as they hold the right to withdraw their child's participation, particularly in the OE context where risk is often associated with. Parents are also important partners in the learning journey of a child, not just gatekeepers. There are two forms of consent: active and passive. **Active** consent refers to consent that requires permission for participation, while **passive** consent refers to requiring a signed form for activity omission (Spence et al., 2015). In passive consent, an information sheet would be provided instead

of a consent form. Traditionally, passive consent forms tend to have the least effect on participation due to a myriad of reasons (Blom-Hoffman et al., 2008; Spence et al., 2015). The context, however, may be subjective to the respective region's regulation on consent for types and formats of activities due to concerns with passive consent violating the rights of parents who may not have received proper notification (Blom-Hoffman et al., 2008). Consent form formats may vary and are often available widely online. In the context of inclusion and engagement, we would instead focus on the information sheet as an engagement tool to increase participation.

Information Sheet

Research has shown that consent forms contribute little to the active engagement of parents in the learning experience of a child (Fletcher & Hunter, 2003; Blom-Hoffman et al., 2008). Kraft et al. (2020) found that even prior to consent forms, 67% of parents have already decided whether to enrol their child or not. The research was consistent with prior research conducted by Grady et al (2017), where they too identified that parents' engagement does not change significantly between an elaborated consent form and a short one. Their research highlighted a key point in engaging parents in education, that continuous engagement has more efficacy than relying on consent forms to increase participation. Not omitting the usefulness of information sheets in engaging parents, a well-made information sheet can increase participation, and thus inclusion, by providing information that can inform parents of the value of a learning experience. Particularly when parents may have inhibitions towards outdoor activities, which have often been mis-associated with risk. In a report on Reporting to Parents in Primary School, Hall et al. (2008) found that schools that use newsletters to engage with parents report the highest parent satisfaction. One of the schools within the research employed bi-weekly newsletters where parents reported high confidence and comfort in the school's approach and interventions (Hall et al., 2008: 99). For an information sheet or newsletter to be effective, there are key elements that must be included. Key elements to include in an information sheet include: Why, When, Where, and What. Participation is the basis of inclusion before any manner of intervention can work. The intention is not simply to inform but to engage parents across a range of different engagement levels to foster participation so that the learning experience can be maximised.

Information sheet example

Indicate how an activity contribute to the learning objective (*Why*)

The date or duration of the activity (*When*)

This is an example of one of the documents organisations need to ensure safeguarding and child protection is at the heart of their activities.

Use this example to write a document that reflects the safeguarding and child protection needs of the children/young people your organisation works with. The document should also align with other safeguarding and child protection policies, as well as key organsational policies, procedures and standars.

Example form

Day/date(s) of activity [if it is a regular activity you could list the day of the week and time it takes place]:

Location:

Type of activity/what the child or young person will be doing:

The venue that the activity is taking place (*Where*)

The specific task involved (*What*)

Source: https://learning.nspcc.org.uk/research-resources/templates/example-consent-form

Why	Informing parents of the value of the activity and how it contributes to the child's growth. It is important to indicate how the activity contributes to the child's growth.
When	The date and duration of the activity provide clarity in the event where travel accommodations need to be made.
Where	Where the activity is taking place can also inform parents of the array of items that may be associated with the venue. Particularly in the event where parents have to prepare any additional items that are not included in the activity preparation. It is important to note that parents should not be tasked with preparing necessary equipment for the activity to be conducted.
What	The specific task that is required of the student. This prepares the parents to be aware of any physical consideration they might feel is necessary to provide to their child.

Let us pause and reflect

- If you were a parent, would you prefer a consent form or an information sheet?
- If you were a parent, what type of information would you look out for in an information sheet/consent form?

The way we presented OE in the chapter invites readers to approach OE not as a peculiar form of education but as a benefit-driven one. The value of any education approach lies in the benefits that it can bring. OE can be a subject in itself or a natural context that we engage with to maximise learning. Effective preparation in forms of risk management and information sheets can alleviate concerns and resistance that are often falsely associated with OE. As teachers, we all know how difficult it is to make lessons 'fun' to keep learners engaged. With OE, we are inversely presented with inherently fun activities that we need to maximise the 'educational' aspects. Learning is natural and fun; let us try to keep it that way.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=635#h5p-32

Closing questions to discuss or tasks

- As a future teacher, what kind of skills and knowledge do you think you may need to be

prepared for Outdoor Education?

- Thinking about your context, how would you involve the local community and natural environment in your teaching? Why?
- Think about an example of effective educational use of risk in an outdoor setting. How would you manage it?
- From your standpoint, what are the most important benefits of Outdoor Education in terms of inclusivity?
- How would you make Outdoor Education applicable to learners at all phases?

About the authors

Beausetha Juhetha Bruwer

Beausetha Bruwer, instructor of inclusive education, deaf education, and

sign language. Experiences as a teacher of deaf children and as a teacher and sign language interpreter trainer at college and university level. Her key areas of research interest include, among other things: language education, early literacy and language acquisition/ development for deaf learners, sign language linguistics and practices, Deaf culture, mother tongue education, multilingual education, early childhood inclusive practices, play pedagogy, outdoor pedagogy, and teacher preparation for inclusive practices.

Chee Shien Tan

Victor Tan Chee Shien has over ten years of experience in special education and is a trained counsellor and educational psychologist. He recently received his Associate Fellowship in higher education from the University of Stirling. His research interests include special education, higher education, and international mobility (ORCID: 0009-0006-3403-4649).

Maria Moscato

Maria Moscato is deeply passionate about democratic human development and global citizenship. During her academic journey, she has specialised in Methodologies of Teaching and Special Education, concentrating on critical areas such as Inclusive Education, Outdoor Education, participatory and transformative processes, teaching strategies, and the professional development of teachers and educators. Her extensive experience as an educator, teacher trainer, and workshop facilitator for prospective teachers has further enriched her profile. Throughout her doctoral studies, she has had the opportunity to contribute to research and projects focused on Inclusive Education and inclusive strategies.

THE MAGIC OF INCLUSION: TRANSFORMATIVE ACTION FOR SUSTAINABILITY EDUCATION

Example Case

Open-Ended Example Case: the "fishbowl" as a pedagogical tool for inclusivity

"You may not have time to read the essay in its entirety, so here's an example of a classroom activity that can give the experience of inclusion-oriented education for sustainable development. First and foremost, it is a method for dialogue designed to offer all participants a sense of active engagement in a discussion, no matter how much or how little they verbally contribute. The actual topic is less important than the formal struggle of the conversation. It is known by some as the "socratic dialogue" but it is more commonly referred to as the fishbowl activity. The set-up is simple enough. The instructor ensures that there are enough people to make two circles, one inner and the other outer. While participants in the inner circle share their responses to a question, those on the outer circle are asked to listen closely without speaking. They are encouraged to take notes and jot down any ideas that spring to mind as they listen to the discussion. One of the remarkable outcomes following such a "fishbowl" discussion is that participants all report having been in an active discussion even if they were in the outer circle whose members did not speak. In one such activity set-up, secondary-school students were asked to share their experiences after reading a short story by Julius Lester called "The Child". Students were asked to share their impressions of having been surprised on learning

something new about how race can be described. An open-ended question that is grounded in experiential learning is more likely to bring to the surface the many assumptions that students have regarding a certain subject. Even when people aren't sharing their own experiences, they nevertheless learn about their own assumptions and habits of thought while listening to other people speaking. The inner circle, by contrast, experiences a heightened sense of being heard by a silent audience. They gain a sense of shared responsibility and responsiveness for the discussion. The "fishbowl" activity becomes a powerful pedagogical tool for interrogating what is often taken as the norm."

who, Institution, Country

Initial questions

In this chapter you will find the answers to the following questions:

1. What is sustainability?
2. Why does inclusion matter in this context of sustainability?
3. What reflective exercises can the reader complete as a bridge into competencies?
4. What is the role of the educator in this context?
5. How can we look beyond the impossible: Why does magic matter?

Introduction to Topic

This chapter explores the question of the intersection between sustainability and inclusion and how the pedagogical approaches of sustainability education and inclusive education can be dove-tailed. The chapter provides impulses for reflection for teachers as well as concrete examples for implementing inclusive teaching practices.

Firstly, let us offer a word about the authors of this chapter. The collective "we" used throughout the chapter refers to a collaboration of three quite different scholars each with their own interests and passions. The plurality of our perspectives as researchers and activists is respected in this use of the first-person plural. Also, our cultural diversity, while not explicitly mentioned in the text, informs the discussions that were part of the writing process. Each of us is based on a different campus and works on a different

professional area of academia and activism and so our choice of "we" is an open cross-pollination of multiple voices and ideas rather than the result of a convergence. In this chapter we combine theory and praxis, drawing from our expertise in and out of the classroom, on and off campus. When planning the chapter, we have been guided by an overarching question: what is missing, who is excluded? With that said, it may be that some readers feel we have made assumptions that do not reflect their circumstances, knowledge or experience. We invite readers to get in touch with any questions or comments you may have, especially if you feel we have overlooked or misunderstood your perspective. Above all, it is our hope that this chapter may serve as one of many departure points for collective thinking around inclusion-oriented education for sustainability (ESD). This cannot be achieved without creating connections between different individuals, cultures, fields and institutions, breaking down hierarchies and disciplinary silos while still respecting the autonomy of research.

Key aspects

Sustainability

We want to start by offering a short background to this rather slippery topic of sustainability. Human welfare in the context of an intact environment was first discussed on an international political level at the first UN Conference on the Environment in Stockholm in 1972. In the same year, the Club of Rome's report "The Limits to Growth" was published. This report discusses the topic of sustainability in considerable detail. With the Brundtland Report in 1983, the United Nations General Assembly formulated a worldwide program or recommendations for action that sharpened the international discussion on sustainability or sustainable development. Among other things, it emphasised the linkage of environmental and developmental issues, as well as inter- and intragenerational equity, all the while taking into account the global perspective. With the United Nations Conference on Environment and Development (UNCED) in Rio in 1992, the model of sustainable development, which gives equal importance to the economic, environmental, and social dimensions, was finally recognised internationally: "The right to development must be fulfilled so as to equitably meet developmental and environmental needs of present and future generations." Relevant milestones and frames of references for the international community with regard to sustainable development were then established following Millennium Development Goals in 2000, which were the result of the Johannesburg Conference in 2002 and the Rio Conference in 2012. More recently, the United Nations subsequently adopted the Agenda 2030 with its 17 Sustainable Development Goals (SDGs).

The SDGs are characterised by their universality. This is to say that they hold all countries accountable in a global partnership that subscribes to a shared understanding of values.

The 17 goals of the SDGs are based on the following guiding principles (also known as the 5 Ps): People – Planet – Prosperity – Peace – Partnership.

The objective of the SDGs is – besides protecting planetary boundaries – also to ensure inclusion and equality for every person. Significantly, this is not just about holding to account, and safeguarding the rights of marginalised groups in the implementation of the SDGs, although this is obviously an important part of it. It is above all about empowering all people, including marginalised groups, to enable active participation in sustainable processes on all levels.

The question is, why does inclusion matter in the context of sustainability? First of all, it should be emphasised at this point that sustainability not only includes the ecological dimension. Social justice is a core element that contributes to the need to break down global power structures at the community level in order to enable equal opportunities for all in a healthy, just, and sustainable environment. Questions relating to how closely the environment and peace are intertwined can be clearly demonstrated by current global crises, be it the Covid-19 pandemic, the loss of biodiversity, or wars such as the war in Ukraine. The effects of these global crises are visible in almost all regions of the world, and they include famines as well as energy shortages. Peace cannot be guaranteed without attending to the environmental crisis.

However, who are we referring to when we talk about inclusion? And what does "All means All" mean in the context of sustainability? With inclusion, we are oriented towards

diversity: all people, regardless of socio-economic background, cultures, individual abilities or disabilities, age, religion, gender, sexual orientation, and so on. Nonetheless, we also mean the inclusion of nature and animals. Consequently, when we talk about inclusion, we understand diversity as a principle of inclusion. In other words, we argue that inclusion should be understood as a process that creates a context free of discrimination. It is a context that empowers everyone to actively participate in questions to do with sustainability. A key element of ensuring inclusion is, quite simply, participation of all. However, there are structural challenges that often tend to hamper participation of all in societal processes. Therefore, the need for cultural, society-wide change is becoming more necessary. Here, education plays a major role with "the importance of building capacities to enable learners to think, reflect more critically about actions, understand and respect diversity with strong beliefs and actions rooted in social justice, equity and participation" (Joon & Roncevic, 2015:35). On the one hand, there is a need for inclusion in education so as to ensure "a sense of change where something excluded or omitted is now being included in the system" (O´Donohue & Roncevic, 2020:20). On the other hand, there is also the need to strengthen inclusion through education. A pedagogical answer can be found in the concept of Education for Sustainable Development (ESD), also Goal 4 in the SDGs, requires us to ensure inclusive and equitable quality education and promote lifelong learning opportunities for all. With Goal 4.7 of the SDGs, ESD and Global Citizenship Education, two approaches are highlighted.

In particular, ESD is about equipping all learners with the competences (for example critical thinking, system thinking,empathy) they require in order to meet the uncertainties that global challenges present, and will continue to present in the future, in a sustainable manner. To ensure inclusion in general with ESD, implementation of this approach is urgently needed. Unfortunately, for the most part, these two concepts (ESD and inclusive education) are discussed separately and from different perspectives. Indeed, there is a research gap in linking the development of a common perspective of both,and there is also a lack of documented practical experiences with inclusion-oriented ESD (Rončević & Rieckmann, (In Press); Rončević & Schulz, (In Press); Vierbuchen & Rieckmann, 2020; Böhme, 2019). We, therefore, want to encourage inclusive education and ESD to   be thought of and implemented together from the very beginning. Inclusive education naturally also refers to people with special (learning) needs. Here, special educational approaches are also used to ensure access for people with different modes of accessibility to ensure that all learners receive the best educational support according to their individual (learning) needs. In concrete terms, this means, for example, that learning opportunities and learning materials must have a certain flexibility so that they can be adapted according to individual needs.

Sustainability means meeting the needs of the present in such a way that the opportunities of future generations are not restricted. Sustainability considers the three dimensions − economically efficient, socially just, and ecologically viable − on an equal

footing. It is important to emphasise, that sustainability can only succeed if it is achieved with, and for all people.

Reflective exercise for the reader as a bridge into competencies

Our first intention was to share best practices of how to incorporate inclusion-oriented ESD in the classroom. In the early stages of writing, however, we grew a little uncomfortable about sharing exercises and activities without knowing more about the social contexts, positions, and even geographical locations of the reader. Inclusion can never be based on a one-size-fits-all model. So, we decided against sharing exercises that could turn out to be ineffective or possibly counter-productive in educating teacher-trainees in some contexts. Instead, we will offer a set of reflective exercises for teachers or trainees aimed at discovering and identifying the thoughts and belief systems that might shape inclusion-oriented ESD. While we will speak more specifically out of our own discipline-specific fields of research later in this chapter, for this exercise we would like you to consider your own subject or field of expertise by reflecting on a set of questions. Please jot down your answers to the following prompts on a sheet of paper or using any digital writing device:

- What can you imagine yourself teaching? It may be a subject or a topic that interests you that you would like to bring to the classroom.
- Name two to three important learning outcomes you aim to provide when you are designing a lesson for this topic of interest.
- What happens if you come up with something that isn't officially recognised as needing to be taught or currently not considered important enough to be taught? How would you translate it into something more recognisable?

It is necessary to think more self-reflexively about what it is exactly that we teach if we want to understand how to make what it actually offers students more inclusive. The questions above are tangential to the matter of inclusivity. This is because what is essentially being asked of the teacher is what would they strive to include in a classroom situation that was not already required of them. It is a matter of acknowledging that inclusivity begins with the teacher's reflections on what is missing in the classroom. The prompts above direct the educator to reflect on what is important to them and others about their subject. They may discover new aspects of the content, theory, and practice of teaching this subject that are relevant beyond their field. This is also an opportunity to build a new vocabulary for communicating with the broader community on what they do in the classroom. This is a way that the input of educators helps to ensure that education avoids becoming inert or fixed.

   Importantly, the foregoing prompts for self-reflection also help to situate educators and learners in their learning environment. An inclusive approach to sustainability education

means that educators and learners work together, that they welcome all ages and socio-cultural groups. In order to envision alternative futures, it is necessary to facilitate multi-vocal contributions of all participants across educational systems. For such encounters to happen in an open and inclusive way, both educators and learners need to practice deep listening. The following exercises can be used as a starting point in any educational situation. Their aim is to develop a sense of agency, identity, and meaning through engagement with us and with the world. It is also an exercise in making visible what may otherwise be hidden, including aspects of our habitat. The age range of learners for this exercise encompasses both secondary school students as well as their teachers.

Becoming aware

To do this exercise you will need 3-5 minutes. No tools are required. Look around the classroom or the space where learning takes place. Take your time. Become aware of the place, the furniture, and the way it is arranged. Where is the light source, either natural or artificial? There may be several. Spread your awareness to include other teachers and learners who share this space with you. Where are they seated in the room? And are there sentient beings other than humans in this place? Can you see or hear something of the natural world? Are any non-human creatures visible from where you are? What about organic matter and other life forms? Has any of the outside come inside? Once educators and learners have developed a habit of awareness regarding the educational environment that they inhabit, it may be possible to turn our thoughts to how we communicate this to the wider community in a broad and encompassing way.

A sense of belonging

Sustainability education is about developing caring relations with both the human and the non-human world. A necessary insight for this is to achieve a sense of being a member of the environment one cares for rather than an external agent tasked with caring. This means moving beyond "humanist stewardship frameworks and their implicit human exceptionalist assumptions" (Taylor, 2015:1449).

Instructions: we recommend that participants write anonymously, for example, by using Padlet as in the following sample student responses, or via journaling that may or may not be anonymous. The **conversation prompt** is: "What I learned from living things: share a time when you learned something memorable from non-human life." In the same way that inclusion can be understood to encompass the non-human as well as everything beyond the human, it is also the case that an inclusion-oriented approach to sustainability education is mindful of future generations. Educational spaces can design a more just, sustainable, and joyous future marked by principles of diversity and inclusion. The following exercise may be useful in reflecting over one's own relationship with future generations of humans. **Instructions**: to do this exercise you will need 10-15 minutes, pens and paper.

Design a message to posterity of what you think your current habitat communicates to strangers. Please only use shapes, shades, patterns, and doodles. You can choose to design a message of caution and warning, or a welcoming and cheerful message. Jagged, spiky, knotted shapes may suggest threat and harm, but what shapes suggest a loving, welcoming greeting from our century? These exercises may guide educators and learners in finding out how we view ourselves and how we invite others into our educational space.

The role of educators as agents of change

Now let us consider how educators might engage with and enact knowledges into actions in their practice. We are consciously using the plural term for knowledges and actions in order to represent the diverse forms of embodied, individual, and collective knowledges as well as conscious and unconscious beliefs, attitudes, values, and judgments that inform the design and carrying out of educational experiences. Educators can play a transformative role as agents of change for implementing inclusion and sustainable development education at local, national, and transnational levels: in the teaching and learning community of the classroom; in the social and cultural community of the early-years setting, school or university; in their own society; and in systems of intercultural exchange and engagement with global citizenship. The educator possesses a powerful opportunity in their everyday practice to enact an inclusive and environmentally sustainable pedagogy which is rooted in principles of care, the uniqueness of each learner, the interconnectedness of humanity and our ecological environments, the integrity of nature in its own right, the rights of each learner, and the rights and needs of each culture, especially indigenous and marginalised groups. It is crucial for sites of formal teaching and learning, such as the institutions of the school and university, as well as informal educational spaces and educational partnerships to recognise and respond to both the individual learning and educational needs of each learner as well as to local and global environmental, economic, and cultural challenges.

Although there are many competing understandings of sustainability education and inclusive education, education at the intersection of these domains involves highlighting local and/or global social injustices and inequities with a view to motivating individuals and groups to work towards a different future, based on a more equitable, sustainable, and just vision of human and ecological worlds (Bryan et al., 2009). The overarching concern of inclusive sustainability education aims towards a re-organisation and re-imagining of human and non-human relations within ecological, economic, and cultural environments for supporting all people and the natural world in the current contemporary moment, as well as in and for the future. Since the nexus of inclusive education and sustainability education within educational contexts is not always named or defined, it is important for student teachers and teacher educators to collectively centre educational practice which

prioritises equitable, inclusive, and environmentally and culturally sustainable relationships in all contexts of teaching and learning.

As part of our invitation to student teachers and teacher educators to incorporate this model of inclusive sustainable development education into your practice, we draw on Marilyn Cochran-Smith and Susan Lytle's theory of practice that conceptualises teaching for equity and social and environmental justice as being far more than the development of skills, strategies, and teaching methodologies. Their framework of 'inquiry as stance' is neither a top-down nor a bottom-up theory of action, but an organic and democratic one that positions practitioners' knowledge, practitioners, and their interactions with students and other stakeholders at the center of educational transformation. Actually, living and enacting the mission statements of educational institutions, especially third-level institutions, is vital in order to recognise and empower educators' agency and all learners' equity of participation within the classroom as well as outside the classroom. An understanding of both the educators' and learners' own lives and lived experiences as well as the potential of collective action and intersectional and intergenerational solidarity are needed.

We encourage you to reflect on your beliefs, attitudes, agency, advocacy for inclusive education and sustainable development education, your professional partnerships, and your relationships with parents and families in this regard. Change towards a culturally and ecologically-sensitive inclusive sustainability education needs to happen at individual, institutional, and community levels and educators need to connect key ideas of inequality and inequitable distribution of resources with conceptions of justice, recognition, and emancipation at the level of each individual learner's educational needs, local cultural and ecological contexts of discrimination, disadvantage and privilege, and global contexts of challenges such as climate justice, poverty, hunger, quality education for all, gender equality, responsible consumption and production, sustainable cities and communities, and peaceful societies. Bringing together inclusive education and sustainability education offers a crucial intervention for an educational practice which is capable of acknowledging and analysing oppressive and discriminatory educational, ecological, and cultural systems as well as the dynamic interaction of knowledges and actions to confront and transform these systems.

In their everyday practice, educators at all levels must negotiate and navigate curricula and contexts in disciplinary-specific as well as interdisciplinary ways. Key to this professional decision-making and series of educational actions is the educator's relationship with what can be called 'Big C' Curriculum and 'little c' curriculum. Curriculum with a 'Big C' involves the explicit and standardised concepts, contents, and skills which are informed by local and national learning outcomes, educational benchmarks, assessments, and standards. 'Little c' curriculum encompasses the 'hidden curriculum', the day-to-day interactions with learners, and the myriad of implicit teaching and learning modes and systems which the institution of schooling implicitly presumes and inculcates, for example, dress codes, the privileging of certain languages over learners' home languages, gender norms, the normative assumption of ableist physical teaching and learning materials and

environments. Both the 'Big C' and 'little C' involve conscious and unconscious normative structures, power relationships, privileges, inclusionary, and exclusionary practices. Just as the 'Big C' curriculum might assume a Eurocentric bias or ethnocentric worldview in supposedly 'objective' content in History or canons of literature around particular communities, histories, and knowledges, the 'little C' curriculum is similarly biased towards maintaining the hegemony of particular norms, individuals and groups while disenfranchising marginalised learners and groups who are neurodivergent, indigenous, working-class, migrants, etc. A socially- just, environmentally-just, and change-oriented teacher is one who recognises that no teaching is neutral (Freire, 1970) and who is committed to critical pedagogy, critical literacy, sustainable and inclusive teaching and learning, democracy, and democratic practice. Educators' acknowledgment and affirmation of the diversity of lived experiences and environmental contexts that they, as well as each of their students, bring into the classroom are key for enabling educators to link real-world issues and challenges, and to make teaching and learning authentic and meaningful.

The letter 'C' also brings us to the importance of educators' own competencies, which are vital for equipping them to act as agents of change at local and global levels, and to culturally and environmentally respond to the needs of their diverse learners, their educational, economic and social contexts, their local and national Curricula, and their own daily interpretation and enactment of curricula. There are many national and international systems and programmes of educator competencies but in our collective perspective, the following three competencies are particularly important for equipping and empowering educators' capacity and confidence to implement inclusion-oriented sustainability education: creativity; collaboration and deep listening; and systems thinking (the ability to deal with complexity). Creative Scotland defines creativity as 'the capacity to generate ideas; things that have value to the individual. Looking at things with a fresh eye; examining problems with an open mind; making connections; learning from mistakes and using the imagination to explore new possibilities' (2013: 55). Creativity supports the development of the pedagogical expertise of student teachers, including subject-specific pedagogical content knowledge such as play-based pedagogy in the teaching of Mathematics or a place-based pedagogy in the teaching of Geography, as well as empowering learners to more fully participate in and have equitable access to learning. We would urge educators in all educational levels and sectors to incorporate these professional values and actions into their own practice as well as incorporating a diversity of opportunities for learners to develop their own creativity and imaginative agency. Educators' own creativity and the fostering of learners' creativity take on even more urgency due to ongoing and new challenges and crises that the human and nonhuman worlds are facing.

The second competency which is vital for designing and implementing an inclusive model of sustainability education involves the importance of collaborations and deep listening between all educators, learners, and stakeholders in eacheducational setting and sector as well as across educational settings and sectors. Meaningful and reciprocal

partnerships and collaborations are crucial. Early-years practitioners, primary-school teachers, secondary-school teachers, teacher educators and all of their diverse educational settings must be regarded as equal and valued sites and producers of knowledge by academia and academics around sustainability education for creating and maintaining successful and cross-sectoral links policy, teaching, learning, research, and lived experience. Deep listening — an ongoing practice of suspending self-oriented, reactive thinking, and opening one's awareness of the unknown and unexpected —is a powerful tool for enabling more authentic and shared understandings and consensus across differences and diversities of learners and their economic, social, and ecological contexts. Through deep listening, we can affirm, motivate, and empower others as well as ourselves, build trust and goodwill, learn and exchange new ideas and alternate perspectives, work through conflict, make it safe for us all to equally and equitably participate in education, and transform human and nonhuman relationships. The third competency of systems thinking is linked with the importance of deep listening as both competencies require a readiness for recognising and respecting complexity. While systems thinking can mean different things to different people, systems thinking generally involves a sensitivity to the dynamic complexity and intersectionality of identities, cultures, and ecologies and calls for compassion, courage, curiosity, clarity, and a commitment to enacting change in ways that benefit all stakeholders. It requires a shift in mindset from the linear to the circular, a willingness to see a situation or problem more fully, and acknowledgements that educators and learners are interrelated, that human and nonhuman worlds are interconnected, and a respect for the legitimacy and diversity of multiple interventions to social, political, and ecological challenges. Bringing creativity, deep listening, and a systems-thinking mindset together in educational practice can offer possibilities for different futures which can sustain and affirm the needs and diversity of learners, contexts, and planetary boundaries alike.

In order for student teachers to develop these three competencies and for educators in all settings to authentically and meaningfully enact the values and actions of inclusive sustainability education, all disciplines, subject areas, and levels of education must embrace and play their individual and collective roles. No discipline or level of education (early years, primary, secondary, third-level, adult education, community education etc.) is exempt from engaging with and enacting the values and transformative actions of inclusive sustainability education. There can be pervasive normative assumptions that inclusive sustainability education is more 'naturally' relevant or applicable for some subjects such as Geography while it can be perceived as irrelevant or inapplicable to subjects such as Drama Education or PE Education or 'too complex' for young learners in early years settings. Such norms and normative knowledges can be embedded in neo-colonialist and conservative power relationships, binaries, and histories of cultural and ecological hierarchies. Many student teachers arrive at their engagements with sustainability education and inclusive education from an ethnocentric place, taking neurodivergent, classist, and ableist norms and European 'superiority' for granted and believing that their viewpoint is both the best

and 'common sense'. Educational theorists such as Douglas Bourn advise student teachers and teacher educators to deconstruct issues and events and consider them from a range of perspectives in order to develop a 'sense of global outlook' or 'global mind-set' which understands the viewpoints of others. Educators need to develop competencies which empower themselves as agents of change and which support their learners to view the human and nonhuman world through diverse lenses. Challenging ethnocentrism and the associated normative regimes of ableism, racism, sexism, and homophobia, and incorporating multiple perspectives into teaching and learning are intrinsic elements of an inclusive sustainability education pedagogy. Creativity and dialogic methodologies such as deep listening and systems thinking are key tools for recognising, naming and fighting oppression and inequities at both a local and a global level and for responding to the needs of contemporary learners, communities, and ecological environments as well as the needs of future human and nonhuman generations.

Magic Matters – looking beyond the impossible

Magic is often thematized as the inexplicable extension of some individual's influence. The form of magic that interests us is much more along the lines of discovering possibilities through the concerted action of collaborative and inclusive groups.

Along with promoting principles of care, the classroom is also a place for provoking a critical perspective on what is or is not possible, especially when dealing with wicked problems and powerful adversaries. It is often a matter of deciding when to employ rational principles based on standards such as precedent or so-called business as usual, and when to seek alternatives. This is acutely relevant in our time considering that schools play a very important role in educating citizens of an uncertain future who will need to be climate aware and capable of adapting to rapidly changing circumstances. At the same time, global decision-making bodies are showing that they cannot effectively turn the climate crisis around via rational argument and strategic planning, and this is despite impressive scientific and technological development over the last few decades. The environmental crisis is literally a case of shapeshifting on a planetary scale and to address it another type of knowledge is required, one that cannot be measured against key performance indicators that do not register the pace and degree of change taking place. We call for the magic of inclusion in the sense that no line of enquiry is omitted simply because it seems impossible or irrational or does not fulfil some established criteria of feasibility. A starting point for understanding what is magical about inclusion-oriented ESD is to remind readers that when people collaborate widely on climate action using methods and motives that conventional knowledge deems impossible and irrational, change happens, previously indiscernible ways forward (or back) become visible and viable. This has been proven most spectacularly by Greta Thunberg. Her FridaysForFuture, and other such global movements of climate activism, are manifestations of action at a distance, a key definition of magic. In this case,

an individual or collective speech goes beyond its immediate audience so that it moves listeners or readers who are far away, sometimes becoming a call to action.

As we know, learning always involves change. When a student gains an insight, masters a concept or acquires a new skill, they do not just become better equipped at dealing with reality, as well they become capable of creating their reality. Moreover, when collaborative and literacy skills are built into everything they learn, then they are able to enlist others in creating worlds they can share. We see the climate crisis as a specifically pedagogical challenge insofar as all responses should involve learning very new ways of being in the world and of living equitably with others. More specifically, in the present context it is as much about unlearning and dropping harmful habits and practices as it is about taking on new ones. The kind of learning that must face climate crisis means comprehending new ways of seeing the human and other-than-human so as to grasp new methods for mutual survival while letting go of other, less sustainable and thus counter-productive ways. It is about broadening and deepening the vocabulary we use for defining and invoking spaces of creative and inclusive practices. Pedagogy changes people in a process that can be likened to shapeshifting as it shifts our boundaries and expands what we believe is possible. At stake is the kind of knowledge acquisition that requires students to pass through liminal and transformative experiences to make real discoveries about themselves and their world. This is what Rudine Sims Bishop means when she speaks of "sliding doors" that readers find in books that they "have only to walk through in imagination" to find themselves responding to actual or possible worlds. Sims Bishop notes these doors can be mirrors as well by which readers learn about themselves and their own worlds. We will say more about that in relation to children's literature. For now, we want to point out that an inclusion-oriented practice towards educating for sustainability emphasises dealing with realities as they are rather than denying them. It also fosters the equally real capacity to imagine different future realities and new ways of collaborating with others.

Collaboration with others requires communication and the ability to share vocabularies and literacies widely. No matter where in the world you are teaching, you will find that language proficiency is an educational goal built into the curriculum. Literacy and language proficiency are important for preparing students to become participants in democratic processes and actively contribute to sustainable communities. Even if you are not teaching languages or literature, we argue that the practice of creative writing as a path towards improving literacy helps forge inclusive approaches to sustainability education. Creativity is a means of welcoming diversity since it is often aimed at discovering aspects of one's world, of oneself and of others that reveal a wealth of possible relationships that might otherwise be excluded or overlooked. Creativity can include improvisation, a focus on listening, as well as a spontaneous call, and response as a way of engaging with expression. Creativity is about getting outside of one's preconceptions and assumptions and learning instead new ways of seeing and responding to diversity. We are passionate about using creativity to develop literacy because this helps remedy the problem of uneven participation

in classroom activities due to varying literacy levels. Naturally, there is a continuation of this benefit after schooling when literacy is a basis for improved participation in society. Creativity has to do with a spirit of adventure in collaboration that can draw on a plurality of voices – one's own as well as others' – for developing relations between diverse beings and bodies. Sustainability education is about bringing creativity together with the courage needed to work with others in imagining alternative ways of living in communities. However, to ensure that these communities are inclusive, it is necessary for all to contribute throughspeaking, reading and writing.

Courage is a focus in many creative exercises that help overcome the fear of looking stupid in the eyes of others. And this is a key element of collaborative creative endeavour. Improvisation is one way of encouraging students to develop trust and the ability to respond to others in a way that is similar to ensemble theatre performance. The following variation on the collaborative writing game called *exquisite corpse* helps students overcome the fear of expressing themselves creatively. It succeeds in this because they are riffing on words and phrases that they did not personally come up with. In this version of the game, the teacher shares with the class the final sentence from a novel or a text that the group is studying. One student then begins the activity by writing a sentence or a phrase beginning with the last four words of that sentence and folds the paper to hide what they have written. Then, before passing the paper over to a fellow student, they write the last four words of their sentence on a new line which the next person now has to complete. They then repeat the process with the folding of the paper and beginning a new line with their final four words for the next student to complete, and so on. This activity can also be done online using a private message function. In this case, students each receive the four prompt words from the teacher and then send their sentence back one at a time to the teacher who will send the final four words to the next student. The teacher is responsible for collecting all the contributions and distributing the words to the next student until all have made their contribution. The body of writing that emerges at the end of this activity becomes a wonderful joint creation that often provokes wonder and curiosity. When the teacher reads it out loud, with the lines of each participant sutured via the repetition of four words, the result is often heartwarming and beautiful.

Similarly to the empowering potential of creative writing and creative self-expression, children's and young adult literature can provide a powerful and transformative space for exploring identities, norms, power relationships, and human-nonhuman relationships. Stories offer opportunities for affirming ourselves and our understanding of our place in our world as well as engaging with diversity and alternative ways of being and doing in non-hierarchical ways for building reciprocal learning and respect. In Rudine Sims Bishop's inspiring framework about the potential of literature for young people to create a celebration of belonging as well as difference, fiction and nonfiction can operate as "windows, offering views of worlds that may be real or imagined, familiar or strange. These windows are also sliding glass doors, and readers have only to walk through in imagination to become part of

whatever world has been created and recreated by the author. When lighting conditions are just right, however, a window can also be a mirror" (Sims Bishop). We would invite you to consider which picture books, films, short stories, poems, novels etc. in your own personal life have acted as windows and doorways into another way of thinking and being and which have acted as mirrors which consolidate and reflect your own experience, perspective, and identity. We would also encourage you to reflect about what kinds of literature you have selected in your professional role as educator and might you select for bringing into your learning community and your educational practice. Who is recognised, privileged, and centred in these works? Whose voices and perspectives are normalised in these works and who is absent or neglected or erased? What kinds of conscious and unconscious biases are involved regarding social and economic systems and issues of class, race, age, gender, sexual orientation, religion, ethnicity, and disability? What kinds of ideas, beliefs, values, and knowledges are being consciously and implicitly taught and learnt regarding human-nonhuman relationships, ecologies, and global environmental challenges?

Children's and young-adult literature as well as the wider area of arts-based approaches can open up and support safe imaginative spaces for educators and learners alike to reflect and collaboratively explore diversities of voices, traditions, identities, contexts, and perspectives while also inviting us to consider our realities and lived experiences and to imagine new possibilities and alternatives. Visual narratives such as picture books, comics, graphic novels, films, animation, and illustrated nonfiction offer rich and enriching potential for developing different learners' linguistic capacities and visual literacy skills while building learners' environmental agency and engagement with ecological issues as well as social, cultural, political ideas. Learners at all educational levels can interact with children's and young-adult literature to inspire their own creative and investigative projects around their own family histories, their local communities, and their understandings and participation in human-nonhuman relationships, for example, creating guidebooks about their heritages which recognise and centre indigenous and marginalised knowledges, keeping a naturalist's notebook which enacts and advocates for care and a commitment to sustainability. Educators and learners might collaboratively explore works of activism, political speeches, guerrilla theatre, hip hop activism, culture jamming, and associated genres as well as create their own activist works such as letter-writing to political and community leaders, petitions, advocacy journalism, and social-media campaigns around issues of economic, ecological, and cultural concern to them, their families, and communities such as sustainable consumerism, discriminations against minority groups, the circular economy, enabling the human rights of all learners, etc. Literature for young people, and by young people, can act as an immersive and accessible springboard for place-based embodied learning and projects around investigating the histories, stories, languages, needs, cultures, and heritages of local, national, and global communities.

Conclusion

Our world is facing complex challenges such as unprecedented loss of biodiversity, climate crisis, geopolitical conflicts. Democracy is also at risk due to increasing populism in some regions of the world. Society-wide transformations are needed to ensure stability together with sustainability. Education needs to be part of these changes which will include transformative inclusion-oriented ESD. An inclusion-oriented ESD prepares the young generation – regardless of socioeconomic and cultural background, (dis)ability, race or sexual orientation – for current and future challenges and enables them to deal with their impacts. Such an approach may result in the participation of all learners in the struggle for a more sustainable future. In this chapter we have offered new orientations for educators and student teachers to begin to incorporate inclusion-oriented principles within the formal school system and beyond. We highly recommend that educators start the process in a way that suits them. This could be through classroom activities, extracurricular activities or subject design with the aim of enabling all learners to actively work through sustainability questions. In uncertain times like these, the focus should be on taking stronger action, opening up spaces for young learners to identify alternative, sustainability-oriented actions and, above all, try out new approaches. In order to realise this ambitious approach, we call for an openness in our educational practices to help facilitate the unprecedented and perhaps inexplicable change that our times call for. This is what we mean by the magic of inclusion.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=381#h5p-23

Closing questions to discuss or tasks

1. How would you like to begin adapting your teaching practices along an inclusion-oriented sustainability education?

2. Where do you see the first concrete opportunities for connection to your daily teaching practices? Is it your subject?

3. What do you need for your teaching?

About the authors

Sofia Ahlberg

Associate Professor Sofia Ahlberg is Vice Dean at the Faculty of Languages, Uppsala University, with responsibilities for education and public engagement. Her research is in the intersection of literary studies and pedagogy. She is the author of Teaching Literature in Times of Crisis (Routledge, 2021) and Magic, Literature and Climate Pedagogy in a Time of Ecological Crisis (Bloomsbury, 2024).

Patricia Kennon

Dr Patricia Kennon is an Associate Professor in children's and young-adult literature and youth culture at Maynooth University, Ireland. She is the General Editor of The International Journal of Young Adult Literature, and the Secretary of NAES (the Irish national section of the European Society for the Study of English). Her research interests include global citizenship education, power and childhood, and inclusive education.

Katarina Rončević

Katarina Rončević has more than 10 years of experience in education for sustainable development and inclusive education and has been working on whole school approaches. Since 2019 she works for Greenpeace Germany in the education team and is a PhD Student at the University of Vechta(Germany). Katarina is a member of the international ESD Expert-Net and CO-Founder of The Turquoise Change e.V.

PART IV

SECTION 4: FOSTERING STUDENT WELL-BEING AND EMOTIONAL HEALTH

UNDERSTANDING SOCIAL AND EMOTIONAL DEVELOPMENT AND BEHAVIOURAL DIFFICULTIES

Initial questions

In this chapter, you will find the answers to the following questions:

- What are possible causes for SEBDs?
- What are the societal pitfalls for children exhibiting SEBDs?
- What are efficient approaches and resources?

Example Case

Let's look at this case from somewhere in Southern Africa.

Maria is 14 years old. She is a high performing learner, among those that were recommended

by all the teachers to become a student leader in her grade nine year. Then COVID-19 started and took away her grandmother, and two weeks after that, her mother and father. She had to grow up instantly and take charge of her three younger brothers. Although they stay with an aunt in the homestead they shared with their mother and grandmother, things have changed a lot. Her grandmother used to get up early in the morning, wake them up and prepare porridge for them before they went to school. Their aunt is a security officer who mostly works at night and only comes home after Maria and her brothers have left for school. She has to set the alarm on the phone, which belonged to her mother, wake up the young learner and make sure they get something to eat. She also makes sure that they are properly dressed, and their books are all in order. At least, when they come from school, their aunt would have prepared lunch. All she needs to do is clean the house, supervise the children's homework and prepare dinner. Only then can she start with her own homework. Maria's teachers are noticing that she is becoming less involved in school activities and her grades are dropping. She also does not spend time with other girls her age. Some teachers say she is moody and withdrawn. Her peers however decided to go to her house every Saturday to help with the shopping, do laundry and cook meals for the whole week so that she doesn't need to cook every evening. She appreciates this a lot, but deep down, she just wants her mother and grandmother back.

Questions and tasks to reflect and discuss:

- *Do you think Maria is showing signs of Social-Emotional and Behavioural Difficulties (SEBD)?*
- *If you were Maria's teacher, what would you make of Maria's behaviour?*
- *How would you go about helping Maria improve her grades?*

Cynthy K. Haihambo, University of Namibia, Namibia

Introduction to Topic

The well-being of children in any given society depends largely on the ability of change agents in their environment to enable them to be adaptable, emotionally intelligent and self-sufficient individuals who can live a content life. Schools are therefore expected to be responsive to the needs of all learners and enable them to experience a sense of belonging and success, regardless of the difficulties they may experience. The starting point for this responsibility is to understand children through their developmental stages and challenges. Social-emotional difficulties are widespread, for example the World Health Organisation posits that about 40 million people across the world are described as being affected by conduct-dissocial disorders (WHO, 2019) characterised by persistently disruptive behavioural problems, which may present as antisocial or impulsive behaviour. Individuals with social-emotional and behavioural difficulties struggle regarding mental, sensory,

physical, communication and/or social-emotional abilities and capabilities (www.southampton.gov.uk/schools-learning/send-local-offer/intro-send/send-conditions/semh/). Some of these behaviours can be linked to certain diagnoses; however, many are influenced by a range of factors including; the home environment, the school setting, teacher-learner relationships, socio-economic backgrounds and stressors in society.

Children with social and emotional difficulties often find themselves confronted with exclusion and ostracisation. Firstly, it is important for us to understand the motivation behind the behaviour both as an expression of underlying needs and difficulties. Social-emotional difficulties should explore the wider context of a child's environment including the emotional, social and societal influences. This raises the question of what different experiences learners need in their environment to develop different behaviours. Secondly, we will identify the educational tools and strategies designed to help teachers dealing with learners presenting with SEBD. We will explore real educational experiences across different countries to facilitate our understanding of social-emotional and behavioural difficulties. Finally, we will conclude the Chapter with recommendations for teachers on how to care for the wellbeing of learners.

Key aspects

Defining SEBD

According to Zhang and colleagues, Social Emotional and Behavioural Difficulties (SEBD) are described as behaviours or emotions that deviate so much from the socially defined norm that they interfere with the child's own growth and development and/or the lives and wellbeing of others (Zhang et al., 2013). The term Social, Emotional and Behavioural Difficulties is an umbrella term and covers a complex range of divergent behaviours which can be extremely challenging for young learners, their caregivers, and educators. In particular, they have been associated in childhood with increased risks of educational underachievement, teenage pregnancy, substance abuse, unemployment, and are also predictive in adulthood of outcomes like delinquency, mental health difficulties, and social marginality (Wren et al., 2022). There is evidence that SEBDs are influenced by various bio-psychosocial factors such as gender, age, and family income level, and an increasing number of children with such difficulties live in settings characterised by social, economic, and cultural disadvantage (UKG, 2015). For example, Maria, a previously high-achieving learner, faced a dramatic life change due to family loss and subsequent caregiving responsibilities, putting her at risk for academic and social challenges that may be interpreted as SEBD.

Regarding social-emotional difficulties, a distinction is made between so-called internalising and externalising forms of expression. Internalising difficulties are characterised by anxiety, somatisation, and depression (Grubert, 2016, p. 3; Scherreiks and

Schwalbe, n.d., p. 4). Internalising symptoms are often less noticeable to outsiders but can lead to a high level of stress for the affected young learners affecting their socioemotional development, and severely impairing their participation in learning. In the context of anxiety and depression, this can manifest itself in a variety of physical and psychological symptoms, including suicidal behaviour (ibid). In Maria's case, her withdrawal from social interactions and school activities could be seen as an internalising response to her overwhelming responsibilities and the profound loss she experienced.

Externalising difficulties, on the other hand, are much more visible to the outside world. This category includes attention and social behaviour disorders, whereby the latter is usually referred to as behaviour that violates social norms, e.g. through aggressive, impulsive or oppositional behaviour (Mingebach, 2018, p. 5).

The described manifestations make it clear that there is a large variety of SEBDs which we can frequently – knowingly or unknowingly – encounter. It is important to underline at this point that the educational intervention must aim at managing the behaviour the child is presenting with, and not with changing the child her/himself. We will elaborate on how to achieve this, including various methods and case studies, in the following chapter.

Childhood development and attachment needs

Social emotional development in early childhood is closely related to the attachment process and to the development of the stress-regulation system (Kain et al., 2020, p. 31). According to Bowlby, attachment is an emotional bond that connects people across time and space. (Bowlby, 1969). Children develop a strong bond with those who are in close proximity to them, and who provide a 'secure base' when they are scared or distressed, even if they are not in the same place at that moment.

The need for attachment is one of the basic human needs. We are unable to survive without attachment. In situations where an infant feels insecure, the emotional connection with the attachment figure helps the infant to self-sooth and regulate his/her emotions, thus creating a secure attachment. Responding consistently and sensitively to the infant's needs is important and infants who are securely attached explore objects in the safety of the caregiver's presence. Safety in attachment is therefore necessary for learning and development. Through attachment we develop the ability to control our own emotional state, so that we learn to deal with situations that trigger feelings such as fear, anger, sadness, etc. (Kain et al., 2020, p. 32).

Babies are unable to self-regulate but rather need an attachment figure to co-regulate them. This means that caregivers support the baby's self-regulation in situations where the child's stress level increases. Therefore, it is necessary for the caregiver to recognize the cause of the increase in stress and respond to it promptly and sensitively (Kain, et al., 2020, p. 32). Caregivers must also be able to regulate children's stress and emotions. In order to do this, they must have first learnt how to manage their own emotions and stress levels.

The autonomic nervous systems of people influence each other. A calm and well-regulated person unconsciously sends out emotions via facial expressions, eye contact, muscle tone, sweat production, and signals of safety, which are also unconsciously picked up by other people to calm their own system. Likewise, the signals of stress in another person can also cause their own stress level to rise (Levine, 2011). This is a challenging task for parents, as stress and emotional distress of the child initially cause their own stress levels to rise.

Consistent co-regulation is crucial for social and emotional development: the process of co-regulation (between caregiver and infant) allows the infant to regulate her/himself. According to Schore, this is one of the main mechanisms of early childhood (Schore, 2001) (Kain et al., 2020, p. 33). Without this, the nervous system becomes overstimulated leading to unregulatable emotions and resulting in stressful behaviours labelled as challenging by others. The real challenge is borne by the children who face a difficult situation in several respects. They do not have caregivers who are available to them as a "safe haven" in difficult situations, and are incapable of managing their own emotions. Their failure to respond appropriately to difficult behaviour, provokes angry or aggressive responses which may be compounded by a stressful environment for which they feel unable to control. Consequently, they may substitute strategies that provide them with a sense of control and safety. This can result in very specific behaviours that compensate? for the lack of emotional regulation? cannot be changed by cognitive explanations, "if – then" interventions or so-called "consequences", as these interventions do not consider the underlying lack of regulatory strategies.

Every person finds their own ways and needs different things to feel safe. Here are some examples:

A seven-year-old pupil tried to be in constant contact in different ways. She was constantly checking in or just talking in class. She often sought physical closeness to her teacher and wanted to sit in front of her and hold her hand. If the teacher refused, she took every opportunity to come to the front. She liked to look for misbehaviours of the other pupils so that she could run to the teacher and tell her about it. In other situations, she felt the need to check every few minutes if what she was doing was right.

Her behaviour was understood as "seeking attention" and was responded to by ignoring her efforts as much as possible so as not to make her feel successful with her strategies. The goal, of course, was to get her to stop these behaviours. The result was different. She repeated these behaviours because the need for security had been reinforced. This behaviour must be understood by teachers as a form of communication if they are to give her what she needs: the feeling of being seen, the certainty of being safe with her teachers, after several very insecure life experiences in early childhood in her family.

The second example shows a different behavioural strategy, which was developed through the experience of domestic violence.

An eight-year-old boy showed great difficulties in concentrating, he was constantly in a state of movement, his reactions were very impulsive and with a high level of aggression.

In addition, he had great problems learning the content which was taught. He was given the diagnosis of ADHD. On closer observation, however, it became clear that the boy had no problem with a lack of attention, quite the opposite. He was able to pick up everything that was going on inside the classroom, every conversation between two pupils, every movement, every emotional change in individual pupils, he perceived every need of each individual pupil. And even things outside the classroom, in the corridor, on the school grounds, he was extremely aware of. If something happened somewhere that was perceived as threatening by his highly activated and not well-regulated nervous system, he left his seat and ensured that the situation could be brought under his control through behaviour that was judged as aggressive from the outside. Since the detection of potential dangers and the reaction to them required his entire capacity, he hardly had any capacity left for the subject matter and was perceived as inattentive, unfocused and impulsive. (Julia Bialek, Counsellor in different schools)

Questions and tasks to reflect and discuss:

- How can understanding a child's need for safety shift a teacher's approach to classroom behaviour?
- How might recognizing the root causes of behaviour help create a supportive learning environment?

These are just two examples, to which many more could be added, which highlight how forms of expression described as SEBD arise out of a dynamic that is always related to experience. One underlying developmental dynamic was described here, yet, a multitude of possible causes could be summarised under the term SEBD from attachment research, developmental psychology, neurobiology and various other fields.

Young learners' problems with the system?

The importance of a strong relationship between learners and teachers has been widely acknowledged (ref?). Research has underlined some fundamental differences between teachers' and young learners' points of views: for example, teachers may attribute behavioural difficulties to young learners' personality, their lack of motivation or disruptive nature, or family problems. Meanwhile young learners complain about unfair treatments, prejudiced attitudes and lack of empathy or listening capabilities and they may exhibit difficult behaviours to resolve problems (Spera and Wentzel, 2003; Cooper and McIntyre, 1993).

A study (Cefai and Cooper, 2010), that sought the views of secondary school students exhibiting SEBDs in Malta, has identified five main themes which represent barriers to learning, well-being and inclusive education:

- Poor relationships with teachers; in which young learners perceive a lack of understanding and support, or feel humiliated and inadequate when teachers ignore them. The lack of connection may prevent them talking about their emotions or problems;
- Sense of unfairness and injustice; especially when young learners are identified by, and labelled for, their own behaviour and sometimes punished for their peers' misbehaviour;
- Sense of oppression and powerlessness; young learners may not feel they have a right to a voice their opinion, leading to feelings of alienation and disengagement from the system;
- Unconnected learning experiences; due to boring and unrelated to real-life situations and curricula;
- Exclusion and stigmatisation; due to teachers' inability to understand young learners' social and emotional needs. Young learners become vulnerable and stop believing in themselves, and disengagement emerges as a self-protective mechanism.

Negative perceptions of young learners can also pose barriers to young learners hindering not only personal development, but the entire learning process. In the next section, we will identify factors which can enhance educational strategies and facilitate inclusion.

Methods and strategies for an education for all

Teachers

Co-regulation, Externalisation

Forming stable relationships within the school setting is crucial to the development and education of young learners. These relationships provide stability, safety, and co-regulation, all of which are essential for effective learning. Building these connections goes beyond being reliable and trustworthy; it requires a genuine acceptance and appreciation of students, regardless of any challenging behaviours they may present with. Such behaviours often serve as coping mechanisms developed in response to previous traumatic experiences or difficult challenges, and should not be viewed simply as problems to be resolved. For learners presenting with SEBDs, addressing these behaviours requires an understanding of their root causes, including family dynamics and home environment, values, and any past traumas. Observing and gathering insights into each learner's background respectfully and empathetically helps foster a deeper connection and trust, forming a foundation for effective support. This approach enables teachers to respond not only to behaviours but also to the underlying needs of each learner (Zimmermann, 2017, p. 23).

Co-regulation

If children do not have the experience of being calmed by their parents in a situation

of stress, or negative emotions, they do not learn to regulate their nervous system and emotional situation hence they must learn to co-regulate in adulthood. Co-regulation is the process by which adults support the child's emotional regulation during situations of stress and strain thus ensuring the regulation of emotion and the activation of the sympathetic nervous system to a more desirable state?. The transfer of this regulation into a self-directed ability is one of the main tasks of childhood and the prerequisite for learning social skills (Kain et al., 2020, p. 33).

How can teachers support the regulation of young learners:

1. Recognise the alarm signals that occur when the stress system is activated;
2. Remain calm themselves and radiate calmness;
3. Identify the causes of stress, show understanding, find words together for what has happened and what is needed, offer alternatives such as short breaks, exercise, etc.

It has also proven to be very helpful to get close to the learner more often, to make "soft" eye contact, i.e. to look at them in a friendly manner and with as little confrontation as possible, as a direct gaze can very quickly appear threatening. We would also recommend going on walks with young learners who are experiencing distress. Any kind of interaction or mundane activity which can happen side-by-side, (rather than directly facing each other) is much less confrontational.

Externalisation

The externalisation approach, developed by Michael White and David Epston (White and Epston, 2009), states that 'it is not the person or the relationship that is the problem, but the problem that is the problem' (White and Epston, 2009, p. 57). This approach separates the problem from the person allowing the person to take control over their life. The following questions may bring about a more productive outcome rather than focusing on the individual. When did the problem start, was it always there, in what situations was it problematic, what is the goal of the problem, what positive things could the problem have in mind for the person?

This approach reduces feelings of shame and guilt and enables the person and those around them to act together in a differentiated way and to change the problem together.

Beyond general trauma-informed principles, which are safe and resonate with young learners with SEBDs, there are a few "life hacks" that can be very helpful when working with these students. The general idea is to make yourself as unthreatening as possible. It is also important to bear in mind that, for young learners with SEBDs, anything can be perceived as threatening, particularly as they are often navigating an unknown environment which is not tailored to their needs. Small details such as personal space, direct eye contact or sudden sounds and movement can feel unsafe or threatening, even though you may have the best intentions.

My go-to are mundane everyday tasks and activities which allow us to move around each

other in our space and while giving us something to do, also allow room for conversation. One of the young learners I worked with frequently exhibited violent and aggressive behaviour when he was triggered or generally overwhelmed with things going on around him. While he and I were trying to navigate everyday life in school with this additional challenge we quickly found that he had no strategy to deal with this feeling of overwhelm and unwind in a safe and healthy manner which did not include harming himself or others. This made him feel extremely ashamed and self-conscious since he felt he had no control of his actions and felt misunderstood. He would often hang back and be apprehensive of going home and so he would spend a lot of time following me around school after hours watching me do the everyday chores, such as washing up, wiping the tables down or making copies for the next day. The company of me or my colleagues seemed to soothe him and while he stayed in the background, he began to take an interest in what was going on around him. With time he became bolder and would ask for me to give him tasks to help out and soon enough he learned to make copies, do the dishes and his personal favourite was hoovering the carpets in our classroom. He started taking pride in these tasks and was very particular about them being done correctly. It became obvious that these things were helping him decompress as he had some co-regulation, mild exercise and a sense of achievement. We began to incorporate these strategies into our class routine, and he learned to express that he needed to unwind and ask whether he could go and hoover the carpets. Now, having someone vigorously hoovering the carpet while you are working is not as distracting to most people as you would expect and the other children were unphased by it, knowing to keep their distance while he was cleaning since it was his way of relieving pressure. Of course some of my colleagues needed some getting used to this newfound strategy since admittedly it is quite unorthodox. To me it was an absolute life saver since we had finally found something that worked and which he responded well to and on top of that proved to be very useful. (Christine Carstens, teacher)

Questions and tasks to reflect and discuss:

- Have you developed specific strategies working with young learners exhibiting SEBDs?

- What are situations in which these methods or strategies could be useful?

- Do you require resources, support or further information in order to apply the aforementioned strategies?

- How can everyday tasks and routines serve as tools for helping young learners manage overwhelming emotions and find a sense of control and achievement?

Parents

Collaboration between families and teachers

Even though there are many contributing factors, it's safe to say that parents and caregivers are key players in the development of young learners. They are experts when it comes to their children, and yet they are often disregarded or excluded by the system. Having a stable and trusting relationship with a teacher is of vital importance, especially as children cannot be viewed in isolation from their families and backgrounds.

Parents or caregivers, especially of young learners who are exhibiting SEBDs, may face many challenges and are often subjected to the judgement of others. That being said, we are fully aware of the limits of teacher training, and some may not feel well-equipped for the task at hand. The collaboration we are referring to here, however, does not necessarily require extensive training or specific qualifications. Rather, it focuses on building relationships with the young learners and understanding the contextual factors which impact their learning/education.

If you feel self-conscious or are not quite sure how to get started, active listening is a quick and simple approach which can be easily incorporated into your practice. This approach also works well with parents. For example, teachers tend to talk a lot, and we would recommend giving parents more time to tell their stories which may be helpful in identifying the difficulties facing the young learner in the home environment. An 80/20 percent ratio is ideal . When speaking with the parent or caregiver, be attentive, ask questions, validate their feelings and try to learn everything about the family situation. Not only does this build a deeper understanding and trusting connection with them, but, it includes them in the process and hopefully empowers the parent to make changes to support their child? (Zimmermann, 2017, p. 75).

I would like to give you a relatable example of an encounter that I had with a mother which happened to be one of the many stories that stuck with me. So, this mother's son was transferred to my group at the age of 16 after having been expelled from numerous schools. For reasons of anonymity, I won't give you an exact number but it was in the double digits. The mother had a reputation of being what most people might refer to as "difficult". Due to her own biography and her experiences concerning the education of her son, she had many negative associations with the educational system, child protective services, institutions and people in general. She was apprehensive of leaving her flat at all and had isolated herself and her son completely. In doing so it seemed that she herself had become a barrier to her son's development and was depriving him of many opportunities he could have had otherwise.

So, I made it my priority to go and visit them in their home regularly. Luckily my school's policy worked in my favour as visiting every family in their home once a year is a mandatory requirement. These visits aren't meant to be any kind of examination but are merely another chance to get a different perspective and form a connection. It took many phone calls and a lot of convincing for her to agree to me coming over. Also, I made a point of explaining and describing to her, in great detail, what exactly would happen during the visit and what to expect. So I literally told her:" I'm going to ring your doorbell, you will let me in and tell me where to sit and that's exactly where I'll be. I won't touch anything, check for dust or otherwise

invade your personal space. If you have a cup of coffee for us, that's lovely and if not that's also fine." That seemed to put her mind at ease a little and when I visited her, I was very careful to stick precisely to what we had previously agreed on.

When we finally sat together on the couch in her living room, the appearance of the flat made it obvious that she was struggling. I kept my thoughts to myself, however. This visit was meant to be about establishing a relationship and not berating her or giving her unsolicited advice about her living situation. I simply let her talk and as it turned out she had so much that she wanted to get off her chest. Feelings about being misunderstood, unjustly treated or simply the perception of being abandoned by the school system. Many school and institutional representatives had initially contacted her and made grand promises about wanting to work with her son. Usually however, a couple of months after these conversations, she would receive a call, telling her that she and her son were no longer wanted and that he was being expelled from this or that school for varying reasons. At some point she had given up on trusting the educational system altogether.

I let her talk and vent about her experience for the entire time that I was there, listening and observing. Then, when it was time to go, I remember us, standing in the door frame together and her asking me out of the blue when I would be back. That was the moment I realised that I had a foot in the door. I asked her when she wanted me to be back, and she suggested that I come back at the same time the following week. From that moment onward our visits became a regular thing which she began to look forward to and our relationship slowly progressed. It was obvious that I alone did not have the expertise or resources to support that woman, I could however install a support system of experts who did. So, with each visit, little by little, I would begin to make suggestions and offers as to how we could improve her and her son's situation and because of the relationship we had built she was able to agree to them.

There were several aspects of her situation that needed to change – for legal, medical or other reasons, which were non-negotiable. Instead of confronting her with that however I would always make sure to give her options to choose from which made the entire procedure more respectful and much less invasive, giving her a sense of control over the process. When presenting her with options I, again, would go into much detail about what would happen at which time and what exactly to expect. Eventually it was even possible for me to bring other people into the equation. She didn't trust those people but was prepared to accept them into her personal space because she trusted me, and I had told her it would be alright.

Her son is no longer attending our school, not because he got expelled, but because he graduated. He is now enrolled in a training programme for young adults preparing them for the job market. His mother is a lot more stable now than she used to be. She has moved to a different apartment, has taken up a job and actively seeks help when she feels that she needs to. Her and I are still in contact, and I receive a Christmas and birthday card every year. I personally see this case as a success and believe that it shows that relationships between teachers, learners and their families go a long way. It wasn't so much about having

specific qualifications or being an expert in anything in particular. It was about reaching out to somebody and making a connection. (Christine Carstens, teacher)

Questions and tasks to reflect and discuss:

- Are there examples where you can include active listening in your performance at school?

- How could you structure a support system in similar cases where you are from?

- What are resources available to you to help you collaborate with parents successfully?

- How did the teacher's approach of consistent visits, active listening, and offering choices in the example above empower the mother to trust the school system again and support her son's path to success?

Peer education

<u>The importance of peers in the process</u>

Peers play an important role in influencing the behaviour and values in the peer group (McWhirter, 2013). Young people form peer clusters which can be a good or bad influence. If the influence is negative, it can jeopardise efforts made by the school. However, if the peers share positive values, schools can identify, and mentor learners in peer support strategies that could have lasting, positive impacts on the wellbeing of the young learner, the peers and the teachers.

According to a guide by Pennsylvania State University (2018), compared to teachers, young learners are better able to understand the life experiences of their peers. This is not unsurprising given the generational difference. In other words, children can relate more to the experiences of their peers. Issues such as your culture, language, socioeconomic background, or being subject to gossip or being excluded from a friend group are important to young people. Children should therefore be allowed, and empowered, to step into the peer support structures to help manage the dynamics of childhood Social, Emotional and Behavioural Difficulties (SEBD) more generally. Schools should not only promote positive peer relations and social-emotional development through prevention and intervention initiatives, but should also engage in teaching and modelling diversity-sensitive peer engagements and peer support. These initiatives may include efforts in two interrelated areas. One is the creation of a positive school environment that promotes belongingness and acceptance, which in turn builds social-emotional skills (this will be covered in more detail in the next topic). The second one is the creation of peer support groups and activities that promote positive and inclusive interactions – these can reduce the marginalisation of those who struggle with forming social relations, or managing emotions due to genetic, neurological and/or socio-ecological factors.

Let's look at this Case Scenario.
