A 12-year-old boy somewhere in Asia was fascinated by online games which he played since early childhood. He could easily access these games through his smart phone and was a pro. These games involved challenges, and if one played till the end and managed the challenge, you got awarded an online medal which you could print and hang on your wall. The boy played a certain game every day and received 13 medals in two weeks. He introduced the games to his friends, and they started competing for medals. It became a status thing in the peer group to have the most medals. Sometimes they played the whole night until they overcame the challenge and got the medal. The challenges became more and more complicated, and he managed to complete them all. There was one more game left to receive the award of an overall hero. He was leading with medals and told his friends that he was going to become the hero. One of his friends showed the game to his teacher and the teacher discovered that the challenges were becoming more dangerous and weird. The teacher also discovered that the final medal actually required the player to kill himself to become a hero. At that moment, the boy alarmed the teacher that they had to go to his friend's house because he was sure the friend would do whatever the game told him to do because he really wanted to become a hero. Unfortunately, it was too late! By the time the police and emergency services made it to the house, the hero had no pulse! (Cynthy K. Haihambo)

Questions and tasks to reflect and discuss:

Why was it important for the boy to achieve the medals?

• Is it normal behaviour for children of this age?

How could the dilemma of losing children in these types of games be prevented at:

• Family/ Community Level?
• School Level?

The development of peer support groups can assume various formats. One common format is delivering a workshop on peer support and at the end asking for volunteers who would like to be trained in peer support. Children can therefore develop agency to not only speak up and speak out, but also to represent themselves and others. Another format is to create a culture of care, openness, and friendliness in which mistakes and imperfections are viewed as stepping-stones and not as punishable offences. In this environment, there should be safe disclosure and support procedures as well as horizontal relationships between learners and teachers, learners and learners, teachers and teachers, teachers and communities (Jansson, 2012). Modelling these kinds of relationships enables spontaneous peer support because children feel comfortable and safe to share information and develop their own support systems (as previously seen in the Case Study of Maria presented in

the introduction of this chapter). Many schools have peer counsellors who are trained in active listening, problem identification, positive feedback and who to tell when someone needs support. From our experience, the peer support method has a number of important components: a) ensure young learners in this role have continuous support, affirmation and rewards and b) teachers are key facilitators in this process and should monitor the wellbeing of children at all times.

Positive peer culture

Developed by Vorrath and Bendtro (1985), Positive Peer Culture (PPC) aims to give children and young people the opportunity to support each other and in doing so, allows them to experience and develop their own strengths and skills. In PPC, regular group meetings are organised and attended by the young people themselves but in the presence of a specialist, who maintains a low profile. Each person in the group is given the opportunity to talk about the difficulties they are currently facing and the group then chooses which topics to work on and suggests up ideas for solving the difficulties based on their own experience. This approach has proven to be very effective as it empowers the young people to resolve issues through group communication, conflict resolution strategies, self-efficacy and social behaviour.

Learning environments

Creating safe spaces in school

Learning environments are crucial when working with learners from our target group. Creating a safe space within a school can be challenging particularly as school buildings are often designed for academic purposes, and may not appear as a welcoming and safe environment. On the other hand, a positive learning environment is essential for working effectively with young learners who struggle with social and emotional regulation. This extends beyond just the physical building and includes cultivating a culture of empathy, respect, and support through consistent interactions, clear communication, and predictable routines that help young learners feel secure. Often, school systems emphasise changing the learner, frequently through categorisation or diagnosis, or focus primarily on curriculum content. Shifting some of this focus toward adapting the learning environment can be transformative, fostering a setting where young learners feel understood and included (Naukkarinen, 2018).

Building and customising a workspace that meets the needs of the young person also presents an opportunity to bond and form authentic working relationships, especially as everyone is working towards a shared goal. When young learners are involved in designing and personalising their classroom – whether through creativity in layout, painting, or choosing resources – they feel a sense of ownership and pride. This sense of autonomy often translates into greater respect for the space and can reduce tendencies toward vandalism, a frequent issue among young learners with challenging behaviours. By creating safe, welcoming, and adaptable learning environments, teachers can significantly enhance SEBD young learners' ability to regulate emotions, focus on tasks, and engage with peers

and learning materials. For many SEBD young learners, feeling secure in their environment is a prerequisite for meaningful participation and academic progress. When young learners have access to spaces that accommodate their sensory needs, or a private retreat to decompress, they are better equipped to manage overwhelming emotions and re-engage with the class when they're ready. Additionally, involving young learners in personalising the classroom fosters a sense of ownership and belonging, reducing feelings of alienation or distrust. As a result, these environments empower young learners to be more active, collaborative, and invested in their learning, positively influencing both their social and academic development.

I personally have a strong dislike for school buildings and can only sit on an uncomfortable chair under a fluorescent light for so long. So, I greatly enjoy remodelling classroom spaces with learners because I too benefit greatly from it. Remodelling my current classroom however was a big undertaking because we wanted to include a new building structure into the available space. This was a necessity because the room had become too small and confining for the group it was supposed to house. So, we needed to get creative in order to use all available space. By chance I remembered a conversation I had the previous year with Frank Müller, the initiator of this project. He had mentioned a Swiss company that produced custom-built beehive like structures that can be vertically bolted up against a wall giving each learner an individual honeycomb as a safe space. They are lined with felt which forms a protective barrier against outside noise (great for learners with sensory issues) and have little collapsible chairs and tables so you can either sit down and work or cuddle up with a cup of tea and a blanket when you feel overwhelmed.

When I told my group about the idea, they were thrilled with it even though for legal reasons it wasn't something we could build ourselves. What we could do however was design it digitally and of course sort out the necessary funding. We were amazed to actually find a private foundation that was prepared to finance our idea and contribute three-quarters of the sum necessary and especially the young learner could not believe that a group of strangers they had never met before were willing to support them with such a huge amount of money. When our own beehive was finally set up, we had a small celebration which even the head of department and the press attended. It was a very proud moment for the group to be able to present their design to the public. Since its instalment the structure has changed the group dynamic greatly because the learners now have the option of withdrawing when they feel overwhelmed, need some space or simply want to work in peace. They still take great pride in our classroom and enjoy showing it off to the occasional visitor. (Christine Carstens, teacher)

Questions and tasks to reflect and discuss:

- Are you efficiently using the space available to you and your group?
- Are there safe spaces available for young learners?
- Have you taken sensory issues, which are often associated with SEBDs, into account?
- On what level do you believe safe spaces would impact young learners' performance?

Classroom management and differentiated teaching

<u>Helpful adjustments</u>

At this point, the need to use educational methods and strategies which allow all young learners to achieve academic success, and to consolidate the personal and social skills useful for realising themselves, in life is evident. It seems useful here to speak of didactic differentiation understood as "a basic methodological perspective capable of promoting significant learning processes for all the young learners present in the classroom, aimed at proposing targeted educational and didactic activities, designed to meet the needs of individuals in an educational climate in which it is customary to approach the didactic work in different ways" (D'Alonzo, 2016, p. 47). In the essay The differentiated classroom: responding to the needs of all learners (Tomlinson, 1999), Tomlinson suggests implementing a methodology guided by general principles such as: scheduling activities

that respect the needs and timing of young learners, creating small flexible work groups, constant monitoring and verification of the results obtained and of the young learners' perception of the work carried out. In particular, he suggests distinguishing across three areas:

- Differentiate the content; i.e. the knowledge and skills that the young learner will have to master with experience and competence, using written and oral communication, non-verbal language, the use of images and multimedia files, and therefore of IT tools;
- Differentiate the knowledge-building process; planning the functional activities to acquire the knowledge and distinguishing the learning phases;
- Differentiate the expected product; by favouring that the young learner demonstrates in an original and adequate way to the person, that they are able to competently activate their knowledge in significant and demanding activities (Castoldi, 2012, p. 190).

The distinction of these three areas therefore requires, alongside careful planning by each teacher, an in-depth knowledge of each young learner and their characteristics, passions and interests, abilities and potential. This lays the foundations of differentiated teaching and makes it possible to develop motivation and curiosity on the part of the young learners, presenting them each time with new challenging but possible and accessible tasks, from the simplest to the most complex.

D'Alonzo (D'Alonzo, 2016, p. 97-103) identifies practical suggestions to guide the action of didactic differentiation, which we deem useful to summarise:

- Organise the classroom environment by choosing elements that can be diversified; using the classroom flexibly, including the arrangement of desks and chairs, based on educational needs and choices. The use of visual signs (billboards, posters, images) which can enrich the walls of the classroom, reminding everyone of the rules to follow, shared objectives, daily steps to achieve, is particularly useful.
- Design with clarity; the objectives, tasks, phases and ways of working by answering the questions: what do I want the young learners to learn? How to know that they have learned it? How will I design teaching and assessment to support learning? (Wiggings and McTighe, 1998).
- Promote the social construction of learning; promote community experiences and the common good, alongside the personal experiences such as improving the sense of belonging, active participation and motivation, and reducing behaviours considered to be challenging.
- Provide more differentiated activities; respecting the different learning styles and times of the pupils and offering alternatives that satisfy the different needs.
- Emotionally involve; create an educational relationship based on trust and mutual support. Involve young learners in choosing the rules to be respected in the classroom

and in planning activities and tasks to be performed.

Incorporating all of the above in your daily lessons at school may seem overwhelming at first – even more so in a group of young learners presenting with SEBDs. The chances of the groups you will face in the field being homogenous enough to work on the same tasks is near zero, so it is unavoidable for you to make some adjustments. The key is to find something reliable that works for you and the group of young learners you work with.

Personally, I often struggle being organised and keeping up with small details for example – I happen to have a young learner who is on the autism spectrum who excels in these tasks however and enjoys nothing more than crossing points off to-do lists and writing evaluations. That is of course a win/win situation, since we achieve our shared goal of keeping organised and the child can make a meaningful contribution. Generally, I have had the experience that apart from a clear structure which needs to be present within the classroom in whichever way works best for you (visualisation, organised and accessible materials, flexible seating arrangements), the tasks themselves are crucial. In order for young learners to emotionally engage, tasks have to be meaningful and relatable (i. e. they need to understand why they are doing what they are doing). Merely working on differentiated materials or tapping menus on a tablet holds no merit and may quickly result in frustration. If possible, I would always favour a complex problem-based approach which is easier than you may think since in a public school with a group of young learners you never fall short of real-life problems which require solving on various levels.

In my case a good example would be an event my group had voted on hosting a couple of years ago. Since many of the children themselves have migrational backgrounds, topics such as migration and deportation were always close to their hearts and often a matter of discussion in our class. During one of these discussions the children realised that the political stakeholders making decisions in these matters, more often than not, have never actually met the people on whose behalf they are deciding. So, in an effort to change that, the children suggested inviting the politicians in question to an event they wanted to host in one of the refugee camps nearby. It was decided that it should be a party for adults and children alike, so that everybody could meet up and have a good time. So, we began to put together the event which required funding, food, drinks, activities, invitations and permits. During this process the fact that the children were so very heterogeneous and many of them were often academically challenged due to SEBDs or other difficulties that they may have been facing, became secondary because we quickly realised that every one of them had their own unique set of skills which made them invaluable to our undertaking. The children who were structured and good with numbers took responsibility for the organisation, children who were experienced with household duties were in charge of food and drinks, others with many siblings got busy planning activities for our young visitors, pupils who were physically able were in charge of setting up the location and others with a political interest accompanied me on my mission of inviting the local politicians (which turned out to be a mission indeed!).

The children quickly realised that the usual structural disadvantages and differences which are quite prominent in regular school life, suddenly became secondary as all of us worked towards a common goal.

The event turned out to be a huge success with the number of visitors ranging somewhere around 100 and even a handful of local politicians showing their faces – something the children were extremely proud of since they didn't believe anyone would show up or be interested in what they had to say. With this event we also managed to make a fair sum of money which we intended to donate to charity completely. To our surprise the charity however refused to accept the entire sum and insisted on our group keeping half of it because the students had worked so hard and deserved a reward. We took a vote on what to do with the money and it was unanimously decided that we would buy two armchairs for our classroom for us to have a safe space to sit and chat. This event was one of many which considerably changed the group dynamic because not only did the group get to experience self-efficacy and agency, they also came to understand that every group member had a specific skill set, which even though admittedly not always useful within a school context, is often indispensable when it comes to tackling the real world. Needless to say that behavioural issues were almost non-existent during this project.

Now obviously you cannot spend your school days planning events, however there are many problems and situations to be dealt with inside and outside of school. Problems which are authentic and have many levels and different tasks, offering opportunities to you and your pupils to collaborate to reach your shared goal.

Questions and tasks to reflect and discuss:

- Are you emotionally involving young learners in your lessons?

- What is necessary for you to do so?

- How can meaningful tasks be constructed in order to educate young learners?

Conclusion

Young learners with SEBDs, as well as their parents and caregivers, face numerous challenges adapting to the rules and regulations across various societal structures. They are often misunderstood or rejected especially when the reasons for their behaviours are not visible at first glance, and require a deeper level of connection, understanding or even expertise. A gap often exists separating them from the rest of society which only deepens when they are repeatedly confronted with failure or punishment within school contexts. Schools may risk reproducing feelings of disconnection or misunderstanding among young learners, but they also possess the skills and knowledge to bridge the gap by exploring different approaches and avenues to supporting to young learners. There

are many methods and strategies which teachers and other staff can utilise, but at the core of this approach is a positive attitude and deep understanding of their difficulties. When working with young learners who present with SEBDs, it is crucial to not only have an open mind, but also the willingness to educate oneself on the topic in order to gain get a better understanding of how best to manage their needs, and to find the suitable resources and approaches to enable the young learner to thrive. We have listed a handful of approaches in this chapter nevertheless, a plethora of possibilities exist to support and educate young learners in school. Developing the skills and mindset to support young learners with SEBDs is a life-long process, and ideally not a journey that should be embarked on alone. Resources are limited, but remember there are many people researching, working and advocating for this specific group of young learners and multiple opportunities exist to share knowledge and practice. Networking and connecting with others and striving to work in multi professional teams, while difficult, can be enormously rewarding. Remember to be patient and understanding, not only with the young learners, but also with yourself, and don't hesitate to reach out and connect with others.

Local contexts

Closing questions to discuss or tasks

- How can specific background knowledge be conveyed to teachers and people in the field?
- How can this background knowledge and research be efficiently implemented into everyday school life?
- How to network and use existing resources as an efficient support system?

About the authors

Julia Bialek

Julia Bialek is working as a research assistant at the University of Bremen in the "All Means All!" project. She is a pedagogist, has a degree in special education, and has been working in the field of trauma-sensitive education for many years. She teaches this topic at the university, in training courses for educational professionals, and works as a trauma therapist.

Christine Carstens

Chris Carstens, based in Bremerhaven, brings extensive experience in teaching English and German, alongside certification as a trauma educator with a specialization in supporting children and young adults facing social and emotional challenges.

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Francesca Mara Santangelo

Francesca Mara Santangelo is a pedagogist with expertise in disability, marginality, and Behavioral Neuroscience. Her research focuses on Special Education and Inclusion. As a musician and teacher trainer, she also works on designing and implementing early educational interventions coordinating networks of schools, institutions, families, and various stakeholders. Her professional experience combines solid expertise with a

continuous commitment to promoting inclusive education and fostering neuropsychological well-being starting with children.

CHILDREN'S WELL-BEING IN INCLUSIVE EDUCATION

Example Case

Child Profile and Initial Observations and Perceptions

"Fatima, a 6-year-old girl, joined the kindergarten class at Harmony Elementary. She recently moved from Syria. Sarah Garcia, her teacher, observed that she seemed quiet and hesitant to participate in activities. Fatima struggled with English, making communication with peers and teachers difficult. She often played alone during break time and showed inconsistent academic performance, leading teachers and classmates to assume she was uninterested or having trouble adapting to her new environment."

Reflection Question: What do you think about Fatima's situation? How is the Fatima's case related to the topic of children's well-being? If you were the teacher, what would you do?

Initial questions

- How can we define and understand the concept of children's well-being?
- In what ways can we account for individual differences in children's well-being?
- How can we effectively identify and assess children's well-being?
- What factors influence children's well-being, and how can educators actively support it?
- What role does national policy play in promoting and safeguarding children's well-being?
- How can schools create environments that foster children's well-being?
- How do teachers contribute to the development and maintenance of children's well-being?
- How do peers and families shape children's well-being, and what are their unique contributions?
- How can children be encouraged to take an active role in shaping their own well-being?

Introduction to Topic

Reflection activity:

- How do you define well-being?
- How do you define children's well-being?
- How do you define children's well-being in schools?
- What has informed your knowledge about children's well-being?

Since the 1960s, the topic of "well-being" has received more attention in public discourse and more recently, the specific situation of children has also been given greater consideration. Ben-Arieh (2014) points out that the understanding of children's well-being has changed over time from that of well-becoming to well-being, and from a risk to a positive perspective. In terms of the legal background, the United Nations Convention on Child's Rights (UNCRC, 1989) plays an important role – it specifies various aspects of children's well-being and has also been ratified by 196 countries. The Convention on the Rights of the Child is increasingly employed as a framework for shaping policies aimed at enhancing children's well-being. It seeks to integrate the right to protection with the rights to autonomy and development. Article 29 highlights the concept of the evolving child and frames well-being as development, emphasising the importance of fostering the child's personality, talents, and mental and physical abilities to their fullest potential. Similarly, the child's right to freedom of expression (Article 13) underscores the importance of respecting

children's perspectives, granting them the freedom to seek, receive, and share information and ideas of all kinds. This demonstrates the right of children to be heard and have their views considered in matters affecting them.

In general, there is no consensual understanding on how to define children's well-being (cf. Minkkinen, 2013: 547; see also O'Hare & Gutierrez, 2012: 614; Mashford-Scott et al., 2012: 235). A number of examples are listed below:

- **Focusing on existential dimensions** of children's well-being, UNICEF (2023) takes into account five domains of child well-being: "Survive and Thrive, Learning, Protection from Harm, Safe and Clean Environment and Life free from Poverty". Within the domains, they use indicators such as "child marriage", "basic hygiene" or "child poverty".
- "From a **child rights perspective** well-being can be defined as the realisation of children's rights and the fulfilment of the opportunity for every child to be all she or he can be" (Bradshaw et al., 2007).

- **Focusing on educational settings**, Konu and Rimpelä (2002) argued that four needs should be taken into account in schools (adapted version of Allardt's theory of welfare) such as "having, loving, being and health status". An example of "having", would be "how do you like the school yard?", whereas "loving" could represent educational relationships. For the domain of "being", this would consist of their academic development.

Existing definitions, such as the ones above, differ in terms of the domains of life they focus on, including the conceptions of the good life on which they are based, and the level of expectations formulated. In this respect, it depends on the spatial and temporal context, e.g. whether the focus is on the current life situation or on factors that will increase well-being in the future (cf. Mashford-Scott et al., 2012). Furthermore, conceptions of well-being differ in terms of how the child is perceived: For example, whether they are perceived as active agents of well-being.

The next step is to introduce the Structural Model of Child Well-being (SMCW), which will be used as a working definition. We will also discuss what child well-being means from a holistic perspective.

Key aspects

Structural Model of children's well-being

Figure 1: Structural model of children's well being

Source: Minkkinen, 2013

As mentioned above, there are different understandings of child well-being. In the following, we present Jaana Minkkinen's structural model of child well-being. We have chosen her model as there are clear references to the UNCRC and it includes Bronfenbrenner's ecological system theory (1981) as well as the work of Vygotsky. For example, Minkkinen emphasises the role of the child as "a constructive, social actor in his or her own life and as an agent in society" (Minkkinnen, 2013: 553). In addition, she highlights the impact of the different dimensions or concepts on children's well-being.

In defining children's well-being, Minkkinnen (2013) lists four dimensions, which interplay with each other:

1. **"Physical well-being** comprises health, the absence of disease, and proper physical functionality" (Minkkinen, 2013: 550). In this regard, Minkkinen takes into account that the prerequisites such as their general health status differ between children, and that they have an impact on their current well-being.
2. **"Mental well-being** concerns the positive mental situation of the child. It refers to mental health and the absence of psychiatric disorders and includes both emotional and cognitive well-being." (Minkkinen, 2013: 550).
3. **"Social well-being** refers to a positive situation between the child and the people in his or her life" (Minkkinen, 2013: 551).
4. **"Material well-being** implies a positive material situation in the child's life. It relates to having sufficient nourishment, housing and other material items that are normally elements in the standards of living in the society and culture surrounding the child" (Minkkinen, 2013: 551) .

In addition, Minkkinen (2013) describes four circles which have an impact on children's well-being (see Figure above):

- **"Subjective action** refers to the internal and external activities engaged in by the child that produce well-being for him or her" (Minkkinen, 2013: 552). It relates to concrete activities such as thinking, speaking or playing" which may an impact on current well-being or have a positive influence on future well-being.
- **"Circle of care** refers to those people interacting with the child face to face and their physical, cognitive, emotional, and material support for the child" (Minkkinen, 2013: 554). It emphases how individuals can have a significant impact on children's well-being. This could be relatives such as parents, peers, medical professionals, people from the neighbourhood and teachers, and those who are jointly responsible to take care of the respective children.
- **Structures of Society** "refer to the way in which social order and cooperation concerning children are organised in society, namely by institutions such as the family, childcare, healthcare, education (…), and the laws and conventions which regulate the functional requirements of these institutions" (Minkkinen, 2013: 555).
- **Culture** refers to "all kinds of human and societal activity, and pervades every circle in the model" (Minkkinen, 2013: 555).

Minkkinen's structural model of well-being takes into account different dimensions of well-being and illustrates how these dimensions interact. In addition, it highlights the idea of the child as an active agent. However, it also identifies different circles that can have an impact on children's well-being.

Children's well-being in educational settings

————————————————

Reflection activity:

- Why is it important for teachers to feel responsible for the well-being of their students?
- What options do teachers have with regard to the well-being of their students?

————————————————————

With regard to children's well-being, O'Toole and Simovska (2022) point out that 'it makes little sense to talk about children's cognitive or academic progress without also assuming their personal, social and emotional well-being, or vice versa' (p. 25), in other words, both dimensions are intertwined. It would therefore be short-sighted to view well-being only as a means towards promoting cognitive achievement. It should also be clear that cognitive performance can also have an impact on well-being. In this respect, both well-being and wellbeing need to be considered.

Well-Being from an inclusive perspective

————————————————

Reflection activity:

- What does children's well-being mean from an inclusive perspective?

————————————————

If we look at the structural model of child well-being from an inclusive perspective, it is evident that the concept of well-being—and how it is experienced—varies greatly from child to child, as their unique circumstances shape what is achievable for them. As Minkkinen pointed out, the prerequisites for well-being are not universal and depend on individual factors. For instance, a child with a chronic illness will have a different understanding and experience of well-being compared to a child without such an illness or disability. In this context, well-being cannot be uniformly defined, as the goals and benchmarks for one child's health and quality of life may differ significantly from those of another.

Theoretical background to children's well-being

This sub-chapter explores key theories essential to understanding children's well-being, and focuses on child development, attachment theory, and resilience theory. These theories provide a comprehensive framework for examining how various factors, including relationships, environments, and personal attributes, influence the growth and well-being of children.

Child Development

Child development is an intricate and dynamic process through which children grow, learn, and acquire the essential skills necessary for living in society. This process is multifaceted, encompassing physical, cognitive, emotional, and social domains, each of which plays a crucial role in a child's overall well-being (Britto et al., 2016; Fattore et al., 2006). During early childhood, particularly the first five years, children undergo rapid brain development, with neural connections forming at an astonishing rate (Britto et al., 2017). These early experiences significantly influence cognitive abilities, emotional regulation, and social interactions (Housman, 2017; Kagitcibasi et al., 2001). According to Jaana Minkkinen's Structural Model of Child Well-being, these early experiences, and the broader environment, are critical in shaping the child's development, linking to the subjective actions of the child—their thoughts, emotions, and activities, which directly contribute to their sense of well-being (Minkkinen, 2013).

The environments in which children are raised, including the quality of their relationships, the stimulation they receive, and their access to adequate nutrition, profoundly shape their developmental trajectory (Bradley & Corwyn, 2008; Britto et al., 2016; Britto et al., 2017). Minkkinen emphasises the Circle of Care, which includes those individuals – such as family, peers and teachers – who directly interact with the child and provide physical, cognitive, emotional, and material support. This circle forms a crucial foundation for the child's growth, ensuring a stable and nurturing environment that promotes healthy development. A nurturing and supportive environment that provides consistent love, intellectual stimulation, and physical care sets the stage for healthy growth and development (Britto et al., 2017). Within this Circle of Care, parents and caregivers play a pivotal role in mediating the impact of external risk factors, such as marginalisation, deprivation, and disadvantages, on a child's outcomes. Parental knowledge, attitudes, behaviours, and resources significantly influence a child's development (Bornstein et al., 2022).

Moreover, societal structures, as described in Minkkinen's model, are integral to children's well-being. Schools, in particular, represent a key component of the societal frame, offering structured opportunities for learning, social interaction, and access to resources that support children's development. Schools not only provide education but also foster environments where children can develop social skills, build relationships, and experience a sense of belonging. Through the societal frame, schools help shape children's experiences and opportunities, serving as a bridge between the immediate support offered by the Circle of Care and the broader cultural values and norms.

Encouraging parents to contribute to early childhood development and minimise inequality and disadvantage is a key national and worldwide public policy priority (Department of Children, Equality, Disability, Integration and Youth, 2023; Government of Ireland, 2019). By ensuring children have access to supportive environments – whether through family, community, or schools – we lay the groundwork for long-term well-being,

resilience, and success in life (Bakermans-Kranenburg et al., 2005) thus ensuring children become agentic citizens of society. This approach aligns with Minkkinen's emphasis on children's roles as "constructive social actors" in shaping their own lives and their ability to engage with society (Minkkinen, 2013).

Attachment Theory

Attachment theory, developed by John Bowlby and later expanded by Mary Ainsworth (Bretherton, 1994) , offers a comprehensive framework for understanding the critical role of early relationships in a child's life. According to the theory, the bond formed between a child and their primary caregiver is foundational to the child's emotional and social development, shaping the child's potential to learn and thrive (Guerrero, 2021; Pallini et al., 2016; Raby et al., 2012). This attachment bond, established in the early years, serves as the blueprint for future relationships. Secure attachment, characterised by a caregiver's consistent responsiveness and sensitivity, fosters a sense of safety and trust in the child, enabling them to explore their environment with confidence and form healthy relationships throughout life. Within Minkkinen's model, these secure relationships are integral to the Circle of Care, directly impacting the child's subjective actions and sense of well-being.

Conversely, insecure attachment, which may result from inconsistent, neglectful, or unresponsive caregiving, can lead to difficulties in managing emotions, forming relationships, and maintaining self-esteem (Lewis et al., 2000; Priddis & Howieson, 2012). Disorganised attachment, often associated with experiences of trauma or neglect, poses even greater challenges, leading to deep-seated issues with trust, fear, and emotional instability (Green & Goldwyn, 2002; Skibniewski-Woods, 2017; Wilkins, 2012). The attachment style that a child develops in these formative years profoundly impacts their ability to build and maintain relationships, handle stress, and navigate social situations. Therefore, fostering secure attachments through attentive and responsive caregiving is crucial for promoting social, emotional, behavioural, and educational well-being in early and later childhood.

Resilience Theory

Resilience theory describes the capacity of individuals, particularly children, to adapt positively to adversity, stress, or trauma (Masten, 2018; Masten & Barnes, 2018). Central to this theory, resilience is viewed as a dynamic process influenced by a combination of internal and external factors such as individual characteristics, family dynamics, and broader social environments. Resilience involves the ability to self-regulate, solve problems effectively, maintain a positive self-concept, and access supportive relationships. These aspects align closely with Minkkinen's concept of subjective actions, as children actively engage in problem-solving and develop coping mechanisms.

The development of resilience is largely facilitated by protective factors that mitigate

the impact of adverse experiences (Rutter, 1985; Rutter, 2012). These protective factors are closely linked to the Circle of Care – supportive relationships with caregivers, positive experiences within the educational system, and a cohesive, caring community (Werner, 1996). Schools, as part of the societal frame, also play a crucial role in fostering these protective relationships, helping children to develop resilience by providing a safe and structured environment for growth and learning.

Conclusion

The concepts of child development, attachment theory, and resilience theory are deeply interconnected, collectively highlighting the critical importance of nurturing environments in promoting children's well-being. Healthy child development is fundamentally dependent on the presence of secure attachments, which provide the emotional foundation necessary for children to explore their world, form meaningful relationships, and develop a sense of self-worth (Masten, 2001). These secure attachments, in turn, are instrumental in fostering resilience, enabling children to face challenges with confidence, adaptability, and perseverance.

When children are supported through the Circle of Care, consisting of strong, stable relationships and positive developmental experiences, they are more likely to thrive, even in the face of adversity. This interconnectedness underscores the need to ensure that children grow up in environments that foster secure attachments, support healthy development, and build resilience. Such environments, influenced by societal structures like schools and guided by cultural values, contribute to children's immediate well-being and lay the groundwork for lifelong mental, emotional, and social health.

By nurturing these foundational aspects, we contribute to the development of resilient, well-adjusted individuals who are capable of contributing positively to society, ultimately leading to a more resilient and healthy community as a whole.

Indicators of children's wellbeing

Internationally, there has been a plethora of well-being assessment instruments designed to determine levels of at least one feature of children's well-being. However, in reality, the practical application of these instruments is inadequate for the purpose of actually teaching in the classroom. In terms of data collection for example, UNICEF must rely on the accessibility, and availability of, data when assessing the status of child well-being across different countries (UNICEF, 2023). Furthermore, while the data provides invaluable, if not complete insight into the implications of events on children's well-being, it does not produce contextual information which educators can use in the here and now.

Within the broader use of well-being measurement instruments, social indicators are key, as they gather data relating to health, safety, feelings of love and happiness, successful social relationships, access to learning and development opportunities, and material or

economic necessities. Indeed, Ben-Arieh and colleagues (2014) argue that the general concept of well-being represents a conceptual framework that merges empirical studies and normative assessments while also bridging policies and research. For instance, The Good Childhood Index (UK) was developed by The Children's Society in 2010 as part of their well-being research programme and is still in use today. It measures the well-being of children aged eight years and over. The Index is made up of a five-item measure of overall life satisfaction using the Modified Students Life Satisfaction Scale – a single item measure of happiness relating to life as a whole – and finally, a series of questions about well-being in ten key areas of children's lives. These areas include: family, friends, health, home, appearance, time use, the future, money and possessions, school, and amount of choice. While this provides important information, there is little practical guidance for the educator on how to understand the thoughts and feelings of children they work with on a daily basis.

Traditionally, well-being measurement instruments, rather than supporting children's current levels of well-being, are very much problem-based and deficit-focussed as they are tasked with providing information to tackle what are seen as potential future problems such as mental health disorders, obesity, or anti-social behaviour (Liddle & Carter, 2015; Tisdall, 2015). For example, the New Economics Forum, a think tank that offers innovative ways of looking at future investment and economies, discusses measuring children's current levels of well-being meaningfully to inform policies which will promote future economic stability (Lawlor et al., 2009). These types of well-being measurement approaches are seen as valuable, particularly in the fields of politics and economics, in terms of both assessing current interventions and informing funding and planning for future ones (Qvortrup, 2009). Such well-being measurement scales construct the child in terms of being a human becoming future adults whose potential physical and social demands on society must be managed by addressing what is 'lacking' within her/his current context, rather than as a human being – a competent and agentic social actor with inalienable rights, operating in the here and now (Einarsdottir et al., 2015; Minnkkinen, 2013; O'Toole, Dowling & McElheron, 2023; Qvortrup, 2009). It could be argued that children's current levels of well-being are frequently scrutinised through a negatively focussed lens, often to inform prospective actions and decisions rather than to recognise and nurture their contemporary levels of well-being. However, it must be acknowledged that children's current lived experiences are valuable indicators of prospective outcomes over which society can have a positive effect and has a duty to nurture.

There has been some movement in terms of the consideration of children's well-being within measurement instruments. This is evidenced by some attempts to reframe mental health and well-being in terms of positive psychology which highlights the power of utilising positive experiences and reflections to bring about effective change (Liddle et al., 2015; Nishida et al., 2021). Yet another development is the move towards considering subjective well-being, or seeking out children's evaluations of their 'personal assessment processes' as Minkkinen has put it (2013: 550). These personal assessments of well-being involve

individual's self-reports of health, welfare and overall satisfaction and happiness and are seen as crucial to the true and effective measurement of well-being. This can be seen in resources such as the Stirling Children's Well-Being Scale (SCWBS) which was developed by the Stirling Council Educational Psychology Service in the United Kingdom, and has been adapted for use in various international contexts. Its development drew on current theories of well-being and positive psychology to provide a method of measuring the effectiveness of interventions and projects designed to promote children's well-being and emotional development. The SCWBS utilises a set of positively-worded questions to establish a holistic gauge which measures the emotional and psychological well-being of children aged 8-15 years. While the SCWBS's move from focusing on mental illness to subjective mental well-being is a constructive one, it should be said that this is a development which has taken place on a limited scale within a specific area of well-being research, that of mental well-being. While this trend of using a strengths-based lens to examine aspects of children's well-being is gaining momentum, it is yet to be the norm in other domains of well-being research, such as environmental or physical (Nishida et al., 2021).

A significant factor to keep in mind when considering children's well-being frameworks is the fact that they have almost exclusively been designed by adults with children as their focus, but with little or no design input from children themselves (Fane et al., 2020; Rosenthal and Ben-Arieh, 2022). The exclusion of children's perspectives from child well-being knowledge is problematic as it affords the possibility for undemocratic and inequitable child well-being frameworks which can stifle children's agency. Notably, recent innovative research has revealed that when children are involved in research on this topic, they bring a unique perspective, often identifying important concepts which have often been lacking in previous research. In particular, child researchers have specifically identified agency and autonomy as key indicators of how to accurately gauge their own well-being (Moore et al., 2018; Moore et al., 2021). These studies sought to address the imbalance between child and adult voices in research on children's well-being. Importantly, they have positioned children as co-researchers and provided a platform for children to contribute to the body of knowledge on children's well-being (Moore et al., 2018; Moore et al., 2021). This repositioning of children as co-constructors in research, rather than merely participants, reframes them as intrinsic and integral to that research rather than simply incidental to the curiosity of the researcher. Within these studies, children have clearly articulated what well-being means to them with many identifying well-being indicators which are already utilised within current child well-being frameworks. However, many of these studies have also empowered children to contribute to new ways of defining and measuring well-being such as the importance of children's agency and autonomy in play (Fane et al., 2020; Hart & Brando, 2018).

With that in mind, whether designed with or without children's insights, such well-being measurement scales generally require the user to answer written questions while removed from the context of a dynamic educational setting, rather than recognising and responding

to indicators of well-being while they are being played out in real time. In essence, whether well-being measurement tools are being completed by a child or an observer, the information which is gathered is based on predetermined measures and is more likely to be used to inform future developments as opposed to guiding dynamic and ongoing interactions. While these well-being measurement scales serve a valuable purpose, they are seemingly ubiquitous, with far fewer resources to support the educator in everyday practice. Resources focussed on dynamic well-being indicators, or in simple terms, those that support educators in knowing what to look out for, are far fewer on the ground. In response to this, a resource to guide educators in gauging children's active and dynamic well-being is available at the end of this chapter.

What has an impact on children's wellbeing and how can we support children's well-being?

Shaping Well-Being: The Role of National Policy in Supporting Children and Families

National policy plays a crucial role in promoting children's well-being by developing strong and supportive families and communities. This role is multifaceted, encompassing the establishment of legal frameworks, the provision of essential resources, and the implementation of programmes designed to create environments where children can thrive. Central to these efforts are national policies that establish legal frameworks to protect and promote children's rights and well-being, ensuring that every child receives the care and support necessary for healthy development. These frameworks align with Jaana Minkkinen's model, particularly in shaping the **societal structures** that impact child well-being. They create a society where the safety and well-being of children are prioritised and safeguarded, contributing to the broader societal and cultural context in which children grow (see Hickey at al., 2023).

One key aspect of policy is the enactment and enforcement of child protection laws. Such laws are designed to shield children from abuse, neglect, and exploitation, which are critical to ensuring their physical and emotional safety (Burns & McGregor, 2018; Devaney & Gregor, 2016; Devaney & McGregor, 2015). For instance, mandatory reporting laws require professionals who work with children, such as educators and healthcare providers, to report any suspicions of abuse or neglect, thus creating a safety net for vulnerable children (Hanly, 2020; Pellegrini et al., 2022). This aligns with Minkkinen's concept of **structures of society**, where institutions like schools and healthcare systems are crucial in maintaining and protecting children's rights. Additionally, family support legislation plays a significant role in fostering environments where children can flourish. Policies that mandate parental leave allow parents to spend crucial early months with their newborns, fostering secure attachments that are foundational to emotional and social development. Flexible working hours and family benefits further support work-life balance, enabling parents to be more

involved in their children's lives, which is essential for nurturing strong family bonds and promoting overall well-being (Hewitt et al., 2017; Heymann et al., 2017; Moss-Racusin et al., 2021).

Child poverty is a complex and multidimensional issue that goes beyond a mere lack of financial resources, encompassing broader concerns such as social exclusion, capabilities, and human development. While traditional definitions of poverty focus on inadequate command over economic resources (Atkinson, 1989), contemporary perspectives recognise that poverty's impacts extend to fundamental aspects of a child's well-being, such as their ability to participate fully in their community or lead a life they value (Sen, 1999). This broadened understanding underscores that poverty not only diminishes material living standards but also limits access to opportunities, impacts social relationships, and restricts agency. For children, these deficits are particularly detrimental as they shape their developmental trajectories and influence their future life chances, highlighting the urgency of addressing child poverty as a multidimensional problem (Lister, 2004). Lone parenthood, ethnicity, disability and family size have been identified as being associated with persistent poverty (Children's Rights Alliance, 2023). Prolonged exposure to poverty and deprivation significantly affects children's outcomes across various domains, including their physical and mental health, educational achievement, and socio-emotional well-being (Children's Rights Alliance, 2023). It can also lead to low self-esteem, which may contribute to mental health difficulties later in life. The longer a child remains trapped in the cycle of consistent poverty, the more profound the negative impact on their self-perception, aspirations, and ability to seize opportunities and reach their full potential. However, these outcomes are not inevitable, and with the right policy decisions, it is possible to break the cycle of child poverty.

National policies allocate funding and resources to universal and targeted supports that directly benefit children and their families. Early family supports are crucial in addressing and mitigating the impacts of poverty and economic stress, which as discussed above, can be significant barriers to child well-being. Welfare programs such as child allowances and tax credits provide families with the financial means to meet their children's basic needs, such as food, clothing, and shelter. These efforts relate to Minkkinen's emphasis on **material well-being**, ensuring that children have access to resources that meet their basic needs and contribute to a stable living environment. Such supports are particularly vital for low-income families, helping to level the playing field and giving all children, regardless of their socio-economic background, the opportunity to thrive. Policy initiatives in Ireland such as Better Outcomes, Brighter Futures (Department of Children and Youth affairs, 2014), the Early Childhood Care and Education (ECCE) programme (2016) and First 5 (Department of Children and Youth affairs, 2018), are dedicated to the provision of quality services for young children and their families in order to improve their child learning, development and wellbeing and support parenting competencies. More recently, the Young Ireland (2023) framework (Department of Children, Equality, Disability, Integration and Youth, 2023),

developed in consultation with children and young people, ensures that future strategies reflect a child rights-based approach to decisions that affect children by placing them at the centre of policy and decision-making. This approach is designed to target child poverty and well-being by focusing on key areas, including; education reform and inclusion in education, child protection, access to housing and access to further/higher education, youth and family justice, and play and recreation and the digital environment.

Early supports for families, supported by national policy, often include the provision of home visiting services. These services are services, are often multi-faceted in their aims, but many prioritise strengthening the parent-child bond, offering guidance on responsive parenting practices that foster secure attachment and emotional stability. In addition, many services often focus on enhancing cognitive development through early learning activities and guidance for parents on how to stimulate their child's intellectual growth at home. By promoting positive interactions, home visiting services reinforce the circle of care described by Minkkinen, to help ensure that children benefit from supportive relationships in their formative years. A recent review of home visiting in Ireland found that home visiting promoted child learning and development, strengthened parent and child skills, and fostered a positive parent-child bond (Hickey et al., 2024). While there is considerable evidence that home visiting, as an early intervention programme, can help to promote positive child development and family outcomes in disadvantaged areas, evidence as to 'what works best' is hampered by the variability of programme components and robust evidence on programme effectiveness (Hickey et al., 2024).Despite this, home visiting programmes are particularly effective in reaching families who might be isolated or have limited access to traditional services. They have been shown to mitigate the effects of poverty and related challenges such as substance use or housing instability by connecting families to community resources and offering tailored support (McGilloway et al., 2024). By offering support directly to families, these services bridge the gap between state resources, including psychological and therapeutic services and other healthcare and educational systems, and the day-to-day realities of parenting. This aligns with Minkkinen's model, where the structures of society – including policies and services – play a vital role in shaping children's environments. By funding home visiting services, national policies help ensure that families receive early, consistent support, enhancing the **subjective actions** of children – how they engage, learn, and grow – within a nurturing and stable context. Ultimately, this holistic approach contributes to creating a more equitable and inclusive society, where every child has the foundation to achieve their full potential.

Policy in inclusive education plays a critical role in upholding the well-being of children with special educational needs (SEN) by ensuring their access to quality education. This begins with legal frameworks that guarantee the right of children with SEN to learn alongside their peers in mainstream classrooms. These frameworks often align with international agreements, such as the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD), which emphasises the importance of inclusive education. By

embedding these rights into law, policies hold educational institutions accountable for providing supportive and accessible learning environments. This legal protection ensures that children with SEN are not discriminated against, and that their specific needs are addressed, thus creating a foundation for their academic and social well-being. By promoting inclusivity, national policies help create a school culture that aligns with the **cultural** aspects of Minkkinen's model, where every child feels valued and supported, which is essential for their social and emotional development. This inclusive approach is not only beneficial to the child with SEN but also enriches the educational experience for all students, fostering empathy, understanding, and a sense of community.

In addition to legal guarantees, inclusive education policies provide for the allocation of resources that are essential for meeting the diverse needs of children, particularly children with disabilities/ SEN. Funding supports the hiring of specialised professionals, such as special education teachers, speech therapists, and psychologists, who can provide targeted support to children. It also enables training for general educators, equipping them with the skills to implement inclusive teaching strategies. Furthermore, policies often provide for assistive technologies and adaptive learning tools that allow children with SEN to engage with the curriculum. These resources ensure that students with SEN have the tools and support necessary to overcome barriers to learning, promoting their academic growth and allowing them to participate fully in the school environment.

Inclusive education policies also focus on fostering school cultures that embrace diversity and create a sense of belonging for all students. This includes promoting whole-school approaches to inclusivity, where teachers, students, and parents work together to build a welcoming and supportive environment. By encouraging practices such as Universal Design for Learning (UDL), policies help schools create flexible teaching methods that accommodate a variety of learning styles and abilities, ensuring that every child can succeed. These inclusive practices not only enhance academic outcomes but also support the social and emotional well-being of children with SEN, as they feel accepted and valued in their school community. Together, legal protections, resources, and inclusive practices ensure that children with SEN are provided with the opportunities and support they need to thrive in a quality educational setting.

In summary, national policies play a pivotal role in promoting children's well-being by establishing the legal and social frameworks necessary for the development of strong, supportive families and communities. Drawing on Minkkinen's Structural Model of Child Well-being, these policies shape the **societal structures** that support the Circle of Care surrounding each child, while fostering environments where children's **subjective actions** can flourish. Through a combination of legal protections, financial support, access to healthcare and nutrition, and the provision of quality education, these policies create an environment where children can thrive. By addressing the diverse needs of children and ensuring that all have access to the resources and opportunities they need, national policies help lay the foundation for a healthier, more equitable society.

Children with Special Educational Needs and Disability: A Holistic Approach to Well-Being

Children with special educational needs face unique challenges that can impact their well-being across physical, emotional, social, and academic domains. Inclusive educational settings are essential in fostering an environment where these children can thrive, not merely by addressing deficits, but by recognising and building on their individual strengths and capabilities (Forde, 2023). The importance of a nurturing and supportive "Circle of Care," as outlined by Minkkinen's structural model, is particularly critical for children. This care network – encompassing teachers, peers, families, and wider community resources – must work collaboratively to create an environment of belonging and inclusion. Legal frameworks such as the UN Convention on the Rights of Persons with Disabilities (UNCRPD) reinforce the necessity of inclusive education, holding institutions accountable for providing accessible learning environments. Practical measures, such as individualised learning plans, assistive technologies, and tailored teaching strategies, ensure that students with SEN have equitable opportunities to achieve their full potential. However, inclusion goes beyond academic support – it also requires cultivating a school culture that prioritises social connection, emotional well-being, and active participation for all students. Schools that embrace UDL principles, for example, not only accommodate diverse needs but also foster a sense of community and shared purpose, enriching the educational experience for every child.

The Ethics of Care in Supporting Inclusion and Belonging

Ensuring the well-being of children with SEN necessitates an "ethics of care" approach, particularly in a neoliberal context where the emphasis on measurable outputs and academic performance often sidelines relational aspects of education (Forde, 2023). In such systems, teachers may find their capacity to extend care constrained by time pressures and accountability metrics, leaving those with the greatest need for support underserved. Yet, care is central to fostering a sense of inclusion and belonging which are critical components of well-being. When educators prioritise care, they create spaces where children feel valued, understood, and empowered to participate. This care must be visible not just in one-on-one relationships but also in the broader school culture, reflected in inclusive policies, collaborative leadership, and meaningful engagement with families and communities. Research underscores that a caring approach mitigates the negative effects of systemic inequities by addressing the relational and emotional dimensions of learning environments. Teachers, therefore, act not just as instructors but as advocates and allies, ensuring that the voices of SEN children are heard and their needs met. By embedding care into the fabric of educational practices, schools can resist the depersonalising tendencies of neoliberalism and instead cultivate environments that ensures the well-being of all

children—especially those with SEN—can thrive as active and valued members of their communities.

Holistic Approaches to Supporting Well-Being in Inclusive School Settings

Reflection Activity:

What might affect a child's well-being at school?

How could schools support child well-being?

The role of the school in supporting well-being in inclusive settings needs to be addressed holistically. According to Minkkinen (2013), a comprehensive understanding of child well-being encompasses not only individual development but also the social, emotional, and environmental contexts in which children thrive. To effectively support children's well-being, schools must address a range of factors, including optimal school conditions, such as resources, physical facilities and support services. Key indicators of students' well-being include positive attitudes and emotions towards school, joy in the learning environment, a positive academic self-concept, and the absence of worries, somatic complaints, and social problems (Hascher, 2003). Creating a nurturing environment and positive climate is essential, as is fostering inclusive leadership practices that engage students in decision-making. Additionally, building strong partnerships with families and the community, along with providing robust support and training for educators, is crucial for fostering an inclusive atmosphere where all children can flourish.

School conditions in terms of well-being refer to the physical conditions of the area, the learning environment, and the services provided by the school (Konu & Rimpela, 2002). An ideal school environment utilises the physical structure to encourage healthy behaviours and support social-emotional well-being, encompassing educational spaces, physical activity, and food preparation (Hawkins et al., 2023). Physical conditions include crowdedness, noise level, lighting, ventilation, temperature, cleanliness, safety (incident risk), and facility conditions. The conditions in a classroom are significantly affected by school resources, and how these resources are effectively used is crucial for creating an optimal learning environment. However, having more resources does not guarantee well-being, nor does having fewer resources mean that children's well-being is not supported. The real impact of schools on children's well-being is not determined by how much resources they have but by how effectively those resources are used. From a justice perspective, as Schweiger (2015) emphasises, the focus should be on what children can realistically do and become (i.e., their capabilities and function) rather than just the resources provided to them. Resources are only valuable if successfully transformed into opportunities that enhance children's well-being. This perspective highlights that, inequities and injustices, such as discrimination, can hinder the effective use of resources, making it crucial for schools to ensure that their resources are used in ways that genuinely support the development and well-being of all children.

Other essential parts of the learning environment are the psychological and emotional environment, often called the school climate. A positive climate feels safe, friendly, inviting, and supportive; others feel exclusionary, unwelcoming, and often unsafe (Kutsyuruba et al., 2015). Thapa and colleagues (2013) identify five essential school climate aspects critical to fostering a positive and effective learning environment. Firstly, safety includes rules and norms, physical safety, and social-emotional safety, ensuring that pupils feel protected and supported. Secondly, relationships play a crucial role, including respect for diversity, strong school ties and commitment, social support, effective leadership and the impact of students' race and ethnicity on their perceptions of school climate. Third, teaching and learning covers a broad spectrum, including social, emotional, ethical and civic education, service learning, and support for academic and professional growth, as well as teacher and student perceptions. Fourth, the institutional environment addresses the physical environment, resources, and facilities that contribute to the functionality and attractiveness of the school. Finally, the school improvement process involves continuous efforts to improve various dimensions of the school environment to create a better overall climate for students and staff. Taken together, these aspects provide a comprehensive framework for understanding and improving school climate.

Positive relationships within the school context are known to contribute to children's well-being. From an ecological perspective, any relationship within the school is interconnected with other ecosystems in children's lives (Roffey, 2012). The role of the school within this system is to develop its relationship positively, both within itself and with other systems as a mesosystem. From this perspective, the school serves as a space for reciprocal interactions between children, educators, staff, and home. The educator-child relationship could be a protective factor by promoting healthy development, especially for at-risk children (Pianta & Stuhlman, 2004). Teacher training from a relational perspective effectively supports teacher-child relationships at the school level (Lyon et al., 2009; Rudasill et al., 2020). Common characteristics of schools, where peer relationships are more positive, include leaders with a vision of safety and well-being, effective behavioural policies, and planning that emphasises relationality (McGrath & Noble, 2010). Holistically, implementing effective school-based Social Emotional Learning (SEL) programmes has demonstrated positive relational and behavioural outcomes for children. Another important relational aspect is staff relations. Caring relationships between colleagues and principals are positively associated with educator well-being and engagement while reducing burnout and coping with stressful situations at school (Eldor & Shoshani, 2016). These findings show that school policies that prioritise relationships can positively affect relationships within the school in a multifaceted way. Similarly, a positive, inviting, and inclusive school culture, leadership with a clear vision, safe and reciprocal relationships, and opportunities for participation are prominent in family-school relationships (Haines et al., 2015). Additionally, the way to effective school-family relationships is to see the family as equal

partners who want the best for the children and involve them as collaborators in their child's learning (Roffey, 2012).

School leadership is seen as a critical factor for children's well-being and inclusion, targeting specific learning needs that vary depending on the context (Fonsén et al., 2022; Douglas, 2022). The principles of effective leadership for inclusion are as follows: inclusive principles, a strategy that includes the whole school, and a shared leadership model (Ekins, 2013). It is important to prepare inclusive principles and a strategic foundation in an adaptable way. This outlines the school's shared idea of inclusiveness and steps to prioritise child well-being. However, creating this shared idea means reviewing the members' values, beliefs, and meanings. The Index for Inclusion (Booth et al., 2006) is helpful for schools planning their inclusive practices. This includes the key concepts for inclusion, such as planning techniques for inclusive frameworks, and outcome evaluation strategies, and is a useful roadmap for schools looking to support child well-being and participation. While it is clear that prioritising whole-school well-being and inclusiveness is a systematic process, it is also evident that the leadership that promotes these practices is highly effective. Ryu and colleagues (2020) indicate that leaders can shift the school approach more positively with their educational vision, personal values, and adjustments to organisational priorities and structures, transcending individual relationships. To effectively implement the systematic changes, school leaders must be trained, exposed to good practices, and supported in developing their vision, as this can significantly impact inclusiveness at schools. Consider visiting the "Leadership for Inclusion" chapters for detailed information about inclusive school leadership.

Teachers as Catalysts for Children's Well-Being: Key Influences and Support Strategies

Improving what we do as educators and perhaps more importantly, how we do it, builds personal practice, confidence and self-esteem. When practice is honed, meaningful connections can be made between educator and student, laying firm foundations on which both educator and child well-being can be built. Considerable research has identified the symbiotic relationship between educator and child well-being (Harding et al., 2019, Lavy & Naama-Ghanayim, 2020; Marigen et al., 2022;). In particular, this relationship emphasises the importance of the connections between educator well-being and classroom interactions, which in turn support affective environments which nurture social, emotional and cognitive development for all concerned. Educator well-being can be influenced by different factors, many of which have been discussed elsewhere in this chapter (see section on School's Role in Supporting Well-Being). However, on an individual level, educators who focus on developing an effective personal practice are well positioned to improve levels of personal and professional well-being. So how can we hone our practice?

Reflective Practice

The process of reflection is regarded as an essential aspect of building teaching practice (Brookfield, 2017; Farrell, 2015); and its implications for improving communication and building relationships, underscores reflection as an integral skill required to support inclusive practice and children's well-being. It has frequently been noted that educators reflect constantly, although often in an informal way (Brookfield, 2017; Kraft, 2002; Schön,1983; Schön, 2017). While the knowledge to be gained from regular reflecting on the practicalities of what happens during an educator's working day is invaluable, critical reflection provides a deeper understanding of an educator's personal practice. So, when does reflection become critical reflection? Schön's research on professional education (1983) focused on distinguishing between reflection *in* action and reflection *on* action. Reflection in action is the thought process that we have whilst involved in a situation, during which we become aware of what we are thinking, feeling and doing. Whereas reflection on action takes place at a later stage, when we consider the events that took place and the subsequent consequences, and relate these to what we were thinking, feeling and doing. The dynamic interplay between both types of reflection creates a process in which the educator can better understand the implications of her/his personal practice and the far-reaching effects it can have on others, including their subjective well-being.

This is particularly pertinent when considering the relational aspect of pedagogy and the complex nature of actions and interactions which take place in a dynamic and diverse classroom environment. Indeed, relational pedagogies require significant levels of responsiveness and reciprocity which are regularly informed by relevant and meaningful feedback on their efficacy. Reich (2017) reports that the ability to be appropriately responsive or as he terms it, reflexive, requires constant reflection. Within the process of self-reflection, there is a degree of self-research which leads to developing levels of personal understanding and growth. Of course, any process is made more fruitful by applying as much pertinent information to it as possible. One way to appreciably inform reflective practice is to utilise Brookfield's four lenses of critical reflection (2017). He suggests that educators need to see themselves from different angles in order to fully appreciate many aspects of their practice, including the effect they have on others and their sense of self. He goes on to argue that as individuals harbour implicit views and assumptions that guide their actions, then perhaps the individual is not always best placed to interrogate their own actions objectively. By extension, when educators reflect on their own teaching, they are more likely to self-confirm their actions rather than self-reflect. Brookfield offers some guidance in counteracting this tendency by identifying four lenses which can be used to guide educators to be objective in their subjective reflection. These are:

Students Eyes

Seeing ourselves through the eyes of students allows us to understand the effect our actions and communications can have on them. Our actions, even when they are entirely well-meaning, can have significant effects on a child's well-being in both positive and negative ways. It is important to recognise and acknowledge that the meanings we ascribe to our actions may not be perceived in the same way by the students who are at the receiving end of those actions; looking at ourselves through the eyes of the students provides valuable insight into how our actions and communications are received.

Colleagues' Perspectives

Inviting colleagues to observe and discuss practice can provide insights from those who have a shared, contextual understanding and appreciation of actions and interactions. They can offer new perspectives and often suggest responses which may never occur to individuals when reflecting in isolation. Moreover, shared and professional dialogue regarding children's learning, development and well-being bolsters shared and sustained thinking, and fosters a sense of inclusive practice amongst team members.

Personal Experience

Your own experience as a student educator brings with it a wealth of understanding of how environment, context and dynamics can help or hinder your ability to feel secure, confident and self-assured. Continuous Professional Development (CPD) provides ongoing opportunities to not only upskill in specific areas, but also offers opportunities for personal reflection on learning contexts and environments.

Theory and Research

Theory and Research can furnish unanticipated and illuminating interpretations of the familiar, as well as revealing unfamiliar knowledge and understanding. Moreover, Theory and Research are not static in nature, but rather evolve, bringing ever-developing understanding to our work as educators. Arming ourselves with the most current and pertinent information can only support our efforts to nurture children's well-being and build inclusive educational settings.

Brookfield's four lenses framework is highly valuable in enabling educators to assess the impact of their personal practice and is particularly pertinent in relation to supporting educator and child well-being.

Pedagogy of Care

A significant element of Minkinnen's SMCW Model (2013) is the presence of *a **Circle of Care,*** in which it is acknowledged that children's well-being is highly dependent on those

individuals who interact with them face to face. Here it is recognised that, amongst others, teachers provide physical, cognitive, emotional and material support to children through a lens of care. However, the connection between care and education is one that is more embedded in some educational areas than others. For example, the field of Early Childhood Education and Care (ECEC) is one which espouses the belief that education and care are intrinsically linked, and that there cannot be one without the other. As a direct result of the interconnectedness of care and education, children's well-being is often a key focus of educators within the field of ECEC. The Key Person Approach (Goldschmied & Jackson, 2004) often acts as an effective framework that Early Childhood Educators utilise to direct their focus and actions. This approach sees each child explicitly linked to an educator who is personally responsible for building a close relationship with the child, acting as a significant figure of attachment for the child and liaising closely with family. Within other educational settings, the subject of well-being is often just that – an explicit topic which is covered by a detailed curriculum. For example, in Ireland, well-being has been added to the Primary and Special School curriculum, with an overall goal of supporting children's well-being through integrating the subjects of Physical Education (PE) and Social, Personal and Health Education (SPHE). This has led to 'well-being' being treated like other subjects within the curriculum, often with the usual set of expectations, such as homework, attached. Correspondingly, a report on equity and excellence in education from the International Organisation for Economic Co-operation and Development (OECD) revealed that indeed, schools in many jurisdictions typically rely on explicit curricula and programmes as the prevailing approach for promoting student wellbeing (OECD, 2016). According to the report, most schools implement wellbeing programmes through dedicated units or strands within physical and health education, civic and citizenship education, moral or religious education. This is in contrast to the area of ECEC, where care and well-being are seen as an implicit part of educators' work with children as opposed to an explicit body of knowledge to be imparted. While it is vital that educators know, and work, within the curriculum they are provided with (what we do), however, how educators work with children when utilising the curriculum (how we do) is equally important. When care underpins educators' actions and interactions, relationships are stronger and well-being is fostered.

Building a Sense of Belonging

It is interesting to note that many well-being measurement scales contain evaluative questions based on feelings of belonging, highlighting the importance of individuals feeling a sense of inclusion or togetherness for the betterment of their subjective well-being. Added to this, the growing body of research which examines the link between a sense of belonging and effective learning contexts and environments (Hurley, 2023; Juutinen, Ólafsdóttir, & Einarsdóttir, 2024; Rose & Shevlin, 2017), points to the necessity for educators to promote environments where children feel they belong. Engaging with diverse communities of students requires the educator to adopt the view of belonging as a holistic

and relationally constructed concept which does not necessarily require a shared language, ethnicity, religion, gender, background or age. Rather, what is required is a sense of shared space and focus, where each person present feels that she/he is welcomed, recognised, valued and has agency within that space. As in all matters related to children's well-being, the educator's role in building a sense of belonging is informed by her/his relationships with those with whom that space is shared. Knowing each child's personality, strengths, and family and cultural context, is key to shaping a space that can both reflect and nurture those who engage within it, adult and child alike. When educators build a welcoming and empowering educational setting, they not only reveal the complexities and the strengths of the children they work with, but they also provide a window into their personal practice, revealing the values and care that underpin their work with children.

Peer's and Family' Role: What has an impact on children's well-being and how can we support children's well-being?

The relationship between parents and children serves as a critical protective factor in a child's well-being, offering emotional security, guidance, and a foundation for resilience. This bond becomes even more significant when extended to include collaborative relationships with schools and teachers, creating a unified support system that reinforces the child's well-being. When schools actively engage with families – particularly those of children with special educational needs (SEN), disabilities, or immigrant backgrounds – they bridge gaps in understanding and create opportunities for tailored support. Adopting a capabilities approach in these collaborations ensures that the focus is on what children are capable of, rather than merely addressing deficits. Close communication between parents and educators enables a shared understanding of the child's unique needs and strengths, fostering trust and aligning efforts to create inclusive and supportive environments. For children from immigrant backgrounds, this collaboration can address cultural and linguistic barriers, promoting a sense of belonging and validation. Likewise, for children with SEN and disabilities, this partnership ensures access to resources, adaptive strategies, and emotional support tailored to their individual circumstances. Families play a vital role in shaping educational policies and practices through active participation in advisory committees, school councils, and decision-making processes, ensuring their perspectives are valued and included. Additionally, strengthening family capabilities through targeted workshops on parenting skills, home-based learning, and behaviour management empowers parents to effectively support their children's education and well-being. Ultimately, when families, schools, and teachers work together with a shared commitment to inclusivity and well-being, they create a powerful framework for protecting and nurturing each child's growth and potential.

Siblings play a critical role in shaping a child's well-being, often serving as companions, confidants, and role models within the family dynamic. Positive sibling relationships can offer emotional support, a sense of security, and opportunities for social learning, which

are especially important for children with special educational needs (SEN) or those from immigrant backgrounds. For instance, a child with SEN who has a nurturing sibling may experience increased self-confidence and social competence as their sibling advocates for their inclusion and helps bridge gaps in communication or understanding with peers and teachers. Similarly, an immigrant child may rely on their sibling to navigate new cultural or linguistic challenges, providing a shared sense of identity and resilience in the face of adversity. However, strained or neglectful sibling relationships can have the opposite effect, potentially exacerbating feelings of isolation or inadequacy. For example, a child with SEN who is teased or excluded by a sibling may internalise negative perceptions of their abilities, impacting their emotional well-being and self-esteem. Minkkinen's Circle of Care framework emphasises the critical role siblings play as part of a child's immediate support network, influencing their social, emotional, and developmental outcomes. Schools can reinforce these positive sibling dynamics by involving siblings in collaborative activities, offering guidance on how to support one another, and recognising the unique contributions siblings make to a child's well-being. By fostering strong sibling relationships, families and schools can create an environment where every child feels valued, supported, and empowered to thrive.

Peers also play a pivotal role in shaping a child's well-being, particularly in the school environment, where friendships and social interactions significantly influence their emotional and social development. Positive peer relationships can provide children with a sense of belonging, validation, and emotional support, which are crucial components of well-being. For children with special educational needs (SEN), or those from immigrant backgrounds, having a supportive peer group can be transformative. For example, a child with SEN who is included in collaborative classroom activities, or befriends peers who offer encouragement and assistance, may experience enhanced confidence, reduced anxiety, and improved engagement with learning. Similarly, an immigrant child who is welcomed by peers and invited to participate in cultural or linguistic exchanges may feel a sense of inclusion and pride in their identity, which fosters resilience and self-esteem. Conversely, the absence of such positive interactions can lead to isolation and exclusion, undermining a child's well-being. For instance, a child who is marginalised, due to their disability or linguistic differences, may feel disconnected and develop low self-worth, negatively impacting their academic and social development. Minkkinen's Circle of Care underscores the importance of these peer relationships within the broader ecosystem of well-being, highlighting how peers, as part of the child's immediate social environment, contribute to emotional safety and positive development. Schools can nurture this dynamic by fostering inclusive practices, promoting empathy, and creating opportunities for cooperative learning, ensuring that all children – regardless of their background or abilities – have the chance to thrive within a supportive peer network.

Schools can play a vital role in fostering well-being between parents and children, siblings, and peers by creating inclusive opportunities that strengthen these relationships.

This approach aligns with Minkkinen's Circle of Care, which emphasises the importance of close, supportive interactions in a child's immediate environment. Below are practical examples tailored to children with SEN such as a chronic illness.

Fostering Well-Being Between Parents and Children

- **Parent-Child Workshops:** Organise regular workshops focused on joint activities, such as art projects, storytelling, or cooking classes. For example, a school could host an "Inclusive Family Art Day," where children with SEN and their parents work together on creative projects that emphasise teamwork and communication.
- **Home-School Journals:** For a child with a chronic illness who may miss school frequently, schools could provide a home-school journal that allows parents and teachers to communicate daily about the child's needs and achievements. Parents could also share positive moments at home, reinforcing their connection with the child.
- **Family Inclusion Days:** Host events like "Family Fun Days," where parents can participate in classroom activities or see their children's work is showcased. For a child with a chronic illness or disability, this could include an adapted environment where they can fully participate.

Fostering Well-Being Between Children and Their Siblings

- **Sibling Support Programs:** Create school-based sibling groups where siblings of children with SEN such as a chronic illnesses can share experiences and receive guidance on how to support their sibling. For example, a school counsellor could facilitate sessions where siblings discuss strategies for helping their brother or sister feel included during play or activities.
- **Inclusive Learning Projects:** Plan activities that involve siblings working together, such as science fairs or reading buddy systems. A child with SEN could partner with their sibling to present a project that highlights their unique strengths, fostering mutual respect and teamwork.

Fostering Well-Being Between Children and Their Peers

- **Peer Buddy Systems:** Pair children with SEN, or chronic illnesses, with supportive peers for activities like group work, lunch breaks, or recess. For example, a peer buddy could help a child with mobility issues navigate the playground, ensuring they feel included in social interactions.
- **Social Skills Groups:** Run small, inclusive social skills programs where children learn about empathy, active listening, and inclusion. A child with SEN could benefit from structured opportunities to build friendships in a supportive environment.
- **Inclusive Celebrations:** Ensure that all children, including those with chronic illnesses,

disabilities, from ethnic minorities etc. are part of school-wide events. For example, during sports day, offer adapted activities where all children can participate, such as wheelchair-friendly races or team-based games that focus on collaboration rather than competition. For cultural events ensure representation of all children.

- **Peer education and self-advocacy:** When children are given the opportunity to share their experiences, such as explaining a chronic illness or a unique learning need to their peers, not only fosters understanding but also reduces stigma and builds empathy within the classroom. This process allows children to develop confidence and agency, enabling them to feel valued and respected for their contributions. For example, a child with diabetes might explain how they manage their condition, helping classmates understand their needs while encouraging acceptance and support. Peer education and self-advocacy not only benefit the individual child but also create a more inclusive and empathetic school culture where all children feel empowered to share their stories and perspectives.

These practical initiatives reinforce the **Circle of Care** by fostering positive, reciprocal relationships among the key individuals in a child's immediate environment, i.e., parents, siblings, peers, and educators. By creating spaces for collaboration, understanding, and mutual support, schools ensure that children with SEN feel valued and included. These efforts not only enhance individual well-being but also contribute to a culture of empathy and community that benefits all children.

Child's level: What has an impact on children's well-being and how can we support children's well-being?

Reflection Activity: How can educators create an environment that empowers children to express themselves and engage actively in their own well-being?

Children's well-being is a multifaceted concept that we are trying to expand our knowledge of. In this section, we will focus on the individual child. We could gain a more comprehensive understanding by considering children as active subjects in their own well-being (Mason & Danby, 2011). Beyond this, conceptualising the child as a social actor who structures their own world and as an agent who transforms society will reveal a more meaningful perspective (Minkkinnen, 2013). Child well-being is connected to daily experiences, including their interactions with people, places, activities, and time (Fattore et al., 2009). Research shows that children's subjective well-being is influenced by their agency and sense of control, opportunities for play, interactions with educators, peers, and staff, and feeling safe and secure at school (Fattore et al., 2009; Jevtić & Visković, 2021). Although these concepts are intertwined and support each other in terms of children's well-being, it would be useful to talk about how they can be supported by looking at their separate meanings.

Fostering children's agency and participation in inclusive settings is essential for their well-being and development. Children have the right to express their views on matters affecting them, and this participation is crucial for their holistic development (UNCRC, 1989). According to Minkkinen (2013), children's agency is integral to their overall well-being, as it enables them to navigate their social environments and contribute meaningfully to their learning experiences. Agency, that is the ability to make choices and have a say in their lives, empowers children to become active participants in their learning and social environments (Jans, 2004). According to Sen's capability approach, children can be seen as agents who construct their own world; however, they must have opportunities to realise their agency so that they can be capable (Hart & Brando, 2018; Sen, 1993). Likewise, looking at the agency as a practical achievement rather than a priori assumption could be a more empowering approach (Jerome & Starkey, 2022). It means that even though agency and the right of participation are universal rights, it is possible to emerge through interaction and negotiations between the child and the school. This can be achieved by providing diverse opportunities for decision-making, whether it is choosing activities, contributing to classroom rules, or engaging in group projects. Using dialogic communication techniques, where children are encouraged to express their thoughts and feelings openly, helps to foster a sense of agency. Tools like visual aids, storytelling, and role-playing can be effective in facilitating this process.

Play is essential for children's well-being, encompassing their physical, emotional, and psychological health. Through play, children can build connections with people and places, learn independently, and develop confidence, resilience, self-esteem, and self-efficacy, all crucial for their overall well-being (Cole-Hamilton & Gleave, 2011). Furthermore, children's subjective well-being is strongly linked to free time and play opportunities (Corominas et al., 2021). Research indicates that engaging in playful experiences positively influences children's development, regardless of their age group (Gordon, 2014). Given these findings, promoting free play in the classroom and at school, and providing playful learning experiences, will positively contribute to children's well-being. Creating supportive environments across multiple domains, to support children's well-being through play within an inclusive education framework, is essential. This involves integrating play-based learning into the school curriculum, designing classrooms with flexible and accessible spaces for various types of play, training educators to incorporate inclusive play into their teaching, and ensuring sufficient unstructured recess time to allow play that benefits all children. Lynch and colleagues (2023) suggested universal design principles for facilitating play in inclusive settings. A play promoting space for all should serve equitable, flexible, simple, and intuitive use, include perceptible information, tolerance for error, different sizes and spaces, and require low physical effort. In this way, the space could be responsive to the changing needs of play and learning.

Children's relationships with peers and adults play a significant role in their well-being, especially in inclusive educational settings. In particular, the quality of those relationships

provides emotional support or a sense of relatedness, which contributes to positive development, including higher levels of engagement, motivation, and academic performance (Sabol & Pianta, 2012). From Minkkinen's perspective, the 'Circle of Care' emphasises the importance of a supportive relational environment where children feel valued and understood. Supporting well-being from a relational perspective at the child level, it is essential to understand the children and their perspective on relationships, help relationship-building skills, and create space for them to express themselves and their feelings. It is thought that the relational support perceived by children may be effective in their adaptation to school, and that negative relationships may also be a determinant to school-related adaptation difficulties (Harrison et al., 2007). In educational settings, where children from low-income, culturally and linguistically diverse backgrounds may risk feeling like they do not belong at school or consider dropping out, the protective role of relationships becomes even more critical (Jain et al., 2019; Reicher, 2010). On the other hand, child temperament could affect teacher-child interaction quality (Rudasill & Rimm-Kaufman, 2009). For example, shyness could impact the closeness in teacher-child relationship. It is important to be aware of the character, temperament and differences between children, to ensure their inclusion and to support reciprocal relationships. For these relationships to progress positively for the child, it is important to think about ways to create opportunities to get to know the child and support them to express themselves.

Initial recognition methods – including observations, checklists, and informal interviews – help educators identify a child's developmental level, interests, and needs (Bagnato, 2007). With young children, it is also essential to have a check-in routine to understand their well-being (Laevers & Declercq, 2018). Creative methods could be used to explore their ideas and opinions about their well-being (Pople & Cotton, 2014). Drawing, playdough, videos, and photobooks could potentially be tools for children to reflect on their perspectives on well-being. While creative methods help to understand children, they also allow children with different needs to express themselves, thanks to various techniques. Another critical method is participatory observation (Fine & Sandstrom, 1988). Observations can be made by understanding the child's culture, verifying the information the adult understands from the child, and diversifying the methods. Building trust through empathetic communication is vital; active listening and attention to verbal and non-verbal cues help educators grasp a child's feelings and thoughts (Petrie, 2011). Offering self-expression opportunities through art, play, or storytelling further deepens understanding, ensuring each child feels seen, heard, and supported.

It should be taken into consideration that different children may give different meanings to these dimensions and have different needs. This can be challenging, and it is crucial to be mindful of and respectful of children's individuality and diverse identities. For instance, a child who speaks a different language at home may require language support, and a child with a physical disability may need specific accommodations to access the playground. Children who feel anxious about interacting with their peers may benefit from private

conversations with their teacher, one-on-one peer support, and gentle encouragement. As seen in the examples, knowing and understanding the child can be seen as an important step in supporting the child's well-being in the classroom. Understanding each child in an inclusive setting begins with recognising their unique strengths, needs, and preferences (Villa & Thousand, 2021).

Building a Strong Circle of Care for All

Ultimately, a strong **Circle of Care** within a school ensures that all children – whether they have disabilities, come from marginalised backgrounds, or face unique challenges – are supported holistically. This approach is rooted in the idea that every child needs a network of caring individuals who provide consistent and meaningful support. By creating a nurturing environment where teachers, peers, families, and communities collaborate closely, schools can offer the emotional security that children need to feel safe and valued. For instance, teachers who are trained in inclusive practices can provide differentiated instruction tailored to each child's unique learning needs, while peers contribute to a sense of belonging and acceptance through positive interactions. Families, when engaged as active partners in the educational process, help bridge the gap between home and school, ensuring that children feel supported in every aspect of their lives. This comprehensive approach allows schools to be more responsive to the individual needs of each child, creating an inclusive atmosphere where all students can thrive.

In addition to emotional support, a strong Circle of Care is critical for fostering social development, which is especially important for children who may feel isolated or excluded due to disabilities or socio-economic disadvantages. Inclusive schools that prioritise peer support and collaboration create opportunities for children to build friendships and develop social skills through group activities, peer mentoring programs, and cooperative learning. These experiences are essential for building empathy and understanding among students, helping them to appreciate the diverse backgrounds and abilities of their peers. For children with disabilities, being integrated into social activities alongside their classmates can reduce feelings of isolation and increase their sense of belonging, while for marginalised children, such interactions can help break down social barriers. By facilitating positive social interactions, schools contribute to a broader culture of inclusivity, ensuring that every child has opportunities to develop the social competencies that are critical for success both inside and outside the classroom.

Moreover, a well-rounded Circle of Care also addresses the **academic foundation** needed for children to thrive, especially for those who might face additional challenges in their educational journey. Through individualised learning plans, access to specialised support services, and a curriculum that respects diverse learning needs, schools can ensure that every child receives the guidance and resources they need to succeed academically. For instance, children with disabilities might benefit from assistive technologies that help them

access learning materials, while those from marginalised backgrounds may need additional academic support to overcome gaps in their educational experiences. By providing these resources, schools help level the playing field, giving each child the tools they need to reach their full potential. The Circle of Care thus acts as a framework that integrates emotional, social, and academic support, creating a well-rounded educational environment where all students are given the opportunity to flourish. This holistic approach ensures that inclusivity is not just a policy, but a lived reality, where every child is empowered to succeed.

Promoting the well-being of children with disabilities and other marginalised groups in an inclusive school is a comprehensive effort that requires collaboration among teachers, peers, families, and the wider community. By strengthening the **Circle of Care** and addressing broader societal barriers, schools can create environments where all students, regardless of their needs or background, can flourish. In line with Minkkinen's Structural Model of Child Well-being, this approach ensures that every child has the opportunity to experience positive physical, emotional, and social development, ultimately contributing to a more inclusive and resilient society.

Conclusion

Now, it's time to recall our case. After reading the chapter, what did you think of to encourage Fatima, include her in the classroom, and support her learning? Here is the rest of the case.

The Unseen Factors

Beneath the surface, Fatima's migration background played a significant role in her behaviour. Her family had left Syria to escape conflict, facing numerous challenges such as housing instability, financial difficulties, and the emotional toll of leaving their homeland. At home, Fatima found solace in drawing and painting, expressing her feelings and experiences through art. She also had a keen interest in animals, though the language barrier and cultural differences at school made it difficult for her to engage with these topics. These unseen factors contributed to her shyness and reluctance to participate in class.

Intervention and Support

Recognising Fatima's potential, her teacher, Ms. Garcia, took the initiative to understand her better. After noticing Fatima's interests, Ms. Garcia arranged a meeting with her parents to learn more about her background. She then incorporated visual aids and bilingual resources into her teaching, helping Fatima grasp the curriculum better. Art projects became a regular part of class activities, allowing Fatima to express herself creatively. Ms. Garcia also paired Fatima with Layla, a bilingual classmate, to assist with language and class activities, and

organised cultural lessons and a "Cultural Heritage Day" to celebrate diversity, fostering a sense of belonging for Fatima.

Transformation and Conclusion

The impact of these interventions was transformative. With the support of visual aids and bilingual resources, Fatima's comprehension and engagement in class improved markedly. Her academic performance showed steady progress, especially in subjects with visual learning components. Socially, Fatima began forming friendships, starting with Layla and extending to other classmates. She became more active in class discussions and group activities, gaining confidence in her language skills and cultural identity. The inclusive and supportive environment at Harmony Elementary helped Fatima feel valued and understood, significantly reducing her anxiety and sense of isolation. Fatima's story highlights the importance of cultural competence and empathy in education, demonstrating that every child has the potential to succeed when given the right opportunities and support.

Local contexts

Closing questions to discuss or tasks

This case study highlights the complexities of supporting child well-being in an inclusive educational setting, where each child's story and needs are unique. As demonstrated by Fatima's experience, a child's initial behaviour and engagement may not provide a complete understanding; instead, they may reflect deeper, unseen factors such as language barriers, cultural adjustments, or past experiences. To effectively support children like Fatima, educators must look beyond first impressions and strive to understand each child's background and strengths. This requires a commitment to empathy, cultural sensitivity, and the implementation of inclusive practices that recognise and celebrate diversity. As you reflect on Fatima's story, consider specific steps you can take in your educational practice to enhance inclusivity. Whether by introducing cultural events, creating partnerships with families, or encouraging peer support, remember that every action contributes to a more inclusive and supportive learning environment. Let's move forward with a commitment to ensure that every child feels seen, valued, and supported on their journey to well-being and belonging.

Relationships	• Do you recognise each child as a unique individual with their own way of being, communicating and coping? • Do you collaborate with parents to gain knowledge and understanding of the child's home and family context? • Do you recognise and acknowledge each child's funds of knowledge (Moll, 2006) such as the knowledge, understanding and skills she/he has learned outside of the classroom environment such as in their family and home context? • Do you provide opportunities for children to demonstrate, celebrate and share their funds of knowledge? • Do you provide opportunities to share your own funds of knowledge?
Communication	• Do you tune in to all children; observing, interpreting and acting on cues given? • Have you developed a 'listening culture' where the physical, temporal and emotional environment is set up to seek input and feedback from others? Do you listen and act upon feedback received and then communicate subsequent developments to the actors involved? • Have you developed a Pedagogy of Listening (Rinaldi, 2001) where you as an educator recognise the multitude of ways that children can communicate? (Consider verbal and non-verbal communication, visual and expressive art, movement, focus, attention, mood, conflict, personal affect etc.)
Educational setting	• Have you provided an adaptable environment where children are facilitated in their communication? • Do you recognise the impact of immediate environmental context on children's actions and interactions (such as the difference between children's levels of movement indoors as opposed to outdoors)? • Are children 'visible' within your classroom? (For example, are individual creations displayed? Are children's quotes displayed?) • Have you built a classroom culture which invites and values diverse methods of communication? • Do you have access to assistive technology?
Reflective practice	• Do you regularly reflect in and on practice (Schön, 2017)? • Do you seek children's feedback in a variety of ways? Are all children enabled to provide feedback? • Are you aware of the Hidden Curriculum – the implicit messages children and adults receive through the actions and communications of others? • Do you seek and consider colleagues' perspectives? • Do you upskill to support practice which speaks to specific cohorts? (For example, becoming familiar with assistive technology or non-verbal communication systems) • Do you celebrate your achievements in supporting children's well-being? • Do you discuss children's well-being with significant others?

Guiding Questions to Support Educators in Gauging and Nurturing Children's Everyday Well-Being

Indicator Domain	Potential Indicator Prompts
Presentation	• Is the child active and engaged? • Is the child visible in all areas of the classroom? • Is the child experiencing enjoyment without constraints? • What does the child's posture say about her/him? • What message does the child's demeanour give? • What message does the child's focus of attention give? (For example, is the child only engaging with specific activities and ignoring others? Does the child seem like she/he is actively listening to others?) • How does the child react to being approached by others? • How does the child react to being touched by others?
Engagement	• Is the child engaging with all aspects of school life? • Is the child engaging with peers? • Does the child find it challenging to enter group play? • Does the child engage with all types of play? • Does the child observe others at play? • Is the child engaging with adults? • Is the child sharing achievements with others? • Is the child inviting input from others? • What message does the child's levels of focus give? • What did the child's transition into the setting tell you? · Did the child find it difficult to start the school year? · Did the child find it difficult to transition from parent/caregiver to school/classroom on the day?

Communication	• Is the child connecting with others? • What emotions is the child displaying? How are they being displayed or shared? • What message is the child's facial expression giving? • What message is the child's body language giving? Consider: · Stance · Posture/Demeanour · Gaze/Focus/Attention – where is the child looking? How is the child's eye contact? · Movement – is she/he moving away? · Proxemics/Positioning – is the child always very close to you? Distant from others? · Kinesics – does the child understand/use physical gestures such as a thumbs up or a waving of hands · Haptics – communication through touch such as holding your hand – does the child seek lots of tactile comfort? • Does the child's body language match their spoken language? • Does the child ask for help when needed? • Can the child communicate how she/he is feeling? • Does the child talk about home or family? • Can the child's behaviour lead to conflict? Is she/he involved in conflict often? • Can the child 'stand their ground'? Can the child advocate for her/himself when faced with a challenge?

About the authors

Anne Piezunka

Anne is an educational researcher from Germany. In her research she is interested in educational relations, the implementation of inclusive education and the potential and limitations of data collection on discrimination. She is also involved in an initiative to improve educational relations called "Reckahner Initiative für Pädagogik".

Büşra Gündeş Orman

Büşra is a researcher in early childhood education from Istanbul Aydın University in Turkey. She has experience teaching children aged 3-5 and has worked on various projects with children from diverse groups, especially those affected by poverty and migration. Currently, she supervises teacher candidates during their practicum. Her research interests include school well-being, socio-emotional learning, children at risk, and inclusive education.

Mahvand Sahranavard Espily

Mahvand is educated in English Literature. She is educated kids music teacher at Adamak institute (orff schulwerk association) in Iran. She is a vocal coach and kids music teacher around 21 years. She is teaching in an alternative school in Iran (kodakan Donya) from 2013 until now, also has experiences in working with kids 3-5 years old, Working with autistic children , low concentration children and hyperactive children. Managing many different kids event such as Pinocchio, Little black fish, Alice in wonderland, manage play week, nations celebration, manage many internal and external travels for kids, manage different visit for kids and invite many different musicians, manage many workshops for parents in different fields, member of literature work group,music work group, child friendly work group and report writer work group. She's got many certifications about vocal pedagogy, education and kids music in Iran and outside of Iran.

Tracy McElheron

Tracy is a practising early childhood educator and Lecturer in Early Childhood Education. She has worked in the early childhood sector in Ireland for 25 years, teaching children from 2 to 5 years old. Her areas of expertise include curriculum and assessment for early childhood education, and the theory and practice of

play as a pedagogy in the early years. Her doctoral work explores the implications of the hidden curriculum on children's articulation of gender in early childhood education. She is a passionate advocate for the transformative capacity of relational pedagogy to build child, family, and educator identity.

Deirdre Forde

Dr. Deirdre Forde is a distinguished lecturer in Inclusive Education at Maynooth University. With a background as a qualified primary teacher and a chartered child and educational psychologist, she brings extensive experience from various educational settings and psychological services to her role. Deirdre's research and teaching interests are diverse and encompass areas such as disability and the dynamics of inclusion and exclusion within educational and societal contexts. She is particularly passionate about amplifying children's voices, advancing relational education, and shaping policies related to Equality, Diversity, and Inclusion (EDI). Her work is dedicated to fostering inclusive environments that acknowledge and celebrate diversity.

STICKS AND STONES: BULLYING AND MICROAGGRESSION AT SCHOOL

Clíona O'Keeffe; Evrim Çetinkaya Yıldız; Fatma Kurker; and Pamela February

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ ama-2025-en/?p=641#oembed-1

Below, we provide three example cases of people who have experienced bullying for various reasons. They describe a few of their experiences, and the chapter will refer to these cases throughout.

Example Case 1 – Sam

"I have experienced a lot of exclusion within school from age five up until about 16, 17 or potentially even 18. I was a really awkward kid. And I'm also trans (gender), so I was hanging out predominately with girls in school. I was always the kid that, they went, "Oh, we don't want to be friends with her any longer. We don't want to play with you, and we don't want to be your friend anymore". And I had that experience every year, all the way through my schooling. It's only in the last couple of years that I've realised I'm neurodivergent, and it explains for me quite a bit of what I had gone through. (I was probably the really awkward kid who was overly chatty). But then my peers basically decided that they didn't want to associate with me any longer, and it became a very lonely space. I moved schools when I was 11 from a mixed school to an all-girls school. The reason I chose that all-girls school was that this school was a feeder school for the secondary school. So, actually the bullying continued and was quite an uncomfortable experience for me being a non-binary masculine person in an all-girls school."

Sam Blankensee, National University Maynooth Ireland, Ireland

Example Case 2 – Andrew

Bullied as a child

"My experience with bullying in schools. It happened in as early as grade one. You know, as a little boy, I was quite effeminate, but I was also very outspoken. And, you were told a lot to shut up. You know, the older you get, you realise shut up is not just verbal. It's shut up physically. Shut up with your talent. Shut up with your gifts. Shut up with your ability. So that bullying for me, at a very early age, I realised it was shutting me down. Not just my voice, but my presence, my involvement, my inclusion. I would be told to shut up in the library, but I'd be shut up on the playground as well. And so you want to be kept silent. By the time I reached grade five, at age ten, I felt like they definitely didn't want to see me at all. "Shut up" turned into "don't be here"—they wanted me to disappear. It becomes a really, really strong exclusion. And then when I went to high school-grades seven, eight, nine, you realise you could feel it because you look around and realise, well, where's everyone? And then you realise that you have been excluded, and that bullying came through the form of exclusion. Everyone is welcome but you. You get to realise that you are being excluded for reasons that sometimes you didn't even understand. And that was something that I think bothered me when I got older, and I realised I was being bullied for things that I didn't even understand. I remember, you know, being described as gay and all those strong words we used back in Jamaica for gay. At that time, I didn't understand people what gay was. But you are being accused and labelled with those words, and it felt horrible. You know, I think we have to realise the impact that bullying has had on many of us. It was horrible."

Bullied as an adult/a teacher

"The bullying is different because now it's coming from outside of school. It's coming from parents. And you kind of want to redefine what bullying is at that time because you wouldn't think it was bullying. But those looks, the questions, the conversations that felt violent because, you know, we're being questioned if it's safe for you not only to be in school, but for children to be around you as a teacher. So it comes again with the assumptions, the stereotypes. And I can tell you for a fact that those assumptions and the stereotypes they follow you. It's no longer the playground. I think a lot of the myth that I wanted to talk about

is that we really think bullying is for just the classroom and the kids on the playground. Bullying is happening in the staff room in our schools. Bullying is happening in PTA meetings and parent council bullying is at every single level in our society. And it's not just a school thing, it's a people thing. When people are doing harm to each other. We bully and it's harmful."

Andrew B. Campbell, University of Toronto, Canada

Example 3 – Yuko

"To begin with, I have a brother who has a disability, and, although he's physically okay, he cannot speak, and has intellectual impairment. When I was in elementary school, bullying started in the first grade. They imitated my brother's voice or demeaned him in front of me to make fun of me and to make me feel really bad, but my family and I got through it. Although the adults also experienced discrimination as a family, we, collaboratively, encouraged each other. The bullying became severe at the age of 13, and, the whole classroom, became an enemy to me. They wanted to attack me. I got verbally, sometimes physically abused. They hid my shoes. They wrote graffiti, such as words like "die" or "get out" or "how is your brother doing?", and so on, on my desk. I thought, I don't have to erase the words using my eraser. They should. They should erase the words. So for four months, I didn't do anything about the desk. Then, finally a classroom teacher noticed and he asked what happened to your desk? Did you write on it? I asked, why would I write this?" This is my desk. Then he realised that I was being bullied. But before that, nobody noticed. So the teacher wanted to improve the situation, but still the bullying went on after school when the teachers were not watching us. So at that time, I really felt I should get over it and one thing I saw as a strategy to survive was to study hard to defeat them, which I didn't before. That's really made me what I am today. And, of course, it was a blessing in disguise for me as it really enhanced and encouraged me. But it is difficult for all the people who are bullied in Japan to get over being bullied. Some killed themselves, and that's happened a lot. Now that I have become a teacher, I really can relate to the students' feelings, but I really didn't want to share my own experience with them because I wanted to be away from my own hardship. So it was difficult for me to share my own feelings until only recently. I started to share my own experiences and found that the situation was better because sharing collaboratively felt great."

Yuko Uesugi, Eikei University of Hiroshima, Japan

Note: For the sake of clarity for the reader, we have amended the direct transcript in the examples. For the exact words, please watch the full interview with Sam, Andrew and Yuko.

Initial questions

In this chapter, you will find the answers to the following questions:

1. Who defines bullying and how?
2. What are the different forms of bullying?
3. What is the prevalence of bullying across different settings and contexts?
4. What are the roles of those involved in a bullying situation?
5. What is the motivation for and cause of bullying?
6. Who to whom?
7. What are the effects of bullying?
8. Mechanisms of change: How can we prevent and address bullying in our schools?

Introduction to Topic

Sticks and stones may break my bones, but names will never hurt me is an old rhyme, adage or proverb (the earliest seen around 1844), at times chanted by children who were taunted and teased. This chapter will prove that sometimes the pen (words) is mightier than the sword. King Solomon (Proverbs 18:21) stated that *"Death and life are in the power of the tongue."* Or as the English comedian Eric Idle said: *"Sticks and stones may break my bones, but words will make me go in a corner and cry by myself for hours."*

If we asked the man in the street about their experiences concerning bullying, that is, whether they have been bullied or witnessed bullying, we would get a vast range of stories depending on who we asked. Their responses may also vary as to how to handle situations where bullying occurs, depending on these experiences. What will probably cut across all their experiences is how vividly they remember them, even if it happened way back in their childhood days. The three examples depicted above of Sam, Andrew and Yuko are cases in point.

The children's rhyme referenced at the start of this chapter underscores that bullying has deep historical roots. First documented in 1844, this chant reveals that even 180 years later (in 2024), the concept of bullying is still widespread, complex, and often misunderstood. Despite the passage of time, confusion lingers, and efforts to address and prevent it continue as we seek effective strategies.

This chapter aims to unpack bullying as follows. The chapter starts by defining bullying and reflecting on who defines it. It looks at terms sometimes confused with bullying and the various forms bullying can take. We look at the concept of microaggression as a specific form of bullying. Based on our introductory remarks, bullying may regularly occur, but what do statistics say about its prevalence? We look at the roles of those involved in a situation where bullying occurs.

The chapter reviews theories of bullying and the related research carried out. We examine the motivation for and cause of bullying. We also scrutinise who is bullying whom. Furthermore, important aspects of the chapter are the effects of bullying on learners, the classroom, the school and the community as a whole. To mitigate these effects, the chapter examines the mechanisms of change, that is, what strategies could the learner, the classroom, the school and the broader community adopt?

This chapter is tailored towards student teachers who will come across situations where bullying occurs. The chapter poses questions throughout that are meant to make the student teacher reflect on bullying in relation to the learner, the classroom and the school community situation in which they find themselves.

Key aspects

What defines bullying, who are the individuals involved in bullying situations, and what are the different types of bullying?

Bullying can be interpreted differently. However, our aim in this section is not to focus on differences, but to develop a common understanding of the nature of bullying. With this understanding, we hope to help readers better understand bullying behaviour, be more sensitive to its detection, and develop effective intervention plans.

a. Bullying

One definition of bullying is "aggressive, goal-directed behaviour that harms another individual within the context of a power imbalance" (Volk et al., 2014). However, the most well-known definition of bullying is "being repeatedly subjected to harmful actions by one or more individuals" (Olweus, 1993). For this author, bullying is characterised by aggressive behaviour or intentional harm-doing, which occurs repeatedly and over time in an interpersonal relationship marked by a power imbalance. In addition to these two characteristics listed by Olweus (1993), power imbalance and harm are also among the characteristics of bullying (Volk et al., 2014). There are 4 key characteristics of bullying:

1. *Intentional:* Bullying behaviours are intentional and driven by the intent to harm (Olweus, 2012). This characteristic distinguishes bullying from self-defence and reactive aggression. Bullying is not spontaneous or motivated by self-defence; it is

carried out deliberately and with bad intention.

2. *Repetitive:* Bullying is a repetitive behaviour and is not limited to a single incident. It occurs repeatedly over time (Olweus, 2012).

3. *Power Imbalance:* A power imbalance exists between the parties involved in bullying, which can manifest in various forms, including physical, cognitive, and social power. Physical power refers to differences in strength or size, while cognitive power involves disparities in intellectual abilities, such as verbal fluency or social-cognitive skills. Social power arises from factors like popularity or social status (Volk et al., 2014).

4. *Harm:* Bullying is harmful to those who are subjected to it. The harmfulness of bullying is the product of both the frequency and the perceived intensity of a behaviour (Harm = Frequency × Intensity) (Volk et al., 2014). In other words, as either frequency or intensity increases, harmfulness appears to increase as well (Ybarra et al., 2014). (Intensity examples: pinching (lower), stabbing (higher), etc.)

While there is no universally agreed-upon definition of bullying, a commonly accepted description emphasises its key characteristics: intentionality, repetitiveness, and the negative (unwanted or harmful) actions of one or more individuals directed at another person who cannot defend themselves. Bullying is often viewed as an aggressive act or deliberate harm that occurs repeatedly over time within an interpersonal relationship characterised by a perceived imbalance of power. A conflict cannot be considered bullying when both parties have equal strength. Therefore, in a school setting, teacher-targeted bullying is identified when a learner victimises a teacher who has authority over the learner, though the teacher may not use that power (Garrett, 2015).

Bullying is often confused with aggression, violence, conflict, and disputes. However, these behaviours have different characteristics.

b. Terms confused with bullying

Aggression: In social psychology, aggression is most commonly defined as a behaviour that is intended to harm another person who is motivated to avoid that harm (DeWall et al., 2012). This harm can be in various ways, including physical injury, emotional distress, or damage to social relationships. There are 4 key characteristics of aggression (Allen & Anderson, 2017):

1. Aggression is an observable behaviour (not an aggressive thought or feeling).
2. Aggressive behaviours are intentional and carry out the goal of harming another.
3. Aggression involves people.
4. Recipients of the aggression must be motivated to avoid harm.

Two characteristics that distinguish aggressive behaviour from bullying are repetition and

power imbalances. Let us not to forget that not every aggressive behaviour constitutes bullying.

Violation: Violence is a risky behaviour characterised by intentional harm inflicted through physical or psychological means. This harm can be directed towards oneself, others, such as in student-on-student, student-on-teacher, teacher-on-teacher, or teacher-on-student scenarios, or objects (Steffgen, 2009). All violent behaviours can be considered as aggression, but not all aggressive behaviours can be considered violence (Allen & Anderson, 2017). Given that violence is characterised as an extreme manifestation of aggression (Bushman & Huesmann, 2010), it can be inferred that the distinction between aggression and bullying parallels the distinction between violence and bullying. This differentiation is mainly due to the repetitive nature of bullying and the presence of a power imbalance inherent in bullying situations.

Conflict: In its simplest definition, conflict refers to incompatibilities, disagreements, or dissonances within or between social entities (individuals, groups, institutions, etc.) (Rahim, 2002). There is a fundamental difference between conflict and bullying. From this perspective, two key aspects set bullying apart from conflict: (a) the perpetrator's intention is not to resolve a mutual disagreement but rather to deliberately and actively harm the victim, and (b) the unequal power dynamic in which the perpetrators hold control over the victims due to a significant power advantage. This power imbalance is pre-existing and present from the onset of bullying. Perpetrators deliberately target victims based on this imbalance, choosing those who are weaker (Baillien et al., 2017; Keashly, 2020; Olweus, 1993). Despite the conceptual distinction between bullying and interpersonal conflict, the literature discusses the potential effectiveness of conflict management skills in reducing bullying in schools. However, studies have shown that there is no relationship between conflict management and bullying victimisation in schools (Burger, 2022). These findings highlight the need for distinct approaches when addressing bullying and conflict in educational settings.

Disputes: Disputes are short-term disagreements between people or groups (Burton, 1990). Two key aspects that set bullying apart from conflict also apply to disputes. In disputes, there is not always an imbalance of power between the parties, and there is no intention by the parties to deliberately and systematically harm each other. Disputes are more easily resolved than both bullying and conflict.

c. What forms can bullying take?

Examining the types of bullying can facilitate defining and intervening in bullying incidents. Therefore, this section provides explanations regarding the various forms of bullying behaviour.

Physical: In this form of bullying, the bully is directly involved in physical behaviours (Crick, 1996). Bullying that involves direct, physical, and obvious behaviours includes

actions such as hitting, kicking, pushing, shoving around, locking someone indoors, damaging their belongings, or seizing or destroying others' property as a means of intimidation (Crick, 1996; Gong et al., 2024; Wang et al., 2009). Physical bullying is a common type of bullying in schools, mainly due to the presence of individuals from various age groups in the school environment. Younger students who are behind in physical development are at higher risk for physical bullying (Crick, 1996).

Verbal: Bullying with cruel words involves hurtful name-calling, verbal abuse, ridicule, threatening, insulting nicknames, and spreading gossip or rumours, such as name-calling and teasing in a hurtful way, which refers to actively saying unfriendly words to harm, hurt, or scare others (Wang et al., 2009; Gong et al., 2024). Verbal attacks can be personal or sexual, or they may target the victim's family, race, or religion (Sticks and Stones, n.d.). This type of bullying can occur in person, by phone, by email, or in other virtual environments. Due to its possibility to extend beyond the school environment and its insidious nature, it is more difficult to detect compared to physical bullying.

Relational: Relational bullying refers to an indirect form of bullying that "refers to the manipulation of social relationships to destroy or damage others' social network or social reputation" (Gong et al., 2024, p.2) and includes social exclusion, such as being excluded from a group of friends or being ignored, and spreading rumours, including telling lies or spreading false information about someone (Wang et al., 2009). Although it has highly destructive effects on the bullied person, it is more difficult for others to notice and intervene. To better understand relational bullying in school environments, you can watch the 2004 movie *"Mean Girls."*

Emotional: Emotional bullying is a type of bullying that targets a person's emotional well-being, self-confidence, and self-esteem. It can manifest in non-verbal forms such as laughing, pointing, staring, or drawing pictures, as well as in psychological forms like isolation and rejection (Fried & Fried, 2004). Unlike physical or verbal bullying, emotional bullying does not involve direct physical contact or words, but rather focuses on disrupting the individual's emotional state. Emotional bullying often overlaps with verbal and relational bullying, but its primary aim is to cause emotional harm through behaviours like constant criticism, blaming, emotional manipulation, and demeaning actions.

The types mentioned above are traditional forms of bullying, meaning they encompass all the characteristic elements of bullying behaviour (intentionality, repetition, power imbalance, and harm). In addition to these, there is cyberbullying, which has become a widely recognised concept in recent times. While cyberbullying is often evaluated as the online extension of traditional bullying, it also possesses its own distinct characteristics while still carrying the attributes of traditional bullying.

Cyberbullying: Cyberbullying can be defined as any behaviour performed through electronic or digital media by individuals or groups that repeatedly communicate hostile or aggressive messages intended to inflict harm or discomfort on others (Tokunaga, 2010). It can occur on social media, messaging, gaming, and mobile phones. Cyberbullying is a form

of bullying that occurs through the use of digital technologies. This type of bullying involves repeated behaviours aimed at scaring, angering, or shaming those who are targeted. For example, spreading lies about someone or posting embarrassing photos or videos of them on social media, sending hurtful, abusive, or threatening messages, images, or videos via messaging platforms, or impersonating someone to send mean messages to others are all examples of cyberbullying. Face-to-face bullying and cyberbullying often occur alongside each other, but cyberbullying leaves a digital footprint—a record that can help stop the abuse (UNICEF, n.d.). The "*Is Anyone Up?*" website serves as a stark example of the severe consequences cyberbullying can have. This platform enabled targeted harassment and revenge porn, causing significant harm to individuals' lives (Tallerico, 2022). It illustrates how cyberbullying can extend beyond individual actions, with its negative impacts spreading at the community level and reaching severe levels of harassment. This case underscores the need for legal regulations to combat cyberbullying, such as the Australian goverment's *Charlotte's Law* (Anti-Bullying Crusader, n.d.). Cyberbullying is distinguished by its feature of anonymity, which, along with a wide audience, increases the potential to harm victims. Unlike traditional bullying, where the victim knows the bully's identity and witnesses their power display, cyberbullies remain anonymous, reducing their risk of being caught and encouraging more harmful behaviour. This anonymity can leave victims feeling powerless and inadequate. Moreover, cyberbullies often fail to grasp the consequences of their actions, leading to a lack of empathy and remorse. The public nature of cyberbullying further amplifies its impact, often resulting in more severe outcomes than traditional bullying (Slonje & Smith, 2008). You can find a cyberbullying case sample: https://www.nytimes.com/2024/07/06/technology/tiktok-fake-teachers-pennsylvania.html

There is also another classification that Smith (2016) suggested.

1. *Bullying based on disability*

This type of bullying, often referred to as disability-based bullying, involves targeting individuals because of their physical or cognitive differences. This form of bullying can occur in various environments, including schools, workplaces, and online platforms. A study carried out by Aljabri, Bagadood, and Sulaimani (2023) addresses the significant issue of bullying experienced by learners with intellectual disabilities during their intermediate school years. Key findings from the study indicate that all participants reported being bullied, with the most common types being physical and verbal abuse, along with social isolation and ridicule. The emotional repercussions for these students included feelings of embarrassment, anger, and withdrawal, leading them to prefer associations with peers with disabilities over neurotypical students. In fact, students with intellectual disabilities often struggle with limited social skills, making them more vulnerable to bullying, which can result in decreased self-esteem and academic performance. The authors recommend promoting respect and appreciation for these students among neurotypical peers, encouraging active

involvement from adults in fostering inclusive environments, and implementing peer support programs to enhance understanding and friendships. In conclusion, the study emphasises the necessity for schools to adopt proactive strategies to combat bullying and support the social integration of students with intellectual disabilities, ultimately aiming to create a safer and more inclusive school culture that benefits all students and promotes diversity and acceptance.

2. *Identity-based bullying*

Identity-based bullying at school refers to harassment or discrimination that targets students based on various aspects of their identity, including but not limited to race, ethnicity, religion, gender, sexual orientation, and socioeconomic status. It also includes disability, as discussed above. This type of bullying can take many forms, including physical violence, verbal abuse, social exclusion, and cyberbullying.

We briefly discuss a few of the identity markers that are common targets of identity-based bullying:

• Race and Ethnicity:

The study carried out by Galán et al. (2021) involving 3,939 participants reported a mean age of 15.7 years (SD = 1.3). Among these learners, 36.3% identified as Black/African American, 53.7% as assigned female at birth, 32.6% as belonging to a sexual minority group, and 10.0% as gender diverse. The findings indicated that race/ethnicity-based experiences of bullying were prevalent, with 9.5% (375 learners) reporting such experiences, while 5.8% (209 learners) were identified as perpetrators of bullying. Notably, youth with multiple stigmatised identities faced even higher rates of victimisation and perpetration. Gender-diverse Black and Hispanic youth reported the highest rates of experiences with identity-based bullying. The study also established a correlation between experiencing identity-based bullying based on multiple stigmatised identities and adverse outcomes, including delays in accessing well-care services. This underscores the significant impact of intersecting social identities on bullying experiences and highlights the importance of addressing these forms of victimisation within preventative and intervention strategies.

• Gender and Sexual Orientation:

LGBTQ+ students often face bullying related to their gender identity or sexual orientation. The research carried out by Atteberry-Ash et al. (2019) reveals significant concerns regarding the safety of LGBTQ+ youth in schools, noting that these students experience higher risks of feeling unsafe, being bullied, and skipping school compared to their cisgender heterosexual peers. Transgender students, irrespective of sexual orientation,

face the greatest challenges, primarily due to societal homophobia and transphobia. Intersectionality is emphasised, revealing that students of colour face even greater safety challenges. The lack of inclusive anti-bullying policies and mechanisms in many school districts perpetuates these risks, stressing the need for systemic change. Their research shows that only 10% of school districts in the US have explicit anti-bullying policies that include LGBTQ+ youth.

These findings by Atteberry-Ash et al. (2019) highlight the urgent need for the educational system to implement inclusivity training for teachers and staff to adequately support LGBTQ+ youth. They are of the opinion that teachers informed about LGBTQ+ issues are more effective in intervening during bullying. Building relationships between students and supportive adults, as well as between peers can enhance feelings of safety, especially for LGBTQ+ youth. A comprehensive curriculum reflecting diverse identities is essential to foster a safe learning environment.

- Religion

The discussion will focus on two aspects of bullying as they relate to religion. The first is where individuals may be targeted for their religious beliefs or practices. The second is where individuals, especially those who are viewed to have "non-conforming" gender and sexual orientation, are harassed under the guise of religion.

- *Bullied because of religious beliefs*

The systematic review by Sapouna, de Amicis, and Vezzali (2023) outlines significant findings related to bullying victimisation among religious minorities. The studies reviewed indicate a strong correlation between visible expressions of religious identity (such as religious coverings) and increased risk of bullying victimisation. This was particularly relevant for Muslim and Sikh youth in the USA, Muslim and Christian youth in the UK, Jewish youth in Australia and Muslim youth in Nordic countries (Estonia, Finland, Sweden). Thus, the visibility of practising one's religion becomes a target for bullying, highlighting the challenges faced by individuals in minority religious groups. The study also revealed that many of these bullying incidents are under-reported. This cycle of silence can perpetuate victimisation as schools remain unaware of the issues. Learners from religious minorities have perceived that school policies and practices may be biased against their beliefs. In addition, in certain cases, negative or dismissive reactions from teachers can lead students to internalise their victimisation as "normal". Hence, the authors indicate a critical need for teacher training and awareness. In fact, research suggests that a sense of belonging and perceived support for cultural diversity can help reduce incidents of bullying based on ethnicity/race. This underscores the importance of fostering an inclusive environment in schools.

-Bullied/harassed due to gender and sexual orientation under the guise of religion

In contrast to individuals who are bullied for their religious beliefs, individuals who do not conform to the religious views of gender and sexual orientation can be bullied under the guise of religion. The study conducted by Newman, et al. (2018) aimed to investigate how religious discourse contributes to the bullying of sexual and gender minority youth (SGMY) by examining the perspectives of service providers and educators in Toronto, Canada. It focused on how religious beliefs and community dynamics operate within the broader social ecology affecting SGMY. The researchers conducted semi-structured interviews with 16 key informants, including educators, service providers, and administrators who work with SGMY. The interviews were analysed thematically to identify patterns of religiously based bullying and potential interventions. The study found significant use of religious language to justify bullying behaviours, such as referencing scriptural condemnations of sexual and gender minority identities. This discourse often equates SGM identities with immorality, creating a hostile environment for affected youth (Homophobic Religious Discourse). Places of worship and faith-based schools perpetuated negative messages regarding SGM identities, often leading to direct harassment or exclusion of SGMY in these spaces (Religious Settings' Influence). Victims of religiously based bullying exhibited higher levels of internalised homophobia and experienced rejection not only from peers but also from family and religious community members, leading to heightened emotional and psychological distress (Impact on SGMY). The study discusses "sexual orientation change efforts" (SOCE), where religious families and institutions pressure SGMY to change their sexual orientation, further entrenching feelings of guilt and alienation (Conversion Therapy and SOCE). The authors suggest that interventions should occur at multiple levels of the social ecology, including:

- Engaging religious institutions in discussions about acceptance and integration of SGM identities to counteract harmful narratives;
- Providing tools and strategies for educators and service providers to recognise and effectively respond to religiously based bullying; and
- Establishing safe spaces within churches and community organisations for SGMY to affirm their identities without fear of discrimination.
- Socioeconomic status

Typically, it is assumed that learners from lower-income families may experience bullying related to their economic situation. The meta-analysis undertaken by Tippett and Wolke (2014) investigates the relationship between socioeconomic status (SES) and bullying roles (victims, bullies, and bully-victims) in response to increasing public health concerns about the impact of bullying on children's health and well-being. The study includes findings from 28 studies demonstrating that, while there are associations between SES and bullying, these relationships are weak. Victims of bullying are more likely to come from low SES

backgrounds. Conversely, children from high SES backgrounds show a negative relationship with victimisation. The findings reveal that bullying perpetration has a weak connection to SES. Children from low SES backgrounds show a slight association with bullying others, while those from high SES show less likelihood to be bullies. Bully-victims (those who are both victims and bullies) are also more likely to come from low SES backgrounds, but no significant relationship exists with high SES. In conclusion, the analysis concludes SES plays a significant, albeit weak, role in predicting bullying behaviour and victimisation among children. Specifically, low SES is associated with increased risk of being victimised or being a bully-victim. The association between SES and bullying perpetration is minimal, suggesting that bullying behaviours are not limited to specific socioeconomic groups. The findings suggest that interventions to combat bullying should not be exclusively focused on low SES children. Instead, efforts should target all children, as bullying is pervasive across different socioeconomic backgrounds.

d. Microaggression

Because of the perceived subtlety of microaggression, it may not always be viewed as bullying, but it may be even more pervasive, hence the need for separate sections.

The term "microaggression" was first introduced by psychiatrist Dr. Chester M. Pierce in the 1970s to describe the verbal and non-verbal insults experienced by African Americans (Pierce, 1970). Since then, the concept has broadened to encompass a wide array of interactions that reflect and perpetuate societal prejudices based on various aspects of identity, such as race, ethnicity, gender, sexual orientation, disability, and socioeconomic status.

Microaggression is characterised as "subtle, stunning, often automatic, and non-verbal exchanges which are "put-downs" of people from minority and marginalised statuses (Pierce et al., 1977). Microaggressions are examples of subtle, verbal, behavioural, or environmental offences, intentional or not, directed at individuals from marginalised groups or underrepresented groups (Sue et al., 2007). These groups include those defined by gender, race/ethnicity, sexuality, and socioeconomic status.

Microaggressions are distinctive in their subtlety; unlike overt acts of racism or sexism, they often manifest in daily interactions and may be perceived as innocent or even benign by those delivering them. However, the cumulative effect of these microaggressions can cause significant emotional distress for individuals who experience them. Research has shown that microaggressions can lead to adverse psychological outcomes, including increased levels of anxiety, depression, and stress among marginalised individuals (Sue et al., 2007; Nadal, 2011). These experiences can erode self-esteem and contribute to feelings of alienation or marginalisation in both social and professional settings.

Types of Microaggressions

To better understand microaggressions, it is helpful to categorise them into three main types: microassaults, microinsults, and microinvalidations. Each type differs in intention and expression, but collectively contributes to the perpetuation of systemic biases.

1. Microassaults

Microassaults are explicit and intentional discriminatory acts that are often overt and aimed at inflicting emotional harm on another individual based on their identity. Unlike microinsults or microinvalidations, microassaults are consciously executed, reflecting a clear intent to demean or belittle. This type of microaggression can take many forms, including racist imagery, derogatory slurs, or outright refusal of service based on an individual's race or ethnicity (Sue et al., 2007).

Microassaults include concrete actions such as displaying racist symbols (e.g., a swastika) in public, using racial slurs toward individuals of color, purposefully avoiding someone based on their identity, mocking accents or language disabilities, and making any theme discriminatory jokes. For instance, a white person using a racial slur to refer to a black individual or a business owner refusing service to a Muslim person due to their attire are clear manifestations of microassaults (Sue et al., 2007; McAndrews et al. 2017).

Unlike microinvalidations and microinsults (discussed below), microassaults are often conscious acts. According to researchers, racial microassaults are small-scale attacks directed at persons of marginalised or minority groups. While some microaggressions (e.g. micro-assaults) can fit the common definition of bullying, microaggressions can also be unintentional, do not always involve repeated interactions between specific individuals, and the power imbalance often reflects broader structures of oppression rather than individual power based on size, strength, or popularity (Walton & Niblett, 2013). As seen, although microassaults are categorised as "micro," they are not so "micro" in terms of intentionality and obviousness (McAndrews et al. 2017).

2. Microinsults

Microinsults involve comments or actions that unintentionally convey rudeness or insensitivity toward an individual's identity. These statements often stem from ingrained stereotypes and can undermine a person's self-worth by implying that they are lesser in some way. Microinsults may occur in the form of seemingly complimentary remarks that carry an underlying message of inferiority. Microinsults are generally unconscious behavioural or verbal slights that demean one's heritage, racial identity, ethnicity, gender, sexual orientation, etc. (Sue et al., 2007, Minikel-Lacocque, 2013).

For example, telling an African woman, "You're so articulate for someone from your background," may be intended as a compliment but reinforces stereotypes about linguistic

abilities based on ethnicity (Nadal, 2011). In the classroom, the following are regarded as microinsults (Kickboard, 2018):

- A learner's academic potential is judged based on their racial background.
- A parent's commitment to their child's education is presumed based on their appearance, manner of speaking, or place of residence.
- Learners of colour are often denied the same opportunities as their white counterparts.
- A black or brown learner is often unfairly perceived as threatening or aggressive.

Such microinsults can accumulate over time, leading to feelings of inadequacy and self-doubt among those targeted, particularly in professional environments.

3. Microinvalidations

Microinvalidations occur when comments or behaviours negate or dismiss the experiences, thoughts, or feelings of marginalised individuals. These statements often convey disbelief in the individual's lived experiences, significantly contributing to feelings of alienation and frustration. Microinvalidations are particularly damaging because they can make the individual feel invisible or unworthy of recognition.

An example of microinvalidation would be a white individual telling a black person, "I don't see colour. We are all just people," which dismisses the unique challenges and experiences rooted in racial identities and minimises the impact of systemic racism (Sue et al., 2007). This type of microaggression can be especially prevalent in discussions about race and identity, where the lived realities of marginalised groups may be glossed over or overlooked entirely.

Microinvalidations are often unconscious verbal or behavioural actions that exclude or neutralise thoughts, emotions, or knowledge of people of marginalised or minority groups (Sue et al., 2007; Minikel-Lacocque, 2013). For example, if you accuse someone of overreacting when they are simply responding to someone making racist statements, that dismisses the seriousness of the situation.

Microaggressions represent a significant yet often overlooked form of discrimination that can adversely affect the mental health and well-being of individuals from marginalised backgrounds. By understanding and addressing the different types of microaggressions — microassaults, microinsults, and microinvalidations — society can foster more inclusive and equitable environments. Recognising and addressing microaggressions, therefore, is crucial for dismantling systemic oppression and creating spaces where all individuals feel valued and acknowledged.

Recognising microaggressions and the messages they send
Before you can respond to a microaggression, it is necessary to recognise that one has

occurred. The following examples are adapted from the University of California, Office of the President published in 2015 (Center for Educational Effectiveness [CEE], 2018).

Table 1: Recognising microaggressions and the messages they send

Microaggressions	Examples	Messages
Ascribing intelligence. Evaluates someone's intelligence or aptitudes based on their race and gender.	(To a woman of colour): "I would never have guessed you were a scientist!" Or "How did you get so good at maths?"	People of colour and/or women are not as intelligent and adept at maths and science as white people, and men.
Assumption of criminality/ danger. Presumes a person of colour to be dangerous, deviant or criminal because of their race.	A white person crosses the street to avoid a person of colour, or a professor asks a young person of colour in an academic building if they are lost, insinuating they may be trying to break in.	People of colour don't belong here, they are dangerous.
"Othering" cultural values and communication styles. Indicates that dominant values and communication styles are "normal" or ideal.	Structuring grading practices in such a way that only verbal participation is rewarded, failing to recognise cultural differences in communication styles, and varying levels of comfort with English verbal communication.	Conform and/or assimilate to the dominant culture.
Second-class citizens. Awards differential treatment.	Calling on male learners more frequently than female learners; mistaking a learner of colour for a service worker.	Men's ideas are more important; people of colour are destined to be servants.
Gender/sexuality exclusive language. Excludes women and the LGBTQ+ community.	Forms that only offer male/female choice for gender; use of the pronoun "he" to refer to all people.	There are only two acceptable genders; men are normative and women are derivative.

What is the prevalence of bullying across different settings and contexts?

Bullying remains a pressing issue with significant global implications. Understanding its prevalence is crucial for developing effective prevention and intervention strategies. Current research provides a comprehensive overview of bullying rates, highlighting significant trends and variations.

a. Global prevalence and trends of bullying

According to the 2019 UNESCO Report, a significant issue regarding school violence and bullying indicates that nearly one-third of school-aged children and adolescents experience bullying (UNESCO, 2019). In 2020, the Centers for Disease Control and Prevention (CDC) reported that 20% of youth experienced bullying in school, with 14% of adolescents facing bullying weekly. Additionally, 33% of middle school students experienced cyberbullying

at least once a week. Research indicates that bullying affects a substantial portion of adolescents worldwide. According to data from over 279,000 youth in 44 countries and regions, the Health Behaviour in School-aged Children (HBSC) report (Cosma, Molcho Pickett, 2024) provides the following key insights:

- **Bullying other students**: On average, 6% of adolescents report bullying other students at school. Boys are more likely (8%) than girls (5%) to engage in this behaviour.
- **Experiencing bullying at school**: Approximately 11% of adolescents report being bullied at school, with no significant gender differences.
- **Cyberbullying others**: About 12% of adolescents, or 1 in 8, report cyberbullying others. Boys (14%) are more likely than girls (9%) to engage in cyberbullying, reflecting an increase from 2018 (boys up from 11% and girls from 7%).
- **Experiencing cyberbullying**: Around 15% of adolescents report having been victims of cyberbullying, with rates similar between boys (15%) and girls (16%). This represents an increase from 2018, with boys rising from 12% to 15% and girls from 13% to 16%.
- **Physical fighting**: About 10% of adolescents have been involved in physical altercations, with a clear gender disparity: 14% of boys versus 6% of girls.

b. Variability in prevalence rates

Survey prevalence rates of bullying can vary significantly due to several factors, including the definitions used, the frequency of bullying considered, and the time periods investigated. Smith (2016) notes that variations in definitions—such as whether they include cyberbullying or different forms of bullying—and differences in how frequently bullying is reported (e.g. once a month versus once a year) can affect prevalence rates. Additionally, the timing of questionnaire administration (e.g. at the start or end of the academic year) can impact reported rates, making cross-study comparisons challenging.

c. Prevalence regarding types of bullying

The prevalence of different types of bullying also shows significant variation. The results of the Global School-based Student Health Survey between 2003 and 2015 in 65 countries revealed that the most common type of bullying was verbal (66.36%), followed by physical (24.02%), and the least common type was neglect (9.62%). Geographically, verbal bullying was highest in the Americas (71.09%) and lowest in Africa (61.75%); neglect was highest in South East Asia (11.10%) and lowest in the Eastern Mediterranean (7.11%); physical bullying was highest in Africa (28.98%) and lowest in the Americas (18.84%) (Man, Liu, & Xue, 2022, p.7). Smith et al. (2016) aslo reported that cyberbullying is an emerging concern, with 15% to 20% of adolescents reporting involvement.

Understanding the prevalence of bullying, along with the factors influencing these rates,

is essential for designing effective prevention and intervention strategies. Efforts must continue to address the varying types of bullying and adapt approaches based on regional and temporal differences to effectively reduce the impact of bullying on adolescents.

Let us pause and reflect

Which type of bullying do you think is experienced more frequently in your school/city/country?

What are the "roles" of those involved in a situation where bullying occurs?

As earlier discussion demonstrates, the concept of bullying is difficult to define. Similarly, ascribing names or terms to the role players in the situation where bullying occurs is not simple either. The choice of language is crucial, as it can profoundly influence the dynamics of the bullying process, just as it does in many psychological contexts. It is essential to avoid language that either glorifies or excessively vilifies the individual engaging in bullying, as well as terms that diminish the agency of the person experiencing bullying, rendering them a passive victim. This section explores the diverse experiences of those involved in bullying, acknowledging that the terminology used is not exhaustive.

Numerous studies on bullying have typically categorised children into three groups: aggressors, aggrieved, and aggressor-aggrieved. Additionally, other roles include bystanders, defenders, assisters, and reinforcers.

Aggressor (bully, perpetrator, who starts bullying)

Perpetrators or bullies intentionally harm or cause suffering in others without facing retaliation (Menabo et al., 2024). While these individuals are generally viewed as disliked and aggressive, a significant portion is also perceived as popular, powerful, possessing leadership qualities, and having various competencies and advantages. The reason for this difference in perception is social power. Bullies who are socially more powerful are perceived more positively by their peers (Vaillancourt et al., 2003). Rettew and Pawlowski (2022) referred to these groups, which differ in terms of social power, as 'alpha bullies' and 'delta bullies.' Alpha bullies are described as a socially powerful group with fewer pathologies, whereas delta bullies are characterised by weaker social skills and a higher likelihood of cognitive and behavioural issues. Considering this distinction when assessing bullying behaviour is crucial to developing accurate and effective intervention strategies. However, a typical bully generally struggles with resolving conflicts and faces academic

difficulties. Such individuals often hold negative attitudes and beliefs about others, come from families marked by conflict and poor parenting, view school unfavourably, and are negatively influenced by their peers (Cook et al., 2010). In addition to the bully's social power, the level of hostility is also a notably variable in the bullying process. The bully's hostility increases the emotional harm inflicted on the victim (Carrera-Fernández et al., 2018).

The Aggrieved (victim, target, bullied)

Victims are those who suffer attacks repeatedly over an extended period. They are typically characterised as being defenceless (Menabo et al, 2024). Anyone can become a target of bullying, even when they have not done anything to provoke it or make a mistake. Often, it only takes being in the wrong place at the wrong time (Sticks and Stones, n.d.). The ones who lack social skills, think negative thoughts, experience difficulties in solving social problems, and come from disadvantaged families, schools, and community environments are risky groups for bully victimisation (Cook et al., 2010). Bullies are often driven by the vulnerable and distressed reactions of their intended victims, which gives them a sense of power and control. Children who are hyper-sensitive, cautious, anxious, passive, or submissive —and lack determination, assertiveness, or decisiveness— are more likely to be singled out than other children. Those who respond to bullying with vulnerability and distress are often subjected to repetitive aggression. What differentiates children who are not victimised from those who are is not their physical strength, but rather their capacity to either stand up to or distance themselves from the bully's aggressive behaviour (Sticks and Stones, n.d.). Victims may not always recognise that they are being bullied, and even if they do, they might not seek help. Therefore, it is essential to observe and identify signs of bullying. Here are some warning signs to detect bullying victimisation (UNICEF, n.d.):

1. Unexplained physical marks, such as bruises, scratches, broken bones, or healing wounds,
2. Fear of going to school or participating in school events,
3. Signs of anxiety, nervousness, or heightened vigilance,
4. Having few or no friends at school or outside of school,
5. Suddenly losing friends or avoiding social situations,
6. Personal belongings such as money, clothing, or electronics being lost or destroyed,
7. Declining academic performance,
8. Frequent absenteeism or calling from school asking to go home,
9. Trying to stay close to adults at all times,
10. Difficulty sleeping, including experiencing nightmares,
11. Complaining of headaches, stomach aches, or other physical ailments,
12. Regularly appearing distressed after spending time online or on their phone

without a clear reason,

13. Becoming unusually secretive, especially regarding online activities,
14. Displaying aggression or having frequent angry outbursts.

However, observation alone is insufficient; prevention plans should also include raising awareness of threatening cues because research shows that bullies-victims are more aware of threatening cues like eye movements; in contrast, victims tend to avoid them by gaze (Menabo et al.2024).

The Aggressor-aggrieved (bully-victims)

A distinct group from the bully and the victim is the bully-victim who both perpetrates bullying and is a victim of bullying. While the exact cause of bullying-victimisation in certain learners remains unclear, prior research has indicated that characteristics such as diminished empathy, restricted prosocial conduct, weak familial ties, or issues with controlling their anger could contribute to their profile (Menabo et al, 2024). The typical bullies-victims (someone who bullies and is bullied) have negative attitudes and beliefs about himself or herself and others. They have trouble with social interaction, do not have effective social problem-solving skills, have low academic achievement, and are not only rejected and isolated by peers but also negatively influenced by the peers with whom they interact (Cook et al., 2010). In comparison to the other groups, bully-victims are the most despised and are more prone to self-harm and experience higher levels of depression (Menabo et al, 2024). Bullies-victims constitute the most aggressive group among those involved in bullying roles (Salmivalli & Nieminen, 2002). Due to their aggression, they receive less support from teachers and peers compared to pure bullies and pure victims (Shao et al., 2014).

The Bystander (uninvolved)

School bullying is a collective issue involving not only the bullies and victims but also a significant number of witnesses who observe the bullying behaviour. There are four distinct bystander roles: assistant, reinforcer, outsider, defender (Salmivalli et al., 1996). Bystanders aren't passive actors; in contrast, they are critical actors in deterring the demoralising and damaging impacts of bullying (Padgett and Notar, 2013). Also, even if they witness it once, bystanders (especially those who have previously been in the victim role) may experience depression, anxiety, substance use, and somatic symptoms related to bullying. (Rivers et al., 2009; Mishna & Van Wert et al., 2014).

Supporter of Aggressor (pro-bully/ assistant, reinforcer)

The assistant and reinforcer roles are described as being pro-bullying. The main and typical

behaviour of these roles is supporting the aggressor. The role of the supporter of the aggressor or the pro-bully is composed of individuals who actively support the bully through either aggressive behaviour or laughter and jeering that encourages the bully (Menabo et al, 2024). Assistants do not initiate bullying; they join it after someone else does (Salmivalli, 2010). Reinforcers are present in the bullying case, as are other bystanders. However, they may display varied behaviours, which can be active or passive. They may be witnesses (not responding or acting regarding bullying) or support the bully. They also may be more active bystanders. Furthermore, they could laugh or actively encourage the bully, reinforcing the bully's aggressive behaviours. The nuance between assistant and reinforcer roles is that reinforcers do not actively join the bullying (Monks & O'Toole, 2020).

Supporter of aggrieved (defender)

In sharp contrast, the defender (as a supporter of the aggrieved) actively stands up for the victim by encouraging them to tell an adult, protecting, supporting and (Menabo et al, 2024; Reinjtjes et al., 2016). Beyond these, defenders may also intervene in bullying, which could directly stop it (Reinjtjes et al., 2016). Defenders' interventions can stop 60% of ongoing bullying within 10 seconds, and the victims whom defenders support have less psychological maladjustments and negative outcomes (Hawkins et al., 2001; Ma & Chen, 2019). Thus, it is clear that adding defenders to prevention and intervention plans is critical for effectively addressing bullying. While Pozzoli and Gini (2010) state that defending a victim can be risky because the defender may confront a powerful bully and their supporter, recent research suggests that defending was not significantly associated with future victimisation, suggesting that it is not generally a risk factor for victimisation (Malamut et al., 2023). As seen, defenders play an influential role in preventing bullying. Therefore, equipping them with the necessary skills and supporting them in potentially risky situations (even if the likelihood is low) is crucial for preventing bullying.

Theories related to bullying

Examining theoretical frameworks that shed light on the fundamental causes and contributing elements of bullying is necessary to comprehend and address it. Some of these theories are briefly summarised below.

  a. Social learning theory

According to Albert Bandura (1973, 1983), bullying behaviour is learned through imitation and observation. According to this theory, people who see that aggressive behaviours are rewarded or ignored are more inclined to bully others. This idea highlights how violent behaviour is shaped by role models such as parents, friends, and celebrities (athletes, singers, actors, social media influencers, etc.). According to Bandura's research, children

who saw aggressive behaviours were more inclined to imitate these behaviours. To better understand Social Learning Theory, you can watch the video of Bandura's Bobo Doll experiment.

b. Frustration and aggression theory

Frustration and aggression theory, first proposed by Dollard et al. (1939) and later developed by Berkowitz (1989, 1993), suggests that bullying and other forms of aggression are caused by frustration. It implies that people may react angrily out of dissatisfaction when they don't succeed in achieving their aims. This theory defines bullying as a way of expressing anger or regaining power and explains reactive aggression as a reaction to perceived dangers or obstacles.

c. Social dominance theory

According to the social dominance theory, bullying is a tactic used to create and uphold social hierarchies. Aggression is a tactic used by people to establish dominance and a better standing in social organisations. This idea contributes to the explanation of why bullying frequently entails an imbalance of power, with bullies wanting to maintain their social standing and influence over their victims. It draws attention to how social structures support and encourage bullying behaviour (Sidanius & Pratto, 1999). Furthermore, there is a personality trait known as social dominance orientation (SDO) represents a person's "degree of preference for inequality among social groups" (Pratto, Sidanius, Stallworth, & Malle, Citation1994, p. 741).

d. Ecological systems theory

Bronfenbrenner's (1979) ecological systems theory provides a comprehensive framework for understanding bullying by accounting for multiple levels of influence. This concept examines the ways in which a person's behavior is influenced by a variety of contexts, such as their family, peers, school, community, culture, and media. The importance of the broader social environment in shaping bullying behaviors and responses is emphasised (Bronfenbrenner, 1979; Espelage & Swearer, 2003).

e. Developmental psychopathology

This approach focuses on the interactions between environmental factors, developmental pathways, and risk factors that shape bullying behavior. The analysis considers the ways in which early experiences, personality traits, and contextual factors interact to shape bullying throughout time. Volk et al. (2012) claim that developmental psychopathology

sheds light on the ways in which individual and environmental factors interact to shape bullying behavior and its outcomes.

f. Attachment theory

According to John Bowlby's attachment theory (1969), early relationships with caregivers have an impact on bullying and other subsequent social behaviors. Strong attachment relationships are the foundation of constructive social interactions, yet insecure attachments can feed aggressive or bullying behavior. This idea emphasizes how early relational experiences shape emotional and behavioral reactions (Bowlby, 1969; Mikulincer & Shaver, 2007).

g. Self-control theory

The self-control theory of Gottfredson and Hirschi (1990) states that a lack of self-control is a major contributing factor to violent behavior, which includes bullying. Individuals who struggle with emotional regulation and behavioral self-control are more likely to act impulsively and violently. The theory states that self-control exercises are essential for putting an end to bullying and other antisocial behavior.

These theories, along with relevant research, provide a thorough knowledge of the intricate dynamics and underlying aspects of bullying. They offer insightful information that can be used to create interventions and preventative measures that effectively address and stop bullying behavior.

Motivating, risk, and protective factors of bullying

Motivating factors

Understanding the differences between instrumental and reactive aggression is crucial to comprehending the motivating factors. Responding to a threat with harm is the goal of reactive aggression, which is motivated by resentment and frustration (Berkowitz, 1989, 1993; Dollard et al., 1939). By contrast, instrumental aggression is associated with joy and excitement and is a planned activity to attain certain aims (Bandura, 1973, 1983). Gradinger, Strohmeier, and Spiel (2009) found that combined bully-victims (traditional and cyber) bullies displayed the highest levels of both reactive and instrumental aggression compared to traditional bullies, cyberbullies, and non-bullies. A subsequent study (Gradinger, Strohmeier, & Spiel, 2012) showed that cyberbullies are primarily driven by power and enjoyment, traditional bullies by anger, and combination bullies by a mix of anger, power, affiliation, and fun.

According to Roland and Idsoe (2001), aggressors have two main goals: power and affiliation. Students often resort to violence to gain control or form favourable relationships.

Bullying motivations also vary by age. For instance, among eighth graders, bullying is associated with power and affiliation but not anger, whereas fifth graders show connections with power, affiliation, and anger. Gender differences reveal that girls' bullying is more linked to affiliation and boys' to power.

Fluck (2017) investigated the causes of bullying and found that one of the five causes (power, revenge, sadism, ideology, and instrumental) was not confirmed (instrumental), but the other four were confirmed. In addition, the qualitative data of the study revealed new reasons (peer pressure and self-control). The seven reasons mentioned in Fluck's research are:

Power: Many bullies are driven by a desire for power and dominance over others. This can manifest in various ways, such as controlling or intimidating peers to assert their superiority.

Revenge: Some individuals resort to bullying as a form of retaliation for perceived wrongs or injustices they have experienced. This response is often driven by a deep sense of hurt, betrayal, or frustration, leading them to target those they believe have wronged them in some way.

Sadism: In some cases, bullies may derive pleasure from inflicting pain or suffering on others. This sadistic motivation is linked to a lack of empathy and a tendency to dehumanise victims.

Ideology: Bullying can be motivated by ideological beliefs, such as racism, xenophobia, sexism, or homophobia. Bullies may target individuals who they perceive as different or inferior based on these beliefs.

Instrumental: Bullying can be used as a means to achieve certain goals, such as gaining social status, securing resources, or influencing group dynamics.

Peer Pressure: The desire to fit in with a certain peer group can motivate individuals to engage in bullying behaviour, especially if the group values or rewards such actions.

Lack of Self-Control: Some bullies may have poor impulse control and act out aggressively without considering the consequences of their actions.

Bullies often cite retaliation as a key motivation, while victims report power and sadism. Understanding these motivations is crucial for developing effective interventions to address and prevent bullying behaviour.

What is the relation between empathy and aggression?

Zych, Ttofi, and Farrington (2017) found that bullies generally lack empathy and exhibit callous-unemotional traits, correlating with repeated bullying. Bullied individuals showed low empathy, while defenders exhibited higher empathy levels.

1. Lack of empathy in bullies: Bullies typically have low levels of both cognitive and affective empathy. This means they struggle to understand others' perspectives and do not feel concern for their victims' distress. This lack of empathy allows bullies to inflict harm without feeling guilt or remorse.
2. Callous-unemotional traits: Bullies often display traits such as a lack of guilt, shallow emotions, and insensitivity to others' feelings. These traits are associated with persistent and severe bullying behaviour.
3. Empathy in victims: Victims of bullying often have lower empathy scores compared to non-victims. This could be due to the emotional toll of being bullied, which can impair their ability to relate to others emotionally.
4. Empathy in defenders: Individuals who stand up against bullying, known as defenders, generally possess higher levels of empathy. Their ability to understand and share the feelings of others drives them to intervene and support victims.

To sum up: The relationship between empathy and aggression highlights the importance of fostering empathetic skills in children to prevent bullying and promote prosocial behaviour.

Risk factors

Several risk factors increase the likelihood of an individual engaging in or becoming a victim of bullying and aggression. Here are some of the risk factors:

Individual factors: Traits such as low self-esteem, self-efficacy, aggression, and lack of empathy can make one more likely to bully or be bullied (i.e. Bandura et al., 2003; Donnellan et al., 2005; Jollife & Farrington, 2006; Salmivalli, 2001).

Family factors: A lack of parental supervision, harsh or inconsistent discipline, and exposure to family conflict can contribute to bullying behaviour (i.e. Bowes et al., 2009; Espelage & Swearer, 2003; Stavrinides et al., 2015).

School factors: Schools with weak anti-bullying policies and mechanisms, lack of supervision, location of school, and a negative school climate are environments where bullying is more likely to occur (i.e. Bowes et al., 2009; Payne & Gottfredson, 2004).

Peer factors: Peer pressure, association with delinquent peers, and social isolation can increase the risk of bullying (i.e. Bowes et al., 2009; Salmivalli, 2010).

Neighbourhood factors: Neighborhood safety, neighborhood structural disadvantage, and residental instability can increase the risk of bullying (i.e. Choi et al., 2021; Foster & Brooks-Gunn, 2012)

Protective factors

Protective factors can help mitigate the risk of bullying and bullying victimization and their effects. Here are some of the protective factors:

Strong social support: Positive relationships with family, peers, friends, and teachers can provide emotional support and reduce the likelihood of bullying (i.e. Espelage & Swearer, 2003; Mishna et al., 2016; Wang et al., 2009).

Effective school policies: Schools that implement comprehensive and regular anti-bullying programs and mechanisms and foster a positive school climate can reduce bullying incidents (i.e. Hall, 2017).

Emotional and social skills: Fostering empathy and assertiveness in and with children, and teaching conflict resolution strategies can protect against bullying behaviour and victimisation (i.e. Ttofi et al., 2014).

Parental involvement: Active parental engagement in a child's life, including monitoring activities and promoting open communication, can serve as a buffer against bullying (i.e. Simmons-Morton et al., 2004; Wienke et al., 2009).

Whom to who?

Schools in many ways are just like all other types of organisations. As long as there are humans in an organisation, its operation will rely on relationships. The dynamics of these relationships can lead to individuals or groups feeling bullied at times.

When we think of school violence or bullying, we tend to think of it as something which happens between individual learners or individuals and groups. Whilst learners are the main group, they are not the only members of the school community who can experience bullying. Adult bullying occurs in schools as it does in other workplaces: teachers can feel bullied by leadership and vice versa (Fahie, 2014), parents can feel mum/dad-shamed by other parents at the school gate, and it is not uncommon for individuals or groups of parents to make a teacher feel bullied. In fact, it is notable that since the Covid pandemic this particular type of bullying is more spoken of within the teaching community. The lack of face-to-face contact between parents and teachers during the pandemic led to all communication happening online. Parents just like everyone else can feel a little braver in online communication: for example, it is a lot easier and quicker to press send on an abusive email than it is to arrange a meeting with a teacher and to say those same things directly to them.

This is not to say that teachers do not engage in this type of behaviour themselves. Depending on the culture of the school you work in, you may find yourself feeling bullied by a colleague, being ostracised in the staffroom or feeling harassed by school leadership.

Learners can often feel as though the teacher does not like them or is picking on them. They may feel as though they are always in trouble and can do nothing right. As teachers, we are human and just like our learners we will not like everyone we interact with on a

daily basis. This may include some of the learners we work with. We have a professional responsibility to ensure that learners never pick up on this. We must ensure that learners feel valued and heard in our classrooms. Unfortunately, it does happen that some teachers cannot maintain their professionalism and bully particular learners. If you notice this in yourself or a colleague, you have a moral and professional obligation to raise it with school leadership.

An increasing trend in secondary and higher education is learner/teacher bullying, which is not as common in primary level education. Such bullying can include cyberbullying as well as traditional bullying. Learner/teacher bullying is most commonly trolling, creation of false profiles/accounts and posting of fake images. A recent study conducted by the Association of Secondary Teachers in Ireland found that 18% of respondents to their survey had experienced some form of cyberbullying from students or parents (RedC ASTI 2024).

Bullying behaviour has negative effects on all those at whom it is aimed. No group within a school community experiences bullying behaviour and remains unscathed. Learners however lack the life experience, resilience and understanding of bullying that adults have and are therefore more greatly affected.

What are the effects of bullying?

Bullying remains a significant issue that impacts both individuals and societies. Studies conducted in the twenty-first century have shown that bullying has a variety of negative consequences on the physical, psychosocial, and academic domains.

Physical consequences

Bullying can have immediate negative effects on one's physical health, like physical harm, or it can have long-term consequences, like headaches, disturbed sleep, or somatisation. But it can be challenging to pinpoint the physical after-effects of bullying in the long run and connect them to previous bullying conduct as opposed to other factors like anxiety or other traumatic childhood experiences, which can also have long-term physical effects that persist into adulthood (i.e. Hager and Leadbeater, 2016).

Psychosocial consequences

The psychosocial ramifications of bullying are extensive and multifaceted. People who are bullied may experience internalising and externalising problems. Anxiety, dread, depression, self harming, and social disengagement are examples of internalizing symptoms (i.e., Juvonen and Graham, 2014; Vaillancourt et al., 2013). Anger, violence, conduct issues, including a propensity for dangerous and impulsive behavior as well as criminal activity, are examples of externalising behavior (i.e., Patchin et al., 2006). Substance use and abuse are examples of externalising difficulties. Bullying has been linked to long-term psychological

suffering, such as post-traumatic stress disorder (PTSD) and chronic anxiety (i.e. Nielsen et al., 2015). Bullying has an impact on social interactions and behaviour as well. Friendship formation and maintenance can be difficult for victims, which can worsen feelings of loneliness and isolation. According to research by Hawley and Williford (2015), social dominance is important in the dynamics of bullying since it causes problems for both bullies and victims in their interactions with peers.

"Sticks and stones will break my bones, but words can never hurt me."Do you think that's the case in reality?

Recent studies underscore that verbal bullying has the highest prevalence and the most substantial detrimental impact on adolescent mental health. Research by Man, Liu, and Xue (2022) using data from the global school-based student health survey conducted between 2002 and 2015, reveals two key findings. Firstly, verbal bullying is the most common form of bullying, and its frequency has a significant and negative impact on adolescent mental health. The study found that the more often adolescents experienced peer ridicule or name-calling, the worse their mental health outcomes were. Secondly, from the perspective of social identity theory, this highly discriminatory ridicule results in poor mental health outcomes, particularly for adolescents with strong social identities. This discrimination increases their psychological distress and contributes to the severity of their mental health issues.

Aademic consequences

Bullying has an effect on kids' academic performance and participation as well as beyond the classroom. Bullying victims experience lower academic accomplishment, as evidenced by an increasing body of research, regardless of how grades or test scores are calculated. Children who experience bullying are more likely to experience poor academic attainment (Nakamoto & Schwartz, 2010) and higher absenteeism (Juvonen et al., 2000), according to cross-sectional study. According to multiple short-term (one academic year) longitudinal studies, academic problems do not predict being the target of bullying, but rather being the victim of bullying predicts academic problems (Schwartz et al., 2005). Speaking about the negative consequences of bullying that are limited to the victim would be inadequate. This is because bullying has negative consequences on the victims as well as the bullies, the bully-victims, and the bystanders. The table below shows the negative consequences of bullying on all students in different bullying roles as reported in different studies (Rivara et al., 2016; Vanderbilt & Augustyne, 2010).

Table 2. Negative effects of bullying for different bullying roles

Victim	Bully	Bully-victim	Bystander

*Absenteeism
 	
*Abusive relationships
  *Aggression
  *Anger
  *Anxiety
  *Conduct problems
  *Delinquency
  *Depression
  *Fear
  *Isolation, loneliness, and withdrawal from social contact
  *Lower social status
  *Maladjustment
  *Mental health problems
  *Peer victimisation
  *Physical health problems (i.e. headache, sleep problems, somatisation)
  *Physical injury
  *Poor academic performance
  *Poor self-esteem and self-efficacy
  *Self-harming behaviour
  *Social deficits
  *Substance abuse
  *Suicidal thoughts
  *Truancy
  *…
	*Higher rates of depression and psychological distress
	
	*Higher risk of criminal behavior, weapon carrying, fighting
	  *Higher risk of dropping out of school
	  *Higher risk of substance use
	  *Mental health problems
	  *Negative attitudes towards school
	  *Psychosomatic problems
	  *…
		* Anger
		
		*Aggression
		  *Conduct problems
		  *Depression
		  *Loneliness
		  *Mental health problems
		  *Negative attitudes towards school
		  *Negative perception of self and others
		  *Peer relationship problems
		  *Physical health problems (i.e. headache, sleep problems, somatisation)
		  *Physical injury
		  *Poor academic performance
		  *Poor social skills
		  *Psychosocial maladjustment
		  *Self-harming behaviour
		  *Substance abuse
		  *Suicidal thoughts
		  *…
			*Anxiety
			
			*Helplessness
			  *Insecurity
			  *Interpersonal sensitivity
			  *Mental health problems
			  *Substance use
			  *Suicidal thoughts
			  *…

The effects of bullying on people in different roles are presented in detail in the table above. We see that some of the same negative effects are experienced by different bullying "roles" (See the colour-code across the columns). For example, physical health problems, substance use/abuse, and suicidal thoughts are experienced by three of the four groups.

Another victim group related to bullying is poly-victims. Poly-victims are one subgroup of school-age children who might be more vulnerable to the negative immediate and long-term effects of bullying victimisation. According to Finkelhor et al. (2007), poly-victims are those who exhibit high levels of traumatic symptomatology and are exposed to the following: (1) violent and property crimes (such as theft, burglary, assault, and sexual assault); (2) child welfare violations (such as child abuse and family abduction); (3) the violence of warfare and civil disturbances; and (4) being the targets of bullying behavior.

Compared to youth who did not meet the criteria for poly-victimisation, youth who were poly-victims were more likely to meet criteria for psychiatric disorders, such as being up to five times more likely to use drugs or alcohol, two times more likely to report depressive

symptoms, three times more likely to report post-traumatic stress disorder, and up to eight times more likely to have comorbid disorders (Finkelhor et al., 2005; Ford et al., 2010).

Understanding the comprehensive effects of bullying is crucial for developing effective interventions. Addressing bullying requires a multifaceted approach that includes **improving mental health support for victims, fostering positive social relationships**, and **enhancing academic support systems**. It also involves creating a school environment that actively prevents bullying and supports affected individuals.

By recognising the broad impacts of bullying on psychological well-being, social interactions, and academic performance, educators, parents, and policymakers can work together to implement strategies that reduce bullying and mitigate its adverse effects.

Mechanisms of change: How can we address and prevent bullying in our schools?

In this section, we discuss the need for collaboration and a common understanding in addressing and preventing bullying in our schools. This common understanding is found in policies that guide schools on the procedures to be followed in addressing and preventing bullying at school. In turn, schools need to ensure that all teachers and learners are fully aware of their role in addressing and preventing bullying at an individual level.

Mechanisms of change – Policy level

As discussed above, bullying will not end if it remains a situation that should be solved between the bully and the bullied only. Thus, the chapter discussed the need for classroom and school strategies. However, we know that what happens at school frequently spills out into the extended environment of the learner. Hence, there is a need to broaden the scope of the area that covers bullying and its impact. In fact, several articles describe bullying as a public health concern (Gong, et al., 2024). As a result, this section will examine the national policies that discuss bullying and the strategies needed to address and prevent it.

As noted above, whole-school policies should be grounded in strong legal and policy frameworks in order to be effective. A national policy or guidelines on bullying are useful tools in supporting schools to design and develop Whole School Approaches (WSAs) which can reach the school community and beyond. One of the issues for schools in tackling bullying traditionally has been that the messages being received and reproduced at home and the wider community could not be controlled and could be in direct opposition to what the school was trying to do. National policies are written and developed to reflect the social norms of a particular society and, as such, tend to be in alignment with the morals and ethics of most of the population. Basing school policy on such documents gives them a greater chance of being acceptable to the majority of the school community, and thus being

more powerful. Many such national policies are based on international children's rights law, such as the United Nations Convention on the Rights of the Child (1989)

One such national policy is Bí Cineálta (2024) from Ireland. Bí Cineálta highlights the rights outlined in the Convention on the Rights of the Child, which bullying interferes with. These include:

- the right to freedom of expression (Article 13)
- the right to freedom of thought, conscience and religion (Article 14)
- the right to freedom of association and freedom of peaceful assembly (Article 15)
- the right to privacy (Article 16)
- the right to be protected from all forms of abuse and neglect (Article 19)
- the right to enjoy the highest attainable standard of health (Article 24)
- the right to education (Article 28)
- the right to enjoy their own culture, religion or language (Article 30)

Bí Cineálta outlines the forms bullying may take and the impact of such behaviour, how bullying may be prevented and addressed. Whilst each section of the policy document provides guidance and suggested courses of action, the ultimate decision about how the school will tackle the issue and the processes to be put in place rests with the school community. This is a recognition of the fact that there is no 'one size fits all' way to ensure that all children feel safe in their schools. The Bí Cineálta policy does however include several requirements which must be included in the anti-bullying policies and procedures of all schools:

- a statement of the school's commitment to prevent and address bullying behaviour
- a statement acknowledging that bullying behaviour interferes with the rights of the child
- the core definition of bullying behaviour as provided in Section 2.1 of these procedures
- how the school engaged with the school community to develop the policy
- how the school engaged with the school community to review the policy
- how the school prevents bullying behaviour (based on Chapter 5 of these procedures)
- how the school supports students who experience, witness and display bullying behaviour
- what happens when bullying behaviour is reported
- the teacher(s) in the school responsible for addressing incidents of bullying behaviour
- how oversight of bullying behaviour will be managed
- how the school will communicate its Bí Cineálta policy

Schools are also encouraged to develop a student-friendly version of the policy in order to ensure that children have a clear understanding of the procedures in place in their school.

There are many other examples of similar national policies, particularly in nations that are signatories to the UN Convention on the Rights of the Child. Does your home country have such a policy or perhaps guidelines for schools? How do schools in your country implement these policies/guidelines[CO(2] ?

National policies like Bí Cineálta provide school communities with the tools they need to tackle and prevent bullying behaviour and to create policies and procedures that are suitable for their school context.

Mechanisms of change – School level

As with many educational initiatives and programmes, the success of any anti-bullying measures at school level relies on the buy-in and cooperation of the whole school community. In taking this type of Whole-School Approach (WSA), schools must ensure that the voices of all stakeholders are heard. The initiative needs to be supported by learners, staff, leadership and parents and ideally by the local community.

In order for a school to establish an effective WSA for the prevention of bullying, nine factors must be in place.

1)   Whole school policies need to **be grounded in strong policy and legal frameworks** which can only occur with robust political leadership. Many nations now have national policies on school-based bullying and violence e.g. Bí Cineálta in Ireland, Respect for All in Scotland and Stopbullying.org in the US.

2)   Bullying prevention efforts are most successful when they are supported by **learner-centred, respectful and caring classroom management strategies**. No child should be demonised due to their involvement in bullying behaviour. Instead, teachers must try to understand the motivations and needs of all parties.

3) The National Curriculum, whole-school plans and teachers' individual lessons and plans should all **provide space for the promotion of a caring school climate**. Dr. Andrew Campbell speaks eloquently on how this can be achieved here .

4) Learners thrive when they feel safe and heard in school. If learners are to feel secure enough to report and/or discuss bullying events, they must be confident that their **physical and psychological safety will be assured in the classroom and school.**

5)   **A formal reporting system must be established, and these procedures shared with learners, staff and parents.** Once a report is made, learners should be confident in the knowledge that they will have access to support services. Some bullying reports may raise safeguarding concerns. A system should be in place for staff to bring these concerns to the relevant individual or organisation. This may be a senior member of the school leadership team and/or the social services in your area.

6) It is crucial that the bulk of the work needed to prevent bullying in a school is not

placed on the staff and learners alone. Learners pick up unconscious bias from their homes and communities, so some attitudinal changes may be required here too. By **engaging groups such as parents and local community groups in accepting and supporting all learners, schools can send clear messages to learners about what is and is not accepted behaviour**. Learners need to hear honesty about the harm and damage that can be caused by their words and actions if/when they engage in bullying behaviours .

7)   As these WSAs are aimed at preventing and/or addressing bullying in schools, it is vital that **learners are empowered to advocate for themselves and their peers, to report bullying, to say something when they see something.** The inclusion of learners in the selection, use and evaluation of anti-bullying programmes being used in their schools will lead to a greater chance of success for such programmes.

8)   There is a great deal of support available to schools internationally with regard to anti-bullying resources and programmes. Many of these resources and programmes are produced by government agencies and departments, others by Non-Governmental Organisations (NGOs) focusing on bullying and academics with an interest in inclusive education. Schools can choose between pre-made programmes or can cherry-pick elements of many to design a programme unique to their school context and needs. The interest and collaboration of all these organisations in supporting bullying prevention in schools highlights the seriousness with which the issue is considered on the world stage.

9)   A successful WSA to bullying prevention **must be grounded in evidence and consistently monitored to check its effectiveness**. Have incidents increased or decreased since taking the approach? Are changes required to improve the effectiveness of the approach? All these questions should be considered by all those involved at least annually, if not more regularly.

There are many different WSAs available for use in schools internationally, some will be completely appropriate for use in your context and others will have elements that can be cherry-picked and adapted to build a unique WSA. Amongst the most evidenced based approaches are Kiusaamista Vastaan (KiVa) (Finland and Estonia), The Olweus Bullying Prevention Programme (OBPP) (Norway), and Restorative Practices (RP) (International). Readers can find more information on each of these approaches by clicking on the hyperlinks.

The key aspects of each of these approaches are outlined in Table 3 below:

Table 3: Whole-School Approaches

KiVa	OBPP	RP
• Aimed at preventing bullying but also tackles individual cases • Consists of 10 lessons taught across the school year • Each school has a KiVa team of staff who function as 'experts' in bullying related matters in their school. They provide the support for individual cases. • Focuses on the responsibility to stop bullying, how to act in a group and respect for all	• Aimed at preventing bullying but also tackles individual cases • All students participate in the programme with those bullied/ bullying receive additional interventions • Focuses on encouraging prosocial behaviour and building a sense of community	• Aimed at preventing bullying but also tackles individual cases • All students participate in the Fair Process which builds with those individual cases being addressed by a staff mediator who uses specific questions to support reflection, accountabilitly and restoration of damaged relationships. • Fosters a sense of belonging and empathy

The systematic nature of these WSAs should be noted. Part of the success is a shared understanding around expectations of behaviour within the school community and the effects of irresponsible behaviour on individuals and the school community as a whole. A key part of the effectiveness of these programmes is the explicit teaching and modelling of acceptable behaviours by teachers and other school community members.

Mechanisms of change – Classroom level

In a study conducted by Smith et al. (2004) on English students between the ages of 13 and 16, the five most common coping mechanisms were talking to someone, ignoring it, standing up for yourself, avoiding bullies, and making new or different friends. Speaking with someone seemed to be the best course of action, since during a two-year period, individuals who had stopped being victims had spoken to someone about it more frequently (67%) than those who had either remained victims (46%) or became victims (41%). According to Hunter and Boyle (2004), older students and boys are less likely to tell a teacher.

To prevent microaggressions, consider using *micro affirmations*, which involve little gestures of inclusion, listening, comfort, and support for individuals who may feel alienated or invisible in their environment. These can include welcoming facial expressions and

concerted efforts to use appropriate names, pronunciations, and pronouns, support children's feelings and experiences, and praise excellent conduct (Rowe, 2018).

A UNESCO Technical Brief from 2022 entitled '*The key role of teachers in ending school violence & bullying',* highlighted the central role of teachers in the successful implementation of WSAs,

Teachers are essential in creating psychologically and physically safe school and classroom environments, and their relationship with students is key in preventing and addressing school violence. (2022:2)

As we saw in *Table 3* each of the three WSAs mentioned had central roles for teachers in the effective delivery of both school-wide preventative strategies and in individual cases.

As teachers, the heart of our influence on our students lies in our classrooms and in the relationships we form with the children and young people in our charge. It is extremely important that as well as actively engaging with the WSA being used in our school, we also create safe classroom environments and open, honest and respectful relationships with and between learners. Students respond best to teachers who are fair, consistent and who actually listen to them.

At the start of each school year, one of the easiest ways of beginning to establish that you listen and are fair and consistent is to collaboratively establish classroom behavioural expectations or rules with the learners. Rather than dictating what your expectations are around behaviour and their interactions with each other and you, it is important to discuss what all of you together expect. This can be done by developing a *class agreement or class contract* with your learners. This should be drawn up collaboratively with your learners. A good starting point is to ask them to share with you*what they need to feel safe and ready to learn* in their classroom. You should then share with them *what it is you need in order to be ready and comfortable to teach.* All of this information should be*recorded* on a flipchart, poster or whiteboard so that it can help shape the *discussion* around integrating the information into a set of guidelines/rules that everyone will follow. Whilst your initial discussions will create a lot of information, it is important to return to the discussion within a day or two and work with your learners to*categorise* it. This helps to consolidate the information and **develop a succinct set of rules which all parties can agree upon**. In order to formalise the process and help learners to see that you are genuinely interested in their needs, *it is important that you as teacher and each of the learners sign the poster.* This should then be *displayed prominently within the classroom* and used to remind both learners and teacher about the agreed acceptable and appropriate behaviour throughout the school year. Learners, like all other humans, respond better to positivity and praise than negativity and punishment. It is important that classroom contracts*use positive language and focus on what learners and teachers should do*. However, in clearly outlining positive behaviours, we implicitly highlight those that are unacceptable and inappropriate.

Following the drawing up of a classroom agreement or contract, it is critical that learners are made aware of the ***processes for dealing with and the consequences of inappropriate behaviour***. If we are engaging with a WSA which takes a children's rights perspective such as those mentioned above, it is important to ***make the learners aware of not just their rights but their responsibilities***. In particular, their responsibilities to ensure that their actions do not impinge on the rights of their peers. This is especially important when it comes to preventing bullying behaviour within a class group or between learners in other classes. Much like the classroom agreement or contract, it is vital that ***teachers and learners discuss the class and school reporting procedures*** in cases where someone feels they have been affected by bullying behaviour or have witnessed the same. In many cultures there may be a history of reporting such behaviour being frowned upon with those who report being called 'snitches', 'rats' or 'touts'. There may also be a culture of reporters or potential reporters being threatened with dire consequences for doing the right thing. The only way that individual teachers and schools can overcome this type of attitude towards reporting bullying behaviour is to ***establish procedures that allow both the bullied and witness to feel safe when reporting.*** Such procedures need to be discussed often and openly. Learners should feel secure enough to flag any issues with the school's procedures. Learners should also ***be aware of the processes in place to handle reported incidents***. They should be familiarised with what will happen at each step of the process. Younger children in particular may be fearful of having to come face to face with the peer they feel has engaged in bullying behaviour. Those to whom such behaviour is reported ***must engage in active listening when taking the report. Learners should feel that they are believed*** and that the teacher will do something to improve the situation. Most of the WSAs suggest that the teacher speaks to both parties separately first, to establish what they believe to be their truth. Many will then bring both parties together and either mediate between them or facilitate them to discuss the issues in a calm, non-judgemental manner. If you as a class teacher find yourself in a position of being the mediator, the use of simple questions can be very helpful. For example, in schools taking a Restorative Practices approach, restorative questions are used with both parties to aid reflection and bring about a restorative action to help restore the damaged relationship. Examples of such restorative questions are outlined in *Table 4* below.

Table 4 – Restorative Questions

Restorative Questions

- What happened?
- What were you thinking of at the time?
- What have you thought about it since?
- Who has been affected and in what way?
- How could things have been done differently?
- What do you need?
- What do you think needs to happen next?

These questions are central to achieving what is known in Restorative Practices as *Fair process.* Fair process builds trust within a school community and within a classroom by *engaging* all involved in the resolution process. Adopting a shared understanding of the situation by having all parties*explain* their truth. By involving all parties in reaching a decision on the restorative action that needs to be taken, the fair process provides *clarity* for all involved.

Two other key components of classroom work help to establish an environment in which bullying is less likely to occur. These include*reward systems to positively reinforce* appropriate and acceptable behaviour and the explicit *teaching of empathy*.

Reward systems are important in showing learners that their actions have consequences in the case of both acceptable and unacceptable behaviour. It is the case that learners of primary school age in particular are developing a sense of right and wrong and need guidance and support whilst developing their own moral compass.. Reward systems, although somewhat behaviourist in operation, help younger learners to correlate appropriate and acceptable actions with positive outcomes. It is important that teachers spend as much if not more time rewarding desired actions as they do dealing with unacceptable behaviours. Younger learners need to feel that their efforts to operate within social norms (these are of course contextual) are rewarded. Reward systems vary from class to class, school to school, and nation to nation. The simpler they are to operate the better, and they do not need to cost a penny. Key to the smooth operation of a reward system is the teacher being active in observing, noting and rewarding the behaviours outlined in the classroom contact. Some systems work with individual rewards, others with groups or whole class rewards, and others combine all three. In one of the authors' own schools, each class teacher has their own reward system, which can either feed into the school-wide reward system or operate separately. The school-wide system highlights three specific aspects of our WSA, these are being respectful, responsible and ready to learn. When teachers observe children engaging in any of these, they can award them a special card for example. When a learner receives ten of these they go to the Principal's office where she allows them to select a prize from a treasure box, asks what they did to get the cards and gives them a note to take home outlining how proud she is of the learner. This

type of system is very effective for primary age children. Each school will have different ways of rewarding learners which work for that school context and the types of learner.

What types of Reward Systems have you encountered whilst on placement? What would improve those systems so that they are more attractive to your learners?

The value of ***explicitly teaching empathy*** cannot be underestimated. Building empathy within a group decreases aggression within and from that group (Connolly et al., 2018). Empathy can be taught using several methods and resources. One of the most basic is through ***modelling*** it for your learners. By dealing with all learners in an understanding manner you are showing them the importance of being able to place themselves in the shoes of others. Most national curricula include subjects such as Social, Personal and Health Education, Wellbeing or Social Science which lend themselves well to teaching empathy. Many countries also have specific programmes which support the teaching of empathy. There are plenty of resources available to allow you to ***develop lessons with a focus on empathy***. Encouraging your learners to put themselves in the position of others can be achieved by having them ***examine and discuss images, listening to or reading stories and books with a theme that helps them realise that not all learners exist in the same context as them.*** There are also international organisations which promote the development of empathy in children and young people. One such organisation is ***Roots of Empathy*** , an organisation which teaches empathy by using 'tiny teachers'. Learners work with a newborn baby and its parents over the course of the school year. The lessons help learners to see one of the most powerful models of empathy, the secure attachment between infant and parent. Learners ***begin to identify and label the baby's feelings, to reflect on their own feelings, and then apply that learning to understand and empathise with the feelings of others.*** The main reason to teach empathy explicitly is that empathy is foundational in navigating relationships successfully and in forming bonds and friendships. The ability to do these two things provides humans with self-worth, feelings of belonging and social interaction, all of which make us less likely to engage in bullying or aggressive behaviours.

Conclusion

This chapter started by providing examples of people who have had experiences of bullying both in their childhood and their adult life. What bullying is was unpacked, together with the different forms bullying could take. Microaggression as a specific form of bullying was explained. Although the perception is that bullying is a fairly common occurrence, the prevalence rates cited in the chapter range from 6 to 40%. This variability in the prevalence rates is explained in the chapter and indicates a need for a clearer definition of bullying, forms of bullying and how bullying is reported.

If we are looking at potential strategies to mitigate bullying, we need to understand what underlies bullying. The chapter examines theoretical frameworks that shed light on the

fundamental causes and contributing elements of bullying necessary to comprehend it. Thereafter, the chapter investigates what the motivation for bullying is by looking at several factors. As part of the understanding of bullying, the chapter examines who bullies whom. Most important are the complex effects of bullying and how they affect the academic, social, and psychological areas of those who are bullied.

Finally, the chapter inspects several mechanisms of change in order to address and prevent bullying. These strategies are discussed along three levels, starting with the national policy level. These national policies are supposed to support the policies and strategies at the school level, specifically those strategies used in the classroom and enforced by the teacher or student teacher. This first level investigates how national policies address bullying and the strategies that are suggested. The second level examined is the school level and how this broader level creates an ethos that rejects bullying and embraces one that includes all learners.. The third level looks at the classroom level where we find the learner. This level is especially important for the student teacher as it is the level at which the student teacher will be directly engaging with the bullied, the bully and the environment that supports either the bullied and/or the bully and how the student teacher could better address the situation. The chapter regularly examines the student teacher's reflection on all the main issues surrounding bullying discussed in the chapter, and thus strives to provide tools that the student teacher can use when confronted with bullying in the classroom.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

Now that you have been exposed to a lot of information regarding various aspects of bullying, will you as a student teacher/teacher be able to:

- Define what bullying looks like in your classroom/school?
- Identify the different forms that bullying can take?
- Distinguish the various players in a bullying situation?
- Recognise who bullies whom?
- Understand the motivation behind bullying?
- Comprehend the effects that bullying has?
- Explore and put into action mechanisms of change which address and prevent bullying in your school?

About the authors

Clíona O'Keeffe

An experienced educator, Clíona is Principal at a large all-boys primary school on the outskirts of Dublin. Having previously worked as a classroom teacher, in curriculum development and in teacher education she has a wide range of research interests these include leadership selection processes in education, inclusive education particularly in relation to learners with additional educational needs, Catholic education and social teaching, and the teaching of History, Geography and Science.

Evrim Çetinkaya Yıldız

Evrim Çetinkaya Yıldız is working as an associate professor at Akdeniz University, Türkiye, Department of Psychological Counseling and Guidance. Her research interests are inclusive education, prevention of student problem behaviours, and school counsellor education.

Fatma Kurker

Fatma is a PhD candidate in Psychological Counselling and Guidance and works as a research assistant. Her research interests include basic psychological needs, social media-mental health, international students' mental health, and racial microaggressions in the university environment.

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

MARGINALISED STUDENTS IN CLASSROOMS

Silver Cappello; Tracy Fletcher; and Nysha Chantel Givans

Example Case

When I was a student, I went to a school in Berlin-Neukölln. A school that was familiar with the term "Brennpunktschule". The term "Brennpunkt" or "sozialer Brennpunkt" refers to an area where many people with a migration background and social disadvantage live. My school was in such an area. Most of the students there came from different countries, had different religions, different cultures and spoke different languages.

There were about 23 students in my class and it quickly became clear how different we were. We all had different social and economic resources, different levels of knowledge and different language skills. How can these 23 students be guaranteed to get the same access to education? Do we all have the same equal opportunities? I kept asking myself these questions, while many high-achieving students were praised for their performance and others were told that they should study more at home. Even though many teachers were always there for us, supported and encouraged us and were confronted with many problems from home, it wasn't always enough to help everyone equally. Sometimes it felt like the education system didn't want to do justice to everyone.

I was therefore lucky to have two class teachers who built up a particularly good relationship with us. They visited every student in the class at home to get to know the families, learn from their culture and communicate with the parents. Many families were simply happy that our teachers took an interest in them and took the time to really understand them. Most of them

cooked traditional meals and shared stories from their lives. I am sure that our teachers learnt a lot about our cultures and our family backgrounds.

I am grateful to my teachers that we were all seen not just as students, but as individual people from different backgrounds. Because sometimes it's simply more than just a facade. Sometimes you have to look behind it to understand someone's stories and needs. We were taught that our voices are important and that every little story is essential. No one should feel invisible any longer. For many of us, school is more than just a place to learn – for many it is a second home. School should therefore be a place where students can feel comfortable and receive the support that is so often lacking outside of school.

Each of us carries a backpack on our back, filled with all kinds of big and small stories, experiences, resources and much more. This backpack makes us the person we are.

Ranya Defairi, student at the University of Bremen

Initial questions

In this chapter, the following questions will be addressed:

1. What does "marginalisation" mean?
2. Who are "marginalised students" and how are they evidenced in the classroom today?
3. Which forms of marginalisation exist?
4. Who is responsible for marginalised students?
5. How can educators create inclusive learning environments that validates the identities and experiences of marginalised students?
6. How can curriculum content and teaching methodologies be adapted to reflect diverse perspectives and histories, empowering marginalised students to see themselves positively represented in their education?
7. What strategies and approaches can support marginalised students, address systemic barriers, and prevent marginalisation in classrooms?

Introduction to Topic

This chapter considers the marginalisation of students within classroom settings. We will explore what is meant by marginalisation, how marginalisation occurs within the context of the classroom and the reasons for this. Lastly, you will be presented with a range of suggestions for possible strategies and approaches that you could apply in your own classroom. After reading this chapter, we hope that you will be more aware of how students can be marginalised and understand the steps you can take to tackle marginalisation.

Key aspects

What does marginalisation mean?

Theorists agree that there is no *"official"* definition of marginalisation (Messiou, 2006), although there is substantial discourse on the topic. Marginalisation refers to the process through which individuals or groups are pushed to the edges of society, where they have limited social, economic, or political power. Importantly, as Mowat (2015:457) discusses in *Towards a new conceptualisation of marginalisation* we need to "recognise that marginalisation is more than a state: it encompasses feelings about that state". This often results in restricted access to resources, opportunities, and rights that are readily available to more dominant groups.

In the context of education, marginalisation refers to the unequal, preferential, or biased allocation of access to learning opportunities, facilities, and resources (Messiou, 2006). This marginalisation is influenced by factors such as geographical location, gender, socio-economic status, or personal circumstances (Messiou, 2006).

Messiou (2012) argues that marginalisation is not a monolithic concept, but rather has multiple conceptualisations, that can be viewed across four distinct interpretations, as outlined in Table 1 below. A crucial element of Messiou's analysis is the differentiation between the experience of marginalisation, as perceived by the individual or others, and its recognition, whether by the individual themselves or by others. This distinction highlights the subjective nature of marginalisation. Consequently, an important question arises: if an individual does not recognise their life as marginalised and therefore does not experience it as such, on what basis can others deem them to be marginalised? This question carries significant implications for public policy.

Table 1. Messiou's conceptualisations of marginalisation	
Experience of marginalisation	Recognition of marginalisation
Experienced by the individual	The individual and others
Experienced by the individual	Not recognised by others
The individual is construed by others as belonging to a marginalised population	Not recognised by the individual
Experienced by the individual	Denied by the individual

Marginalisation can be viewed through the lens of the *'social capital'* theory. Marginalised or more disadvantaged groups are seen to lack the social capital which more dominant groups use to promote social mobility and economic benefits? The concept of *'cultural capital'* is obtained through learning and social connections, hence any barriers to learning should be viewed through the lens of social and cultural capital (Bourdieu, 1972). There are possible links to '*habitus*'which Bourdieu (1972: 86) defined as "a subjective but not individual system of internalised structure, schemes of perception, conception and action common to all members of the same group or class". One of the key principles is to understand the implications of the concept of '*capital*'. Capital can buy you a higher position in society and build key social networks? and can determine your role in the social world.

The OECD report (2014) *Equity, Excellence and Inclusiveness in Education* states: "The challenge we face is how to ensure our education systems give every child the quality learning experiences they need to develop and realise their individual potential, and to do so in ways that value who they are, their language, identity, and culture. How do we harness diversity, create fairness, and ensure our learning environments engage and achieve the best outcomes for all individuals, not just a few?" (Schleicher, 2014: 3). How do we address the tension (or imbalances) between creating an inclusive learning environment and empowering marginalised students?

Mowat (2015) explores the subtle ways in which marginalisation can occur. For example, when a child is excluded from participating in a reward system, such as "Golden Time," due to their misbehaviour, the psychological trauma resulting from such actions would require immediate address to support the healing of marginalised children. Interestingly, Mowat highlights an often-overlooked form of marginalisation, involving children who may have abundant access to material wealth, but lack the emotional warmth and love commonly found in other family settings. This absence can lead to attachment or behavioural issues, as noted by Cooper (2008), and serves as a form of marginalisation for these children. This underscores that marginalisation is not exclusively rooted in lower socio-economic groups.

Who are "marginalised students" and how are they evidenced in the classroom today?

We use the term "marginalised students" to refer to those who experience unfair or inequitable access to learning. Students who differ from the dominant norms of identity may face marginalisation. This group includes students who are neurodiverse, from low-income backgrounds, racial or cultural minorities, those who speak different languages, have physical disabilities, or identify with different sexualities. Marginalised students often receive limited and poorer-quality education compared to their non-marginalised peers.

Poverty can influence not only children's experiences at school, but also their future aspirations and opportunities. According to Carter-Wall and Whitfield (2012), a significant attainment gap exists in the UK between children living in poverty and those from higher socioeconomic backgrounds. The research indicates that this gap begins to widen at an early age, with disparities becoming apparent by the age of three. Consequently, children from severely impoverished backgrounds are only half as likely to pursue higher education compared to their more affluent peers. Socioeconomic background is a key predictor of students' learning outcomes. Unsurprisingly, low attainment has long-term impacts on both students' educational and psychological well-being. Sosu and Ellis (2014) found that children living in poverty face higher levels of marginalisation that have long-term consequences for their future well-being, ultimately reinforcing cycles of deprivation.

A significant issue identified by the Millennium Cohort Study, as discussed by Dickerson and Popli (2012), is that ongoing poverty, rather than short-term poverty, has the most detrimental effect on children's cognitive development during their early years. Bell Hooks (1994) discusses how identity plays an important role in the identity politics for oppressed and exploited groups??. This framework allows for a critique of dominant structures, giving their struggle purpose and meaning. Encouraging students to share their personal experiences enriches the learning environment, benefiting both students and teachers, and fostering inclusive learning environments.

Which forms of marginalisation exist?

Marginalisation in the classroom can exist in a number of ways, and some are more explicit than others. Some of the more obvious forms of marginalisation can include *Othering* , which includes microaggressions, isolation, racism, and discrimination of students. The framework of Intersectionality also explores the combined factors, or parts of a students' identity, that can contribute to marginalisation. Intersectionality, as a tool, represents an inclusive method of viewing culture and the dynamics of power in a way that recognises the complexity of discrimination and oppression which affects individuals. As our cultures are increasingly diverse, it is important to consider different social identities, as well as the intersecting parts of an individual's identity, and how these can contribute to greater inequality. This is especially important if we are actively working towards fairness and

justice. Intersectionality also increases awareness of how an individual's own privilege can influence their experiences of the world and create empathy for the situation of others. In the classroom a student may be marginalised due to a combination of their gender, ethnic background, and disability. This type of student could then experience a higher level of discrimination due to the combination of different aspects of their identity.

Other subtle forms of marginalisation exist, such as micro exclusion. While less obvious as other types of exclusion, such as segregation of students or discrimination of ethnic groups, it can also have a significant effect on a student's attainment, and also their well-being. An example of micro exclusion could be a student who is an immigrant and who is allowed to attend a class with their peer group but is given material which differs from other students. On the surface, it appears that they are included, however, they are not being given the same access to the curriculum as the other students. Another example could be students who are removed from the classroom for the purposes of more focused work for example, rather than remaining with their classmates and having extra support.

In inclusive school systems, another possible form of marginalisation and micro exclusion occurs on a micro-level, for example on a class level, where marginalisation can occur within the single school for all and yet could be present inside the same context and classroom. Research has shown that these forms of micro exclusion take place where some students work in separate rooms (so-called support rooms or special places in general) or remain in the common classroom but not collaborate or learn with their peers or leaving the class for several amounts of time or staying in the common classroom, but separated from classmates (D'Alessio, 2011; Nes, Demo & Ianes, 2018). When this micro exclusion exists within the school context this reinforces the marginalisation of students. Micro exclusion within inclusive school systems occurs more frequently in upper school grades. This means that, although students are formally enrolled in a mainstream school, there is an overall decrease in classroom participation from lower to upper classes and a congruent increase of time amount spent out of the class (Ianes, Demo & Zambotti, 2013; Wendelborg & Tøssebro, 2011).

One of the most explicit and marginalising experiences is the 'push and pull out' phenomenon, which describes situations where a pupil or a group of pupils are removed from the classroom and carry out activities removed from their classmates. Such exclusion can be linked to internal class factors, such as a teacher who cannot manage pupils' behaviours and sends them out with another teacher, or external factors like a well-equipped space that attracts pupils out of the class (Ianes, 2014). They can also take the form of special classes or units within the school. Research suggests that leaving the classroom can have varying effects in terms of inclusion depending on the context. For example, whether leaving the classroom, or the division into groups, effects the whole class group or only some pupils. Also, the criteria by which the groups are organised and how much choice is shared among all teachers can have varying effects on the whole class group (Buli-Holmberg & Jeyaprathaban, 2016; Nes, Demo & Ianes, 2018). However, the

pedagogical meaning of the phenomenon still remains unclear – while in some cases the risk of marginalisation to inclusion is evident, in others, leaving the classroom seems to be able to be interpreted as a phenomenon of an organisational flexibility of pupil groups that conforms to the idea of inclusive education (Bellacicco et al., 2019).

Another aspect to be aware of is what is known as *the hidden curriculum* (Jackson, 1968). This refers to a range of unspoken or implicit rules that students are expected to follow through the social situation of attending school. In contrast to the formal school curriculum, the hidden curriculum is not explicitly taught yet involves the expectation that these rules will be understood and followed. This also relates to the norms and values of the school, which are expressed via the school culture. According to the psychiatrist, Benson R. Synder (1970), these can have a negative impact upon students, causing anxiety and conflict. The hidden curriculum can inform the way students see themselves, and their abilities, and students can therefore be marginalised due to the demands of the hidden curriculum. Paul Willis in *Learning to Labour* (1978) found that the hidden curriculum led to resistance and the development of school subcultures. In his study of working class boys in the UK, he discovered that resistance to the norms and values of the school could contribute to poorly paid employment. An inclusive school culture should promote healthy values and allow for students to have agency in their learning and employment choices.

Another form of marginalisation, often more covert than the previous one, is the school disaffection. This describes circumstances based on the students' difficulty in perceiving contact between the school and the world outside, as well as in those students who continue to perform the assigned tasks, living the classroom experience with low participation and involvement (Rudduck, Chaplain & Wallace, 1996). Even if they are physically present, they are mentally absent and reluctant towards learning (Collins, 1998).

There are also cases in which school disaffection is visible, with manifestations of a poor sense of belonging, lack of interest, commitment and participation, dislike of teachers, lack of trust in the school, low aspiration, self-esteem and achievement (Keys & Fernandes, 1993; Lenzi, 2004).

In some cases, there are extreme situations where the individuals can no longer tolerate social norms and they exhibit negative emotions towards institutions (Hayton, 2013), which includes destructive behaviours and alienation. This often results in persistent absences or exclusion from class, as the student may want to avoid specific lessons, teachers or tests, or the fear of being bullied (Hargreaves & Reid, 2011; Harrison, 2004; Krawczyk & Horner, 2006; Newburn, Shiner & Young, 2013). Skinner and Belmont (1993) state that disaffected pupils are passive, bored, depressed or angry and rebel with teachers and classmates. According to Klein (1999), the founder of the International Journal on School Disaffection, the causes of disaffection can be different and can range from discrimination and accentuation of differences in students' abilities, excessive punishment in cases of disciplinary problems, and curricula that do recognise students' experiences, interests and talents. Other possible causes can be attributed to the family environment: low socio-

economic status, single-parent family, migrant background, impoverished parents, disordered home life, family breakdown, lack of family support, negative parental attitudes towards school and education, (Lenzi, 2004; Riley et al., 2002).

All these negative experiences could lead students to be part of this drop-out phenomena as a "virtual drop-out" (Kumar, Gheen & Kaplan, 2002), which is another visible form of marginalisation, even if it derives from various causes: socio-cultural (family cultural poverty), school-related (in school orientation and teacher-pupil relationships) and personal (negative experiences of the subjects and refusal behaviour towards school) (Bertolini, 1996).

Who is responsible for marginalised students?

We believe that all those connected to, or working in education, have a responsibility for tackling marginalisation and promoting an inclusive school. This will benefit everyone, by providing a democratic education which enables equity, and promotes social justice. It is crucial therefore that all school staff act as role models for students, and recognise the value of inclusive work, and the relevant opportunities and potential that exists in different contexts. For example, the school leadership can implement a school wide policy to establish and set the tone for an inclusive school culture. In practice this means actively nurturing a safe space for students to be themselves, providing the necessary resources, (such as support staff and training for teachers), to promote inclusivity across the whole school.

However, a top down approach is not enough, and all members of the school community must take responsibility by reflecting on how best they can support students. At the classroom level, teachers can take responsibility by being mindful and aware of classroom dynamics, by using inclusive language, and by being open-minded to applying inclusive pedagogy. Teachers need to examine the dynamics of their classrooms, and the diverse identities that make up the learning environment. Although teachers often have good intentions, they should also be aware of the influence of unconscious bias, and reflect upon their views, position, and context in the classroom (for more information on these aspects see the chapters about anti-bias education and teacher habitus).

With guidance from school staff, classmates can be encouraged to include other students, or students themselves can take responsibility for their own situation, by being conscious of their peers?, and reflect on how they engage in their own learning journey. Students should feel empowered, safe, and able to voice their opinions and concerns.

In the wider community, we can extend the circle of support by involving parents and other members of the community. This method assists those from marginalised groups to build on their existing circle of support or to build a new one. When a circle of support is formed around an individual who might otherwise feel excluded, it can shift its focus to empowering that person. This approach is particularly effective when supporting

individuals from marginalised groups and can empower them by providing a community that helps them achieve their goals and build meaningful relationships.

How can educators create inclusive learning environments that validate the identities and experiences of marginalised students?

Creating inclusive learning environments for marginalised students involves recognising and valuing their diverse identities and experiences. Educators should focus on integrating diverse perspectives into the curriculum and fostering an atmosphere of mutual respect and support. It is important to create a safe space where all students feel comfortable expressing themselves and where their backgrounds are acknowledged and respected. Building strong, supportive relationships with students and involving families and communities in the educational process can enhance this sense of belonging (for more information on these aspects see the chapters about inclusive learning environments and collaboration with parents). Additionally, ensuring that teaching practices and materials reflect and celebrate diversity helps all students feel seen and valued. Finally, continuous professional development for educators on issues of diversity, equity, and inclusion is crucial to maintain an environment that supports the academic and social success of all students.

A positive school culture, and classroom culture, recognises the value that all students have in the learning environment. This involves the acknowledgement of diversity, and a celebration of a variety of different identities that make up the student body. In the classroom, this could include collaborative work between students and using a variety of materials that represent the different identities that are present in the classroom (for more information see chapter about inclusive school culture).

Research suggests that marginalisation can have enduring effects, leading to detrimental impacts on mental health, including depression and anxiety, which may further exacerbate marginalisation within broader communities. Prince and Hadwin (2013) emphasise the importance of fostering positive relationships between students and teachers, particularly as these relationships can promote resilience among marginalised students. Additionally, a supportive and caring school environment plays a crucial role in mitigating the effects of marginalisation.

How can curriculum content and teaching methodologies be adapted to reflect diverse perspectives and histories, empowering marginalised students to see themselves positively reflected in their education?

Recent educational reforms across the globe reflect a growing commitment to decolonising the curriculum and adapting teaching methodologies to include diverse perspectives – a notable example being the UK's ongoing initiative to decolonise the curriculum (DcT). Wales is at the forefront of this movement with its Anti-Racism Wales Action Plan (ARWAP),

which aims to dismantle systemic and institutional racism by 2030 (Welsh Government, 2022). This initiative acknowledges that Global Majority communities, including Black, Asian, and Minority Ethnic groups, face ongoing challenges of racism, race inequality, and colourism (Welsh Government, 2022). Addressing such issues requires not only changes to the curriculum, but also an adaptation of teaching practices.

In the context of decolonising education, Chetty's (2022) contribution to Decolonising Curriculum in Education: Continuing Proclamations and Provocations underscores the importance of self-reflexivity within White power structures as a necessary step towards dismantling these hierarchies. Chetty highlights the need to examine the power dynamics and advocates for a commitment to change at an institutional level (Race et al., 2022). Similarly, in the U.S., the Ithaca school district has developed an anti-marginalisation curriculum that includes topics such as 'pronouns, flags, and feeling safe', and encourages students to challenge their own assumptions about identity, diversity, and power through critical thinking and collaboration (Mansfield, 2022).

Furthermore, Hooley's (2002) model of "two-way enquiry learning" (see Table 2 below) provides an example of how educational systems can integrate diverse knowledge systems. He explains how Australia adapted its educational practices by incorporating Indigenous and Western knowledge systems, a practice that could be applied to non-Indigenous educational settings globally. This approach allows both Indigenous and Western ways of knowing to coexist, promoting mutual respect without placing one above the other. Learning, in this model, is derived from community and social practices, requiring reflection on significant experiences, with a particular emphasis on environmental learning (Hooley, 2002).

Table 2. Neil Hooley's seven dimensions of two-way learning

Dimension 1	Continuity of experience as the basis of all learning programs.
Dimension 2	Recognition that the expression of learning occurs in different ways for different children based on their cultural and socio-economic background, but that a set of similar factors may exist in all cultures that emphasise construction of new knowledge rather than instruction in old content. This demands a respect for the knowledge and culture that all children bring to school, and an acceptance that learning occurs actively from this platform in an outwards – inwards cyclical manner.
Dimension 3	Long-term systematic processes of reflection on experience.
Dimension 4	Integrated theory and practice, incorporating respect for and learning from the natural environment.

Dimension 5	Teaching and learning that enables a framework of:
	
	– holistic, integrated and constructed knowledge
	  – emphasis on knowing by doing and experimental work
	  – collaborative interaction with peers and teachers in real life situations
	  – combining informal and formal situations and events
	  – negotiated decisions on directions and processes
	  – strategies of trial and error, reproduction and critique
	  – multiple pathways for entry and enquiry
	  – unknown results by teachers and students
	  – opportunities for thinking about previous and new action
	  – construction and critique of ideas and proposals
	  – applying context specific and general ideas
	  – utilising respected local and expert advice as required – encouragement of personal and group interests and – being challenged by local and global events.

Dimension 6	Validation of children's learning, knowledge, experience and propositions that is based upon long-term consensual communication and democratic dialogue between participants and agreement on what is generally considered as being acceptable and true.
Dimension 7	Holistic views of life and learning where knowledge arises from and returns to social and cultural environments for the betterment of communities of interest and where formal systems of education must be connected with the major trends and debates within communities to ground their purpose and meaning.

This model aligns with the necessity of adapting curriculum content to reflect diverse perspectives. Incorporating materials that highlight the contributions and experiences of different cultural, ethnic, and social groups ensures a more inclusive educational environment. These adaptations are crucial for enabling marginalised students to see themselves reflected positively in their education (Welsh Government, 2022). In practice, educators can integrate literature from marginalised communities, present historical events from multiple perspectives, and engage students in discussions on contemporary issues relating to diversity and equity (Mansfield, 2022).

Equally important is the adaptation of teaching methodologies to reflect diverse perspectives. Inclusive pedagogies, such as collaborative learning and inquiry-based methods, allow students to explore and share their own experiences, fostering a more inclusive classroom environment (Hooley, 2002). This also includes the incorporation of

multimedia resources and guest speakers from diverse backgrounds to enrich the learning experience. Mansfield (2022) highlights that these inclusive approaches not only challenge the exclusion of Global Majority students, but also build a foundation for future citizens to engage with a globalised vision. Wright Edelman's famous quote, "It's hard to be what you can't see" (Mansfield, 2022), underscores the need for visible role models and the importance of diverse representation in education.

Importantly, these adaptations should not be seen as merely compensating for past exclusions, but rather as a forward-thinking approach that recognises the evolving nature of education. This is evident in the practice of two-way enquiry learning, which reinforces the value of Indigenous knowledge within the broader context of human learning. By positioning Indigenous learning on equal footing with non-Indigenous learning, this approach fosters the development of inclusive curricula that are reflective of diverse cultural perspectives (Hooley, 2002).

The inclusion of diverse perspectives and histories, in both curriculum content and teaching methodologies, is essential for empowering marginalised students. By reflecting a broad range of experiences and knowledge systems, educational institutions can create a more inclusive and equitable learning environment that benefits all students (Hooley, 2002; Mansfield, 2022; Race et al., 2022; Welsh Government, 2022).

What existing strategies and approaches can be used as examples of facilitators and benefits to help and support marginalised students, address systemic barriers, and prevent marginalisation in classrooms?

Studies indicate that when students feel a sense of belonging, they tend to achieve higher levels of academic success and experience improved well-being . However, marginalisation can undermine this sense of belonging, thereby negatively affecting students' overall educational experiences and outcomes.

Inclusive education aims to tackle students' diversities in order to minimise exclusion, marginalisation and inequalities, and guarantee quality education for all. For marginalised students, feeling a sense of belonging in educational spaces means experiencing acceptance, value, and inclusion within the academic community, despite the systemic barriers they face. If a student does not feel that they belong to the school community, they may experience a form of social pain which includes feelings of rejection, and this can affect brain activity that is very similar to that which is produced by real physical pain (Eisenberg, Lieberman & Williams, 2003). This may lead to avoidant behaviour and isolation (MacDonald & Leary, 2005) and have serious consequences. For example, feelings of isolation are a common characteristic of religious fundamentalism as well as supporters of radical right-wing political parties (Doosje et al., 2016).

According to Booth and Ainscow in the Index for Inclusion (2011), inclusive education

involves full participation, and high quality learning, for all learners. This broad definition focuses on diversity and inclusion of all learners, and not on specific groups. Furthermore, it does not view inclusion as the simple placement in a mainstream setting but instead considers co-existence as the initial starting point, followed by involvement, sharing and quality of learning processes. The goal of inclusive education also aligns with global initiatives, such as the UN 2030 Agenda's Goals 4 and 10 (UNESCO, 2015), which seeks to ensure inclusive and equitable quality education and promote lifelong learning opportunities for all, thereby tackling all forms of exclusion, marginalisation, and inequalities.

Mowat (2015) explores the subtle ways in which marginalisation can occur, which may not be immediately apparent. An example provided is when a child is excluded from participating in a reward system, such as "Golden Time," due to their behaviour not meeting a teacher's expectations. The psychological trauma resulting from such actions would require immediate address to support the healing of marginalised children. Interestingly, Mowat highlights an often-overlooked form of marginalisation, involving children who may have abundant access to material wealth but lack emotional warmth and love, which is commonly found in other family settings. This absence can lead to attachment or behavioural issues, as noted by Cooper (2008), and serves as a form of marginalisation for these children. This underscores that marginalisation is not exclusively rooted in lower socio-economic groups.

Mowat (2015) also investigates the role of schools in the marginalisation process, highlighting the paradox that, while education is often perceived as a pathway out of marginalisation, schools themselves can inadvertently act as agents of exclusion. This occurs through the implementation of curricula that fail to address the diverse needs of students, and through inflexible systems and structures that do not account for the discrepancies between behavioural expectations and students' capacities to meet them. Such conditions can create environments where exclusion becomes more likely (Munn & Lloyd, 2005). Additionally, the emphasis on a 'standards agenda', which inherently produces "*winners and losers*", can further contribute to the marginalisation of students (Razer et al., 2013).

Peim, as cited in Bennett and McDougall (2013: 34), reinforces this notion by stating: "The agents of education will tell students not only what they need to know, but what they need to do and to be. Students will be educated above all in the norms of conduct befitting their social destiny". This suggests that education systems often impose norms that may not align with the diverse needs of all students, leading to marginalisation.

To address this, several strategies have been proposed that effectively combat marginalisation in the classroom. Culturally responsive teaching, which integrates students' cultural backgrounds into both curriculum and pedagogy, is one such strategy. It validates the identities of marginalised students, enhancing their engagement and academic performance by making them feel acknowledged and respected, which in turn boosts their

motivation and participation. Restorative practices, focusing on community-building rather than punitive measures, also play a crucial role. They help create a positive classroom climate, reduce the need for suspensions and expulsions, and support students' social-emotional development, which is especially beneficial for those who may feel marginalised.

Addressing systemic barriers within education also involves implicit bias training and recruiting diverse staff to mitigate biases and ensure equitable resource allocation. Differentiated instruction, mentorship programs, and support services like counselling and tutoring are essential in accommodating diverse learning needs. Anti-bullying policies, inclusive classroom practices, and cultural competence training further contribute to creating a supportive environment, fostering a more equitable and inclusive educational system.

Lloyd (2008) critiques efforts to promote inclusion through the removal of learning barriers, suggesting that these efforts often perpetuate deficit models of students within an exclusive curriculum where success is narrowly defined by norm-referenced standards. Lloyd argues that "members of the excluded groups can join the game if they submit to the rules and demonstrate that they can play the game at a standard which is acceptable" (Lloyd, 2008: 234). In such exclusive educational environments, both teachers and students can experience marginalisation, often reinforcing each other's negative experiences (Razer et al., 2013).

Which other strategies and approaches can help and support marginalised students, address systemic barriers, and prevent marginalisation in classrooms?

Teacher education, and continuous professional development, is a vital component towards combating marginalisation. Teachers with insufficient training might not be aware of the different needs that can exist simultaneously in the classroom, and most importantly how to address them. Teachers should feel supported, empowered, and have agency to work in a manner that confronts marginalisation. Investing in regular training for teachers and school support staff is crucial to targeting marginalisation. While we recognise the importance, and influence of government policy, teachers should feel that they can challenge those aspects of the classroom setting that may cause marginalisation (for more information on these aspects see the chapters about continuous professional development and teacher agency).

   **Certainly, teacher collaboration plays an important role in general, even more if they can work through the co-teaching method with its different forms. It is a practice where two or more teachers (class and/or support teachers) plan, teach and assess together for a group of students. According to Friend and Cook (2007), there are six kinds of models:

1. *One teach, one observe*; where one teacher conducts the lesson, while the other simply

observes students' learning processes and collects different kinds of data which have been determined in advance.

2. *One teach, one assist;* where one teacher teaches a full group lesson, while the other teacher roams and helps individual students, often providing additional support for learning or behaviour management.

3. *Parallel teaching*, where the team splits the class into two groups and each teacher teaches the same information at the same time to a smaller group.

4. *Alternative teaching*, where one teacher instructs most of the class and the other teacher teaches an alternate or modified version of the lesson to a smaller group of students

5. *Station teaching*, where the class is divided into three or more groups and students rotate through the stations, while teachers teach the same material in different ways to each group.

6. *Team teaching*, where both teachers are in the room at the same time but take turns teaching the whole class, like co-presenters. With these models, it is possible to reduce contextual barriers, improving the benefits for students (for more information about the co-teaching method see the chapter "Teamwork in the classroom").

Other possible strategies and approaches to address systemic barriers and prevent marginalisation are the Universal Design for Learning (UDL) and open learning. With the UDL it is possible to recognise the individual differences and to pay attention to the context in terms of barriers and benefits where contents are represented in different formats, each individual can have more ways of action and expression, and teachers can motivate and engage students in multiple forms (for more information see the specific UDL chapter).

Open learning is a student-centred approach with more freedom of choice, based on different degrees of openness (Demo, 2016).

1. On the first level, an openness of organisation would allow pupils to decide *where, when and with whom* they are learning.

2. On the second level, the openness is methodological and the emphasis is on *how* to learn something.

3. A third openness level is related to learning goals and contents, so *what* the students would like to learn.

4. The last level works on *socialisation*, relationships and rules, namely on the *class community*. With this kind of approach, it is possible to include everyone, creating a context where each student could perceive to be included.

To reduce marginalisation in the classroom and enhance inclusivity in educational settings, several strategies can be applied. Implementing assigned mentors or key individuals to support each student, akin to a key person approach, can be highly effective. Additionally,

peer buddy programs that foster peer-to-peer assistance and relationship-building should be put into practice. Developing an inclusive school culture, where diversity is celebrated, is essential to ensure all students feel a sense of belonging.

Creative pedagogical approaches, such as "coming out pedagogy," can help create safe spaces for students to express their identities and experiences. Furthermore, applying an intersectional lens to teaching and school policies ensures that the overlapping identities and experiences of students are acknowledged, allowing for tailored support to address their unique challenges.

In the beginning of this chapter an example case was given of a school in Germany in which marginalisation had occurred using the lived experience of a student. This chapter has allowed us to explore the concept of marginalisation in more detail, firstly by considering what marginalisation is, how and why it can happen, exploring types of marginalisation, and using intersectionality as a tool to understand how different types of marginalisation can exist simultaneously. Lastly, and perhaps most importantly, we have provided practical suggestions as to what can be done to tackle marginalisation, and the strategies that educators can apply in the classroom.

Local contexts

Closing questions to discuss or tasks

- Why is it important for teachers and school staff to actively address marginalisation? What are the benefits?
- Based on this chapter, what steps can you take in your own context to better support marginalised students? Do you now perceive yourself more able to identify and help them?
- Think about your context and try to answer this question; who is responsible for marginalised students? Based on this chapter, could you find some solutions to extend the responsibility to all staff around them? Is it possible to realise a shared responsibility among all members of the school community?
- How could marginalised students be supported and included?
- Reflect on a personal experience where you, or someone important to you, faced marginalisation. How would you address that situation using the insights from this

chapter?

About the authors

Silver Cappello

Silver Cappello has accomplished a PhD in General Education, General and Social Pedagogy at the Free University of Bolzano-Bozen (Italy). He is qualified as primary school teacher with a specialisation as support teacher and he has worked as primary school teacher (mainly teaching second language), as assistant for people with disabilities, and as research assistant on different research projects at the Competence Centre for School Inclusion of the Free University of Bolzano-Bozen.

Tracy Fletcher

Tracy Fletcher is a teacher in the subject of English, and researcher, originally from the U.K but has been based in Sweden for the last 14 years. She has experience of curriculum planning and management, co-ordinating CPD for teachers, as well as working to support newly arrived immigrant students integrate into a new school system. Her research interests include anti racist education, inclusive education, and student mental health. She is also an activist for autism awareness and trans rights.

Nysha Chantel Givans

Nysha Chantel Givans is currently pursuing a Professional Doctorate in Education at the University of Wolverhampton, with a research focus on the educational challenges faced by marginalised communities from lower socio-economic backgrounds. Her work encompasses a range of topics, including navigating the English education system, decolonising education, and addressing Afro hair discrimination. Employing methods such as autoethnography, film analysis, and literary text examination, her doctoral thesis will delve into Shane Meadows' This Is England to illuminate the educational barriers encountered by working-class individuals and explores the impact of communitarianism on these communities.

BREAKING THE SILENCE - EMPOWERING SCHOOLS IN THE PRACTICE OF TRAUMA INFORMED EDUCATION

Julia Bialek; Evrim Çetinkaya Yıldız; Cynthy K. Haihambo; and Ramona Thümmler

Example Case

"We would like to start with a case study from the school that illustrates the difference between trauma-sensitive interventions and standard intervention practice.

It is about a 6 year old boy who attended the 1st grade. He had many conflicts with his teachers because he kept climbing on tables and trampling over everything that was on them, such as notebooks, books, etc. The teachers tried to stop this behaviour with different interventions, the boy was even suspended from school several times for some days, but the interventions did not show any effects.

During the observation of this boy, it became clear that this behaviour was triggered by different situations. The main triggers were moments when he did not know exactly what was going to happen next.

After traumatic experiences, anything that cannot be fully predicted and influenced feels dangerous and threatening to the person affected. His body reacted to these situations with massive stress, which forced the boy to remove the danger. He found a very effective strategy:

by climbing on the tables he took control of the situation that he experienced as dangerous. Wat would happen next became predictable and controllable for him, and he could feel safe again.

Once we understood this, we worked with him to find alternative ways of dealing with situations where he felt threatened. He was asked what he needed when he felt uncomfortable in class and he said that he needed a place to hide in class. He was allowed to build a small safe place in a corner of the class. Great care was also taken to ensure that the structure of the class was very transparent and predictable for him. And additional procedures were agreed with him for difficult situations by agreeing on emergency signals he could use to indicate the need for support.

With this support, the boy was able to participate in the class in a relatively stable way without having to control it through his behaviour. This was possible because he had been given alternative ways of acting which gave him a sense of security, predictability and control. The previous "if…. then" interventions had only taken away his ability to feel safe without offering him an alternative. With these interventions the boy could not change his behaviour."

Initial questions

1. What is trauma? What are the effects of trauma on children, on the classroom, and on the school climate? How to break the silence about these questions?
2. What are the responsibilities of educational staff and education institutions when working with children who have had traumatic experiences?
3. What are the options to support learners who have had traumatic experiences?
4. What are the responsibilities of school for trauma awareness and trauma prevention?
5. How does society take responsibility for empowering individuals, peers and teachers?
6. How can silence be broken?

Introduction to Topic

The number of children and young people in the world who are exposed to traumatic events on a daily basis due to neglect and abuse, violence against them, deprivation of basic needs, exclusion and discrimination is increasing (Mew, Koenen, & Lowe, 2022; UNHCR, 2023). In

addition to these micro- and meso systemic factors, many children around the world are exposed to man-made macro- and ecosystemic factors, such as wars, natural disasters including floods, severe droughts and earthquakes, and structural inequalities, leading to migration and multiple factors of vulnerability. It is therefore necessary for teachers to have trauma-sensitive knowledge and to use this knowledge to develop trauma-informed interventions (Carello & Butler 2014).

Trauma is defined as the events experienced or witnessed by the individual when death, threat of death, serious injury, or a threat to the integrity of the body occurs in human life (American Psychiatric Association [APA], 2013, pp. 265, 266). Children and adolescents around the world experience high rates of traumatic experiences. These include physical, emotional, and sexual abuse; neglect; exposure to community violence; bullying; natural disasters; poverty; homelessness; immigration; and parental problems such as domestic violence, incarceration, death, mental illness, involvement in substance abuse, and military deployment. Traumatic experiences undermine students' ability to learn, to form relationships, and to regulate their emotions and behaviour, putting them at increased risk for trauma and a range of negative academic, social, emotional, and vocational outcomes (Schäfer, Gast, Hofmann, et. al, 2019; Vibhakar, Allen, Gee & Meister-Stedmann, 2019). For many children and young people, the school environment is the best option for accessing support services, particularly during periods of trauma that are inevitable in their developmental stages. The school, as a place of inclusion, education and socialisation, has a responsibility to positively identify and respond to the needs of learners who have experienced trauma in their lives. WithIn trauma-informed schools or places of education, all adults who come into contact with children, including teachers, school counsellors, school administrators and parents, should be informed about the effects of trauma on the nervous system and the psychosocial impact of trauma on children. Teachers and other role players in the school should therefore be empowered to practice embedded trauma-informed education.

In this chapter we explain the meaning of trauma-informed education, the types of trauma and possible school responses. We focus on the professionalisation of teachers for trauma-informed education and on the well-being of teachers in this work.

Key aspects

What is trauma?

The term 'trauma' is derived from the Greek word 'trauma', which translates literally as 'wound' or 'injury'. The World Health Organization (WHO) defines trauma as "a delayed or protracted response to a stressful event or situation (either short or long-lasting) of an exceptionally threatening or long-lasting nature, which is likely to cause pervasive distress in almost anyone" (WHO, 2010). Several key characteristics of trauma can be identified.

1. Such an event can be overwhelming. The individual lacks the capacity to cope with the circumstances and experiences a sense of vulnerability and exposure. The potential for resolution is severely constrained or absent. The extent to which an individual is affected by a traumatic event is dependent on their personal circumstances and the potential for coping mechanisms to be exercised.

2. Such occurrences are typically unanticipated. It is not possible to predict the occurrence of such an event, nor can one assume that another individual will perpetuate such an act against them.

3. It engenders feelings of fear and helplessness. The occurrence is so pervasive that it causes significant anxiety and feelings of helplessness.

4. It is life-threatening. The occurrence is so devastating that it alters subsequent lives and is remembered for an extended period.

The definition of a traumatic event is contingent upon the individual's experience and perception of the event, rather than the specifics of the event itself. The person's available options are of paramount importance for assessing and coping with the trauma.Childhood trauma can be defined as an event experienced by a child that evokes fear and is commonly violent, dangerous, or life-threatening. The experience of physical or emotional neglect or abuse can have a traumatic effect on children. Similarly, one-off occurrences such as road traffic accidents, natural disasters (e.g. hurricanes), the death of a loved one or a significant medical event can also have a profound psychological impact on children. The global pandemic of the novel coronavirus (2019-nCoV) and the associated public health measures, including prolonged school closures, were experienced as traumatic by many children, particularly those whose educational institutions remained inaccessible for extended periods.

It is a common misconception that childhood trauma is exclusively characterised by direct experiences of the child in question. Observing a loved one undergoing a significant health challenge can be profoundly distressing for children for example. It is erroneous to assume that all intense experiences are traumatic. Trauma is not a final, life-determining fate. It can be dealt with and healed. Furthermore, in light of the growing multicultural and diverse nature of schools, it is imperative for educators to recognise that certain experiences may be perceived as traumatic by children from one cultural background, while being less so by those from another. It is therefore incumbent upon teachers to ascertain from their pupils' behaviours and responses (which may be observed, reflected upon, undertaken, illustrated or conveyed in narrative form) whether or not they have been traumatised by a specific event in their lives. Cultural identity is not the only determining factor in the experience of trauma. A number of factors contribute to an individual's vulnerability, including membership of a disadvantaged group. Such groups may include people with a migration background, persons with disabilities and special needs, those living below the income threshold, and those enduring bullying, stigmatisation and

exclusion. Such circumstances can render individuals more vulnerable to traumatic experiences, and to a greater extent than might otherwise be the case. One illustrative example is that of natural disasters such as floods. In the event of such occurrences, those who are impoverished and reside in regions with inadequate infrastructure are the most severely affected. They are at an elevated risk of losing their lives and possessions, and may require a longer period to rebuild their lives. In addition to their vulnerabilities, they also do not have back-up resources like insurance or savings to rebuild their lives.

Similar circumstances have been documented in cases where individuals have been exposed to armed conflict, torture, and forced displacement. In 2022 over 108 million people worldwide were forced to flee their homes due to a range of factors, including war, torture, natural disasters, and political persecution. These individuals often lose not only their homeland but also their loved ones and social support systems (UNHCR, 2023). Furthermore, they frequently encounter additional trauma in their new surroundings due to stigma, discrimination, and rejection. Trauma-informed education equips educators with the knowledge and skills to provide sensitive and supportive learning environments for children with migration histories, thereby reducing the risk of secondary trauma.

What are the types of trauma?

In the literature, there are several different classifications of trauma. Some classify it according to the number and duration of the traumatic event. Others classify it according to the source of trauma.

Different types of trauma can be distinguished according to the type and length of exposure. Single-event trauma, sometimes referred to as Type I trauma, describes abrupt, unplanned events that pose a serious risk. Serious accidents, natural disasters, and violent attacks are a few examples. These traumas usually have a distinct beginning and might result in disorders such as post-traumatic stress disorder (PTSD) or acute stress disorder (ASD) (Terr, 1991). On the other hand, Type II trauma is the result of persistent or recurrent exposure to stressful events. This category, which encompasses ongoing events like persistent emotional or physical abuse, marital violence, or extended exposure to conflict, is frequently predicted. Complex psychological effects, such as challenges with emotional regulation and interpersonal interactions, might result from the cumulative impact of Type II trauma (Courtois & Ford, 2016).

Apart from Type I and Type II trauma, the differentiation between "Big T" and "Small T" traumas is also a helpful classification. "Big T" traumas are those intense or overpowering incidents that are usually connected to severe and unmistakably traumatic situations, such as rape, serious accidents, child abuse, and war. Because of their severity and lasting effects, these incidents are typically acknowledged as major traumatic experiences (van der Kolk, 2015). Even though they have the capacity to be extremely overwhelming, "Small T" traumas are frequently more subdued and may not be identified as such right away. A few

instances are losing a job, moving to a new house, or losing a loved one or pet. "Small T" traumas may not seem as dramatic, but if they are not properly addressed, they can have a major and long-lasting effect on a person's mental health.

Acute, chronic, and complicated trauma are other categories of trauma (DeThierry, 2015). A single incident causes acute trauma. It is a psychological trauma brought on by an extremely stressful incident, including going through a violent or natural disaster, seeing a major car accident, or being in a car accident. Trauma of this kind might result in acute stress disorder (ASD), a mental illness that usually manifests three days after the incident and can last for up to a month (American Psychological Association, 2020). Long-term mental health problems might arise from acute trauma if it is not appropriately treated (Herman, 2015). The result of recurrent and extended stressful encounters is chronic trauma. It may be the consequence of chronic conditions such as poverty, marital violence, or abuse on a physical, sexual, or emotional level. More severe psychological consequences, like anxiety, sadness, and complicated post-traumatic stress disorder (PTSD), are frequently brought on by this kind of trauma (van der Kolk, 20015). When a person experiences several ongoing or protracted traumatic events—often starting in childhood—they develop complex trauma. This can result from events such as childhood abuse or neglect, domestic violence, sexual assault, or war-related trauma and is tightly linked to generational trauma (Courtois & Ford, 2016). Emotional control, self-perception, and the capacity to establish and sustain healthy relationships can all be significantly impacted by complex trauma. Complex trauma's long-term impacts can cause serious problems with one's physical and mental health (DeThierry, 2015).

The National Child Traumatic Stress Network (NCTSN, 2023) categorises trauma based on the occurrence that led to it. Trauma occurs when a youngster experiences or sees an event that makes them feel extremely threatened. Children and teenagers may be exposed to a variety of traumatic events or trauma types. Children may be subjected to a variety of traumas, including bullying, complex trauma, disasters, intimate partner violence, early childhood trauma, medical trauma, physical abuse, trauma from refugees, sexual abuse, sex trafficking, terrorism and violence, and traumatic grief.

Putting traumatic occurrences into categories such as those generated by nature and those purposefully brought on by human hands is another popular way to group traumatising experiences. Yet inadvertent, human-caused accidents can also occasionally have traumatic effects. Human carelessness frequently results in the transformation of natural occurrences into traumatic ones. An earthquake, for instance, is a natural occurrence, but it causes destruction because structures built in an unsafe location get damaged. Experiences that could be considered natural disasters that do not cause damage or casualties could turn into painful experiences if earthquake-resistant structures are developed. Lastly, it should be mentioned that traumatic incidents can occur in large or small groups. A single person or a small group of people may be impacted by an event, but in other situations, like forced migration and war, it may have a mass effect on a significant

number of people. Comprehending distinct forms of trauma is essential to customising efficient interventions and therapies that cater to the individual requirements of individuals impacted (Courtois & Ford, 2016).

The prevalence of trauma: A few global and national statistics from our countries

Worldwide statistics: Regretfully, across the globe, children are exposed to various forms of trauma at a very high rate. This is amply supported by the findings of extensive research projects on the topic. According to projections from the World Health Organization (WHO, 2020), 1 billion children between the ages of 2 and 17 may have been victims of physical, sexual, or emotional abuse or neglect in the previous year. Approximately 420 million children are estimated to be living in conflict zones by UNICEF (2019). There is a greater chance of trauma from violence, displacement, and war for children in these locations. More than 35 million children have been forcefully relocated due to conflict according to the UNHCR (UN Refugee Agency), which greatly contributes to trauma experiences. Sexual abuse before the age of eighteen is estimated by the World Health Organization (2018) to affect about 18% of girls and 8% of boys worldwide. Over 100 million children are impacted by natural disasters and humanitarian crises annually according to UNICEF (2020), which causes severe psychological damage. Felitti et al.'s (1998) Adverse Childhood Experiences (ACE) Study investigated the long-term effects of maltreatment, neglect, and dysfunctional households on the health and behaviour of adults. According to the study, more than two thirds of the individuals said they had had at least one ACE, and over 12.5% said they had had four or more.

Turkey: The United Nations Children's Fund (UNICEF) and the Social Services and Child Protection Agency released a study on domestic violence and child abuse in Türkiye in 2010. The study's findings show that 51% of Turkish children aged 7 to 18 experienced both physical and emotional abuse, 43% experienced physical neglect, 25% experienced emotional neglect, and 3% experienced sexual abuse. As per UNICEF (2010, p 17-37) the survey found that 56% of children had witnessed physical abuse, 49% had witnessed mental abuse, and 10% had witnessed sexual abuse.

Şirin & Rogers-Şirin (2015) did research with 311 children (mean age 12) at a refugee camp in Türkiye in 2012. They conducted a study on the traumatic experiences and psychological problems of children that are under temporary protection status in Turkey. Results revealed that compared to their Turkish peers, they are in a higher risk group for survival. These children had experienced very high levels of trauma:

- 79% of children witnessed the deaths of family members
- 60% of children witnessed physical injury or shooting of a family member
- 30% of children were exposed to violence (injury, shooting)

- almost half of the children had post-traumatic stress disorder (PTSD), ten times more often than other children
- 44% of the children showed symptoms of depression
- almost a quarter of these children experiences daily psychosomatic pains in their arms and legs
- about one in five children experiences headaches on a daily basis

In February 2023, Unicef reported that 4.6 million Turkish children and 2.5 million Syrian children were affected by the earthquake in Turkey and Syria. One year after the earthquake, according to the data announced by Unicef (2024), psychological support was provided to 1.5 million children and caregivers in Turkey.

Germany: In Germany in over the the last number of years, several discussions about child abuse, neglect and emotional and physical maltreatment of children and also of sexual abuse were held.

Research on respondents from the general population (n = 2504) aged 14 and over shows the presence of severe emotional maltreatment in 1.6% of respondents, severe physical maltreatment was reported by 2.8% of respondents and severe sexual maltreatment by 1.9%. Severe emotional neglect was reported by 6.6% of respondents and severe physical neglect by 10.8%. In the most recent study on the prevalence of sexual violence in Germany, a representative sample of 2513 persons over 14 years of age was interviewed. It showed that 0.6% of the male respondents and 1.2% of the female respondents reported having been victims of sexualised violence within the last 12 months (Witt, Glaesmer, Jud et al., 2018).

Namibia: In a study about post-traumatic stress disorder amongst children aged 8–18 affected by the 2011 northern-Namibia floods (Taukeni S. G., Chitiyo,G., Chitiyo, M. Asino, and G. Shipena, G.) the results show that 55.2% of learners aged 12 and below and 72.8% of learners aged 13 and above reported experiencing symptoms of trauma following the floods in Northern Namibia, 2 years after the event.

Descendants of the genocide that was committed by the German Truppe in Namibia against the Herero and Nama people of Namibia in 1904 -1908 have revealed signs of transgenerational trauma.

Many children and adults continue to battle the persisting trauma caused by the COVID 19 pandemic between 2020 – 2023 (deaths of loved ones, isolation from friends, falling behind with education targets, online learning) (UNESCO, 2022).

In a study on children's use of online platforms and vulnerabilities in the online space in Namibia, 81% of children aged 12–17 were found to be internet users during the time of the research. In the past year alone, 9% of internet users aged 12–17 in Namibia were subjected to clear examples of online sexual exploitation and abuse that included blackmailing children to engage in sexual activities, sharing their sexual images without permission, or coercing them to engage in sexual activities through promises of money

or gifts (ECPAT, INTERPOL, and UNICEF (2022). There are continuous cases reported of childhood trauma emanating from abuse in the online space.

A child abuse survey conducted in Namibia revealed that nearly two out of five females (39.6%) and males (45.0%) aged 18-24 years experienced physical, sexual, or emotional violence in childhood (Ministry of Gender Equality, Poverty Eradication and Child Welfare, Republic of Namibia, 2020).

Possible Effects of Trauma

Exposure to different types of traumatic events may have different consequences. Not everyone who experiences a traumatic event develops post-traumatic stress disorder, as the experience of a potentially traumatic event and the way in which an individual processes it can vary greatly from person to person. Therefore, it should not be assumed that the experience of one or more potentially traumatic events will automatically lead to traumatisation, or that a person is not affected by traumatisation simply because they have not developed clear symptoms. Crucially, trauma is subjective; what one person may consider to be a severe trauma may not be regarded as such by another (Courtois & Ford, 2016). Some situations such as the magnitude of the traumatic event, the way it occurred, its duration and how many people were affected by this event, as well as the person's own coping mechanisms and previous experiences determine how traumatic this event can be for this person.

Effects on the nervous system and the brain

Traumatic events can change both psychological and physical processes, as the body remains in a state of defence that is no longer present but is still experienced as persistently threatening. Trauma-induced changes affect the nervous system, which is limited in its ability to regulate. Traumatisation can only be processed when the permanent stress reaction has come to an end and the entire organism can operate again from a safe state (van der Kolk, 2023, p. 90).

In threatening situations, the stress level arises to enable a person to defend himself. The sympathetic nervous system is activated and stress-related hormones are released in the body. If there is no way out of the threatening situation, the stress level rises further. In the brain control activity is directed to the brainstem and the fight and/or flight response is initiated. This is an automatic response that the person cannot control.

If the danger still cannot be averted, the organism switches to survival mode. In addition to the sympathetic nervous system, part of the parasympathetic nervous system is activated. This puts the body into a state of reduced energy so that the danger can be survived. With the sympathetic system still activated it is as if one were trying to simultaneously accelerate fully and brake fully. This puts the body into a state of "freezing" where reactions are no longer possible and information cannot be processed (Van der Kolk,

2023, S. 135). "In a state of shock, the images disintegrate into fragmentary fragments that concentrate exclusively on the threatening aspects that stand out most" (Levine, 2011, S. 152).

The different activation states of the autonomic nervous system

Stress

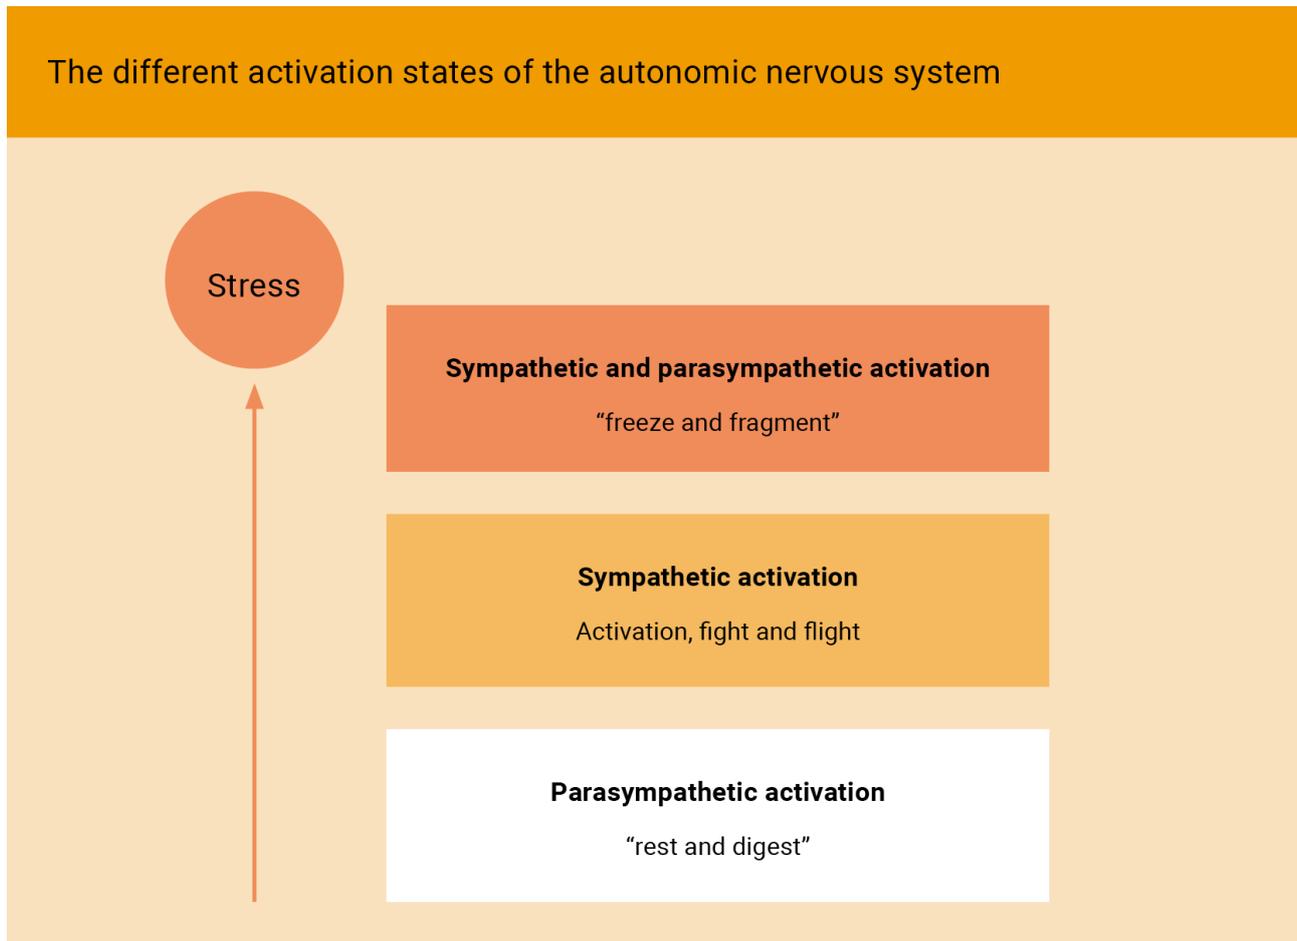
Sympathetic and parasympathetic activation

"freeze and fragment"

Sympathetic activation

Activation, fight and flight

Parasympathetic activation

"rest and digest"


To be traumatised means to have had one's boundaries violated. This violation is primarily physical rather than psychological. The nervous system loses its ability to regulate and to adapt. It remains in a state of hyperarousal or hypoarousal and can no longer adapt appropriately to a situation (Levine/Kline in: Jäckle et al., 2017, S. 695). As a result, rapid shifts between states occur and emergency responses such as fight, flight or freeze are sometimes triggered even by minor demands. There is also a risk of using substitute strategies for regulation, such as medication, drugs, alcohol, risky behaviour, overeating or self-harm. Thus a really important and helpful aspect of supporting traumatised people is to help them to regulate their nervous system.

A variety of possible effects of traumatic life experiences on the brain, the body and especially on learning and developmental processes have been identified. All these processes take place very quickly and automatically in the brain. An important part of this is that memory plays an important role in these processes, which is particularly affected by trauma.

In comprehending trauma an examination of the brain and autobiographical memory is essential. This memory can be delineated into two distinct categories: cold memory and hot

memory. Cold memory encompasses factual recollections of life-time periods and specific events, typically stored as objective information. For instance, one might recall being in the workshop of the project "All Means All" in June 2023, engaged in discussions about trauma (Huber, 2020). Conversely, hot memory encompasses emotional and sensory recollections, incorporating subjective experiences such as feelings and thoughts, alongside physiological responses like increased heart rate, respiration, or perspiration. Through the amalgamation of these hot memories, a fear network is constructed within the brain. The functionality and even the structural composition of the brain undergo alterations when individuals encounter life-threatening situations, as stress induces changes within the brain's dynamics.During a situation where flight is unattainable and fighting appears futile, individuals may experience a state of freezing. This triggers an alert within our systems, leading to a disconnection between hot and cold memory networks. Consequently, data regarding the situation may be inadequately stored.

Subsequently, when such individuals encounter stimuli reminiscent of the traumatic event, the fear network is reactivated, plunging them into a state of disorientation commonly known as flashbacks. In these instances, individuals may perceive themselves as being once again in the midst of warfare, experiencing torture, or enduring instances of past bullying by peers.

The symptoms associated with post-traumatic stress disorder can be divided into three groups: symptoms of hyperarousal, caused by the changes in the nervous system described above; symptoms of re-experiencing, caused by the altered storage of the experience in the memory; and, thirdly, avoidance behaviours and withdrawal, so that stress triggers and symptoms of re-experiencing are avoided as far as possible.

According to the currently valid DSM-5, these include the following possible symptoms and behaviours:

Criterion	Symptom description
Intrusion Symptoms (B)	• Recurrent, involuntary and distressing memories of the traumatic event • Distressing dreams where the content relates to the traumatic event • Dissociative reactions (e.g. flashbacks) where the individual feels or acts as if the traumatic event ist recurring • Intense or prolonged psychological distress upon exposure to internal or external cues related to the event • Marked physiological reactions to reminders that symbolise or resemble aspects of the traumatic event
Avoidance and Negative Alterations in Cognition and Mood	• Avoidance of distressing memories, thoughts, or feelings associated with the traumatic event • Avoidance of external reminders (people, places, activities) that bring up memories or the traumatic event • Persistent negative emotional state (e.g. fear, anger, guilt, shame) • Markedly diminished interest or participation in significant activities • Feelings of detachment or estrangement from others • Persistent inability to experience positive emotions
Marked Alterations in Arousal and Reactivity	• Irritable behaviour or angry outbursts • Reckless or self-destructive behaviour • Hypervigilance • Exaggerated startle response • Difficulty concentrating • Sleep disturbance (e.g.) difficulty falling or staying asleep or restless sleep

(American Psychiatric Association, 2013, S.271f)

This is only a rough overview of symptoms; a wide range of other forms of expression of traumatisation can develop, which can then be assigned to these subgroups in terms of their origin. What all forms of expression of traumatisation have in common is that they make subjective sense in the context of the individual's life experience and, more specifically, the traumatic experience, or at least made sense for survival in an earlier period.

Effects on physical and mental health

Children and adolescents who have experienced traumatic events often exhibit a series of other types of social-emotional and behavioural problems. Although not all children who experience challenging situations develop symptoms of trauma, the majority often have problems with fear, anxiety, depression, anger and hostility, aggression, self-destructive behaviour, feelings of isolation and stigma, poor self-esteem, difficulty in trusting others,

substance abuse, and sexual maladjustment among many other emotional and behavioural difficulties. Children who have experienced traumas also often have relationship problems with peers and family members as well as problems with acting out, which leads to difficulty with academic performance.

There are a number of psychiatric disorders that are associated with traumatic experiences. These may include anxiety disorders such as separation anxiety, panic disorder, and generalised anxiety disorder; and externalising disorders such as attention-deficit/ hyperactivity disorder, oppositional defiant disorder, and conduct disorders (Frieze, 2016).

Trauma can have physical and mental impacts:

In addition to the emotional and psychological difficulties explained above, trauma can have physical and mental impacts. When a child experiences a traumatic event, it can negatively affect their physical development. The stress related to the trauma can impair the development of their immune and central nervous systems, making it harder to achieve their full potential. Because of poor health and poor general well-being, they may experience lack of sleep, lack of appetite or binge eating and poor self-esteem. The children can experience concentration and memory difficulties and struggle to complete learning tasks. These are impacts of trauma and should not be confused with Attention-Deficit Hyperactivity Disorder (ADHD), or learning disabilities. The child may undergo learning and social-emotional difficulties as a result of the trauma, as their bodies are drained by the traumatic experience (Maercker & Hecker, 2016). These are complex psychological and psychiatric conditions which require the interventions of professional psychologists.

Activity: Think of a big problem you or a friend experienced as a child.

In one paragraph, describe the event. What happened and what caused the problem? How did you or your friend respond/ react? How did it affect your life / the life of your friend? Go back to the list above and select any five impacts you think could have been your or your friend's reactions to the trauma. Create a table where you write down the term and what it means for example:

Term/ Impact Behaviour / Thoughts	Meaning Symptoms or Effects of Trauma

Effects on the educational process

Traumatic experiences undermine students' ability to learn, form relationships, and manage their feelings and behaviour and place them at increased risk for trauma and a range of negative academic, social, emotional, and occupational outcomes (Rossen & Hull, 2013). If not managed properly, this makes the learning environment unsuitable for all children. Children affected might start to underperform in learning situations, even if they did not

present with learning difficulties before. Teachers should refrain from blaming or labelling them. Instead, teachers could conference with the learner and where possible with parents and guardians of the learner showing the above signs to try and understand the issues they are facing. They should try to work on achievable targets with the learner.

Exposure to trauma can "impact learning, behaviour, and social, emotional, and psychological functioning" (Kuban & Steele, 2011, p. 41). Maslow's hierarchy of eeds suggests that children whose basic needs – such as physiological needs, a sense of security, and emotional needs are not met, are more likely to be unable to concentrate and achieve in school. These children will have difficulties with concentration, memory, application of knowledge and focus. These learners will develop emotional and behavioural problems, which will in turn manifest poor academic performance, with poor attendance and low reading and numeracy levels (https://khironclinics.com/blog/trauma-and-education).

Learners who have experienced trauma may struggle with reading and writing skills, participation in debate and discussion, and solving mathematical and other cognitive problems. The development of each of these skills relies on the brain's ability to organise, comprehend, remember, learn, trust, and produce work. A big part of cognitive functioning is emotional self-regulation, attention, and optimism demonstrated in a belief in oneself. The ability to control one's emotions, retain attention, and behaviours are crucial for healthy brain development and personal growth through education (https://khironclinics.com/blog/trauma-and-education). Unfortunately, traumatic experiences disrupt these brain processes and concerted efforts are needed to restore and normalise emotions and functions needed for learning and socialisation.

Here are some examples of how trauma interferes with the brain functions:

- Hindered development of brain areas associated with language and communication
- Jeopardised sense of self
- Compromised ability to pay attention in class
- Reduced memory – difficulty following instructions
- Poor organisation skills
- Difficulty grasping 'cause and effect' relationships (https://khironclinics.com/blog/trauma-and-education).

Case study

Suppose that you have a 13-year-old boy in your class who recently lost both his parents as a result of COVID-19. Your learner is the eldest of the siblings and has since taken over a parental role over his younger brother (12 years old) and a younger sister (7 years old). These children have no problem accessing food and other basic necessities because their parents left enough resources for them to survive on. However, this eldest child finds it difficult to supervise all the activities at home, including the sibling's school work. By the

time he sits down to focus on his own academic work, he is tired. He comes to class with incomplete homework and sometimes he writes his work in the wrong book.

- Would you say that this boy and his siblings had a traumatic experience? Explain your answer.

- From the list above, what do you think is the specific area of this boy's brain that is affected by the new role of caring for his siblings?

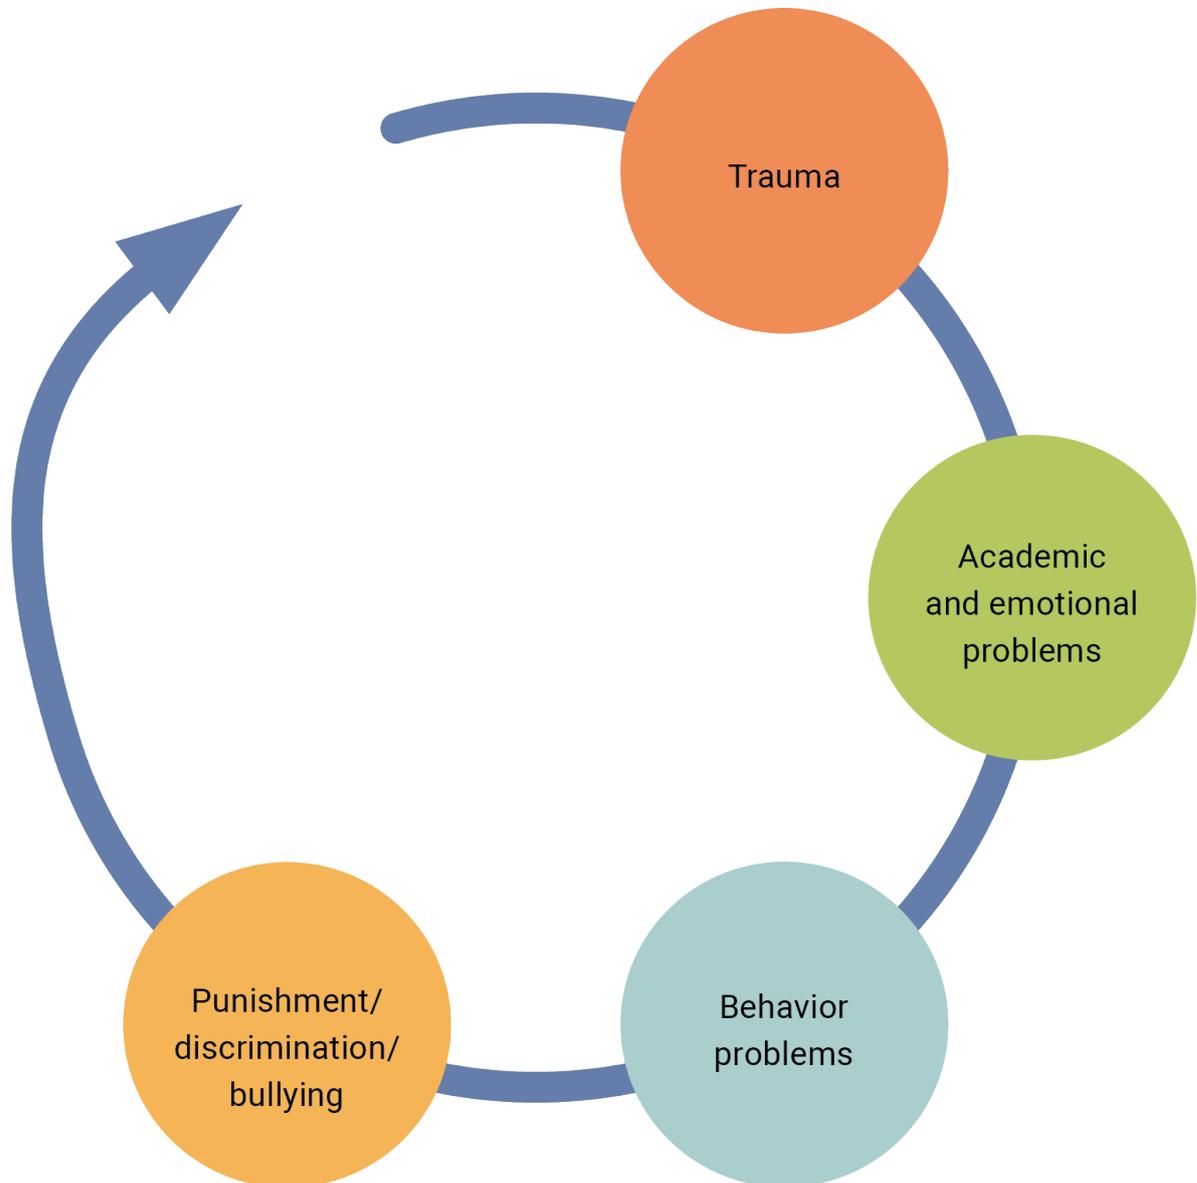
- Make three suggestions on how you would support this boy in class.

Importance of Trauma-Informed Education

Children and adolescents are the ones who become the victims of traumatic events the most. They are usually school aged children, and if they are lucky, they can attend a school. For instance, the majority of refugees fleeing the Syrian war are children, and the schools they attend are often forced to meet the psychological, social, and educational needs of these children who are victims of war (Sullivan & Simonson, 2016).

Schools are places where students can learn, explore, and grow as individuals. However, a crisis or traumatic incident that occurs within the school community jeopardises the mental well-being and academic progress of pupils (Finelli & Zeanah, 2019). These crises can manifest in many different ways, such as a natural disaster, a war, or the death of a pupil. Crisis situations in schools can be acutely traumatic, but they can also have long-lasting effects on students' well-being. For instance, psychological vulnerabilities such as post-traumatic stress disorder, anxiety, and depression are linked to natural catastrophes (Makwana, 2019). Finally, by interfering with students' metacognitive learning processes, the psychological impacts of trauma can hinder academic achievement (Panlilio et al., 2019). At the same time, stress reactions experienced by children and adolescents in trauma situations make learning almost impossible and also cause behavioural problems at school (Dyregrov, 2004). Therefore, attending to kids' post-crisis mental health needs may help to lessen the effects of long-term trauma. However, research revealed that many schools lack comprehensive plans for responding to crisis situations (Sokol et al., 2021).

Figure 1 demonstrates the trauma cycle in an educational setting. Children affected by trauma might start to underperform in learning situations, even if they did not have learning difficulties before. They might also demonstrate behavioural problems. If not handled properly by the educators, the trauma cycle continues, and new traumas due to punishments, failure, or bullying may be added to the original trauma. We can say that if not focused/handled properly, trauma can make the learning environment unsuitable for all children. Instead schools should try to work on achievable targets with the learner. Teachers can also confer with the learner showing the above signs to try and understand

the issues they are facing. By observing students during lessons and other activities at school, it may be advisable to adjust the educational environment and/or homework according to the specific needs of the learner. The timely involvement of teachers or a child mental health professional, depending on their academic, social or psychological needs, may help to resolve the child's problem before it progresses further.


Schools are critically important settings to intervene and foster trauma-affected children's resilience. As Weist, Paternite, and Adelsheim (2005) stated, schools play an important role in community-based mental health. Because many children and families can be reached easily, it is a very practical place to implement change. Therefore, considering the effects of trauma on children's well-being and the role of schools in the community, we can say that teachers and other school personnel should be informed about the trauma.

Trauma-informed education means teaching with the awareness that children go through serious, challenging events, and those experiences can affect learning. has the following characteristics:

- It is a strength-based approach
- It emphasises safety in all aspects for both educators and students
- It creates opportunities for people who have survived trauma to rebuild a sense of control and empowerment (Hopper, Bassuk, & Olivet, 2010, p. 82).

Trauma informed Interventions

"Trauma-informed approaches in schools must be implemented at all levels, from classroom practices to school policies, in order to create a consistent and supportive environment for students." (Luthar & Mendes, 2020, p. 148)

In order to establish educational institutions as environments that are responsive to social circumstances which have the potential to cause psychological trauma, it is essential to consider a multi-faceted approach that ensures the safety and well-being of young learners, even in the aftermath of traumatic life experiences. Firstly, educators require trauma-specific knowledge to facilitate individualised relationships and lessons. Given that teachers typically work with groups rather than individuals, there is also a need for opportunities to work with groups in a trauma-sensitive way. Secondly, social awareness and recognition of the factors that cause trauma and the need to take responsibility for this as a task for society as a whole is essential.

Individual-based interventions – Experiencing school as a safe space

After harrowing and potentially traumatising experiences, people also need to feel safe in everyday life. In a trauma-sensitive context, we talk about creating safe spaces. This means not only making the environment in which the person lives safe, it also includes the willingness of the environment to be there in situations of stress, to help with stress regulation, to reorient in crisis situations and to develop a high level of sensitivity to the person's need for safety. "Schools must create trauma-sensitive environments where students can feel safe and supported, which in turn fosters their capacity for learning." (Luthar & Mendes, 2020, p. 148).

In order to achieve this, educational establishments must first be prepared to address the consequences and requirements of traumatic experiences. It is also essential to cultivate a trauma-sensitive approach throughout the institution, enabling the identification of trauma-specific indicators and the implementation of trauma-sensitive strategies. "In trauma-informed schools, adults are trained to understand that disruptive behaviours are often not intentional but are rooted in a child's emotional pain." (Luthar & Mendes, 2020, p. 148).

There are some general principles and methodological considerations that should be taken into account in schools and in teaching, which will be discussed in the following section:

a) Experiencing a Secure Relationship
Both brain research and therapy research have shown that the main condition for

successful trauma processing is the corrective experience of a relationship that provides security. "According to previous empirical knowledge, it can be assumed that the correction of the loss of trust through new, positive experiences about the reliability of relationships is perhaps the most important starting point for dealing with traumatic experiences" (Hüther, 2002, w.p..; translated b.t. authors).

This is not simply about being in the company of other people, but about experiencing reciprocity with at least one person in the sense of being truly heard, seen and responded to (Van der Kolk, 2023, p.132). It is not necessary for this supportive person to be always available; resilience research shows impressively that the willingness to see and support a person is more important than a permanent presence.

Kline (2020, p.120) offers very good guidance on how to create secure relationships and support secure attachment experiences with 8 points:

1. Safety, containment and warmth, transmitted through the adults own well-regulated nervous system
2. Soft mutual eye gazing
3. Shared attention, intention and focus – this is called "attunement" and is experienced as a sincere desire to discover the needs, intentions, and energetic rhythms of the other and to be in synchrony
4. Appropriate touch or appropriate proximity, which does not have to involve physical contact
5. Soothing voice, rhythmic movement programmes
6. Harmonious movements, synchronised movements and facial gestures
7. Having pleasure: smile, play and laugh together
8. Alteration between quiet an arousing /stimulating activities

When teachers include these aspects in their teaching, new, corrective experiences of security in relationships can be experienced.

b) Support through co-regulation

As described in Chapter 2, traumatic life experiences alter the ability of the stress system to regulate itself appropriately to a given situation. It remains in hyperarousal or hypoarousal or switches between these states. In such heightened states, learning and emotional regulation become difficult. Educators must create an atmosphere where students feel physically and emotionally safe. This includes using a calm tone of voice, controlling body language, and maintaining patience, especially during moments of heightened stress by being regulated of their own emotional states. "Co-regulation, where adults help children manage their emotional states through calm and supportive interactions, is critical in helping trauma-affected children develop the ability to self-regulate over time" (Walkley & Cox, 2013, p. 124).

c) Being sensitive to students' signals

It is frequently the case that trauma is not conveyed through verbal communication, but rather through vegetative responses that give rise to behavioural patterns, specific requirements or barriers. This refers to the importance of educators being keenly aware of students' nonverbal cues, such as body language, facial expressions, and tone of voice. Educators must learn to read these nonverbal signals to gauge how much stimulation or learning a child can handle at any given time. This attunement allows teachers to adjust their approach, providing individualised support that meets the child where they are emotionally. A very helpful question to ask yourself or the young learners is: "Are you doing this/showing this behaviour, because of……?" (Weiß, 2016, p.122f).

d) Being present

Being present means giving attention to students in the moment, ensuring they feel seen and understood. Educators who are mentally and emotionally present with their students help to create a sense of security, which is crucial for building strong, supportive relationships. This mindfulness not only fosters emotional safety but also models healthy relational patterns, which can have a profound healing effect for children who may have experienced inconsistent or harmful relationships in the past.

e) Transparency, predictability, routines and structures

People who have experienced trauma often view the world as unpredictable and unsafe. Establishing predictability in their daily routines can help mitigate this sense of chaos. The principle of predictability emphasises the importance of routine, structure, and repeated positive experiences. When students can anticipate what will happen next, they are more likely to feel secure and less likely to act out due to anxiety or fear (Garner et al., 2012). Predictability also reinforces a sense of control, which trauma-affected children often lack in other areas of their lives. Educators can implement predictability by maintaining consistent schedules, providing clear expectations, and offering regular feedback to help students feel grounded in their school environment.

f) Participation and opportunities for choice and control

If a person has experienced situations in which they have felt completely helpless and out of control in the face of an extreme threat, they need to feel in control at all times. Demands or unclear situations, which are usually difficult or impossible for the learner to influence in a school, can therefore have a triggering effect. For this reason, it is necessary for learners to have the opportunity to shape things that affect them. For example, they need to be able to choose the order in which they start tasks. They also need agreed alternative strategies and emergency signals for situations in which they have no direct choice (Kline, 2020, p. 108).

g) Trauma-sensitive crisis interventions

Trauma-affected children may have difficulty regulating their emotions, which can lead to outbursts or extreme reactions when they feel threatened or overwhelmed. In addition, trauma-related triggers or feelings of insecurity can lead to rapid, uncontrollable increases in stress, resulting in emergency responses such as fight or flight. In such situations, it is

crucial for educators not to let their own emotions intensify the situation. "This means that teachers are themselves well-regulated and poised to contain conflict rather than feed the fire of a scared student" (Kline, 2020, p. 147). Instead, staying calm and controlled, even in the face of emotional distress, helps de-escalate the situation and provides a model of emotional regulation for the student.

One crisis intervention that is often necessary is reorientation from flashbacks and dissociation. In addition to the ability to recognise them, this requires methods of reorientation. This means taking the person out of the stressful experience and bringing them back to the sensory reality of the here and now. This can be done by talking to them, by focusing their attention on what they can see, hear and feel, or by using pre-arranged skills.

An example for a step-by-step plan for reorientation:

1. Making contact: make contact from a distance (so as not to frighten the other person) by briefly introducing yourself to the person: 'I am …'.
2. Orientation: Briefly inform the person where they are: 'You are safe here. Today is 23 October 2011 and we are in the living room of the flat at Amselstraße 5.'
3. Activation: You can then try to activate the person by giving easily understandable prompts ('Try as best you can to open your eyes, move your hands …').
4. Further activation: If the first activation is successful, it is helpful to ask the person to look around the room and, for example, to name a given number of objects.
5. Self-reorientation: For self-reorientation, the person can now be asked again what their name is, how old they are and whether they know where they are.
6. Clarification: The other person is then briefly informed that they have just had a flashback and were in an old film.
7. Maintain contact: Then ask if it is possible to make eye contact and maintain contact with the person (Scherwath & Friedrich, 2016, p. 167).

Group interventions

For children or youth who have experienced trauma, there are many group interventions available in addition to individual ones. Group interventions enable the delivery of the intervention to more kids at once. This method of delivery is seen as especially helpful in lower-and middle-income nations, where resources can be especially scarce after widespread traumas like natural disasters or conflict. Even the health systems of developed countries may find it difficult to respond to the needs after mass traumas.When compared to individual evidence-based interventions such as Trauma Focussed Cognitive Behavioural Therapy (tf -CBT), group treatments frequently require less training for facilitators (or on-the-job training through the role of co-facilitator), and can be provided by non-mental

health professionals. This allows a greater number of children to access support (Berger & Gelkopf, 2009; UNICEF, 2021).

The effectiveness of group-based therapies was examined in a recent meta-analysis (Davis et al., 2023). A total of 42 studies involving about 5998 kids (aged between 6 to 18 years) were included. In comparison to no treatment, the study indicated that such interventions, particularly those based on cognitive behavioural therapy (CBT), were effective in reducing trauma symptoms and depression. There was proof of effectiveness when given to a variety of trauma-exposed groups, including those exposed to war or conflict, natural disasters, and abuse, in extremely complex and resource-limited contexts. The authors of this study also concluded that the results of the study have important implications for contexts in which group programmes may be the most or only viable option, including communities exposed to conflict or natural disasters and poorly resourced services. While individual tf-CBT remains the best-evidenced treatment for Post-Traumatic Stress Disorders (PTSD) in children, our meta-analysis demonstrates that group programmes are also a valuable therapeutic resource.

Some of these CBT based trauma-focused group interventions are translated and adapted to different cultures. Tf-CBT in group format usually 12 sessions, Deblinger, Pollio, & Dorsey, 2016), Teaching Recovery Techniques (TRT, usually 5 sessions, Children and War Foundation, 2002-2018), and Cognitive Behavioral Intervention for Trauma in Schools (CBITS, usually 10 sessions, Jaycox et al., 2012) are the most commonly used programmes. These programmes also include parent/caregiver sessions.

In order to give an example, the outline of the TRT intervention that was developed by Children and War Foundation will be briefly presented here. The Children and War Foundation develops and disseminates effective psychological procedures for helping large numbers of traumatised children by teaching techniques to recover from trauma. They have developed five manuals to help children cope with their reactions to war, disasters, and violence. The names of the manuals are, Children and War Manual, Children and Disasters Manual, Children and Grief Manual, Writing for Recovery Manual, and Manual for Children Between 4 and 8 Years. The Teaching Recovery Techniques (TRT) manual is based on the A-B-C model (Thoughts and memories, Feelings, and Behaviours) of CBT and includes five group sessions for children and adolescents and two parent sessions. The main goal of the program is to show the children that their reactions are normal for their situation and that they are not going crazy. Specifically the goal is to give children skills to regain control over their thoughts and feelings and be able to remember without being overwhelmed. There are several studies that prove the effectiveness of TRT. For instance, Barron et al. (2013; 2016) and Qouta et al. (2012) implemented it after war in Palestine; Chen et al. (2014) used it for traumatic bereavement in China, Ooi et al. (2016) implemented it after war in Australia, Pityaratstian et al. (2015) used it after natural disasters in Thailand.

Community-Based Interventions

Statistical evidence indicates that a significant proportion of individuals experience traumatic events throughout their lifespan. The social implications of trauma, traumatisation and the ways in which these can be addressed are therefore also worthy of consideration. In this context, it is pertinent to examine how society can enhance awareness of these issues, how it can facilitate effective responses and what options are available.

It is imperative to begin by establishing a culture of openness and communication. It is essential that within a society, there is an understanding of the emergence and consequences of trauma. In order to make grievances visible, it is necessary to create spaces in which trauma can be addressed. It is very important that those who have suffered are afforded the opportunity to articulate their experiences. The following section will examine the issue of sexual violence in Germany in closer detail.

In Germany, following the revelation of numerous scandals concerning the sexual abuse of children and young people in educational institutions, a commission was established to investigate these incidents. The Federal Ministry of Education and Research allocated funding for research into sexual violence, with the aim of facilitating further investigation and reappraisal of the issue. The commission provides a forum for those affected to articulate or document their experiences. Furthermore, it serves as a representative of the affected parties within society. The objective is to elucidate the structural conditions that facilitated the occurrence of the abuse. It would be beneficial for contemporary social sectors to adopt a similar approach. One consequence of these endeavours in recent times is discernible in the Child and Youth Welfare Act (KJSG), which mandates that institutions engaged in the care of children and young people must possess a binding violence prevention strategy.

It is of the utmost importance for societies to establish structures that render the occurrence of man-made trauma an improbable outcome. Conversely, it is imperative that instances of trauma are brought to the fore within society, and that those affected are provided with the requisite assistance and backing.

Empowering Teachers with Trauma-Informed Pedagogy

Why should teachers and other educational personnel be empowered in trauma-informed education?

Trauma-informed education provides teachers with the tools to effectively manage traumatic stress, facilitates the provision of comprehensive support to other members of the school and education community, and enables the delivery of targeted training and skills development. A school-wide trauma-informed education approach has been demonstrated to enhance students' sense of comfort (de Stigter et al., 2024).

It is incumbent upon educators to be conversant with the following areas:

The objective is to provide guidance on how to respond to the needs of students who have experienced trauma. The regulation of stress levels is a crucial aspect of maintaining mental health and well-being in educational settings. This can be achieved through a combination of school- and classroom-based methods. The first objective is to establish school as a secure environment. The second objective is to determine the most appropriate course of action to take when a student is experiencing a crisis or a stressful situation.

Furthermore, the curriculum encompasses a range of additional methodologies, including stress management, classroom management, anti-discrimination activities, peer bullying prevention, and numerous other subjects.

The remaining contents include the definition of trauma, its various types (such as those resulting from war and migration, child abuse and neglect, natural disasters, loss and mourning), the causes of trauma, the symptoms of trauma, the short- and long-term effects of trauma, and the effects of trauma on the learning process. Additionally, the course addresses how to respond to trauma. The training will equip teachers and school administrators with the knowledge and skills to identify and respond to the needs of children exhibiting symptomatic behaviours in the educational environment. This will include guidance on positive discipline, classroom management, in-class psycho-social support activities, peer bullying and anti-discrimination activities.

Why teachers' well-being is important?

Being a teacher is already a stressful role and there is always a risk of burnout. So many things are going on in school and teachers usually receive little or sometimes no support at all. Teachers are usually the ones who do the heavy emotional work and this leads to stress and burnout. As teachers are charged with constantly balancing multiple responsibilities, there is generally little deliberate attention to their own emotional well-being, thus threatening abilities to withstand the continuing stressors that come with their demanding work lives (Richards, Levesque-Bristol, Templin, & Graber, 2016).

In the literature, it is stated that people involved in the education and rehabilitation process of traumatised children are affected by this experience, both positively and negatively. Positive effects are mostly related to post-traumatic growth, resilience, and satisfaction, and they are called vicarious post-traumatic growth, vicarious resilience, and compassion satisfaction. However, there are some other effects that are negative, such as secondary trauma and burnout. These negative effects not only affect the individual person (teacher or helper) but also other systems (education, organisation, NGO, etc.) and individuals (other students and family members of the teachers and helpers). Neglecting teachers' psychological health is problematic because this can greatly affect their students (Schonert-Reichl, 2017). It should be something like wearing the mask yourself first and then helping your children in a flight.

The literature also provides some information that people who contribute to helping processes neglect their own self-care (Figley, 1995; Stamm, 2010). In many countries, teachers delivering trauma-informed education (life skills teachers, teacher counsellors, school counsellors, etc.) lack facilities where their emotional well-being can be restored. It is also important to note that dysregulated teachers cannot support dysregulated children. It is advisable for educators to seek therapeutic support when triggered by behaviour or trauma responses within the classroom. Thus, it is very important for those who provide services to traumatised people to be informed about the importance of self-care and to use self-care skills in their lives in order to maintain their well-being.

Self-care encompasses all the actions that individuals take to protect their well-being and to cope with stress effectively. Professional self-care of therapists or people who provide support to traumatised people can be defined by Wise and Barnett's (2016) definition. Self-care is the routine behaviours that individuals consciously perform in order to protect or improve their physical, emotional, social and spiritual well-being in their professional life.

Showalter (2020) listed the activities that need to be done in order to improve the level of self-care as follows. Staying calm, being aware of feelings, thoughts and behaviours and experiencing them in the present moment, meditating, exercising, eating regularly, spending time with loved ones, sleeping regularly, taking time to rest, appreciating oneself and what they are doing, accepting the difficulty of providing assistance. Sholter (2010) also shared a list of what not to do. This list includes: working harder than usual, giving up on leisure activities and personal needs and interests, ignoring the problem, complaining, blaming coworkers, quitting to look for another job or looking for surface solutions.

Lastly, educational staff or people who provide help are also human beings and must accept this and continue to work according to their own well-being. Especially after traumatic events which affect so many people at the same time, such as earthquakes, legally and ethically, it is not appropriate for people to offer help by neglecting their own well-being. In the same line, legal authorities should not expect them to help others or continue their work while they are not feeling well.

Conclusion and Questions

This chapter provided insights into the situations that lead to trauma among children across the globe. We further unpacked the concept of trauma, the types of trauma and its effects on the brain and aspects such as physical and mental health on individuals and their significant others. We provided examples of trauma affecting children from the perspective of four different countries. We mainly focused on trauma-informed education and its application in inclusive and democratic schools. We explained the concept in terms of its meaning, both subjectively and objectively and provided guidelines to teachers on how to use trauma-informed education. We also provided information on the importance

of teacher-wellbeing in the process of providing psycho-social care and support to their learners.

We concluded that trauma among children is a widespread phenomenon and should be treated with sensitivity. Learners from diverse cultural backgrounds perceive trauma differently. Teachers should observe their learners carefully and be aware of their own biases. It is important to note that there is silence around issues contributing to trauma amongst children, especially the man-made and environmentally created traumas. Learners might not disclose, and therefore, teachers must be attuned to notice inner-suffering of learners and attempt to support them through the process by using culturally relevant and inclusive trauma-informed approaches. Some learners develop PTSD and they would need further support from schools and communities. Such support can only be provided if schools and communities can work together in the minimisation of the trauma effects and the prevention of primary and secondary trauma.

While teachers have a responsibility to respond to the needs of their learners who experience trauma, they should be conscious of their own emotional well-being and seek support they may need to continue with their demanding responsibilities toward learners who undergo traumatic experiences. The chapter ends with recommendations to increase awareness on trauma-informed education and to enhance teachers' capacity to deal with traumatisation emanating from changing societies.

Closing questions to discuss or tasks

- Which aspects of trauma-informed education are already being implemented in your school?

- What changes does your school need to make to become a trauma-informed institution?
- Is there anything you would like to change in order to work in a more trauma-sensitive way?
- What social necessities do you see to break the silence about trauma in society and in institutions?

About the authors

Julia Bialek

Julia Bialek is working as a research assistant at the University of Bremen in the "All Means All!" project. She is a pedagogist, has a degree in special education, and has been working in the field of trauma-sensitive education for many years. She teaches this topic at the university, in training courses for educational professionals, and works as a trauma therapist.

Evrim Çetinkaya Yıldız

Evrim Çetinkaya Yıldız is working as an associate professor at Akdeniz University, Türkiye, Department of Psychological Counseling and Guidance. Her research interests are inclusive education, prevention of student problem behaviours, and school counsellor education.

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Ramona Thümmler

Ramona Thümmler is an educational scientist and child and adolescent

psychotherapist who works at various universities in Germany. She conducts research on refugee children, multi-professional cooperation and the professionalisation of teachers.

BEING AFRAID OF 'THE OTHER' - PHOBIAS IN EDUCATION

Example Case

Fig. 1: Example case.

Take some time to look at Figure 1 above. It depicts an unknown person who is receiving the comments displayed around them. You may notice that these comments do not specify an identity but mainly are using words such as "you" and "we", or "us" and "them". This is being done so that you, our reader, firstly reflect on who you think this individual could be and secondly to think about the emotions that they may be feeling as they hear them. As a teacher in training, it would be also beneficial to reflect on this scenario taking place in a school environment and apply the same two questions to this context. We suggest that you list or write both the identities and feelings you think of, so that you can refer to them as you read this chapter.

Initial questions

In this chapter you will find the answers to the following questions:

- Who is "the other"? How do you construct "the other"?
- What are the emotions at play, in the process of (re)producing othering?
- How does othering manifest itself in schools?
- What can teachers do to counter othering processes in their classrooms/schools?

Introduction to Topic

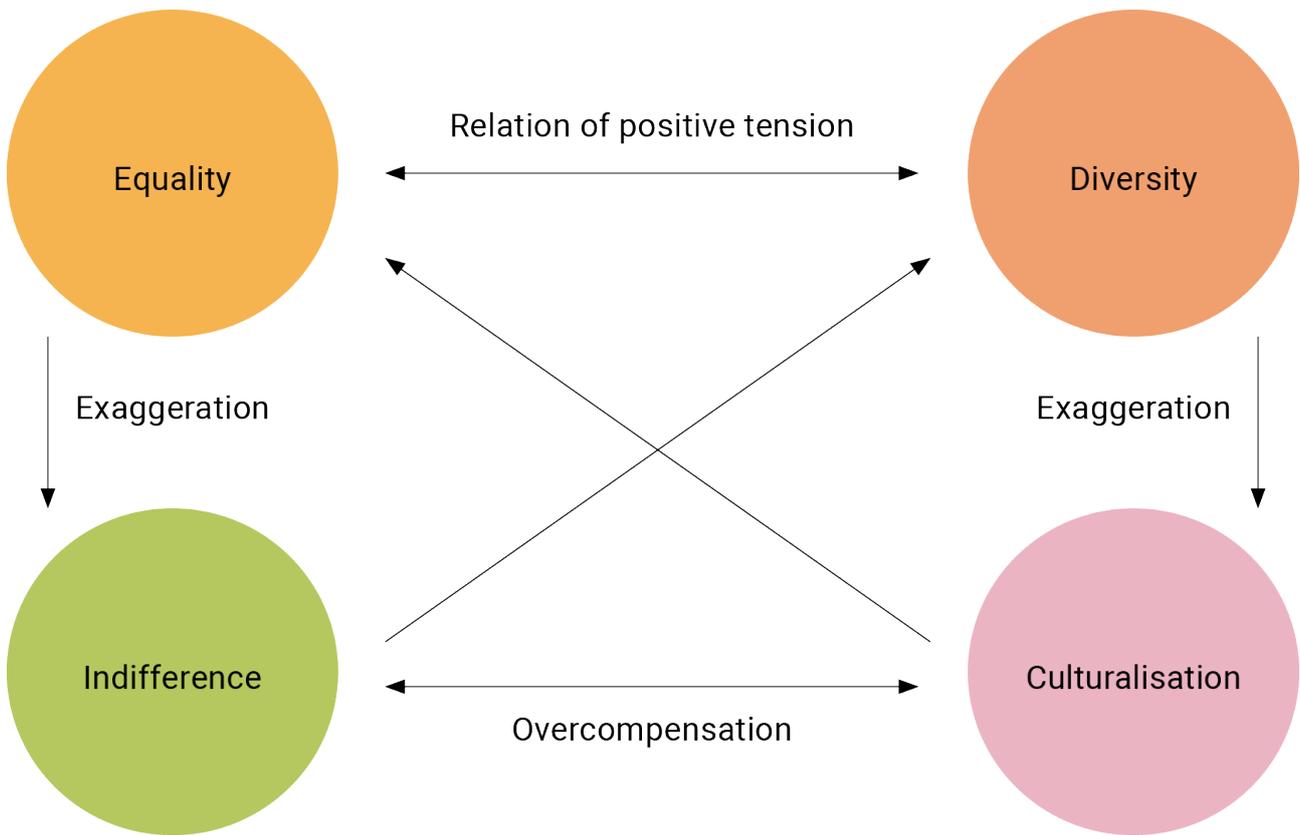
Difference, diversity and otherness are classic themes in education generally and specifically in teacher education. Schools, as key sites of interaction, are where individuals often encounter "the other" – i.e., those who differ from themselves in various ways. Teachers play a pivotal role in shaping these encounters, influencing how diversity is navigated and understood within a given classroom or school. The concept of "the other", along with associated phobias, significantly impacts educational environments and the experiences of both students and educators. Phobias linked to race, sexuality, gender identity, and other dimensions of human diversity can foster climates of fear, exclusion, and discrimination in schools. In educational discourse, terms like xenophobia, homophobia, transphobia, and Islamophobia are often used to describe specific forms of prejudices and discrimination. These phobias can trigger strong emotional reactions, and for those who are marginalised, the resulting discrimination can lead to feelings of fear, anxiety, shame, and social isolation. Consequently, addressing these issues is essential for creating inclusive, supportive educational environments where all students can thrive.

This is precisely why teacher education programmes should explore this topic beyond rhetoric. This means in the first place defining what otherness and diversity mean and understanding the experiences linked with them in educational environments. Various disciplines deal with this from a particular perspective: inclusive education, intercultural education, social psychology, cultural and educational anthropology, sociology, etc. However, given its extremely extensive and complex nature, defining the concept of "otherness" is a very complicated task and involves the examination of related and crucial notions like identity, difference, normality, culture, social order, etc. Therefore, interdisciplinary exchanges are necessary and allow us to go beyond simplistic explanations for overly complex phenomena whose understanding cannot be

compartmentalised by a single disciplinary view (Morin, 2008). That is the reason why in this chapter we will refer to different theories and authors, trying to merge their perspectives in defining and addressing othering processes in education.

In doing so, this chapter focuses on the need to appreciate the uniqueness of each person without losing sight of the sameness that characterises us as persons. Our reflections concentrate on schools. Nonetheless, in every context there is an encounter between people with different baggage (Ainscow, 2016; Bernstein et al., 2020). An idea of unity (e.g., sharing a condition, a context, a perspective, a communicative code, etc.) and at the same time an idea of diversity (e.g., the different origins, biography, reference value system, etc.) are necessarily recalled (Granata, 2018). Unity and diversity are not antinomies, but dialectical polarities that are in constant dynamic relationship with each other (Granata, 2016; Lanes & Demo, 2023). Therefore, pedagogical action must take these two different and complementary dimensions into account. An excessive focus on the dimension of diversity runs the risk of forgetting the common humanity of people. Conversely, a strong focus on the dimension of human equality risks perpetuating an indifference to differences that can lead to inequalities, and a dynamic of exclusion and marginalisation.

The dialectical model of cultural diversity elaborated by Ogay and Edelmann (2016) explains these dynamics and the resulting need to find a never-final balance between the dimensions of diversity and equality in order to highlight the uniqueness of each individual without falling into a dynamic of exclusion that is difficult to overcome (see Fig. 2). This elaboration refers specifically to cultural diversity, but we can imagine that the risk of culturalisation is present in any type of diversity, as will be explained throughout the chapter.

Figure 2: Dialectical model of diversity


Based on Ogay & Edelmann (2016)

In the following sections, we address this issue from a theoretical-practical perspective. Firstly, we examine the academic debate and the various theories that describe the processes of othering and their consequences for people's lives, and in particular for their educational experience. Secondly, we focus on the emotions associated with othering, both from the perspective of those who perpetrate it and of those who experience it. Thirdly, we concentrate on school systems and schools, showing, on the one hand, how they produce and reproduce these phenomena and, on the other, how they can act to overcome them.

Key aspects

"The other" as a social construct

As you may have noticed from our example case, this chapter deals with the general concept of "the other"/otherness, without framing it in specific dimensions of diversity and/ or groups. There are two reasons for this. Firstly, we are reflecting here a constructivist stance in the definition of otherness. This means understanding otherness as a social product emerging from the interactions among individuals and groups which, in turn, reflect power relations and dynamics present at the societal level. Within this framework, diversity and otherness are not fixed or given once and for all, but socially produced through socio-

cultural practices and discourses (Wieworka, 2004). This, in turn, implies that they have nothing to do with the intrinsic characteristics of individuals, but rather on the meanings that are attributed to them in specific contexts (Goffman, 1968). It follows that "the other" can be considered as such only as far as he/she/they is/are perceived and identified as "different" by someone else. All this leads to the rejection of the idea of an ontological and/or biological foundation of diversity, which can instead be interpreted as the result of a *relation* involving certain individuals and their respective cultural systems and structures of signification (Burbules, 1996).

The process through which "the other" is "produced" in the sense we have just described is called *othering*. The term was originally coined within post-colonial theory, but the notion itself has deeper roots and draws on several philosophical and theoretical traditions coming from sociology, psychology and anthropology, amongst others. The concept of othering is used to describe the processes through which someone (usually the majority or dominant group) is ascribing difference or otherness to someone else or to some other group (usually the minority or non-dominant group) to categorise and form individuals' and groups' identities (Udah, 2019). Otherness is indeed an essential category of human thought, given that it is constitutive of the self: there must be the other for the self to exist and *vice versa*, and by defining self, one defines "the other" (Canales, 2000). This dichotomy, by putting emphasis on the differences between individuals and groups, is reflected in and based on a dualistic or binary thinking, which distinguishes and marks a border between self and other, us and them, ingroup and outgroup, and centre and margins (Brons, 2015; Dervin, 2012; Udah, 2019). This could for example be based on differences in terms of ethnicity, class, gender, sexual orientation, language, ability, dress, religion or other characteristics. Specifically, people tend to emphasise "negatively" what differentiates them from others, in terms of some positive or desirable characteristic of the self or ingroup that "the other, /the outgroup, does not have. Conversely some negative or undesirable characteristic that "the other", the outgroup, possesses and the self or ingroup does not (Crang, 1998, cited in Brons, 2015) is emphasised. Stereotypes and prejudices play a crucial role in such differentiations. In this way, both the identity of the self and of the others are constructed, but while the former is not defined by difference – but is rather recognised as "the norm", or the standard to conform with – the latter comes to coincide with otherness, being often stereotyped and thus usually excluded or discriminated against (Canales, 2000).

All of this finally leads us to the second reason why, in principle, we are not referring in the current chapter to any specific diversity dimension: because we do not want to (re)produce othering processes by defining some individuals or groups as "the others" ourselves. Nevertheless, there will be examples in the text that refer to some specific groups and experiences: these must be understood as an attempt to raise awareness about exclusion and discrimination processes that need to be overcome, and not as an occasion to reinforce them.

Different forms/the roots of othering

As mentioned above, the concept of othering was first used by authors from the post-colonial, feminist and cultural studies to analyse "the lived experiences and oppressions of colonised, enslaved, marginalised, misrepresented and exploited people marked as Other" (Udah, 2019: 4). In the following section, we will provide examples of some of these authors' analysis of different forms of othering to exemplify how such processes take place and can affect different identities or individual characteristics.

Post-colonial theory concerns itself with the study of the impact of colonialism on the colonised people and their societies. This suspected impact has been on language, politics, economy, and culture. In particular, language affects how people view and engage with the outside world: colonisers utilise language as a means of control and dominance to oppress the colonised. Within this framework, Gayatri Spivak first coined the term *othering* and used it systematically in her essay "The Rani of Sirmur" (Spivak, 1985) to describe how Europeans and Westerners have created differences between themselves as the norm and the others as inferior, using the example of the relationship between the British colonisers and Indian population. According to the author, the latter are silenced and denied their subjectivity through the dominant discourses, and thus relegated and forced into a position of inferiority and subalternity.

Similarly, in his writings on orientalism, Said (1979) explores how the Occidental scholars have built and portrayed the Orient (East) as barbarous, subpar, and strange to establish its inferiority and thus justify its colonisation, while reaffirming at the same time the cultural superiority of the West (Udah, 2019). According to the author, Occidental scholars indeed disregard the traditions, languages, and knowledge of the East and seek to justify colonial dominance via oppression and the need to "civilise" the local population. In this sense, the process of othering indeed upholds colonial legacies and strengthens societal hierarchies by not including the knowledge of the marginalised groups who do not appear to fit in and whose experiences are not valued (Young, 2009).

The same reasoning was used almost 30 years before by de Beauvoir ([1949] 2011) to describe how women have essentially been constructed as "the inessential other" by men to explain their subaltern position in society. According to the author, this is the result of a historical process of definition and mystification that ultimately relegated them to a position of inferiority and dependence on men. To put it in the author's words, "she is determined and differentiated in relation to man, while he is not in relation to her; she is the inessential in front of the essential. He is the Subject; he is the Absolute. She is the Other" (de Beauvoir, 2011: 26). De Beauvoir's notion of "the other" – understood as a social construct *opposed* to and therefore *constitutive* of the self – is the one upon which the concept of othering is based (Brons, 2015).

Foucault also examined this in the light of sex and sexuality, where he contested that "by the Age of Reason, what was involved was a regulated and polymorphous incitement

to discourse" on the subject leading to a repressive understanding of the nature of sex, as a "genitally centred sexuality devoid of the fruitless pleasures" (Foucault, 1978: 34-36). The rise of science and medicine in the 18th and 19th century brought forth a focus on and development of terminology on the subject, which until then was devoid of language to distinguish it. This judiciary-medical rise of knowledge and discourse on the subject, referred to by Foucault as *Bio-Power*, had the capacity to categorise sex and sexuality into, 'notions of "normal development" and "instinctual disturbances;" and it undertook to manage them' (1978: 67). Thus, society became obsessed with eliminating the dangerous and perverse practices of sexuality through medical terminology.

These same processes are related to the cultural discrimination and social oppression often experienced by people with disability, as highlighted by Disability Studies and advocates for the disability rights movement. According to them, the category of disability stems from the dichotomy "abled" vs "non-/dis-abled", based on a certain idea of the normal body and its functioning, both of which are socially constructed notions (Davis, 2013; Monceri, 2018). This is the result of a dominant discourse defined by the so-called medical-individual perspective (or "deficit model"), which considers disability as an internal characteristic of the person and sees a causal link between the individual impairment and being disabled. According to Medeghini (2010), this creates a condition of isolation for people with disabilities, by locating "the problem" within them instead of relating it to the possible causal role of contexts in the construction of disability.

Bourdieu's theory of capital and social reproduction provides a critical lens through which to examine processes of othering and exclusion in society. He posited that different forms of capital – economic, cultural, and social – are not equally distributed, leading to the perpetuation of social inequalities (Bourdieu,1986). Cultural capital, in particular, plays a crucial role in this process. Bourdieu argued that educational institutions, while ostensibly meritocratic, actually serve to reproduce social hierarchies by valuing and rewarding forms of cultural capital possessed predominantly by the dominant classes (Bourdieu & Passeron, 1990). This unequal distribution of capital contributes to what Bourdieu termed "symbolic violence"; a form of non-physical violence manifested in the power differential between social groups. Bourdieu's theory thus unveils the subtle mechanism through which social exclusion is perpetuated, challenging the notion of a truly meritocratic society and highlighting the deeply ingrained nature of social inequalities.

This is what happens in the caste system in India which, as analysed by Ambedkar in "The Annihilation of Caste", provides an insight into "the other" within society (Ambedkar, [1936] 2022). Ambedkar's concept of graded inequality illustrates how the caste system establishes a hierarchy where each group is superior to those below. The persistence of caste-based distinction leads to deeply entrenched discrimination in this form of social stratification. For instance; restricting access, participation and opportunities of individuals belonging to the lower castes especially Dalits. Students who belong to the lower structure

of caste experience discrimination based on caste and are denied a share in the cultural and social capital of society (Sukumar, 2022).

As is evident from this overview, otherness and therefore othering processes are and can be linked to different individuals' characteristics or identities and serve different "dominant" groups' purposes by producing and reinforcing power dynamics and relations. Before describing how this is achieved, it is fundamental to highlight that some people may experience othering also on different levels because of their multiple identities. This is known as *intersectionality*. The concept has its origins in black feminism (Crenshaw, 2015; Hill Collins, 2019) and invites a multidimensional view of inequalities and discrimination: gender, geographic origin, religion, culture, sexual orientation, skin colour, education, socioeconomic status, age, nationality, (dis)ability are all dimensions that can add up and lead to inequalities and injustices that combine in unprecedented ways.

The construction of "the other"

As discussed above, othering is strongly hierarchical and lies on power dynamics between individuals and groups, as well as relationships of inclusion and exclusion (Canales 2000; Udah, 2019). However, one might ask at this point how othering is concretely achieved – i.e., how *others' otherness* is defined – and how it manifests itself. It is indeed not enough for one individual to define another as "the other" to give rise to othering processes or, at the very least, to reach its most extreme consequences. This requires that practices and discourses related to otherness are shared and deemed legitimate within a given community. In this sense, the construction of "the other" is deeply rooted in power dynamics, discourse practices and knowledge production. This process is fundamental to understanding how social exclusion and discrimination operate within various contexts, including educational settings.

Power Dynamics and Exclusion

Those in positions of power, often representing dominant social groups, have the means to create and disseminate knowledge about themselves and those they regard as 'the others' (Foucault, 1980). This power allows them to shape the discourse by establishing power and reinforcing stereotypes about how society perceives other different groups. For instance, as seen above, Said's Orientalism (1978) demonstrates how Western scholars constructed "the Orient" as backward, exotic and irrational, justifying colonial domination. Additionally, in line with Bourdieu's (1984) concept of cultural capital, dominant groups maintain their power by valuing certain forms of knowledge and cultural practices over others. In Indian educational settings, this might manifest as curriculum choices that prioritise urban, upper caste perspectives, marginalising the experiences of rural, Dalit, and Adivasi communities (Nambissan & Rao, 2013). Those in power often have the means to widely disseminate their views through various platforms – social media, media, education systems, and

cultural institutions. This influence shapes societal norms and values; often normalising the marginalisation of certain groups (Hall, 1997).

Power, discourse, and knowledge thus intertwine to create and maintain exclusion, discrimination, and othering in society. As Thomas-Olalde and Velho (2011) explain, drawing on Foucault and Laclau, "discourses produce subjects" (Thomas-Olalde & Velho, 2011: 35), shaping them through dominant narratives and power structures in society. These hegemonic discourses establish what is considered "normal" and construct distinctions between those who belong (the "inside") and those who do not (the "outside"). Laclau's concept of the "constitutive outside" is particularly relevant here. It suggests that powerful groups define themselves by creating "the other" – often marginalised groups, such as migrants or religious minorities. This process of othering is reinforced through various channels, including academic discourse, media, and public debate, which often present these groups as homogeneous and fundamentally different from the majority. For instance, the media representation of LGBTQI+ individuals can influence how they are perceived in society, which extends to educational institutions. McInroy and Craig's (2015) research highlights this through their study of LGBTQI+ youth perspectives, where participants emphasise that media representations often reinforce problematic stereotypes. For example, transgender individuals are frequently portrayed as "sex workers, mentally ill… and as unlovable" (McInroy & Craig, 2015:607) or as individuals conforming to heteronormative gender expectations. The impact of these representations extends beyond media representations. The study found that over 20% of transgender individuals reported experiencing verbal harassment directly stemming from these media portrayals, with participants noting that negative media representations significantly influenced how they were treated in various social contexts, including educational settings (McInroy & Craig, 2015). These representations often reinforce existing stereotypes and contribute to the othering process.

This cycle of power, discourse, and knowledge production makes exclusionary practices seem natural and unquestionable, thereby maintaining existing power structures. By presenting certain perspectives as "factual and given" (Thomas-Olalde & Velho, 2011: 36), this system makes it challenging to recognise and confront discrimination and othering in society. In this way, the oppressor, holding societal power, can therefore reinforce their position by keeping "the other" away from centres of influence and decision-making (Freire, 1970). This exclusion prevents marginalised groups from challenging existing narratives or contributing to knowledge production, which results in perpetuating their otherness. In educational settings, for example, this implies that the dominant group's culture and practices become the norm, which can make it difficult for marginalised students to feel included and can lead to their experiences and perspectives being overlooked or undervalued. For instance, history curricula often present a eurocentric perspective, while literature courses may feature few authors of colour. These omissions send powerful messages about whose knowledge and experiences are valued in society.

In this sense, power dynamics in educational settings – often mirroring broader societal hierarchies – play a crucial role in shaping students' experiences and outcomes. Paulo Freire's (1970) critique of the "banking model" of education highlights how traditional teaching methods can reinforce existing power structures. In this model, teachers are positioned as knowledge holders who deposit information into passive students, reflecting and perpetuating societal power imbalances. The content of curricula significantly contributes to these power dynamics. Stuart Hall in his work "Representation: Cultural Representations and Signifying Practices" conveys that cultural representation helps us understand how the systemic omission or misrepresentation of certain groups in educational material shapes societal perceptions and reinforces marginalisation (Hall,1997). For educators, understanding such power dynamics is therefore crucial. They shape not only the content of what is taught but also how it is taught and who has access to educational opportunities. As teachers navigate these complex dynamics, they must be aware of how their own positions of power can influence student experiences and outcomes, particularly for those from marginalised communities.

Among the various authors who have dealt with the processes of othering and the possibilities of overcoming them, bell hooks[1] (1994, 2003, 2010) is particularly noteworthy. This scholar and feminist has long emphasised the importance of looking at the dynamics of otherness, discrimination and racism from an intersectional perspective. Furthermore, she has emphasised that educational contexts are not neutral, but themselves produce and reproduce dynamics of inequality, dominant discourses and narratives, practises of subalternity and social exclusion. Only the construction of new narratives, the transformation of the classroom into a space of possibilities and the abandonment of transmissive modes in favour of dialogical and collaborative processes of knowledge construction, can promote marginalised voices and the awareness that there is not only one belonging, but multiple belongings that belong to us all. Education has a central role to play, but it too must be transformed from a decolonial perspective: diverse stories, narratives and experiences must be given a voice and space so that they can enter into a dialogue, so that pluralism is lived as a daily experience, in school and in society.

In this sense, intersectionality represents the key to interpreting educational and social contexts "in the plural", taking into account all identity variables that can lead to exclusion and marginalisation due to their non-conformity with the dominant norm and the non-membership of subjects to dominant groups (Al-Faham et al., 2019; Cho et al., 2013). At the educational level, the intersectional approach shows us, on the one hand, the need to pay attention to all those aspects of identity and personality that can lead to exclusion

---

due to their distance from dominant narrative and on the other hand, it emphasises that people are not monolithic but are composed of several variables that are mixed in a unique way. The encounter with "the other" thus becomes an opportunity for self-knowledge, for discovering "the other" within us and for overcoming all those cognitive, emotional, social and psychological barriers that produce othering processes.

Stereotypes, Prejudice formation and Discrimination

As mentioned above, the (collective) knowledge of "the other/s" promoted via dominant discourses is often based on negative representations and stereotypes about them (Brons, 2015; Udah, 2019). These are in turn incorporated in individuals' social representations which influence their attitudes and behaviours, ultimately leading to the discrimination of those "othered". In this sense, othering processes are fuelled by stereotypes and prejudices. In the following section, we will try to define these concepts and explain where they stem from – i.e., the psychological mechanisms behind them.

The formation of stereotypes and prejudices is often a result of the overgeneralisation of social categories. Stereotypes are general and often inaccurate beliefs about a group and serve as the cognitive foundation of prejudice. Allport (1979:191) defines stereotypes as "exaggerated belief(s) associated with a (social) category". When internalised by society, these contribute to the formation of in-groups (those perceived as similar to oneself) and out-groups (those perceived as different or "other"). The theory of social identity (Tajfel & Turner, 1986) suggests that individuals belonging to the same social group (ethnic group, socio-economic class, caste, gender) naturally tend to favour members of their in-group over members of their out-group. The out-group perceives its "members as undifferentiated items in a unified social category, rather than in terms of their individual characteristics" (Tajfel & Turner, 1986: 279). This often leads to in-group favouritism and out-group discrimination. Hence, a stereotypical view of the out-group justifies discriminatory behaviour towards its members. In educational settings like schools, this process is evident in the formation of caste-based, class-based or language–based cliques, reinforcing existing social divisions. Research from educational settings indicates that educators often assume that students from the "dominant" groups hold the same views as fellow students from the "other" group (Garibay, 2015). This situation results in students feeling "othered", like some form of difference from the norm.

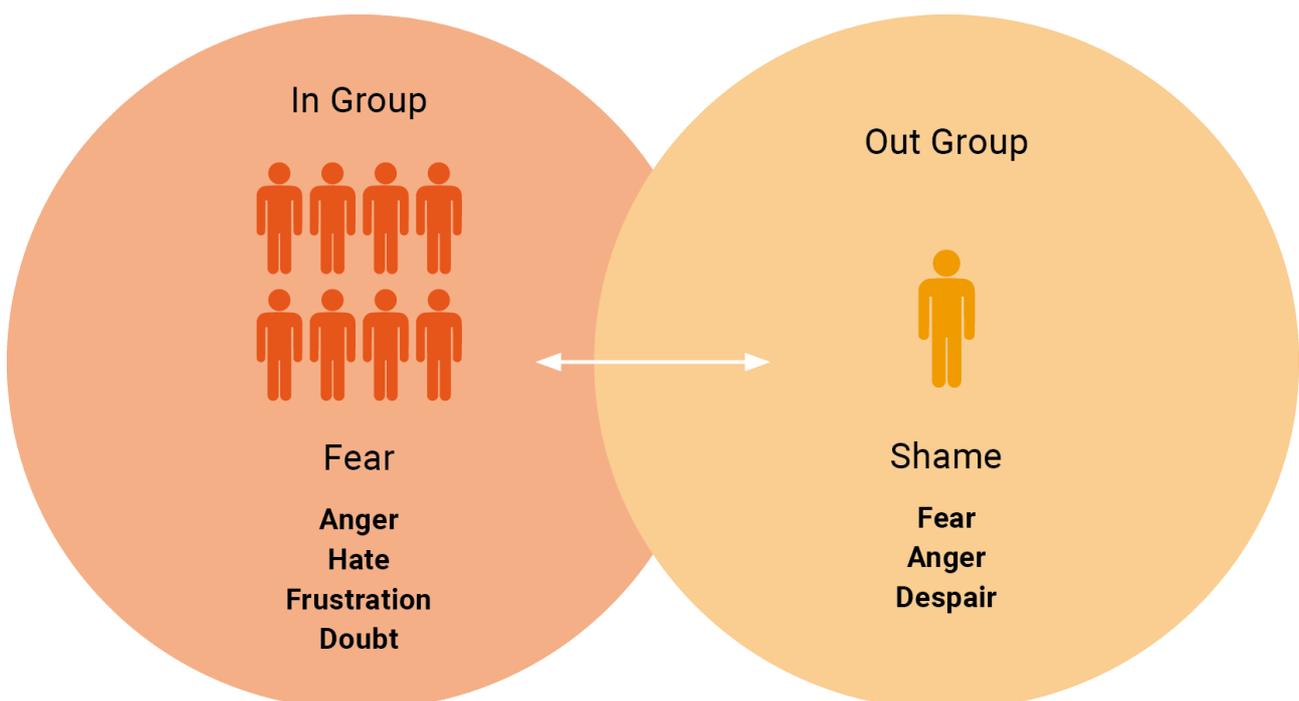
Prejudice, instead, is defined as a "bias which devalues people because of their perceived membership of a social group" (Abrams, 2010:3). This bias can lead to negative attitudes towards out-groups based on stereotypes and has both cognitive and emotional components (Pettigrew & Meertens, 1995). The cognitive aspect involves the stereotypical beliefs about the out-group, while the emotional aspect involves an element of fear, uncertainty or anger towards them. These prejudices lead to discrimination, which is the

unfair treatment of individuals based on their group membership. Prejudiced attitudes form ideologies and beliefs that justify discrimination (Pettigrew & Meertens, 1995).

Members of privileged groups legitimise their position with positive regard of the in-group and negative regard of the out-group. This also applies to educational institutions like schools where teachers and/or students belonging to in-groups discriminate against students from out-groups. In an educational context, this might manifest as lower expectations for students from marginalised communities, leading to academic achievement gaps and social participation. For instance, teachers may unconsciously hold lower expectations for students with disabilities, which influences their participation and academic achievements in the classroom. Discrimination and isolation were found to result in increased school dropout rates, poor academic performance and impact on the mental health of students (D'Augelli et al., 2002; Kauffman & Landrum, 2012; Priest et al., 2014; Ruijs et al., 2010). Further research highlights that students who are discriminated against spend more time struggling with discrimination in the classroom instead of focusing on learning (Anjorin & Busari, 2023).

All of this shows how the concepts of othering and discrimination are deeply intertwined with emotional and psychological processes as they evoke a range of emotions and feelings, both in those who are othered and those who engage in othering.

What are the emotions at play, in the process of (re)producing othering?

Figure 3: A depiction of some of the emotions at play in othering processes.


In the sections above we focused on the roles that knowledge and dominant discourse play for the majority to maintain power over those who are perceived as "the other." We also elaborated on how this manifests itself in different forms of prejudice which are consolidated cognitively through beliefs and thoughts about the subject (i.e., internalised discourse and knowledge) and then manifested behaviourally (ie., through externalised action and expression of the former). This section focuses on the affective elements that are evoked in humans as they perpetrate and experience cognitive and, consequently, behavioural biases towards individuals and groups considered as "different others." It further elaborates on the emotions that are at play in the process of categorising what is a part of "the us" and "the other" (Dovidio et al., 2010; Hovland & Rosenberg, 1960).

Ahmed (2004) explains how emotions are not just personal feelings, but are deeply intertwined with cultural and social contexts. Emotions shape and are shaped by the social norms, influencing identity and power structure between those constructing them and those abiding by them. This takes place through a continuous process caused by the nature of human relations, and the role that emotions play in the processes of socialisation and internalisation of the self in response to the reactions of everyone else. As Butler is quoted in Kahil (2017: 162),

For I am confounded by you, then you are already of me, and I am nowhere without you. I cannot muster the "we" except by finding the way in which I am tied to "you"!

Since there exists an inseparable and inevitable emotional connection between the individual and the social, the emotions of both those contributing to processes of marginalisation (in-group) and those who are othered (out-group) need to be considered here. Moreover, since the expression of these emotions is sometimes outwards, there is also an interplay between these two sets of emotions (see Fig. 3. This element exemplifies the capacity and power that emotions have at (re)producing constructions of othering. Figure 3 lists only a few of the emotions experienced, because literature suggests that these are at the core of establishing and maintaining power over individuals or different forms of minorities elaborated on above. This is especially the case for fear and shame, which are marked in colour in Figure 3 (Ahmed, 2004; Kahil, 2017). However, it is to be noted that there are other emotions which can be manifested in such interactions. This is why our example case asks our reader to list some of their own and we here once again encourage you to refer to them.

Fear & Hate

Fear is presented in both circles of our diagram because it is an emotion experienced by both groups. While the resultant impact of the emotion is common, that is to maintain and reproduce constructions of othering, it affects the people in the two circles differently. Focusing on the fear which is experienced by the in-group brings back to light the processes of negative stereotyping explained above (Dovidio et al., 2005: 7). The latter are needed

because it is through these identifiable signifiers of a different "other" (object) that fear evokes itself as a consequential negative emotion. By establishing these characteristics as a threat, fear manifests itself in members of the in-group (Ahmed, 2004: 64). This requirement for an identifiable object to stir up aversion, through fear, is what comprises phobia. In fact, the same object being feared is often included as a prefix to the word "-*phobia*". A subgroup of phobias is related to signifiers that make up the characteristics of an individual or a group within society. These include but are not limited to Islamophobia, anti-semitism, racism, ableism and queerphobia. Through such phobias, fear acts as a primary emotion which often triggers other emotions and also even mobilises the in-group to act on these. This, as history has repeatedly shown, results in mechanisms which seek to exclude and at times even exterminate feared figures who are perceived as a threat.

Following fear, other emotions then often manifest themselves in ways which further strengthen this divide, especially since these are directed toward the marginalised group, rather than being felt by the in-group witnessing a feared object's approach (Ahmed, 2004: 66). Hatred is one of such key emotions. It is defined as a long lasting emotion involving bitter feelings usually towards a collective group and many times expressed in the face of "the other" (Smith & Mackie, 2005: 361). Hence, when it is expressed towards the out-group it directly impacts the individual witnessing and absorbing this emotion being thrown at them. In sum, while fear helps with classifying and establishing the threat, hatred is a resultant execution which directly impacts this threat through the distribution of various forms of violence. Anger and frustration are included in our diagram because these tend to play a similar and important role in intrinsically energising a population, which is trying to justify or make sense of the difficulties that they themselves may be experiencing. These are often the emotions that politics feed on to (re)produce power by locating the blame on a specific list of identities. Allport coins such type of hatred as *character conditioned,* whereby the individual thinks up some convenient victim and some good reason (Smith & Mackie, 2005: 362). An example of this in the context of schools is when "the other" is blamed for their inability to behave like the norm or for failing to catch up with their peers. This perception often fails to criticise the institutions which are failing to address the needs of both the student and provide the right support. This can often cause frustration which further propagates and strengthens the parameters through which the individual is perceived as "the other".

On the other hand, the fear experienced by the "the other" is a consequential and reactionary emotion. The fear felt by those in the out-group is a reaction to the hate or other negative emotions thrown at them for failing to conform and thus of being excluded. Naturally, this further legitimises centres of normalised majorities and margins of minorities to which people respectively belong. As the minority succumbs to the feelings of being othered, it strengthens the power of those establishing the norms and practices for belonging. Unless contested, this fear experienced by "the other" manifests itself in different spaces in the form of active silence. Active silence refers to the deliberate,

conscious choice of avoiding the subject and often it has the loudest voice in its impact (Humphry, 2012: 484). This is so because it further strengthens the visibility of the majority against the invisibility of "the othered" groups.

This pathologizing and repressive interaction between the two groups leads to dominant discourses not being contested by the opposing experiences of the silent other. Subsequently, inclusive, reparative and positive change fails to take place (Freire, 1970: 61). Kahil (2017: 135) suggests that such "pathologizing, repressing, excluding, and discounting the experiences of those othered within their own communities [have] a direct route to [the feeling of] shame". In fact, shame is considered to be a leading emotion prompted by oppression and often it is said to hide itself behind other emotions including fear, anger or despair. This is why we will now delve further into this emotion.

Shame & Pride

"Shame is sensed as a result of a feeling of negation, which is taken on by the subject as a sign of its own failure, […] usually experienced before another" (Ahmed, 2004: 103). It is characterised by a threatened social image; Image Shame, or a threatened moral essence; Moral Shame (Allpress et al., 2014: 1270). Naturally this threatened image is based on the expectations and reactions of the same person or group in front of whom one is feeling shamed (the social). "The shaming targets any expression of subjectivity outside the boundaries of those ideals and is considered a trespass against the social" (Kahil, 2017: 138). The latter further affirms the location of both the in-group and the out-group since it requires a hierarchical system where the shamed is *"the inferior"* with the threatened image and *"the superior"* who is the one threatening the image of the other (Johnson, 2013: 90). In short, one cannot feel ashamed outside of a social interaction involving other people and the expectations established by them. It is experienced once the ego of the individual experiences a form of deviance from the norm which is pointed and even more so, if they are asked to change or address it.

Shame binds us to others in how we are affected by our failure to 'live up to' those others, a failure that must be witnessed, as well as be seen as temporary, in order to allow us to re-enter the family or community (Ahmed, 2004: 107).

On the other hand, this resultant feeling of shame is in itself a declaration of our interest, love and need to belong to the centre and not the marginalised other, according to Rula (2017: 138-139), which highlights the productive power that is contained within this emotion. In feeling shame, the self exposes its need for belonging with others and unless it contests this feeling, it submits to potential forms of oppression which decide who gets to belong and who does not. The latter is maintained through the established discourse and knowledge which distinguishes between the characteristics of the two parties. This sees the act of "colonisation" move away from the overt, physical and geographical colonisation of land and people, to "the colonisation of the psychic space" (Oliver, 2004: 43). This

takes place when the psyche of the individual or group becomes colonised by that of the dominant individual or group through socialisation and the production of oppressive emotions.

The colonisation of psychic space is the occupation or invasion of social forces – values, traditions, laws, mores, institutions, ideals, stereotypes, etc. – that restrict or undermine the movement of bodily drives into signification…The psyche is the 'place' where bodily drives intersect with social forces (Oliver, 2004: 43).

Amidst all the emotions at play in this space, Kahil (2017: 135) explains how this colonising effect manifests itself mostly through shame because this emotion is expressed inwards, towards the self and not outwards. Other emotions such as melancholia and despair are then related to shame and likely to manifest since the subject takes on the "badness" as its own, by feeling bad about "failing" loved others.

We have so far mainly focused on the negative impact that emotions have in the process of othering, thus, picturing "the other" as a powerless individual absorbing and submitting themselves to this power. However, as we have seen throughout history, from different social movements, this is not always the case. The Black Lives Matter, MeToo and LGBT+ pride marches around the world are all recent examples of this. Pride and courage are also resultant emotions that stem from such experiences of shame. This is especially the case when these emotions experienced individually are spoken about, gathered and collectively raised by a marginalised group, through which, the same yearn for longing to a group, finds solace and energy in the experiences of more marginalised others. This emancipatory journey is deemed by Kahil (2017) as the productive face of shame.

Shame's productivity stems from its capacity to motivate self-reflection on a lot of things, among which are the structures we take for granted, our complicity within such social structures and the validity of the norms/social codes we live by. (Kahil, 2017: 142)

Being able to question the established power structures and knowledge has the potential to lead the way towards emancipation. As the othered no longer confines themselves in fear and silence, powerful and normative discourse is challenged by that conceived as non-normative.

Having considered this productive face of shame, it is to be noted that sometimes, contesting and revolting against established structures and powers may not be an easy thing. Therefore, those choosing to be in silence and absorbing these negative emotions, may not necessarily be unaware of these structures or simply absorbing them. However, they can be in situations where they would be at greater loss if they had to speak up, especially if they do so on their own. Therefore, as Kahil (2017: 136) explains, "revolt ought to be accompanied by assurances that one will be forgiven by the same community or by an accepting/loving third". Thus, if forgiveness is not possible, revolt may not necessarily manifest itself through major social movements calling for changes in communities. It can also be grasped individually by choosing to leave that community through migration.

All the structures and emotions at play described here are not new to the dynamics of the

school culture. As a teacher in training, you, our reader, may be wondering as to how you can contest against experiences of othering that you witness in schools. The next section examines the different levels of people and stakeholders found in school communities and how they exert such colonising power and emotions on each other. After that, we try to provide some practical solutions and ways you can yourself challenge these structures.

Education systems and schools as (re)producers of othering processes

Othering processes often take shape in schools (Borrero et al., 2012; Canales, 2000; Wright, 2010). As shown by the several examples provided throughout the present chapter – educational contexts are indeed not neutral, but themselves produce and reproduce dynamics of inequality, dominant discourses and narratives, practices of subalternity and social exclusion. As such, as highlighted by Anjorin and Busari (2023: 3), "schools are cultural contexts that have the power and potential to promote students' cultural assets or to 'other' youths in a way that keeps them from creating meaningful academic identities".

The search for the causes of such manifestations is a very complex undertaking, as various factors and actors come into play at different levels. Between structural and cultural aspects, we can distinguish the level of the self, the dynamics in the classroom, the decisions at the level of school governance and what is happening in the broader social and cultural context (Boeren, 2019; Ferrero, 2023), according to Brofenbrenner's ecological-cultural model (1981; see Fig. 4).

Figure 4: Bronfenbrenner's ecological-cultural model

Based on Bronfenbrenner's Model as cited in Berk (2013: 24).

Reflection on the dimension of the self is crucial and involves different actors: teachers, students, school leaders, families, etc. Within a kind of cognitive economy, each of us interprets the world through categories and schemas: we need to be aware of this dynamic in order to avoid developing stereotypes and prejudices that can lead to real discrimination and a compartmentalised understanding of reality. Going to school with stereotypical and prejudiced views runs the risk of othering processes (Brons, 2015; Dervin, 2012): based on a false and non-existent idea of the norm, certain groups of people are defined as different because they differ from the dominant group. This, as discussed above, creates

real inequalities that have a major impact on pupils' well-being and their chances of success at school.

At the level of the classroom, this means that the history and perspective of the country one lives in, and Western countries in general, take centre stage (Azada-Palacios, 2022; Bull & Alia, 2004): often there is no space for other visions and meanings, and everyone must conform to the dominant discourse. In many cases, the idea of co-construction of knowledge is not realised, instead we witness forms of cultural transmission where it is necessary to adapt to the thinking of the majority. This affects both the pedagogical relationship between teachers and students and the relationship between peers: the school culture (MacNeil et al., 2009; Roach & Kratochwill, 2004; Glover & Coleman, 2005) conveys a hierarchy in terms of languages, countries of origin, genders, social classes and many other dimensions, in turn conveying a colonial view that excludes those who are perceived as different.

The role of single school governance, in which teachers, head teachers, parents and sometimes students are entrusted with more institutional tasks, is also crucial. This is where rules and forms of organisation are established (Allen & Mintrom, 2010; Fullan, 1995): this is where a colonial, elitist school culture based on the idea of the norm can be changed. In fact, any attempt to approach homogeneity is artificial and doomed to failure (Dupriez et al., 2008): heterogeneity is a characteristic inherent to all social groups; creating situations of homogeneity in school means to be the bearer of a mindset that is not open to diversity and to the recognition that everyone has multiple belongings. Phenomena of school segregation and curricula that do not include histories other than the national one are two clear examples of how the institutional level can generate processes of othering with negative consequences for the educational pathway (Frankel & Volij, 2011; Watras, 2007).

Finally, the social, political and cultural context has a major impact on both school systems and individuals (Thomas-Olalde & Velho, 2011; Weiguo, 2015). When inequities exist at the structural level in terms of access to resources and social and civil rights, in terms of social norms and values, at the level of dominant policies and discourses, and when inequalities become institutionalised, a change on the part of the individual, but also, and more importantly, a paradigm shift involving policy makers and society as a whole is urgently needed. In this sense, individuals can play a crucial role in recognising forms of injustice and oppression and making their voices heard by the institutions that can change the social order (Hackman, 2005).

The dynamics we describe here are certainly complex and have been layered over the course of thousands of years of history. Therefore, it is difficult to unhinge the dominant discourses and practices of the subaltern, and there are no ready-made solutions. Yet, there is a lot that schools can do at each of these levels in order to counter othering processes. In the following section, we will provide some examples of how this can be concretely achieved.

Cultivating "the other" in us: the role of the school

If we think of the school context, work on the individual and professional self at the institutional level must be mediated through the dimension of collegiality (Bovbjerg, 2006; Shah, 2012). It is essential to promote self-awareness of groups in which positions of privilege or marginality can emerge that affect professional practice, in relationships with students and between teachers, in relationships with school leaders and families. Being aware of these dynamics is the first step to unhinge what produces processes of othering and inequalities in pedagogical action.

At the institutional level, it is important to develop educational policies that promote equity, inclusion, belonging and valuing the uniqueness of each individual (Karlsson et al., 2020; Ward et al., 2015). As also specified in Agenda 2030 (UN, 2015): the curriculum needs to be decolonised by giving importance to other languages, other histories and other narratives, giving voice to marginalised groups and those who cannot normally participate in decision-making processes, and imagining new forms of teaching and learning. This also has an impact on pedagogical practices in the classroom: from the transmissive model, we are moving to forms of teaching that typify active learning (Settles, 2012), where the student's diverse and unique perspective is valued through dialogic and collaborative processes.

School systems, schools and all their actors can play an essential role at the policy level when it comes to activism and social change (Youdell, 2010). As teachers, principals, parents and students, we must have the courage to bring demands for equity and social justice to the public debate and to raise broad awareness of othering processes and all those groups that are excluded or marginalised because they bring some diversity to the dominant model (Apple, 2012). This political role of schools has been repeatedly emphasised by us and in other chapters: a pedagogical attention and awareness of the colonial mechanisms that characterise our societies is indispensable to promote diverse discourses and practises at every level (personal, classroom, institutional and political) against dominant thinking and to go beyond the classification "us/them" in order to be able to cultivate "the other" in all of us.

Practical implications

Focusing on the school and classroom level, the literature offers several approaches and strategies that teachers can apply to create inclusive learning environments valuing each individual's identity/identities and promoting equity, inclusion, belonging for all. With a view to counteracting othering and its consequent forms of marginalisation in educational settings, we deem three of these as particularly important: (1) culturally responsive teaching; (2) anti-bias education; and (3) pedagogy of coming out (see Table 1).

Table 1: A summary of the three practical implications

Culturally Responsive Teaching	Anti-Bias Education	Pedagogy of Coming Out
Requires educators to develop cultural competence through self-reflection, curriculum diversification, and support for linguistic diversity to promote belonging.	Helps students understand and build positive relationships with difference by creating learning environments that acknowledge and celebrate students' different identities and encourage them to recognise and confront discrimination and inequities stemming from them.	Adopts notions of coming out to allow students and all those involved in the classroom to present their true authentic self rather than a conforming self.

Firstly, as mentioned above, this implies a decolonisation of the curriculum so as to value different languages, histories and narratives, including those of usually marginalised groups. In this respect, culturally responsive teaching emerges as a powerful approach to address issues of othering and promoting belonging in educational settings. As Ladson-Billings (1995: 17) notes, it is a pedagogy that "empowers students intellectually, socially, emotionally, and politically by using cultural referents to impart knowledge, skills, and attitudes". However, this observation underscores the critical role that educators play in fostering an inclusive environment that promotes belonging for all students. Instead, this pedagogical approach recognises and values students' cultural references in all aspects of learning, creating inclusive spaces where everyone feels valued and respected (Gay, 2000, 2002). In this way, educators can create learning environments that not only address othering but actively promote a sense of belonging for all students.

To effectively implement culturally responsive teaching, teacher education programs should focus on developing cultural competence among pre-service teachers. Firstly, self-reflection is crucial. Educators must understand their own cultural background, biases, and assumptions. Ladson-Billings (1995) suggests that teachers engage in exercises that explore their cultural identity and how it influences their teaching practices. This self-awareness is the first step in recognising and addressing instances of othering in the classroom. Secondly, curriculum diversification is essential. Teachers should be trained to critically examine and diversify their curriculum to include perspectives from various cultural backgrounds. This might involve incorporating literature from diverse authors or using historical accounts that represent multiple cultural viewpoints. As Ladson-Billings (1995: 17) notes, "Culturally relevant teaching uses student culture in order to maintain it and to transcend the negative effects of the dominant culture". By seeing their cultures reflected in the classroom, students from marginalised groups are less likely to feel othered or alienated. Addressing linguistic diversity is also crucial in creating inclusive environments. Teacher education should equip future educators with strategies to support linguistic learners, encourage the use of students' home languages as resources for learning and promote the value of multilingualism. This approach not only supports academic achievement but also affirms students' linguistic identities, countering language-

based othering (García & Wei, 2013). Therefore, fostering belonging through culturally responsive teaching is not just about a welcoming atmosphere; it's about fundamentally changing how we approach education to ensure that all students, regardless of their background, feel valued, respected and capable of success.

Alongside this decolonising effort, it is also important for teachers to actively address prejudices and discrimination in their classrooms and schools. The Anti-Bias Education (Derman-Sparks & Edwards, 2019) approach could provide a useful framework in this regard. Anti-bias Education aims to create learning environments accepting, understanding and celebrating students' differences (i.e., different identities) while acknowledging and tackling the discrimination and inequities deriving from them (Derman-Sparks & Edwards, 2010, 2019; Wagner, 2009). The approach requires teachers and students (and the whole school community) to identify and confront unfair and discriminating beliefs and behaviours. To do that, the approach proposes four lines of action (Derman-Sparks & Edwards, 2019):

- Building positive personal and social identities for all students (Goal 1: Identity);
- Enabling students to understand and build positive relationships with difference (Goal 2: Diversity);
- Developing students' empathy, sense of justice, fairness and critical thinking, so that they will be able to recognise discrimination around them (Goal 3: Justice);
- Enable students to stand up against discrimination (Goal 4: Activism).

These four objectives should permeate all aspects of the school life and be reflected in the values and culture of the school, the curriculum, the teaching methods and materials used in the classroom, in the relationships among individuals within (but also beyond) the school, as well in its policies and activities, etc. In this way, students are likely to develop an inclusive mindset and develop the necessary knowledge, attitudes and skills to positively relate to and deal with "the other" also beyond the school walls.

Another way for teachers to address different forms of discrimination as the result of one's identity/identities is constituted by the "pedagogy of coming out". While the term "coming out" is mostly associated with the LGBTIQ+ community as they allow their identity to be shared with others, as a pedagogy in the classroom, this does not restrict itself to this one specific community. It is instead a teaching strategy which can be exercised by all those involved in the classroom. In essence it strives for visibility as opposed to the silencing of the individuals often experiencing othering. "It places [a primary focus] on the power and politics involved in the production of knowledge, and the political-economic circumstances of teaching and learning" (Pykett, 2009: 103), and contests it by making other forms of knowledge visible and accessible.

This pedagogy does not only address the exclusion of "the other" but also challenges the social location of "the normal" together with "the normal", that is the majority itself.

Therefore it is a pedagogy both for the oppressed and the oppressors. Freire's (1970) work in "Pedagogy of the Oppressed" is instrumental to it because the author embraces such principles. The mere promotion of respect towards "the (different) other" in schools, falls in line with what Freire refers to as a 'false charity, which constrains the fearful and subdued, the "rejects of life," to extend their trembling hands,' rather than 'striving so that these hands … need be extended less and less [as] they become more human hands which … transform the world' (1970: 19). Applying this to the subject discussed here implies that what a liberating pedagogy of coming out should do, is beyond only celebrating diverse identities. It should instead, provide the space for all humans to understand their unfinishedness and their potential to be othered in some shape or form and to allow for the critical self to transform reality, in the continuing process of the humanisation of all human beings. As a pedagogy it is mostly achieved during day-to-day life in the classroom, through authentic interaction with different realities of the lives that make up the community itself and the emotions that are at play. Authentic interaction for teachers with students, strives to let go of the soulless disseminator of knowledge and instead transforms into a being with their own story that can be shared. The latter is naturally evermore crucial if the teacher is a part of the othered minority. On the other hand, authentic learning and teaching for the student sees also transformation, as they no longer remain a lifeless vessel of content but instead an active participant in the formation of new knowledge. Students are encouraged to talk about their identities and experiences. These are used together with the classroom to build a community.

Through such a strategy, liberation no longer remains as another deposit to be made into men, but it is praxis, "the action and reflection of men and women upon their world in order to transform it" (Freire, 1970: 61).

These are of course just a few examples of ways through which teachers and educators can counteract othering processes in their classrooms and schools. In this handbook you will find several other possible approaches and strategies, addressing all the levels of the model depicted in Figure 4.

Closing questions to discuss or tasks

We would now like to suggest some open questions for you to reflect on yourself as a person and as a pedagogical professional. Do not consider these questions as exhaustive, but as a possible opening for other questions to think critically about the processes of othering, the binary "us/them" categorisation and the need to engage in ways of decolonising our minds.

1. Have you ever felt like "the other"? How did you feel? What feelings did you experience?
2. Have you ever been in a situation in which you saw other people as different from you, in which you carried out othering processes? What attitudes did you adopt? What provoked them?
3. Are there differences that you dislike less than others? And why?
4. What can you do in the classroom to cultivate a culture of diversity that does not ghettoise, but unites, so that everyone discovers "the other" in us?
5. What ideas could you bring to the leadership of your school to avoid othering processes and decolonise the school experience?
6. How do you envision your political role?

About the authors

Anna Frizzarin

Anna Frizzarin has a PhD in Pedagogy and Didactics and works as a researcher in the field of inclusive education. Her research focuses on inclusive teaching and learning, inclusive development processes of educational contexts, attitudes and social representations in relation to perceived diversity and the resulting implications for students' participation in schools.

Damini Sharma

Damini Sharma is an educator and researcher specialising in inclusive education and child development. She has worked as an inclusive facilitator at schools in India. Damini's work focuses on social justice, teacher education, and policy development, exploring inclusive practices and their implementation to promote equitable education.

Jean Karl Grech

Jean Karl Grech is from Malta. A gay primary teacher with a particular passion for inclusion and cultural integration. A recent graduate with a Master's in Euro-Comparative Education. In his studies at the University of Malta, he focused on the inclusion and visibility of the LGBTIQ+ community in schools through subjects and daily school practices.

Valerio Ferrero

Valerio Ferrero does research in the field of intercultural education, focusing on equity and inequality in schools. He is also interested in community philosophical practices, on which he also carries out training activities. Before starting his research work, he was a primary school teacher.

IDENTITY POLITICS - LABELING IN EDUCATION

Sam Blanckensee; Özge Özdemir; Lina Render de Barros; and Josefine Wagner

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ ama-2025-en/?p=429#oembed-1

The examples we chose are multilayered and a complex part of our everyday experiences at school. You might have already witnessed similar or very different, but equally complex incidents. You might have engaged spontaneously, tried to overlook it, felt helpless, angry or shocked or even confident. With the example cases, we suggest taking a closer look at different angles of these complex situations. This might help you to navigate complexity and dilemmas in the future. Feel free to add your own experiences, questions, worries and good practice. It might be helpful to read the examples and discuss the questions that follow each situation with a partner.

Example Case 1 – Negotiating friendships and (group) identities between religious dogma, racist stigma, liberal values and LGBTIQ* rights

"So I remembered an example from school where a group of otherwise very well-adapted girls, friends even, excellent students, were suddenly found split in two different groups, shouting at each other in the courtyard. They looked like they had ganged up against each other, like a mob. People in one group were shouting: "If you don't respect LGBTQ rights, we don't respect your religion". And the other group started to shout: "You're a bunch of racists" and then some boys entered the group and started shouting "Allahu Akbar".

1. What is going on here?
2. How are you going to deal with this as a teacher? How can you make sense of this situation?

3. How can you interfere without reproducing racism or discrimination against LGBTIQ* or Muslim students?
4. How could this have been prevented? How could this be mediated?
5. How can we develop solidarity between marginalised groups? What kind of feelings could this situation provoke in queer muslim kids or colleagues?
6. Who is being homogenised? By whom or what?
7. How were your immediate emotional responses? Did you take a side? Which one was it? Why? Try to imagine yourself taking the other side. What is different?"

Example Case 2 – The Girl that was a Horse

"In one of my internships at primary school, the class teacher referred to one of the girls, let's call her Elen, as a horse. Not because she really believed Elen to be a horse, but because Elen would refer to herself as a horse. Elen had been diagnosed with Fetal Alcohol Syndrome (FAS) and had had difficult school experiences with other teachers. Apart from the FAS label, she had been labelled as being unable to sit still or concentrate. This teacher was an experienced primary school teacher in her late 50s. Her radical acceptance of Elen's self-identification manifested in her use of Elen's language and adopting and expanding it. Elen did quite well at school and got along well with classmates and the teacher. When she had difficulties concentrating or started acting out by neighing or pawing the 'hooves' in class, the teacher would remind her that the classroom was not very well suited for wild horses. She would ask her whether she was a domestic horse, a racehorse or a wild horse at that moment, and would suggest the courtyard as an appropriate environment for wild horses. The girl then sometimes chose the courtyard and ran around neighing until she came back to play and interact with the people in class, or she would choose the domestic or race horse and start with exercises or games in the classroom.

1. *What is going on here?*
2. *How are you going to deal with this as a teacher? How can you make sense of this situation?*
3. *Have you ever been in a situation where somebody's reality is radically different to your*

own?

4. *What role does power (teacher-student, adult-child, rich-poor …) play in affirming, accepting, playing with or attacking people's versions of reality, especially with regard to the sense of self?*

5. *In what respect is the teacher in a position of power in this situation?*

6. *How does the behaviour of the teacher likely affect the behaviour of Elen, the behaviour of the class and of other parents?*

7. *Imagine a different approach of the teacher, where she negates Elen's version of reality. What effect would this have on Elen, the class, or other parents?*

8. *In Q5, you have reflected on the position of power of the teacher, in how far is Elen in a position of power, or the class and the parents?"*

Initial questions

1. How do you describe yourself? Are there any ways that you describe yourself that are especially important to you?

2. Have you ever been labelled in a way that made you feel uncomfortable? How was that? Did it have any impact on how that person treated you?

3. How do labelling and identity politics influence students' learning experiences and full participation in education?

4. What are the challenges teachers face with regard to identity politics and labelling?

5. How can we recognise that students are affected by structural discrimination and how can we empower students with multiple identities?

Introduction to Topic

We, the authors, of this text write with sometimes divergent understandings of difference as we come from different schools of thought and also different biographical experiences, privileges and experiences of discrimination. All Means All is a collaboration of teachers, students, activists and academics from different fields. We speak to you as educators, and

as people, whose perspectives on the world have been shaped by theory and academia as well as by activism motivated by the experiences of exclusions that sexist, trans-misogynistic, heteronormative, capitalist, racist societies create. We would like to sensitise teachers and trainees for the struggles students face as they try to develop a sense of who they are.

However, we also want to engage you with our own voices as teachers who are personally affected by discourses that deny us, our friends or our families the right to expression and existence. As we advocate for full personhood of students and educators – inside and outside of the classroom – we also want to highlight, and reflect, on the difficult decisions teachers need to make during everyday classroom dilemmas. It is not easy to generate effective solutions to bullying or to find the correct words when children's views or actions limit the abilities of others. It is also no small feat to understand, work with or confront the structural conditions of schooling. Mass institutions, such as public education systems, designate certain roles and tasks to children and adults in ways that appear to be driven by the logics of bureaucracy and austerity politics, instead of the wellbeing of those involved. Nonetheless, schools are important spaces with regard to personal and social learning, in which we can set examples for living peacefully with each other and for learning how to navigate conflict, negotiate, argue, or reconcile, and how to stand up for ourselves and others and be part of a community.

Throughout this chapter we invite you to reflect on your own experiences, biographies, overwhelming feelings, powerlessness, agency and privilege. In our group of four, we combine people with backgrounds in disability studies, teaching, teacher training, political education and anti-discrimination work. We have German, Irish, Kurdish and Brazilian roots, and we hold passports from three continents. We identify with the journeys and struggles of neurodivergent, trans* and queer people. We have been labelled and have applied labels to ourselves and to others. All these experiences help us to better understand the sometimes conflicting demands that are put on recognising differences, normalising differences, but also emancipating ourselves from prescribed norms and oppressive structures.

Our chapter starts with scenarios from everyday school experiences, which illustrate some of the core questions and challenges that teachers deal with on a daily basis. A key challenge is the difficulty between naming yourself and being named by others. The case studies help to understand the practical consequences of this dilemma around identities. On the one hand, while labels are used to allocate resources, they can also be used to categorise marginalised and disenfranchised people, without their consent and consequently result in further stigma. At the same time these labels can be adapted, (re-)appropriated or (re-)invented by groups of people to make claims for participation and share of resources.

As a potential tool to navigating this dilemma on how best to support young people

in their way of being, in encouraging playfulness around identity with or without labels, while at the same time understanding and drawing boundaries to protect those affected by discrimination, we introduce May-Anh Boger's concept of the trilemma of inclusion. Her empirical study and model offers a theoretical framework which contextualises the dilemmas, or rather trilemmas, that we encounter and exemplify in our interviews with Danielle, Özge and Sam.

Having a look at our example cases

The example cases in the introduction illustrate the value, and necessity, of respecting and understanding our students' expressions of who they are. In the second example, adopting Elen's language and developing it into pedagogical metaphors helped her to become aware of her behaviour and needs, without feeling rejected. She learned to differentiate her needs and develop an awareness of when she wanted to sit and concentrate on a task, or when she needed to self-regulate impulses through exercise. Instead of merely seeing Elen through the lens of deficit or her special needs label, the educator worked with the student's imagination. She followed her lead and was able to pick up on the individual student's creativity, resources and needs. The student's imagination then started to become a resource for communication of needs and a tool for self-regulation. This illustrates how our perception of students can be transformative?

On a superficial level the first example at the beginning of the chapter seems to be a miniature reproduction of conflicts between religious dogma, on the one hand, and LGBTIQ* rights on the other. If we see only mutually exclusive templates or prototypes of religiousness and LGBTIQ*, it is very hard to mitigate this very real conflict in the present. Conflicts at school that seem to appeal to a supposed opposition of religion and homosexuality, transgender[1] and queer identities are often rooted in a secure world view. As students mature, they begin to explore their place in society, and begin to develop their political standpoints and opinions. This is particularly challenging, especially if one feels that these positions are mutually exclusive. Students play with, provoke, and change their positions and attitudes, if they are given the opportunities. Individual positions often reflect belonging or isolation from a social group. So if a student comes from a conservative Muslim family that teaches their children to respect others independently of their gender or sexual orientation, this student may still feel the need to experiment with expressions of queerphobia, since the social discourses in Europe construct Islam as being in opposition

---

1. The language surrounding transgender and queer identities has been rapidly evolving over the past number of years. We have chosen to use trans or transgender without an asterisk. See here: Why We Used Trans* and Why We Don't Anymore for further information.

to LGBTIQ* rights. Students who try to find their Muslim identity in the midst of predominantly Christian societies, and where anti-Muslim racism is increasingly viewed as a concern, might be experimenting, rather than conveying, a fixed mindset or being aware of the fact that they are (re-)producing hate. It is important for teachers to know exactly where freedom of expression ends and discrimination begins. It is equally important to be able to see that students are still developing and experimenting with ideas, opinions and boundaries and finding ways to view students not according to tabloid headlines, but rather in their complexity as a whole. As teachers, we need to face social and political realities inside and outside of the classroom.

If these example cases seem straightforward to you, you may want to focus on the questions in the following paragraphs. If you also wonder, or worry, about how to act or react in complex everyday interactions with students, the following paragraphs may help. We have collected suggestions and questions for self reflection which requires you to think, and respond, to. Every student becoming a teacher needs to find his, or her, own personality in the classroom within a professional, pedagogical and ethical framework. You can use the theory-loaded ideas as guidelines with regards to the creation of your pedagogical framework and the questions can help you to reflect on what kind of teacher you would like to be, and on how best to develop, sharpen, and (re-)invent your professional identity.

Teachers today are expected to create a surrounding where every student can reach their potential and thrive. They are expected to negotiate boundaries and support the development and practice of ethics and behavioural expectations. Teachers are currently struggling to understand and negotiate the complexity of identities, the language around identity discourses, student's needs and the structural discrimination and violence of various types students may face in schools.

How can teachers navigate these complexities of classroom realities: identity construction, individuality, belonging, discrimination, violence? You are already working on the first step: becoming aware of the complexity. We need to respect that complexity, to avoid reproducing exclusionary discourses or erasures. Becoming aware of power and social hierarchies is another important step in preventing (structural) violence. I, as a teacher, can only intervene if I recognise violence, so I need to educate myself about it. Apart from academic education and activist literature, an important source of information are the students themselves. We need to learn to listen. One possibility to protect students from structural discrimination and violence in the classroom is to create spaces and relationships in which they feel seen and valued as a person with multiple aspects of their identity. In these spaces students are visible to the teachers as more than simply their role as students. Students get the chance to determine themselves, with which part of their identities they want to become visible to the class and/or the teacher. The feeling of security stemming from these kinds of relationships is one central aspect for the prevention of violence. Furthermore, it also offers possibilities for interventions. Only if we are aware, witnessing or being told about boundaries can we successfully intervene. In the following

paragraphs we will further develop this first step of becoming aware of the complexity of identity and identity construction in postmodern societies, we will then take a closer look at labelling and its critique as well as identity politics and its critique. We will see that a conflict arises between a strong critique of labelling and an identity politics approach. We will sketch Boger's model (2023), the trillmatic theory of inclusion, to navigate this conflict and show how the model can be a tool to increase your own tolerance of ambiguity and also your agency in the classroom.

Naming Yourself and Naming Others: Why does it matter?

What is the difference, you might wonder, between claiming an identity and being labelled? To make it short, the latter is creating knowledge about "others", 'objects of knowledge' so to speak, while the first is actively taking a subject position. It is crucial to understand the context within which "claiming an identity" emerged as a liberatory and emancipatory act, rooted in social movements that advocated for solidarity and gaining political power for marginalised groups in a pluralistic society. "Labelling" on the other hand is a passive experience as it implies the individual is being given a marker that it may or may not identify with. Labels organise and structure reality, they influence expectations and in the field of education, disability studies and social services are often a prerequisite to access to the social and health systems.

A central argument in this article is that an understanding of theory, theoretical models and politics on identity, society, discrimination, power, labelling will help you navigate the complex everyday interactions taking place in schools. We want to encourage everybody to understand the theory, as this can affect your ability to analyse everyday situations in their complexity and provide you with opportunities to (re-)gain agency in otherwise often overwhelming situations.

What is identity?

The question of identity can roughly be translated to the question "Who am I?". While the answer to that question may change over time, places and contexts, it also suggests a kind of stability and continuity, since the answer can only be understood if it refers to the object the question has been about. The following argument is based on a non-essentialist sociological and social-psychological concept of identity as presented by Heiner Keupp, Jean-Claude Kaufmann and Zygmunt Bauman. Identity is understood as the concept with which an individual makes sense of one's experiences. It is a central point of reference for the interpretation of all experiences internal and external and initiating everyday task solving (Keupp et al., 2008: 60). Identity construction is not only an individual's choice. It is the process of constructing a subject that has the ability to act, despite contradictory environments and the resulting contradictory demands. The production of coherence and

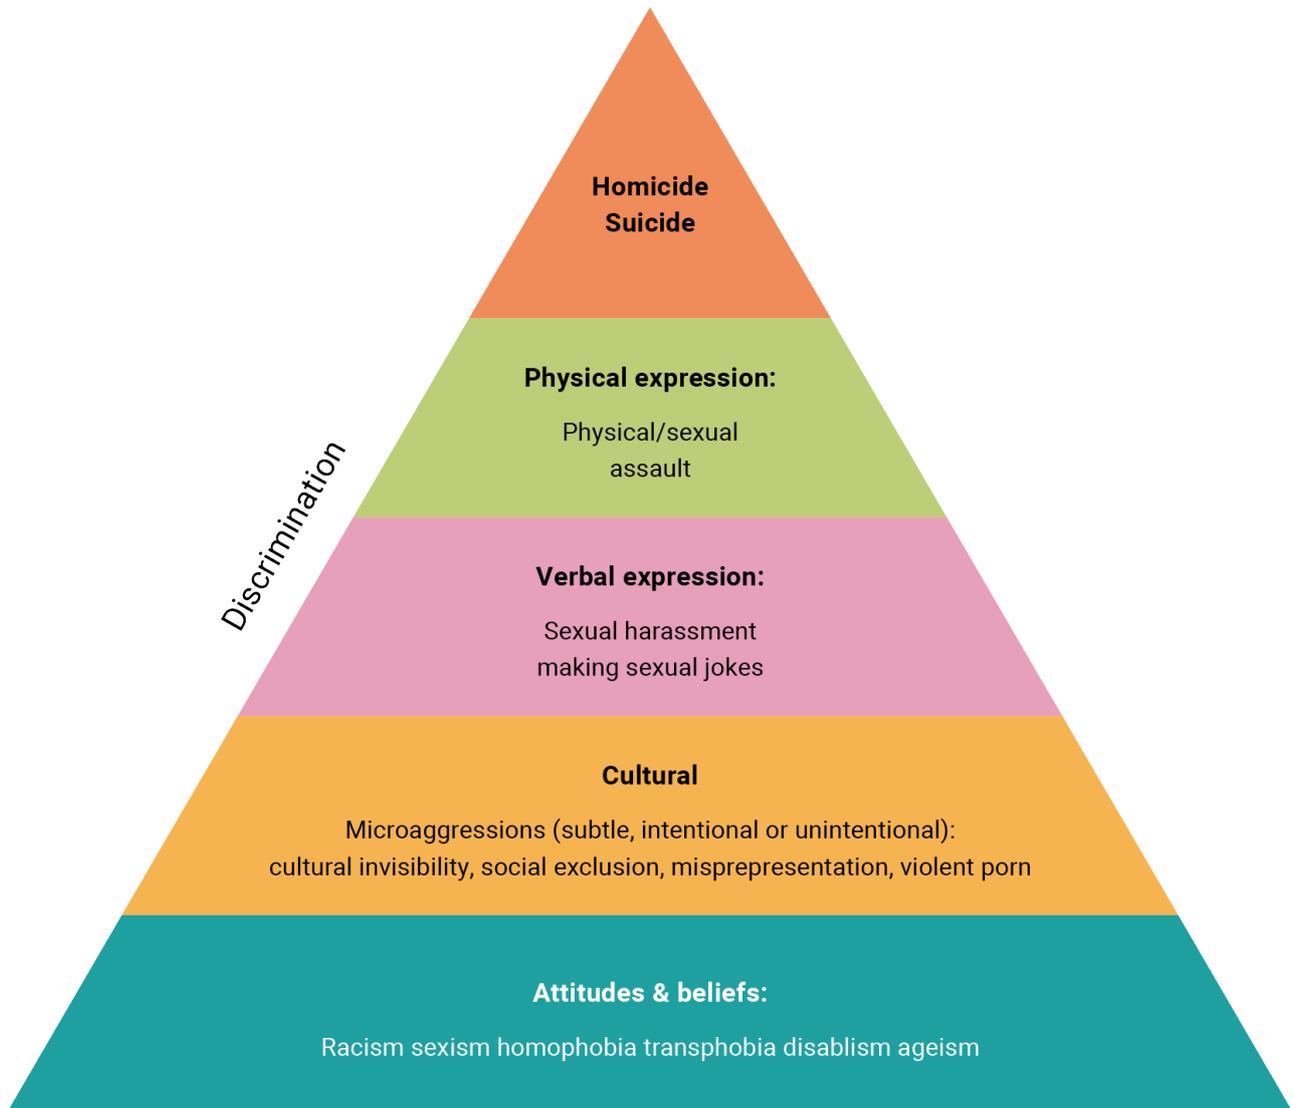
the ability to bear ambiguities are no oppositional goals, instead they complement each other in making identity possible and balancing out different areas/aspects of life (Render, 2014).

There are social and historical reasons behind the emergence of the concept of "identity" and the omnipresence of the question "Who am I?". Society has changed rapidly and many shared belief systems and stories (known as meta-narratives) are being deconstructed or drastically altered. Processes such as globalisation, migration movements, emerging democracies, and the internet have contributed to this change, along with the availability of information online and the acceleration of social interaction through technology. These processes lead to changes in the way societies organise themselves and established concepts such as families, nation states, religion and gender are now increasingly being challenged and questioned. As these concepts are being broken down, people are less and less bound to external determination (e.g. farmer, clergy, nobility or husband, wife, child, grandparent). This situation is simultaneously liberating (offering possibilities to be different – not determined by birth), violent (uprooting from communities and concepts that had offered orientation and a sense of belonging) and creating a need / obligation of identity construction. If your faith and future are not determined by birth – if it is not clear to everyone who you are, or have the potential to become, people will ask themselves and others who they are and want to be(come) in order to make sense of the social world. This historical period is called Late Modernity or Liquid Modernity (Bauman, 2010).

This loosening of social ties brings freedom of choice on the one hand, and uncertainties on the other. The institutions that structure and give meaning to life are increasingly being questioned. Institutions and ways of organisation that offer alternatives to institutions such as religions, hetero-normative family models, gender binary, and the power of nation-states. So while this might feel like freedom to some, it might feel like a loss or an uprooting from community to others. People now not only can choose what they believe in, they also have to choose in order to construct their identity. You can choose who you are and want to be, but you also have to choose. Create your identity. Social Media, Tiktok, Instagram and others can be regarded as a means of creating and sharing an image of oneself, but also as creating and (re-)inventing oneself.

In a society where "identity" holds such a prominent place, it is valid to conceptualise "identity markers" which can be considered as a new form of capital interchangeable with economic, cultural and social capital (Bourdieu, 1997). Since identity construction is not only an individual choice, but also depends on recognition by others through validation and confirmation, the need for the construction of identities introduces a new dimension of suffering for marginalised individuals (Render, 2014). There may be less resources available for some individuals to construct their identities, and the flexibility of constructing one's identity can offer more or less opportunities. In regard to the identity- process, the unequal distribution of resources is not only important on a material-existential scale, but is also of existential importance on the psychological constitution level. If I am a member of a

marginalised community, there may be people who wish harm upon my group. Ignoring or avoiding the naming of the part of my identity that others want erased is a collaboration in this erasure. The erasure of people through language is a form of violence that mirrors the erasure of people through killings.

Figure 1: The Anti-Violence Continuum/Pyramid Model


Illustrated by Calgary Communities Against Sexual Abuse based on the Pyramid of Hate: Anti-Discrimination League

Example

"My queer friend is living in their family home currently, they are dependent on their family

financially and emotionally. They want to tell their family about being queer but they are afraid of their family's reaction and being kicked out or abused. Sometimes people with a strong social network outside their family have those fears too but they may be able to take that risk and 'out themselves' because they have a support system and won't end up alone."
Anonymous – Germany

Everyone feels the need to belong or to feel connected to other people. In the context of teaching, it is important to understand the student's emotional and social need of belonging and how it shapes their identities. In the case of poverty and stigmatisation, individuals can be denied access to recognition and identity and belonging at the same time. This implies that identity has structural determinants. Through a process of over-generalisation and elevation of identity to the state of a collective 'identity', identities can become powerful instruments of exclusion. At the same time, these overgeneralised aspects of identities can also be used in political struggles for example, to raise awareness of these structural determinants that benefit one group and deprivilege, or discriminate, the other.

Labelling: Being named by others

In most education systems, children with special needs are categorised according to a special educational needs status in order to allocate resources in support of these students. In Germany, for example, there are up to eight different categories that students can qualify for: sight, learning, emotional and social development, speech, mental development, hearing, physical and motor development and instruction for sick pupils (KMK, 2023). In other education systems, differentiation varies. Usually, special educators, doctors or psychologists, diagnose students with specific needs through standardised testing. Students are either already registered at schools with special needs labels, or are later indicated for testing by teachers, parents or educators. When difficulties in the classroom arise and they are unable to keep up with tasks, they are frequently mentally or physically absent, or show sexualised or overly provocative or violent behaviour. Their "disability" becomes translated into a pedagogical special needs diagnosis that offers different types of support measures. For example, a student who is diagnosed with a learning disability has the right to special assistance by a special needs teacher. A student who is diagnosed with intellectual delay, receives the right to more hours with a special needs teacher. What is common to all special needs diagnosis is that they are formulated under a deficit hypothesis. This means that a student is assessed through the lens of what they are not able to do, and compared to an (imaginative) average child. This view might be "thickened" through repeated iterations which in-turn produces a limiting belief set and likely impacts students' sense of self (Wortham, 2006; Pfahl, 2011; Wagner, 2023).

The history of separating students according to different educational needs, and creating a divide between regular students and those deemed ineligible to participate in mainstream education, became institutionalised through the first special schools. These were established to cater for the needs of children with sensory impairments, i.e. schools for the blind or the deaf. Such developments took place in Western Europe during the late 18th century. With the turn of the 20th century, so-called "help schools" were established in Germany and were mostly attended by children from lower socio-economic backgrounds to address the needs of children who lack care and support. Help schools also alleviated the stresses of mainstream schools. Therefore, they had two main functions: provide education to those who need more support and alleviate the need for regular schools to create provisions for children seen as morally and intellectually "inferior". Later, these schools continued to support children with learning disabilities, social and emotional development or cognitive delay. During the Nazi era, children that attended special schools were targeted for sterilisation and those who did not succeed in special schools were considered 'ineducable' which served as a criterion for murder under the term 'euthanasia' (Hänsel, 2006). After World War II, special schools continued to operate. A special educational needs label has now become a bureaucratic mechanism for which students are referred to different types of schools. While it is important to mention that children with intellectual impairments did not receive any education for many decades, the establishment of special schools also led to stigmatisation by communities (parents, other children, teachers, etc.) and by the students attending special schools (Schumann, 2007). With the emergence of inclusive education in the 1970s, a number of students who were labeled with severe additional needs (often labeled as special school students) could continue their education in primary schools and received additional support by former special school teachers in a regular classroom. The label also served as a prerequisite for the allocation of additional resources.

In contemporary inclusive schools, children often become affiliated with certain labels to administer extra support. Children with learning difficulties or disabilities might have a special needs status, whereas children whose families migrated to a new country may need more support and are seen as children with a migration background or second language learners. These additional markers are not typically diagnosed, but rather attributed through (first) subjective impressions and often do not lead to the allocation of further resources. In other words, they are not necessarily connected to a deficit, but they often imply a deficitary lens and thus create differences. A favourable reading of markers allows us to say that they are intended to offer additional support for children through state funding. A label could allow a child to receive more time during a test or assistance from specialised members of staff or extra language classes. These measures are intended to support students within an inclusive setting. However, research on stigma and subjectification

(Goffmann, 1963/2010; Pfahl, 2011; Pfahl & Powell, 2014) has shown that labels can have an impact on students' self-concept and thereby ability to perform. In the German context, this mechanism has been described as the "Etikettierungs-Ressourcen-Dilemma" (Füssel & Kretschmann, 1993), highlighting the predicament how resources are linked to labelling, while a label usually carries a set of expectations and behaviours that a child must exhibit to access the necessary resources.

It can be said that labels are an approach used by an education system to guarantee individual legal entitlements, and these legal entitlements have changed over time in terms of the location and form of special support (United Nations, 2006). However, the stigmatising element is problematic, both in terms of outside attribution and from the learners themselves. As students with labels like special educational needs often have access to resources (e.g. special education teachers, assistants), it can sometimes lead to a differentiation of "my students"/"your students". This is different to other dimensions of diversity, as resources are rarely allocated based on such differences.

The concept students have of themselves plays an important role in the way they view themselves as capable members of the classroom community (Rubin, 2007). This is particularly the case at the intersection of racialised minority status, socio-economic conditions and learning difficulties, where some school systems are poorly equipped to offer teaching content that is accessible for students with a variety of different needs – whether due to mental health or abilities, stigma, different first languages, bullying, discrimination or violence. In Germany and Austria, for example, children who speak Turkish or Bosnian/Serbian/Croatian at home are more likely to attend special schools than mainstream institutions (Statistik Austria, 2022/23: 25). Waitoller and Ammanna (2017) have emphasised the importance of space and location in how student identities are viewed negatively in relation to expectations around performance and success. Individual districts as well as urban versus rural neighbourhoods offer very different interpretations of student backgrounds. In rural settings, comprehensive schools are often the only choice for all children in the community, whereas in urban centres competition around specific schools creates hierarchies between academic bourgeois secondary schools and comprehensive schools. The latter is often dominated by students who are designated as more disadvantaged, such as migrant children or those whose abilities are considered below average. While such schools may exist in rural settings, they become a place to divide student populations according to specific identity formations (Nasir & Saxe, 2003).

Therefore, we are concerned with questions around naming differences and creating specific realities around labels and identities. When does it serve a child to be labelled in a particular way? How invisible can a label really be? When does visibility cause suffering and when does invisibility create pain? How can we grant special provisions to students who

need support without labelling them publicly? And when do these practices preclude the possibilities of participation of children and limit their engagement with teaching content and classroom peers? While schools often encourage children to introduce aspects of their culture in the mainstream classroom, these events can become token incidents that blur the much more subtle preconceptions around students' cultural backgrounds. When do children feel seen and appreciated? And when do students' multiple perspectives – due to their presumable differences – strengthen the understanding of the group regarding complex issues?

Identity politics: Naming yourself

Claiming Identity as an emancipatory practice

The term "identity politics" was introduced by the Combahee River Collective, a black feminist lesbian socialist collective: "as children we realised that we were different from boys and that we were treated differently – for example, when we were told in the same breath to be quiet both for the sake of being 'ladylike' and to make us less objectionable in the eyes of white people. In the process of consciousness-raising, actually life-sharing, we began to recognise the commonality of our experiences and, from the sharing and growing consciousness, to build a politics that will change our lives and inevitably end our oppression" (Combahee River Collective, 1977).

The central idea of identity politics lies in turning around a shared experience of marginalisation, humiliation or discrimination by adopting a label, derogatory term or external definition (crip, queer, f-gg-t, black, N*Word, …) for oneself (Alick, 2023; Worthen, 2023). This process is called reappropriation and holds the possibility of using the language of power that has separated and degraded human beings. This language of power, with its derogatory terms, turns people into projections that serve self-identification. It turns them into objects of a range of emotions such as hate, fear, fantasy or pity. The seemingly counterintuitive act of appropriating a term that is often used to humiliate or belittle, can be extremely powerful, if done collectively. Through the collective process of identification and redefinition of the labels or categories, individuals are no longer mere objects of this process. They become powerful subjects, claiming spaces in public discourse, politics and (re-)gaining access to rights and resources formerly withheld. The function and purpose of identity politics is consequently to point out how universal promises implied in the declaration of human rights, often fall short and are being used to protect the rights and interests of particular social groups (Dowling et al., 2017). When the advantages of some groups become normalised and accepted and almost invisible to those growing up with them, we call these advantages privilege. The status quo is already a type of identity politics, we just tend to label it as "normal". Have you ever thought of Christian Democratic

Parties in predominantly Christian European countries as actors in the field of identity politics? Some prominent examples of emancipatory movements that are also publicly viewed as identity politics on the other hand are: The black Lives Matter movement, Kanak Attack (Germany), the Zapatista resistance (Mexiko), the MST Landless Worker Movement (Brasil) or the #Metoo movement, just to name a few.

   Identity politics is controversially discussed, often by those who are unaware of their own privileges, but not necessarily in positions of power. This is not surprising since identity politics is a tool to call for a redistribution of resources, such as money, access to health care and education, and access to social and political participation. If people are not in positions of power and economically disenfranchised, and unaware of e.g. white privilege, they might feel threatened by calls to redistribute resources that do not centre or even further decenter their own experiences. Instead, they may understand a shared oppression and include the fight for BIPoC rights, people with disabilities, queers in their own struggles for dignity and liberation.

The Dilemma

With all of the above in mind, it can be said that labels can be problematic as they can limit our capacities of self-expression, they can also be mistaken and tend to be somewhat reductionist since they can never encapsulate a person's complexity and reality of their experiences. However, labels are also a pragmatic way to claim special support that enables individuals to access resources and spaces. Some of the information that labels carry might also hold useful insights to the individual or might be taken on voluntarily as an emancipatory act. Therefore, labelling can be perceived as a balancing act, weighing the pros and cons of being named, on the one hand, while claiming an identity on the other. In the next part we will discuss a model that helps understanding the challenges and also this act of balancing.

Working with the Trilemma

The trilemma of inclusion is a theoretical model by May-Anh Boger (2023) that helps us navigate the dilemma between identity politics and a radical critique of labelling. It offers insights into the dynamics of how groups deal with oppression. Through empirical research, she highlights how the struggle against oppression manifests in various ways. She challenges the notion that what is expected from oppressed people is very often contradictory, and therefore the solutions to oppression are also often contradictory.

Three Dimensions

May-Anh Boger outlines the three dimensions of the trilemma; empowerment, normalisation and deconstruction. Her findings show that it's impossible to follow the three

different strategies at the same time. You can follow one. But if you follow two, the third is automatically excluded. So when labelling in education is critically discussed, this often occurs within a deconstructionist approach ('labels are bad, because they limit our capacity of self-expression and they are wrong, because they never cover the complexity of reality'), while for identity politics this is often undertaken through empowerment and normalisation ('I am x and as x I should get access to y').

When we discussed the role of labelling and the role of identity politics in inclusive education, there was some controversy in the beginning. The perspectives of the four authors of this text included self-advocacy with regard to working class identity, neurodiversity, trans rights, queer rights, lesbian and gay rights, racisms and also cis, straight, white perspectives, formal teacher training special education and secondary schools, political educator in NGOs, sociology, HR, activism, feminism, care work and mental health.

From the biographical perspective of a special education teacher and researcher in the field of special education teacher training, there was a strong need to deconstruct labels and show the harm they do in the school system with regard to migration background, class and disability. As a reaction to the strong activist position for a call for deconstruction, one of the authors felt threatened and maintained the empowerment and normalisation position. This could be summarised as follows. The special education teacher says: "Since labels are bad, because they limit students' development and they are for the most part oversimplifications and never fully accurate, we should abolish labels altogether." The queer activist says, on the other hand: "I'm a Lesbian and am not giving up the labels, 'Lesbian' nor 'Queer'".

The first step of working together was understanding the difference between naming yourself and being named by others. The trilemma then helps us to understand what is happening among us on a deeper level. While all three aspects empowerment, deconstruction and normalisation are important, not all of them can be adopted at the same time. It gave us a way out saying that all the points are valid.

Practical Consequences of the Trilemmatic Theory of Inclusion

This experience can be very helpful for teachers to understand that, if you make any emancipatory statement with regard to a marginalised group, it can at most follow two of three emancipatory strategies: empowerment, normalisation or deconstruction. Since it automatically excludes one of the other strategies, for example, a student or a colleague might take the excluded position as they feel that their strategy has been threatened by the position you have taken. A practical consequence of the trilemma is an understanding

of this dynamic and taking a step back and realising its impact, and attempting to include different strategies in similar statements and to encourage conversations on this topic with older students or colleagues.

Figure 2 Title: Examples of self-understanding as (not)in_sane applied to the trilemma

Normalization

EN: Strategically-Essentialist Otherness

"People with mental impairments have the right to full participation and dignified, self-determined treatment."

ND: De-Essentialized/De-Categorizing Individuality

"We all err, only each of us errs differently."
(G.C. Lichtenberg)

Empowerment

Deconstruction

DE: Resistant/Fundamental Otherness

"Truly insane would be the attempt to be healthy and happy in a sick society."

Boger, 2020, translated by the authors from German

Example Cases of three individuals navigating the trilemma

As discussed in the paragraphs about identity, the process of answering the question, 'Who am I?' is both individual and collective. While every person's journey is different, there are some common experiences marginalised groups share. When we refer to marginalised groups, we see this as encompassing LGBTIQ* people, disabled people, racialised people including Roma and Traveller groups, Jews, working class people, single parents, migrants,

poor and homeless people and all of those living on the margins. However, there are also significant differences among people who are targets of the same ideology of inequality. Ignoring these differences within groups can contribute to tensions and render invisible specific pain and inequality (Crenshaw, 1991).

Intersectionality, as coined by Crenshaw, is a key concept that helps understand how identities work for individual learners. The intersection between two or more identities creates a different experience of marginalisation. Crenshaw (1991) argued that black women are discriminated in ways that are a combination of both racism and sexism (though not neatly fitting into the legal definitions of either), as the behaviour in the case of sexism is compared to the experiences of all women including white women, and in the case of racism to all black people including black men. This leaves the experiences of black women largely unseen, as their blackness cannot be removed from their womaness (Crenshaw, 1991).

In the context of the classroom, intersectionality speaks to how teachers and students with intersectional identities, for example, a black disabled person, would not just experience disadvantage due to racism and ableism, but also another form of disadvantage experienced when ableism and racism combine. Therefore, in this instance, an approach may be taken to recognise the complexity of identity, combining the learnings of studies in the inclusion of disabled people and anti-racism and considering the additional barriers created at the intersection. Although individuals have different experiences (due to a combination of their own identities and the relationship between those identities), there are commonalities between people who share an identity and it is useful to be aware of this.

In the video that accompanies this written chapter, you will find two of the authors (Özge and Sam) speaking with Dr. Danielle Farrel on their experiences of identities, labelling and the role of schools and teachers in facilitating students to express themselves, participate and thrive as people with complex and some marginalised identities. For the purpose of the discussion they describe themselves briefly as follows: Sam describes themself as a non-binary trans neurodivergent person, as an activist, a partner and a family member; Özge describes herself as a woman of colour, student and activist. Below we will take a few examples from the discussion to illustrate the trilemma and how it may be used within the classroom to identify solutions and strategies.

Normalisation

Normalisation, as part of the trilemma, can also be described as integration or transnormalism (Boger, 2023). Boger explains:
   Normalisation (N) is defined as the process of opening privileged positions

and institutions to enable full participation. Others, having multiple identities can create a stronger sense of community when engaging with others with a similar identity, similar experiences and similar emotions even if not all of those identities always overlap. (2023: 21).

Normalisation can play out in a desire to raise the 'other' voice within normalised structures or to create a society where everyone is equally normal or equally different. As Sam explains:

"I was in a Catholic Girls school and stayed in the Catholic all-girls school until I finished, and my teachers did not know how to cope at all [with Sam being trans]… The focus was that I have to keep wearing the school uniform. Not on how I was getting on and whether everything was okay at home. My parents and I weren't really getting on very well, and I was trying to finish my schooling but it wasn't about supporting me. It was about making sure I follow the school rules."
Sam (Ireland)

In this example the school was prioritising normalisation, potentially as a means of protecting the student. However, they did not support the position of normalisation with either empowerment or deconstruction, either of which may have enabled greater inclusion for the student.

Consider some strategies the school could have used using the lens of normalisation:

- They could have enabled Sam to be empowered and have a conversation about trans people in the school. If Sam identified as male, this might have meant the introduction of a boy's uniform option and the identification of boys' toilets. As a non-binary person it would be including non-binary options within the school setting and creating a space for non-binary people within the categories of the school.
- They could have brought in more uniform options for all students, with a focus less on gender, and the deconstruction of norms.
- Can you think of any others?
- What about strategies that empower and deconstruct rather than normalise? Could that be to take away all uniforms and gender categories and enable students to express themselves away from labels?

Deconstruction

Deconstruction within the trillemmatic framework for inclusion can also be described as dissolution or resistance (Boger, 2023).

Deconstruction (D) is defined as the process aiming at the dissolution of dichotomous orders of difference (as, for example 'men vs. women', 'disabled vs. able-bodied', 'white vs. black/of colour') in which the normalised is represented as desirable and as the centred position from which the others are constructed as the others and thereby decentred.' (2023: 21).

Deconstruction is a rejection of categorisation and the pursuit of fundamental change in how society orders itself. Danielle spoke of her experience being labelled by doctors, before she had had the opportunity to progress through life:

"And so I think it is difficult when you have or you're faced with labels of medical diagnosis before you even meet milestones like going to school and progressing through school."
Danielle (Scotland)

Those labels assumed a deficit in her abilities and her potential. It determined whether she could go on a school tour, go on sleepovers and how much she was expected to achieve in the eyes of her teachers. A deconstructionist look at disability would require an examination into the assumed truth, to show the power relationships and how social inequalities are presented in the lives of children. On a basic level it would mean removing labels from the classroom, and removing practices where children are categorised.

- Consider some strategies the school could have used using the lens of deconstruction:
- Paired with normalisation, they could have treated Danielle as an individual with individual needs in the classroom, while treating her classmates in the same manner. Instead of categorising students by ability or needs, they would each be treated as individuals and given individualised support, outside of any categorisation.
- Paired with empowerment, this could have meant Danielle refusing to be normalised, or expected to fit in within that space. In this respect, Danielle would be seen and heard as a member of this classroom with her needs met within and by the collective (Boger, 2023). This could mean being within a group of exclusively disabled people, away from the ableist gaze. Danielle spoke about finding the experience of being outside the mainstream empowering, as in secondary school there were less limits put on her by others with assumptions of her abilities.
- Can you think of any other strategies?

Empowerment

Empowerment can also be described as emancipation or participation:

Empowerment (E) is defined as the political process in which an oppressed or discriminated group forms a collective to gain power and raises the other voice that has been silenced and not listened to' (Boger, 2023: 21).

Educators build relationships with their students. This relationship should be built on mutual trust and validation. Students need positive experiences in school, to feel believed in, and supported in their efforts to excel and to achieve. Özge describes her positive experience:

"I think for me it was in secondary school. Well, I don't really remember a lot of primary school, but in secondary school, I had the feeling that my class teacher… she was believing in me, and like trying always to motivate me and trying to find ways in how I would understand the content of the subjects. And I had the feeling she was like really supportive and always telling me, you can do it and you will make it."
Özge (Germany)

Marginalised people may or may not see their marginalisation as core aspects of their identities. However, due to others perceptions of marginalised identities, these identities can be suppressed or erased. More complex identities can be found, expressed and fostered through representation and empowerment. Danielle does not see cerebral palsy as the core aspect of her identity and explains:

"Cerebral palsy is only a small part of who I am. It's not insignificant because without it, I wouldn't be the person I am, but it doesn't define me. I am also aware that other people, other disabled people, aren't able to voice that. So I have a passion for disabled people in general to be able to embrace their own identity, whatever that might be, and to advocate for the fact that identity doesn't need to be just an appearance."
Danielle (Scotland)

- From above, have we thought about strategies the school could have used using the lens of empowerment paired with deconstruction or normalisation. Are there any others that you can think of?
- Can you think of times where empowerment would not be a good approach or may come into conflict with other perspectives?

Reflecting on Identity and Labelling in Practice for Teachers

During their school years, many students are grappling with the question of who they are, and this process can often appear overwhelming. Rather than labelling them, we should

aim to structure and shape the classroom in a way that enables students to go through this process of self-naming independently.

We, as educators, have the responsibility to create a space where students are not discriminated against based on their identity. While we cannot guarantee that discrimination will never occur – as classrooms inevitably reflect societal structures thus reproducing discriminatory discourses and actions – we can work on raising our own and our students' awareness of the complexities of identity. Through our actions, methods, and language, we influence the overall dynamic in the classroom, which can reduce discriminatory behaviour. One of our goals should be to create a learning environment where students do not feel pressured to identify with specific categories, groups, or communities, but where they have the freedom to choose to do so if they wish. Being labelled by others, especially by teachers, can be an inherently violent act, as it can strip students of their agency.

Labels often come with preconceived notions about students' abilities. Their bodies and identities are already coded and constructed by outsiders – including teachers – before they even enter the classroom. This process is inherently biased and does not give all students an equal chance for fair treatment. Our identity is not solely defined by what marginalises us, but often, because of these marginalised aspects, others make assumptions about our capacities and our ability to be individuals. Consequently, these assumptions become part of the everyday experiences of discrimination that students face in schools.

In every classroom, there are students who experience this structural inequality due to different or overlapping aspects of their identity. To help these students build new narratives about themselves, educators need methods that show them that characteristics or skills society labels as deficits are, in fact, powerful resources. This is particularly true for multilingual students. Society often leads them to believe that growing up with multiple languages can have a negative impact on the language they use in school. However, the opposite is true: being able to understand and speak different languages provides students with access to diverse cultures, literature, and knowledge systems, making it a valuable resource. In order to support students in this way, it is crucial to get to know them well, to understand their unique needs, and to be aware of potentially discriminatory situations they might face. The need to empower students is crucial to providing them with the necessary tools to assert their identities and their self-worth.

Students have complex and nuanced identities, and some may want to label their experiences, while others may feel restricted by labels. Students benefit from feeling seen and valued, not just as marginalised individuals, but as complete persons, including their

marginalised identity. Throughout their school years, students will explore their own identities, learning more about themselves and the communities they belong to or could potentially belong to. For some, these identities will be shaped by the norms of the communities they were born into, and as they grow older, they may begin to challenge these norms. It is important to question those norms and create space for students to explore their own sense of self.

As educators, we encounter emotionally charged situations on a daily basis, particularly when identity is involved. Identity touches the core of who we are – our sense of self, self-esteem, and personal beliefs – making these moments inherently emotional. The process of exploring one's identity is not just social, but deeply existential. This is why such situations can be so intense. By recognising this, we can maintain composure and professionalism in these charged moments. Being "professional" does not mean being devoid of emotion; it means being aware of both our own emotions and those of the students, particularly the existential struggles they may be facing. Identity formation is not just a social process, but a deeply personal one, and threats to one's identity can cause significant existential pain. Being mindful of this allows us to stay centered and offer the support students need during these crucial developmental moments.

Questions you could ask yourself as an educator:

1. What actions am I taking to help students get to know each other better, and to foster a deeper understanding of each student's individual background?
2. Am I staying informed about political or societal changes that could impact my students and, in turn, affect the classroom dynamic? (For example, elections, issues affecting diasporic communities such as war or family living situations abroad, or incidents of racism, sexism, or queer and transphobic violence.)
3. Do I feel unsure or overwhelmed when conflicts arise in the classroom, and struggle to find effective ways to address them?

Closing questions to discuss or tasks

- How can teachers be questioning themselves and open while at the same time – have enough confidence and have tools to navigate the complex situations? (not one solution, but different…)
- How can we make sure educators refer to students by name and not by labels (administrative or self-constructed like stars-, sun- and moon-kids)?
- How can we ensure rights to support for students who need it without stigmatising them?
- How can we create a safer space for students to develop their identity with peers, while staying part of the school/classroom community?

About the authors

Sam Blanckensee

Sam Blanckensee (they/he) is a equality, diversity and inclusion practitioner based in Ireland with extensive experience in equality in Higher Education through their role as the Equality Officer at Maynooth University. Sam holds an MA in management for the nonprofit sector. Sam has worked within Irish LGBTQ+ organisations in voluntary and professional roles since 2013. Sam's work covers a broad range of equality, diversity, inclusion and interculturalism initiatives including LGBTQ+ matters, gender equality, anti-racism, disability awareness and access for those within the international protection system. Sam is a non-binary trans person who is also neurodivergent and queer, All Means All is a project where the personal meets professional for Sam.

Özge Özdemir

Özge Özdemir works in extracurricular political education with a strong focus on anti-racism, anti-discrimination and empowerment. During and after her studies of political science and sociology in Frankfurt am Main, she specialised in working with young people and adults in educational work. Her activist experiences form the basis for both her practical educational work and her academic career.

Lina Render de Barros

Lina Render de Barros is a queer of color activist from Pernambuco and Münsterland. She completed her first state examination (teaching degree) and her master's degree in bilingual European education at the University of Education in Karlsruhe and her master's degree in sociology at the Goethe University Frankfurt. She researches, lives and works in Cologne, always with the aim of taking a stand against group focused enmity and contributing to a more peaceful coexistence.

Josefine Wagner

Josefine Wagner is a postdoctoral researcher at the Department of Education and Social Work at the University of Luxembourg.

She has completed several postdoctoral fellowships with a focus on inclusion and the origins of special needs education, including a visiting fellowship at the United States Holocaust Memorial Museum (2020), at the Departments of Education and Anthropology at the National University of Ireland, Maynooth (2024) and the Department of Teacher Education and School Research at the University of Innsbruck in Austria (2021-2024).

ENHANCING MINORITY LANGUAGES FOR INCLUSION

Petra Auer; Beausetha Juhetha Bruwer; Pamela February; and Federica Festa

Example Case

"What? … No. … Do they maybe mean … Ah no. They didn't. Maybe I should try again … at least try to explain … What? … Ah! Maybe I got it now. … No. … If they just could understand what I was trying to say. … Are they getting mad? … Or are they just as frustrated as I am. … If I just knew what they wanted to tell me …"

Initial questions

- How can we implement a learning environment that enhances minority languages and makes learning accessible for all learners?
- Are there common strategies that can be applied to different scenarios?

Introduction to Topic

"Language learning [or learning in general] becomes a different issue seen from the perspective of the speakers of a minority language […]" (Gorter, 2007:1). In contrast to students speaking the language of the majority community, who speak the language at home with their parents, and at school it is the only subject and medium of instruction, however, this is not true for students of a minority language community. Instead, what they encounter in school is a mismatch between the language they speak at home – their first or native language(s) (for example, L1) – and the language they encounter in the classroom (Gorter, 2007). As the example case illustrates, students' first language(s) is their language(s) of thought, emotion, identity and the construction of knowledge (Cummins, 1981; Gibbons & Ramirez, 2004; Lange & Pohlmann-Rother, 2020). It can therefore be deduced that learners who are speakers of a minority language and attend schools with a "monolingual habitus" (Gogolin, 1994) face an increased risk of exclusion or marginalisation. The following section elaborates on how the enhancement of minority languages can foster the inclusiveness of schools or education systems in a broader sense. Before that, however, we want to venture a definition of the terminology.

Key aspects

What do we mean when talking about minority languages?

The concept of "minority language" can be understood as controversial, which mainly arises from the fact that the term "minority", no matter from which discipline it is seen, is problematic (Gorter, 2006). The endeavour to define what is a minority and what is not, to set criteria for who belongs to a minority group, is a very complicated one (Laakso et al., 2016). Very often, minority language is simply defined as the language spoken by less than a certain percentage of a population in each geographic context (for example, region, state, country), that is, it is about the size of the speaker population within a specific territory (European Charter for Regional or Minority Languages, 1998; Grenoble & Singerman, 2014). Contrary to this, Garcia (2006) defines "minority language education[…] as the school's use of a language (or languages) spoken by students whose heritage language differs from that of the more powerful members of society who usually exercise the most control over state schools" (Garcia, 2006; 159). Her definition does not refer to numbers but rather to language status and associated power relations. Thus, the question arises as to which language is dominant rather than how many people speak the language in that situation. Finally, it can be added that different types of minorities exist; old or traditional (i.e., indigenous, autochthonous) versus new minorities (i.e., migrant). In this regard, it needs to be stated that some of these nominations are discussed controversially and very often, borders between one type and the other can be fuzzy (Laakso et al., 2016).

It becomes evident that when it comes to minority languages, we might meet various and sometimes even conflicting definitions and understandings of what a minority language is. The above example case depicts a lone learner who does not understand what is happening in the classroom as their home language is different from the language of instruction. It may be familiar to you, as this situation is happening in classrooms around the world daily. You might also notice the risk of exclusion that lies within the fact that a learner does not understand what is going on in the learning situation (De Korne, 2021).

In the following, we are going to examine in closer detail four scenarios that depict diverse (language) learning situations that may make you think about the topic differently. These scenarios will be accompanied by the specific language policies that underpin them and the realities of each of the instruction contexts within which the learners in these scenarios find themselves. In this way, we try to illustrate how the concept of minority language is strictly related to and interwoven with contextual and structural factors such as the policy context of the nation-state, which, for instance, plays a crucial role in defining which language varieties obtain minority status and thus rights and protection (Gorter, 2006), and consequently, is given importance and space in education and in the classroom.

Description of a structural disadvantage and how to address or prevent it through the use of four scenarios

Scenario 1: Finnish Sign Language and the case of a deaf learner

Deaf/hard-of-hearing (DHH) pupil named Jenna is schooling in a classroom using spoken language, Finnish, with a hearing teacher in an environment where others do not know a national sign language, Finnish Sign Language (FinSL). Jenna herself has started to acquire FinSL with her family. In this scenario, how can she learn and acquire FinSL in a non-signing environment where the teacher and other classmates do not sign? Also, how does Jenna

understand what is spoken in the environment, and what the teacher is teaching? How can we support Jenna's evolving bilingualism and DHH identity? Why is Jenna in this situation?

Language Policy

According to various estimates, there are more than 70 million deaf people in the world, and an even larger number who are hard of hearing (World Federation of the Deaf, 2023). Signed languages, like spoken languages, are natural, complete, and independent languages in the visual-gestural modality that have emerged in deaf communities around the world over time. Each country has its own signed language and even more than one, like in Finland, there is a FinSL and Finnish-Swedish Sign Language (FinSSL). Signed languages have been researched for decades in the field of sign language linguistics (Brentari, 2010) and Deaf Studies (Gertz et al., 2016), but still, public knowledge of these languages and communities seems to remain quite limited.

The status of sign languages varies in different countries in Europe and around the world. Recently many European countries have acknowledged sign languages in their legislation (Murray et al., 2015). In Finland, sign language was recognised in 1995 and the Sign Language Act, concerning both national sign languages, was enacted in 2015.

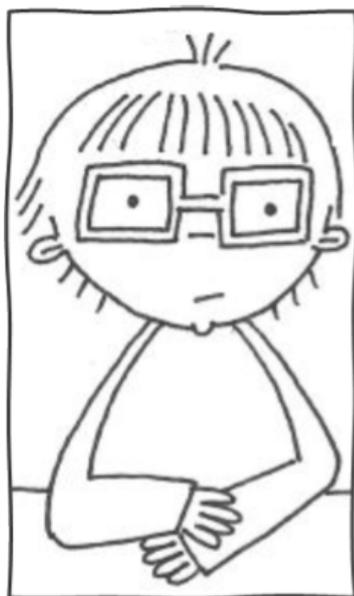
DHH people who use a signed language are a group with a unique double status – are not only a linguistic minority but also a disability minority. The rights and needs deaf and other people with diverse hearing status, should therefore be seen from different and complementary perspectives.

The majority of DHH children, over 95%, are born to hearing parents, most of whom do not know a national signed language, so DHH children do not automatically learn a national signed language (Mitchell & Karchmer, 2004). In the case of DHH children, hearing parents who do not know a national signed language also have to learn a new language with their children. Ensuring bilingual education and support in a national signed language at different educational stages and in public services for families is crucial for a DHH child's balanced bilingual development and growth with full linguistic accessibility.

Instructional context

Current situations are always shaped by history. There have been, for example, also serious human right violations in Finland, like sterilisations as part of racial hygiene policy efforts and deaf people have been forced to speak and the use of sign languages has been banned in education (Katsui et al., 2021). In Finland, this history has contributed to the beginning of a unique national truth and reconciliation process about the injustices done to the sign language and deaf community. It is similar to that of the Sami minority, where the truth and reconciliation process began earlier (Katsui et al., 2021).

Deaf people's language proficiencies have often been controlled by normative standards, such as deaf children's national sign language learning being restricted by governments, early invention and so-called "inclusive" education system (Snoddon, 2022; Snoddon & Paul, 2020). Many DHH children in mainstream schools are isolated with other non-signing children in the classroom without support services (Murray et al., 2018). Henner and Robinson (2023) find that DHH children very often experience language deprivation and lack of linguistic capital because they do not have access to a community of languages inside and outside school and they do not have fluent signers around them. Snoddon (2022) describes this situation as social and epistemological violence against deaf bodies and deaf ecosystems, as the education system deprives children of direct instruction in a signed language and access to the signing community of DHH peers. There is an intergenerational transmission that has been disrupted by so-called 'inclusive education', resulting in a loss of identity for DHH children (Snoddon, 2022).

Recent research shows that pupils in special education have a much better chance of receiving instruction in a signed language than those in mainstream education in Finland (Katsui et al., 2021). This can be a difficult situation for families who would like their children to attend a local school, and to be taught in a bilingual way with signed language (FinSL/FinSSL). Advanced hearing technology and its practices has contributed to the contradiction between medicalisation and rehabilitation discourse and the linguistic-cultural view. This dual distribution and discourse can still be seen in the field of education, thus leaving bilingual education in a signed language on the margins of education.


Scenario 2: Migrant Students and new minority languages

Enson is a 15-year-old student. His family is originally from Albania and moved to South Africa when Enson was four years old. As a result, Enson speaks both Albanian and English as a native speaker. Last year he arrived in Italy as an unaccompanied minor because he had been recruited by a professional football team. He initially enrolled in a scientific

secondary school because of his excellent maths results in South Africa, but he failed. He is now in the first year of a commercial vocational school. Why is Enson in this situation?

Language policy

In Italy, according to the Ministry of Education (MI, 2024), 11.2% of the students are migrant students; more than half of them (65.4%) were born in Italy, others arrive, like Enson, when they are already grown up. For the school year 2022/2023 it was observed that there was a decrease in the total school population (-1.2%). The number of students with Italian citizenship declined (-2%) while those students with non-Italian citizenship showed a growth (+4.9%). Italian citizenship is transmitted through *jus sanguinis*, that is, students born in Italy as children of parents who are both non-Italian citizens are considered migrants in the statistics. Linguistically speaking, many of the students are new minorities that are gradually becoming part of the national historical heritage. Almost half (44.4%) of the students with non-Italian citizenship are of European origin, but there are almost 200 countries from which students originate.

According to Italian law, students under the age of 18 have the right and duty to be educated and must be enrolled in the grade appropriate to their age. In practice, however, many secondary schools refuse or discourage the enrolment of migrant students on the grounds that their level of Italian is considered insufficient to enable them to succeed in school (Bonizzoni et al., 2006; Barban & White, 2011; Romito, 2014). So, these students often choose a vocational or technical school, regardless of their previous educational background. It is also very common for migrant students to drop out of school. Sometimes, because they fail, other times, because they are placed in classes below their age (despite legislation). According to the Italian Ministry of Education (MI, 2024), more than one quarter of foreign students aged between 17 and 18 drop out of school, with a strong gender difference that sees the schooling rate of female students' 20% lower than that of males.

Enson's story is very common among migrant students and indicates that the presence of new minority languages is regarded as a problem, even though Italian law (Law 482/ 1999; MIUR, 2014) and common European and international documents (Council of Europe, 1992; Pasikowska-Schnass, 2016) affirm that the presence of many national, regional, old and new minority languages spoken in Europe enriches the common cultural heritage. The proportion of low-achieving migrant students exceeds that of native-born students in most European countries, even when socio-economic status is controlled for (OECD, 2016).

It seems that teachers, in spite of the legal guidelines, give different values to the

different languages and thus they appear in a hierarchy. If Enson had been the son of an English couple who had just moved to Italy, would the school have thought of rejecting his enrolment? In Italy, the law has been protecting linguistic minorities since the Constitution of 1948, and some regions have a bilingual or even trilingual education system. Instead, for example, the Romanì language, which historically is considered a minority in Italy, is not recognised as such by the law (Scala, 2021), and the same is true for other regional languages.

Instructional Context

As we can see, theoretical principles and policies are often not applied in everyday school life. Very often teachers ask learners to exclusively use the language of instruction at school and to avoid their native language or languages. So, Enson is a typical case of a *heritage speaker*. On the one hand, the immersive situation allows students to learn the target language very quickly, but on the other hand, it seems to be a demand for cultural assimilation.

In Italy, foreign students are immediately placed in mainstream classes where they learn the language of the school as a second (or third, or fourth, …) language in an immersive way, since any form of special schooling has been abolished in Italy since the 1970's (Law 517/77). Only for pupils who have been in Italy for less than a year are schools obliged to activate L2 courses during school hours, and it is more common for schools with a high presence of pupils with non-Italian citizenship to be well organised to support the L2 learning path both for newly arrived pupils and for all levels of academic language learning as L2. In fact, any other Italian L2 course is only activated when the class council/teaching team deems it appropriate and with the agreement of the pupils' families, as the law stipulates that language learning must be predominantly immersive, through the adaptation and personalisation of the curriculum (C.M. 24/2016). The most recent legislative provisions allocate resources to schools in the form of specialised teachers for the teaching of Italian as a second language and funds for the activation of courses, but only to schools with at least 20% of foreign pupils. The percentage of pupils with non-Italian citizenship in science high schools is 4.3%, while in technical and vocational schools it ranges from 9% to 28.4% (MI, 2024), so science high schools usually do not have Italian L2 courses, but exceptions to the average can be found, both virtuous and less so.

Despite studies (D'Anglejan, 1988) showing that it takes about one year to learn the basic interpersonal communication skills of a new language and about 5 years to achieve cognitive academic language proficiency, bilingualism is still a disadvantage in formal education, so much so that 53% of foreign pupils are behind their age group at the end of secondary school (MI, 2024).

How can Enson's teachers change their attitudes, possibly changing the outcome of his studies and supporting him on his path of growth and identity construction as a migrant

and multilingual person? In this scenario, there was no suggestion that Enson should do his studies in his mother language at the same time as learning Italian. Study material in English could have been found easily and the use of translators could have been encouraged. Additionally, it would have been possible to activate the Albanian-speaking community in Turin, or to look for other Albanian- or English-speaking students in the school or in similar schools. What kind of teacher knowledge would have been necessary to activate these resources?

Scenario 3: Official Minority Languages in a multilingual context

Giulio is in his first year of primary school and just started learning German as a second language. At home, he speaks Italian with his mother, his father, his little sister Francesca, his *nonna* (grandmother) and his *nonno* (grandfather). With all his friends from kindergarten, he primarily spoke Italian, even if it was not always everybody's native language. He learnt some words in Albanian and Moroccan from his friends there. However, learning German is a totally new thing for him, so in the first days of school he struggled because he does not understand what the German teacher is telling him. Why is Giulio in this situation?

Language Policy

The Autonomous Province of Bolzano, a region in Northern Italy bordering Austria and Switzerland, is characterised by a specific ethnolinguistic reality with three different ethnolinguistic groups historically cohabitating on the territory: Italian, German and Ladin (Nössing, 2017).

With the end of World War I and according to the peace treaties of Saint Germain in 1919, the province, which before was part of the Austro-Hungarian Empire, was annexed to the Italian Kingdom (Steininger, 2004). Due to this annexation, German and Ladin became linguistic minorities within the Italian Empire. In 1922, with the fascist takeover of power, the so-called time of Italianisation began, a forced assimilation of the German- and Ladin-speaking inhabitants (Voltmer et al., 2007). After World War II, the latter started striving for the province to become autonomous to ensure their language and culture were protected, which at times also took on violent overtones (Alcock, 2001). Consequently, tensions and mistrust dominated the relationship between and coexistence of the three language groups

for a long time (Baur, 2009). In 1972, the Second Autonomy Statute came into force, which implemented a series of provisions (for example primary responsibilities for public services, agriculture, kindergarten and school buildings; introduction of a quota system to regulate access to public positions; autonomous administration of the school) guaranteeing the protection of minorities and aimed at setting the pillars for a peaceful coexistence of all.

Nowadays, all three languages share the status of official languages and Ladin and German are further recognised as minority languages within the Italian nation-state and protected as such by law (Nössing, 2017). These historical events and the resulting legislation led, among others, to a tripartite division of the education system according to the "language groups" (i.e., the establishment of three parallel school systems, each with its administration, education authority, directing body, and evaluation board) (Wisthaler 2013). Consequently, all educational institutions from kindergarten to secondary education are separated by language.

Instructional Context

In the territory, you can find schools in the German, Italian and Ladin language. However, children and youth in school learn the other official language(s) as second/third language(s) (i.e., in German schools Italian is thought as L2, in Italian schools German, in Ladin schools both German and Italian as L2 and L3). While the Italian and German educational institutions can be defined as "monolingual schools" (Baur, 2009), where the second language is taught as a subject for a certain number of hours per week, Ladin schools follow a "parity model" (Rautz, 1999). Here, an equal number of lessons are taught in German and Italian, and Ladin is taught as a subject creating a trilingual school model. More specifically, Ladin is used as a teaching language in kindergarten and an auxiliary language in primary school. In first grade, literacy is achieved through Ladin and one of the two other official languages, Italian or German, and the respective third language is taught for at least one hour per week with the aim to respond individually to the child's language skills. From the beginning of second grade equal use of German and Italian is applied (Verra, 2008, 2011).

Even though, having schools in each of the official languages was initially implemented to protect the linguistic minorities, recently, scholars also address the current situation critically as contributing to the creation of parallel worlds because the strict separation hinders daily contacts between the children of different language groups (Baur, 2013; Gross, 2019; Zinn, 2017, 2018). It is the case for Giulio, who has no German-speaking friends, even though Hannah lives next door; she also just started primary school in the exact same building as Giulio, but their classrooms are on different floors, and the break time is not the same. As the statistics show, the chance that Giulio and Hannah will ever become friends is small. A survey from 2017 showed that 90% of the interviewed youth stated having many friends of the same language group. Further, only 23% of those interviewed considered the

co-living of the different language groups as a positive aspect of the province, and only 20% identified the division among language groups as problematic (ASTAT, 2017).

Therefore, taking an inclusive perspective, one of the central questions regarding the Province of Bolzano is "[…] whether the policies aimed at protecting the historical traditional minorities in South Tyrol help or hinder the creation of a tolerant and pluralistic society […]" (Medda-Windischer, 2015: 101). Even though the Italian school system in terms of its structure and the long tradition is one of the most inclusive education systems around the world, when taking the perspective of languages, the inclusiveness of schools in the Province of Bolzano might be questioned (Auer, 2023).

Scenario 4: The official language of instruction is not native to anyone

Elina is a Grade 3 learner from Namibia who speaks Khoekhoegowab at home with her parents, her friends, and everyone else in her community. She loves interacting in her language with her friends, as the "click" sounds of her language are music to her ears. Elina and many of her friends go to an Afrikaans school, because of a lack of Khoekhoegowab schools in the area where she is staying. In school, Elina's teacher teaches in Afrikaans, which makes learning difficult for Elina as she does not always understand what the teacher is saying. In addition, Elina must also learn to read and write in English, which is even more confusing as she only uses English at school. Why is Elina in this situation?

Language Policy

In Namibia, the language policy states that from Pre-primary to Grade 3, learners should be instructed in their home language, with English offered as a subject. Grade 4 is a transitional year where English becomes the primary medium of instruction and the home language is taught as a subject (MEC, 1993). The objectives of this policy were to promote the equality of all national languages in Namibia and to ensure that all citizens had a sufficient level of English proficiency to support the establishment of English as the official language (Norro, 2022). Although this is the language policy, it is not always implemented in the prescribed manner, as seen in Elina's case.

According to Kamwangamalu (2013), two opposing ideologies, decolonisation, and internationalisation have influenced language planning in post-colonial African nations. In contrast to decolonisation, which involves replacing the ex-colonial language with indigenous languages, internationalisation results in the preservation of the ex-colonial

languages to gain economic advancement and greater communication. Globalisation has most recently expanded and strengthened the internationalisation ideology. In order to provide their children with an equal chance to prosper in the new global order, more parents are insisting that their children learn English, which has increased the language's significance (Norro, 2022).

Interviews with people from various ethnic groups in Namibia revealed that the majority of parents, teachers, and learners agreed that English should be the primary language of instruction and that it should be taught in the first year of primary school. They believe that early exposure to the language will accelerate learners' fluency in it and that people who cannot speak English are unable to contribute effectively to society (Chavez, 2016). The leniency with which the policy is applied in schools makes this another reason why many learners do not receive early primary education in their home languages. For example, if schools can demonstrate that there are a significant number of residents from other language communities in the area, they may apply to the Ministry of Education, Arts and Culture to teach in English from Pre-Primary to Grade 3 while using the learners' home language/local language as the second language. In this sense, English becomes superior to local languages.

Instructional Context

Statistics showed that only 42% of Khoekhoegowab-speaking learners have Khoekhoegowab as their medium of instruction (February, 2018). As Elina's language is a Khoisan language, which is different from the Afrikaans language, which has a Germanic root (Norro, 2022), it is difficult for the teacher to accommodate Elina and her friends in the class. The teacher does not understand Elina's language and struggles to explain the content of the lessons to Elina and her friends. As she is not familiar with Khoekhoegowab, she can also not use code-switching to make the learning process easier. This is an unfortunate situation, but it is a common situation in Namibia where learners are taught in a language that is not their native tongue. The scenario of the Namibian situation (in terms of the number of Khoekhoegowab-speaking learners) is indicative of the power of a dominant language that is legislated to be taught to the learners in spite of their heritage language.

The fact that learners are taught in a second or third language that they find challenging to grasp makes learning difficult for them. Often, they find themselves in a situation where they have to learn a language at the same time that they have to learn in the language. In Elina's situation, she has to learn Afrikaans at the same time that she learns in Afrikaans. She is also consecutively introduced to English as a subject in which she needs to gain a level of proficiency that will enable her to read and write in the language. In these situations, the learners' self-esteem and confidence in their ability to speak and write in the instructional language may suffer. Learning in these circumstances can lead to frustrated learners, as they may feel that their own language and cultural experiences have no place

in formal education. They may face the situation of being looked down upon by those more fluent in the language of instruction and characterised as underachieving and slow. This can result in them avoiding situations where they have to express themselves using the language of instruction (Motitswe & Taole, 2016).

Figure 1: The four scenarios at a glance

Scenario 1	Scenario 2	Scenario 3	Scenario 4
Deaf learner in hearing context	**Immigrant learner in monolingual context**	**Monolingual school in a multilingual context**	**Instruction languages ≠ home/heritage language of the majority**

Policy

Status of sign language varies from country to country In many European nations ↓ legislative acknowledgement Right for interpreter service Right for bilingual education and in a national signed language	Italian Constitution and legislation ↓ protection of (historical) linguistic minorities & national, regional, minority and migrant languages = enrichment	Officially recognized and legally protected minority languages ↓ Tripartite division of the school system according to all three official languages	(Pre-)Primary Eduaction ↓ instruction in home language From grade 4 ↓ English becomes main instruction language

Classroom

• Teacher and classmates do not sign • No sign language interpreter in the classroom • Most deaf children do not receive bilingual education • Limited school / community/ government budget • No other signing peers or adults - lack of role models	• Migrant students learn language of instruction in an immersive way • Bilingualism is often perceived as disadvantage • Migrant students > vocational schools	• Monolingual schools > students learn other official language(s) as a subject • Parity school model > subjects are held to an equal amount in the two languages and Ladin becomes auxiliary language	• Students are taught in a language, which is not their native tongue • Learning in L2 or L3 is difficult • Learning a language while learning in a language • Missing status of minority language in formal education

Finland	**Italy**	**Italy**	**Namibia**

To sum up, Figure 1 provides an overview of the four scenarios just presented. As represented in these scenarios what we are talking about when using the term "minority language" can be very different and is strongly related to language policy and contextual factors. Further, the scenarios demonstrate the complexity of the different classroom situations. You may typically have assumed that minority language is a case of the lone learner who speaks or uses a different language than the rest of the class, for example, the case of the deaf learner who uses Finnish Sign Language (Scenario 1). In Scenario 2, in addition to the case provided, there is also a discussion of several migrant learners who speak different languages to those taught at the school. Instead, in Scenario 3, the fact that the minority language(s) are officially recognised and protected by law leads to monolingual schools in a multilingual context. In the Namibian case (Scenario 4), the Khoekhoegowab learners are the majority in the class but do not reflect the language of instruction, Afrikaans and English. Despite the individuality of each of the scenarios, in the following, by responding to two initial questions, we try to elaborate some overarching possibilities for action, which might be applicable for all four and even other possible scenarios of minority languages in educational contexts.

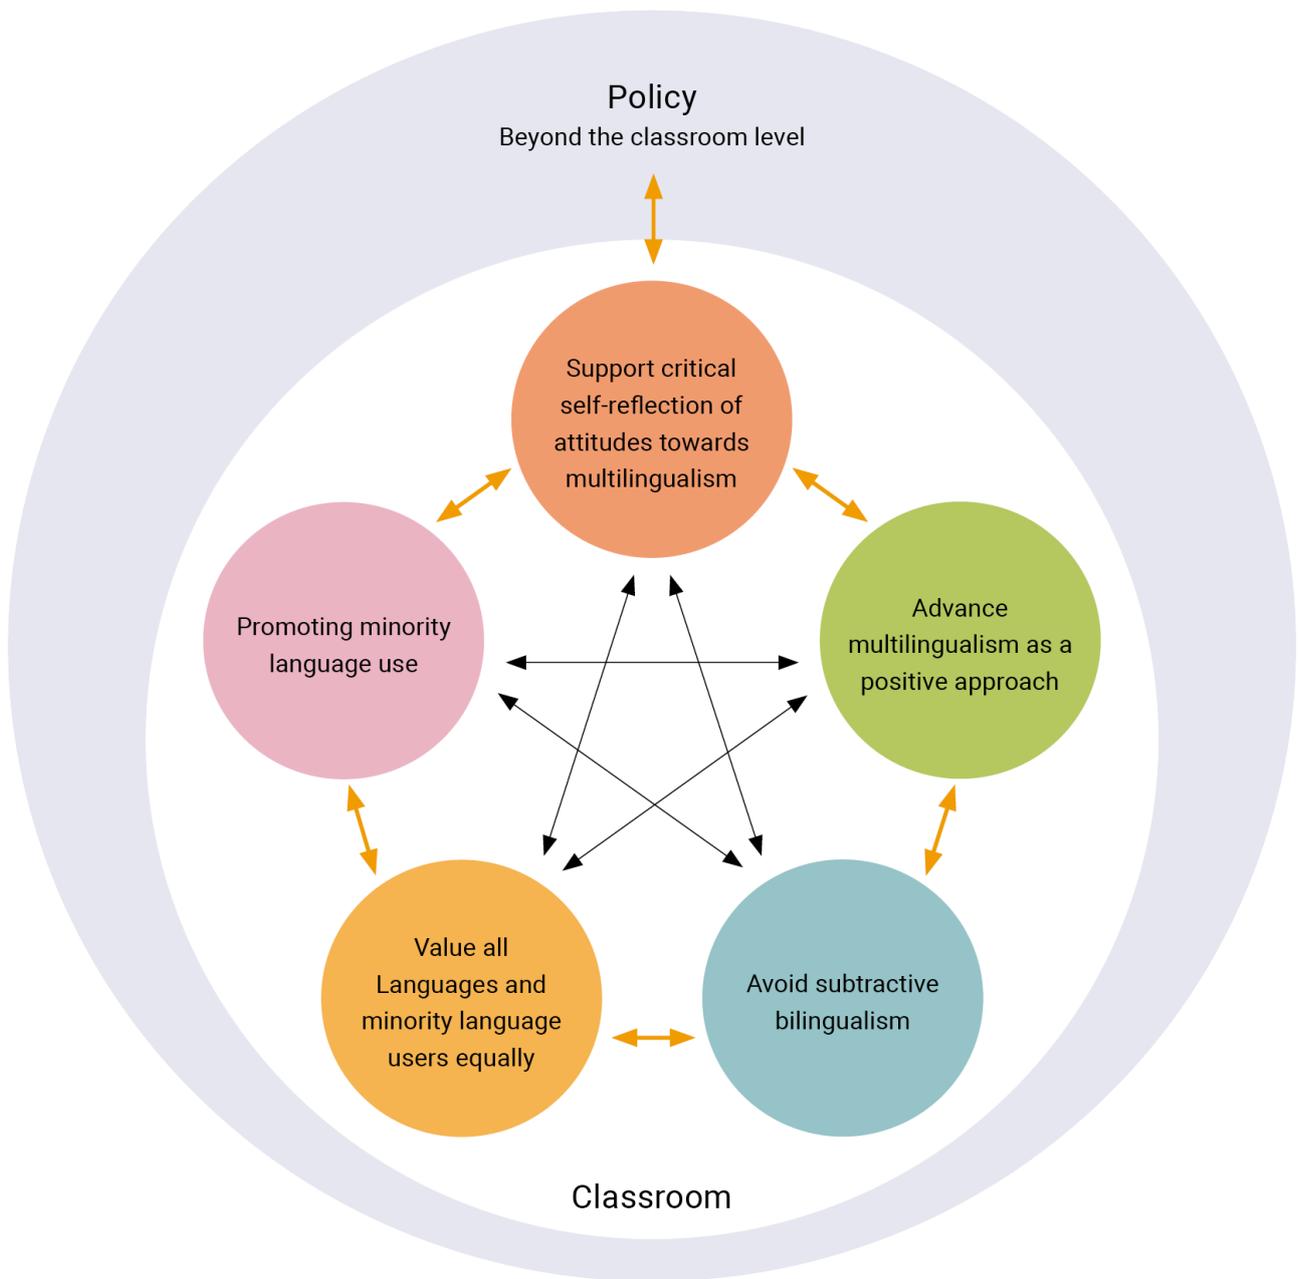
Enhancing minority languages

Over half the world's population is bilingual and many people are multilingual. In China, for example, there are 56 nationalities that use around 80 different languages (Fang, 2017). According to the Atlas of the World's Languages of UNESCO (n. d.), "language is a carrier of human heritage, a local knowledge repository system, a system for communicating between people and a regional, national and global economic-political resource to be managed as an asset along with natural, human, financial and other resources, as part of good governance and societal development" (UNESCO, nd). Schools and teachers, but also more broadly, education authorities and the surrounding community play a role in how a minority language is preserved for future generations and what development opportunities it has (European Commission, 2019). This is particularly important in the case of small national minority languages, which may have only hundreds or a few thousand language users. The situation is different in the case of transnational languages with a large community of users. These languages often have more resources, for example in the form of networks, institutions, and learning materials. Instead, for instance, signed languages often have very few materials appropriate for primary education and different subjects (Katsui, 2021). According to the World Report on Disability (Lancet, 2011), people with disabilities, including the deaf, are the most discriminated group in the world. Deaf people are socially disadvantaged and vulnerable in many parts of the world, and are often denied access to education, among other things (Lancet, 2011). The World Federation of the Deaf and many researchers, consider the use of signed language and education in a signed

language to be a human rights issue (Murray, Meulder & Maire, 2018). Similarly, indigenous people, who represent a significant part of the world's vast cultural and linguistic diversity and heritage, often do not have access to schooling in their traditional languages (United Nations Department of Economic and Social Affairs [UN DESA], 2017).

As argued previously (see Introduction), it is not only about preserving minority languages around the globe, but from an inclusive perspective, it is about responding to the diversity of *all* learners through the removal of barriers and the prevention of exclusion, which can arise from specific attitudes towards the many possible facets of diversity (Ainscow et al., 2013). Language can be understood as one of these facets and therefore needs to be taken into consideration in the realisation of inclusive education as a human right and as groundwork for a more equitable society. Therefore, it needs to be asked, how schools can provide *all* students with the opportunity to learn, to play an active citizenship role, and communicate a policy of equal value for *all* languages.

In this regard, it is believed that the school community, as well as the wider society, could respond in the following manner. In Figure 2 there is an overview of six possibilities for action in terms of approaching the goal of a more inclusive education from the perspective of minority languages. As can be seen, five of them can be located in the classroom or school level, while one of them operates at a higher level of legal anchoring. Further, certain strategies will lead to another creating a recurring circular structure in their application but essentially, they are all interrelated in a reciprocal way, which is why the application sequence can be flexible, reversed, or swapped.

Figure 2: Strategies to enhance minority languages for inclusion


Support critical self-reflection of attitudes towards multilingualism

The construction of plurilingual language environments and opportunities is also influenced by the teacher's own perceptions and attitudes (Heller, 2007) as part of the school culture. It is therefore important for teachers to reflect on their own perceptions of multilingualism and multilingual learners.

Among the various directions taken by research on multilingualism education, teacher training is one of the main fields of action for integrating pluralistic approaches into a language policy open to plurality. Teachers need to be stimulated to adopt a reflexive attitude that makes them critical of the representations and certainties related to the profession and teaching disciplines. Just as the focus in the classroom has progressively shifted from the subject to the methodology and finally to the learner, so teacher training, which was mainly based on the transmission of concepts and know-how relating to

classroom management, has more recently recognised the centrality of the trainee teacher's individual experience.

Pluralistic approaches, as a way of looking at language teaching and because of the challenges they pose to many preconceptions about languages and language learning, are an ideal way to promote education based on reflection, critical thinking and collaboration. Many factors come into play when teachers relate to languages, which are difficult to identify if they are not critically recognised in their own training: the social status that distinguishes each language, the possibility of appropriating them, the hope of their practical usefulness in the future, and the affective dimension (Blondeau & Salvadori, 2020). For instance, in the Scenario of the Autonomous Province of Bolzano it seems to be important – due to the historical events and ongoing tensions between the different language groups (the three language groups live together separately and ethnic conflicts still occur) (Baur, 2009, 2013; Carlà, 2007; Heiss & Obermair, 2012) – all those involved in education critically reflect their own language history and attitudes towards the other official languages. As Baur (2013) argues, in the case of the Province of Bolzano, the coming together of the language groups and the acquisition of multilingual and intercultural competences depend not only on contacts and cooperation but also on joint processing of the historical trauma, which alone can produce a sensitive understanding of societal equality.

Literature suggests many strategies that can be used to develop greater awareness of multilingual identity. The *linguistic autobiography* (D'Agostino, 2012; Andrade et al., 2020) is an example of a tool to reflect on the complexity of everyone's linguistic history. A linguistic autobiography is a personal narrative or account that focuses on an individual's experiences of and relationship with language throughout his or her life. It usually includes information about the person's linguistic background, including the languages they speak, their language learning experiences and the ways in which language has shaped their identity, culture and communication. Language autobiographies are often used as a tool for self-reflection and as a means of exploring the complex interplay between language and personal identity. For this reason, this technique has been tried and tested in the in-service and initial training of teachers working in multilingual contexts. Other similar tools that can be used in teacher training include *Identity text* (Cummins, 2010), which are written or visual representations, such as essays, stories, drawings, or any form of creative expression, that allow individuals to explore and express their own cultural and linguistic identities.

Advance multilingualism as a positive approach

The term "multilingualism" has many definitions. The term can refer to multilingual individuals or locations where multiple languages are spoken. Therefore, it may be useful to apply the Council of Europe's distinctions between plurilingualism and multilingualism (Lid, 2018). Plurilingualism is defined as the quality of an individual possessing a "plurilingual

repertoire" of language competences, and multilingualism is the attribute of a place, city, society, or nation-state where many languages are spoken (Council of Europe, 2007). Even with precise definitions, the description and perception of multilingualism can occasionally change from one context to another.

A common view of multilingualism is having a population that speaks or understands two or more main languages learnt in school in addition to one or more national languages. Some will define multilingualism as the ability to distinguish between languages that are considered "valued" and those that are not. With very rare exceptions, the languages of relatively recent immigrants continue to be those that are considered to have less significance than the extremely important languages of communication, such as English. In some African countries, there are children who can speak more than one language before they start primary school. They learn one language at home, one or more in the neighbourhood, and then a third or even fourth language at school, where it serves as the medium of instruction (Lid, 2018).

The way people think of multilingualism is as varied as its reality. Linguistic diversity and multilingualism have often been seen as problematic, with monolingualism being considered a more natural and preferable option. Many parents and educationalists believed that having more than one language was detrimental to cognitive development or at least caused some confusion (Cenoz, 2012). However, studies show that multilingualism has a positive impact on cognitive development and meta-linguistic awareness (Baker, 2011) and it seems that professionals are beginning to make more use of learners' entire linguistic repertoires in foreign and second language (L2) education (Taylor & Snoddon, 2013).

The number of multilingual students in European schools and elsewhere has increased recently, which has prompted a re-examination of multilingual student models to enhance multilingual students' academic performance and participation (Duarte & van der Meij, 2018). Considering our four scenarios, which include a national language, a minority language, a foreign language, and numerous immigrant languages, it can be difficult to meet the requirements of multilingual education in an educational system that reflects these realities.

If schools strive for multilingualism and multiliteracy, then multilingual education is the use of two or more languages in the classroom. As such, it serves as a catch-all phrase for a variety of pedagogical strategies that make use of several instruction languages, as well as those that seek to promote elite bilingualism. Using students' family languages as a resource for instruction is a typical element of many new programs designed from a multilingual education perspective (Duarte & van der Meij, 2018).

Translanguaging is one of those novel linguistic subjects that scholars are interested in studying. It refers to the act of multilingual people using their whole language repertoire to communicate, or more specifically to learn in an academic environment. A translanguaging approach to teaching would mean that multilingual students would have the opportunity to

use any language they have access to in a school setting. Although it was always thought that a teacher conducting a language exercise in a L2 setting had to do it exclusively in L2, researchers are now attempting to develop new educational approaches for bilinguals considering the large-scale migration. As a result, translanguaging was presented as a means of bridging L1 and L2. Students can use their whole language repertoire in a translanguaging classroom, and they can switch between L1 and L2 at different points during the learning process (Evgenikou, 2017).

Numerous studies have highlighted the benefits of a translanguaging pedagogy at various school performance levels for both new and old minority languages. According to Duarte and van der Meij (2018), some of these benefits include:

- better lesson completion,
- balancing the power dynamics between the languages in the classroom,
- minority language protection and promotion,
- increased participant, confidence and motivation,
- learning maximisation,
- language empowerment,
- and higher cognitive engagement in content matter learning.

In the past, bilingualism, or multilingualism, was viewed as a hurdle in educational environments, resulting in the separation of languages. However, with translanguaging pedagogies, all languages spoken in a classroom are purposefully and systematically utilised to improve learning outcomes and recognise all students' linguistic diversity and abilities. By providing encouragement and training for teachers to strategically use translanguaging practices, the focus can shift from viewing multilingualism as a problem to continuing to recognise it as a valuable resource (Norro, 2022).

Avoid unbalanced/subtractive bilingualism

The previous section emphasises the shift from viewing multilingualism as a problem and instead encourages the perception of viewing the use of all languages as valuable. Discouraging the use of other languages in school and institutional contexts very often leads to an unbalanced and subtractive bilingualism, in which one or more languages are gradually abandoned and "hidden" because considered less valuable, resulting in a loss of wealth for the individual and society. This is of particular concern when the "hidden" language is the child's first language.

In direct contrast, additive bilingualism encourages learning the second language while the first language is reinforced. In addition, Garcia and Cole (2014) argue that the common practice of treating two languages as equal but separate disregards the intricate language skills of multilingual learners who strive to balance the power dynamics between multiple

languages. This includes efforts to counteract linguistic hierarchies between majority and minority languages, as well as between spoken and signed languages. To give a concrete example, instead of confrontation between spoken and signed languages, the education sector and its authorities should see different languages, cultures and different human abilities as human capital and thus support the bi-multilingualism and identity development of DHH learners in a holistic way.

The growth of bilingualism and the acquisition of a bilingual identity are hampered by keeping one language out of reach of the other (diglossia). Garcia's concept of "Transglossia" was first introduced as a result of this insight (Garcia & Cole, 2014). Transglossia is a communication network that functions on stable and dynamic principles, where diverse languages function in a mutually beneficial interdependent relationship. It prioritises flexible language practices of bilingual/multilingual individuals over preserving linguistic asymmetries among nation-states and socio-economic groups by upholding two or more of their respective languages. Consequently, the study of bilingualism moves away from defending national languages and ideologies.

In the first scenario, there was a DHH learner in a classroom in a 'hearing' environment where others use spoken language. The school could deploy a paired teaching model where two teachers teach in parallel in signed and spoken languages, that is one of the teachers being deaf or hearing person who is fluent in national signed language. The school could also organise an interpreter who conveys the information that enables the DHH learner to access spoken instruction and interaction with others and to express her thoughts in a signed language. These different solutions, such as organising a paired teaching model with suitable teachers, interpreting services and placing other signing children in the same school or classroom supports the DHH learner's identity development. These arrangements show that the school environment accepts the languages and bilingual and cultural identity of DHH people.

Regarding new minority languages, Unganer (2014) claims through her personal migration experience that language loss or attrition has a huge impact on the individual in various aspects of their life. She recommends the following:

- The establishments of partial immersion and/or cultural heritage programmes.
- Educating the public against hostile and racist attitudes.
- Raising parents' awareness of the need for proficiency in the second language, while maintaining their first language identities and cultural values.
- Most importantly, second language teachers should promote additive bilingualism over subtractive bilingualism by creating a welcoming environment.

It is believed that these strategies promote a child's well-being and indicate to the child that all languages are valued equally.

Value all languages and minority language users equally

Minority language is often seen as less important and often ignored. This mindset and attitude reflect linguistically discriminatory thinking, which is also called "linguicism". It is estimated that more than 40% of the world's languages are endangered (Harrison, 2007). Throughout the world, the status of deaf people, signed languages, and deaf education has long been marked by the struggle between spoken languages and signed languages, and by discrimination against deaf people and signed languages (Gallaudet University, 2023).

Minority languages are easily overshadowed by majority languages. The different roles and status of languages are often visible in the school environments, because languages are often valued in different ways, as we can see in all the scenarios. In the field of applied linguistics, multilingualism has been examined from perspectives such as language policy, language planning and attitudes towards the use of different languages. When it comes to language learning in the classroom, it is important to provide a more equal status to the different languages coming together in one classroom, be it the student's native or heritage languages, the language of instruction or the second/third language.

Research has shown that, when the language of origin is used in school, the students' sense of identity, self-esteem and self-concept are strengthened, whereas when these children are simply placed in 'mainstream' education, they are vulnerable to loss of self-esteem and status, and their motivation and interest in schoolwork suffers, with negative effects on performance (Council of Europe, 2020).

To critically address the existing power relations between languages within the school, it is necessary for teachers to work on their own attitudes and perceptions (Section 1), to adopt an approach that values multilingualism in their teaching practice (Section 2), and thus to actively work to prevent their student's bilingualism from becoming unbalanced (Section 3). However, this is not enough if we do not broaden our view to include the context, which, through its organisation, helps to convey a hierarchy of languages and cultures.

A useful tool in this direction is the observation of the *linguistic landscape*, which in this particular context, is called the *linguistic schoolscape*. The term *linguistic landscape* refers to the visual representation of languages in a particular geographic area, typically in public spaces. Traditionally, when thinking of languages in school, our mind runs directly to reading and writing. The landscape perspective broadens our gaze to classrooms and corridors, assembly spaces, playgrounds, signs posted on doors where staff or students work and where students congregate, blackboard writings, signs, and posters on walls. There images combine with different languages to inform, instruct and/or influence. As Krompák and colleagues (2021) have well demonstrated, multilingual inequalities in schools are often reflected in the linguistic schoolscape, because schools are one of the key institutions in the reproduction of the symbolic order, but the mobilisation of the linguistic landscape can also be a pedagogical tool to pursue broader pedagogical goals,

and the use of critical and participatory linguistic landscapes can be an instrument of democracy at school.

Promoting minority language use

In the case of Scenario 1, the UN Convention on the Human Rights of Persons with Disabilities (UN CRPD, 2016) contains provisions requiring the recognition and promotion of the use of sign languages. DHH-learners' access to inclusive education on an equal basis with others means delivering education in the most appropriate languages that maximise their academic and social development as per CRPD Article 24. Not providing access to national signed languages constitutes discrimination (International Disability Alliance [IDA], 2020; World Federation of the Deaf [WFD], 2023). Learning and teaching (national) signed languages, sign language-medium education and promotion of positive deaf identity are actions that implement the points of the CRPD agreement which states that "Facilitating the learning of sign language and the promotion of the linguistic identity of the deaf community" (Convention on the Rights of Persons with Disabilities [CRPD], Article 24, b) and "Ensuring that the education of persons, and in particular children, who are blind, deaf or deafblind, is delivered in the most appropriate languages and modes and means of communication for the individual, and in environments which maximise academic and social development." (CRPD, Article 24, 3 c).

Inclusive multilingual education consists of managing learning environments in a way that supports learners' language learning and linguistic-cultural identity also in their minority languages (L1). It can mean, for example, collaborative teaching, peers and adults using the same minority language, translanguaging, using multilingual media materials, teaching each other one's own L1 and linguistically sensitive curriculum planning. More examples and solutions for teaching are described also in the Chapter on *Language Learning for All*.

One important aspect that enables learners to become fully proficient multilinguals is offering multilingual education based on their L1 (Skutnabb-Kangas et al., 2009). This might be one of the biggest challenges in inclusive education. However, education in a minority language (L1) is important for the preservation and protection of the minority group's identity since "its capacity to survive as a cultural group is in jeopardy if no instruction is given in that language" (Capotorti, 1979: 84).

Continuing to learn in the L1 by making constant linguistic comparisons with the L2 does not slow down the learning of the L2 but facilitates it. In the migrant student scenario, no one suggested that the student should continue to use his or her L1 for study in parallel with learning Italian. Either it would have been very easy to find study material in English or to encourage the use of translators. It would also have been possible to activate the Albanian-speaking community in the wider society or to look for other Albanian or English-

speaking students in the school or in similar schools. We therefore argue that teachers should promote the use of the L1, namely the minority language, for learning.

The model suggested by Cummins (1996) serves as a foundation for considering how first-language (L1) proficiency might be seen as significantly facilitating the acquisition of a second language (L2). He claims that a shared underlying skill across languages allows for positive transfer if a L2 is sufficiently exposed to and motivated to learn it. This suggests that transfer will only happen if learners are proficient in their L1, if they receive adequate input in L2, and if they are motivated to acquire that language (Holzinger & Fellinger, 2014; Knoors & Marschark, 2014). Cummins distinguishes between fundamental academic and interpersonal communication skills and broad cognitive language abilities. Academic language skills include broad cognitive language skills as well as language-related problem-solving abilities and literacy abilities. Based on interdependence theory, this fundamental cognitive and academic competency is universal across languages, allowing for the transfer of shared higher-level language and literacy-related skills (Holzinger & Fellinger, 2014). This hypothesis thus suggests that proficiency in a home language will result in a higher level of conceptual and linguistic proficiency as well as literacy in the second language (L2).

Literature further suggests some strategies and adjustments that teachers can practise to promote native language use and the attitude of appreciation of all languages through context. About promoting L1 use, some authors suggest that encouraging *Child Language Brokering* (Pugliese, 2016) improves academic results, as well as *encouraging students talking at home about academic topics* (Andorno-Sordella, 2021). Other strategies that are widely used for this purpose are *Translanguaging* (Cioè-Peña, 2017) and *Intercomprehension* (Wei, 2023).

Intercomprehension and translanguaging (see Section 2) are two concepts that deal with interaction and comprehension between different languages but differ in their approaches and goals. In contrast to translanguaging, inter-comprehension is a concept that refers to the ability to understand and communicate in a foreign language using knowledge of one or more similar or related languages. Individuals using inter-comprehension can recognise similar words, grammatical structures, and language patterns between languages, enabling them to understand and communicate effectively even if they are not fluent in the target language.

Enhancing minority languages beyond the classroom level

As it has been argued in the introduction of this section, when it comes to the enhancement of minority languages, the everyday reality in the classrooms around the world first and foremost depends on the language policy (Laakso et al., 2016). Even though, teacher's actions and methods, their language-awareness and attitudes towards linguistic diversity improve learners' access to their first language and their multilingual development and contribute to more inclusive school environments, the preconditions for doing so are

dependent on measures and actions on a higher level. It is public authorities and educational planners who have a key responsibility in building the foundations that support linguistic diversity at an administrative level.

To make it more concrete, for instance, in the Scenario of the Autonomous Province of Bolzano, changes on the macro-level (i.e., the organisation of the school system) might be necessary. A cross-linguistic "collaboration between policymakers, school authorities, school heads, and teacher training" (Gross, 2019: 159) and the creation of one single school system involving personnel from all three language groups could sustain the preparation for a multilingual society (Baur, 2000; Baur & Videsott, 2012). Another important step could be the adaption of the Ladin school model, the parity model, in which all official languages – minority and majority languages – do have their place and equal value. Further, teachers in these school's act as role models since children encounter the teacher as a trilingual person able to switch from and to each of the three languages since all teachers at Ladin schools have to document their knowledge in all three languages (Risse & Franceschini, 2016).

Another concrete example for possibilities of action on a higher level applies to Scenario 1, the case of Jenna. Around the world and in Europe interpreter services for sign languages vary even though interpreting services are crucial for accessibility as it enables the learner to know what is discussed in the classroom and what the teacher is teaching in the spoken language. Providing interpreting in the educational setting, thus, promotes linguistic accessibility in the learning environment. The World Federation of the Deaf has estimated that 90% of deaf children do not have access to education (Haualand & Allen, 2009). Out of those 10% who have access to education, only a small minority, receives bilingual education where a signed language is used. Communities using signed languages, called as deaf communities, embody a rich Deaf culture with different events, traditions, customs and values. These communities also provide spaces to learn a (national) signed language and build a Deaf identity. Thus, Deaf and sign language communities have valuable knowledge, Deaf-centred ontologies and views of social inclusion (Snoddon, 2020) to share with community members and others. Collaborating with the wider community would therefore be one possibility of action going beyond the classroom level. Teachers and schools can work with local language communities to create spaces where people from minority languages and cultures can meet and teach each other.

Finally, the enhancement of minority languages in educational contexts might be reached also through a higher degree of diversity within the teaching staff. It would be important that linguistic minorities are represented also among the teaching staff, not only among the students. Empirical data of the European Commission (European Commission/EACEA/Eurydice, 2023) show that diversity in the teacher population is still quite uncommon in most European countries. Only few European countries do have policies and measures for increasing diversity in the teacher population and these are mostly restricted to the facets of disability and migrant backgrounds (for example, through specific quotas reserved for people with disabilities in the public sector). So, on the one hand we have an increasingly

diverse student population and on the other hand a still quite homogeneous teacher population (Bellacicco & Demo, 2022; Bellacicco et al., 2022), even though research was able to show the positive effects of a diverse teacher workforce, for example role model effects (Goldhaber et al., 2019). Furthermore, dating back to 1994, international agendas asked for a diversification of the teacher population as being a right of students with special educational needs (UN CRPD, 2016; UNESCO, 1994). But why would it be important to have teachers who are minority language speakers in the schools? This possibility for action can be applied to all four scenarios. Jenna, for instance, would encounter a teacher who is deaf or fluent in a national sign language and knows about specific didactical strategies making education accessible to her, acts as a role model, (i.e. self-empowerment, self-advocacy, autobiography), deals openly with the disability and the fact of being a member of a minority language group, who understands Jenna emotionally (Bellacicco et al., 2022). This would not only have a positive impact on Jenna but for *all* children in the classroom. Very similar positive outcomes can be expected for Enson and Elina if in their classroom there would be a teacher of their same linguistic community. For Giulio's case, options of action might be slightly different since the presence of the minority language teachers in the school has already been established but is apparently not sufficient to make the context inclusive. Instead, a closer collaboration between the Italian speaking subject teachers and the L2-German teacher would be necessary to reach a further level of inclusion (for example, co-teaching and bilingual lessons; content integrated language learning [CLIL] where teachers of both or all three languages are involved).

Closing remarks

Human communication varies widely, showing up in the many linguistic families, the wide range of dialects and registers within each community but also in the diverse communication practices among different actors, contexts, and time points (Blommaert, 2010). Therefore, it seems clear that "diversity is an inherent feature of the phenomenon of language" whereby the latter can play a powerful role in creating and reinforcing social inequalities (de Korne, 2021), such as when children and adolescents who are minority language users are disadvantaged in educational contexts (Heller & Martin-Jones, 2001). Due to restricted time and resources very often, it is decided to only give space to specific languages without considering what would be an effective contribution to the learners' well-being and social equality (de Korne, 2021). For decades, there have been criticisms that education systems have failed to support minority language learners. As teachers, we must be particularly careful to ensure that the use and development of *all* languages is actually supported, since these issues are linked to democracy, linguistic and minority, but more generally, to human rights and sustainable development. Even though language is mostly absent and invisible in the Sustainable Development Goals (SDGs) (Fettes, 2023), according to Tonkin (2023), it is a key issue and affects human rights and (e)quality of

education. Therefore, "if we wish to unite humanity around a common goal, we must first address the need for effective and inclusive communication: talking is of no avail if it is not accompanied by understanding – and understanding will not lead to action if it is unaccompanied by persuasion. Persuasion implies listening, because our common future requires consensus" (Tonkin, 2023: 3).

Local contexts

Closing questions to discuss or tasks

1. Investigate and describe a scenario in your community/country that may be similar or vastly different from those depicted in this chapter.
2. Describe the policies/laws that underpin your scenario.
3. What works well in your scenario and what does not?
4. What possible strategies do you suggest to enhance the learning environment for the learner(s) in your scenario?

About the authors

Petra Auer

Petra Auer is a trained primary school teacher qualified to teach children with special educational needs. She holds a PhD in General Pedagogy, Social Pedagogy, General Didactics and Disciplinary Didactics. Her main research interests are diversity and inclusion in education settings, children's values, value transmission, and socialization and acculturation in the school context.

Beausetha   Juhetha Bruwer

Beausetha Bruwer, instructor of inclusive education, deaf education, and sign language. Experiences as a teacher of deaf children and as a teacher and sign

language interpreter trainer at college and university level. Her key areas of research interest include, among other things: language education, early literacy and language acquisition/ development for deaf learners, sign language linguistics and practices, Deaf culture, mother tongue education, multilingual education, early childhood inclusive practices, play pedagogy, outdoor pedagogy, and teacher preparation for inclusive practices.

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

Federica Festa

Federica Festa focuses on participatory practices in schools and conducts research on how to include individuals with predominantly or entirely non-verbal communication in such practices. She works as a special education teacher in upper secondary schools and teaches in specialization courses for special education teachers. Her teaching focuses on how to analyze oral and written texts in schools from a sociolinguistic perspective, aiming to design their accessible adaptation within an inclusive framework.

PART V

SECTION 5: INCLUSIVE TEACHING METHODS AND ASSESSMENT

UNIVERSAL DESIGN FOR LEARNING

Margaret Flood; Anna Frizzarin; and María Pilar Gray Carlos

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ ama-2025-en/?p=144#oembed-1

Example Case

This practical example provides a possible template that teachers can follow to plan their learning and teaching. Column 1 represents a learning activity designed for a Science class adopting a rather traditional approach. Column 2 describes the same activity but planned according to Universal Design for Learning (UDL) principles and guidelines. Column 3 specifies which aspects of the UDL-framework are tackled by the changes made in the UDL-plan.

	Non-UDL	UDL	Actions
Objective(s)			
	The students will write the name and the correct functions of each cell part.	The students will be able to correctly identify each cell part and describe its functions.	The goal is written as to provide flexibility so that students will have choices for how the goal is to be achieved.
Learning Activity			
	The teacher introduces the information about the cell parts and functions using a PowerPoint with text (frontal lecture).Afterwards students are asked to create cell models with cookies and decorations.*Materials available: cookies, icing, decorations.*Physical space: students sit in their assigned seats.	The teacher introduces the information about the cell parts and functions using a PowerPoint with text, pictures, video clips (frontal lecture). After that, students examine and discuss in pairs 3D cell models.The teacher then asks the students to name cell parts and describe their functions. To carry out the activity, students can choose to work individually, with a partner, or in a small group. Moreover, they can choose among what "product" to create: a cookie model, a poster, 3D models, a song, a video, an interactive web-based program on cells, other (get teacher approval).*Materials available: cookies, icing, decorations, poster boards, writing utensils, computers, and iPads with needed software/apps.*Physical space: tables, desks, computer stations, open spaces.	Provide options for perception. Foster collaboration and community.Foster collaboration and community. Optimise individual choice and autonomy. Use multiple media for communication.Use multiple tools for construction and composition.
Evaluation			
	Given a worksheet, students will fill in the blanks by writing names of cell parts and their functions.	Students will have the following options: • Write cell part names and descriptions of functions on a blank diagram. • Point to and verbally name each cell part and describe its function (on the 3D cell model). • Other options if approved by the teacher.	Optimise individual choice and autonomy. Use multiple media for communication.

In this chapter you will find the answers to the following questions:

1. What is UDL's framework?
2. What is variability and neurodiversity?
3. How does UDL support my Planning, Teaching and Learning, Feedback and Assessment?

Introduction to Topic

What is UDL?

This introduction to Universal Design for learning (UDL) describes the concept of UDL and its three principles of Engagement, Representation, and Action and Expression. It talks about variability, a key concept underpinning UDL, and how neurodiversity is defined within the context of UDL.

The UDL Guidelines were first introduced by CAST in 2008 as a framework to improve and optimise teaching and learning for all people based on scientific insights into how humans learn. The guidelines have evolved through several iterations, with the latest being UDL Guidelines 3.0, released in July 202412. UDL Guidelines 3.0 emphasises creating inclusive and flexible learning environments by addressing barriers rooted in biases and systems of exclusion. It integrates asset-based approaches and theoretical frameworks, focusing on learners' multiple and intersecting identities. This version shifts from educator-centred to learner-centred language, promoting interdependence and collective learning. Since its inception, the UDL framework has been dynamic, continuously developed based on new research and feedback from practitioners. Each update has aimed to better honour and value every learner, ensuring that all can access and participate in meaningful, challenging learning opportunities. Universal Design for Learning is a change in mindset and a framework for inclusion. UDL is a proactive approach to learning, teaching, and assessment design that supports the varied identities, competencies, learning strengths, and needs of every learner in our classroom and school community. The UDL Guidelines are the tool to support inclusive practices in our learning environments. They do this by providing opportunities to offer a variety of pathways (choice and flexibility) to learners to ensure that:

- Learners understand the lesson content
- Goals are clear and specific to the expected outcome
- Assessment is flexibly designed to facilitate every learner to communicate and demonstrate their learning, knowledge, values, and skills through a variety of formats (Meyer et al., 2014).

UDL highlights three design principles that provide a map for teachers: Engagement, Representation, and Action and Expression. The UDL Guidelines offer recommendations, or checkpoints, for enacting each UDL principle (see Fig. 2).

The Universal Design for Learning Guidelines

The goal of UDL is **learner agency** that is purposeful & reflective, resourceful & authentic, strategic & action-oriented.

Design Multiple Means of Engagement	Design Multiple Means of Representation	Design Multiple Means of Action & Expression
Access		
Design Options for **Welcoming Interests & Identities (7)**	Design Options for **Perception (1)**	Design Options for **Interaction (4)**
• Optimize choice and autonomy (7.1) • Optimize relevance, value, and authenticity (7.2) • Nurture joy and play (7.3) • Address biases, threats and distractions (7.4)	• Support opportunities to customise the display of information (1.1) • Support multiple ways to perceive information (1 2) • Represent a diversity of perspectives and identities in authentic ways (1.3)	• Vary and honor the methods for response, navigation and movement (4.1) • Optimize access to accessible materials and assistive and accessible technologies and tools (4.2)
Support		
Design Options for **Sustaining Effort & Persistence (8)**	Design Options for **Language & Symbols (2)**	Design Options for **Expression & Communication (5)**
• Clarity the meaning and purpose of goals (8.1) • Optimize challenge and support (8.2) • Faster collaboration, interdependence, and collective learning (8.3) • Faster belonging and community (8.4) • Offer action-oriented feedback (.5)	• Clarity vocabulary, symbols, and language structures (2.1) • Support decoding of text, mathematical notation, and symbols (2.2) • Cultivate understanding and respect across languages and dialects (2.3) • Address biases in the use of language and symbols (2.4) • Illustrate through multiple media (2.5)	• Use multiple media for communication (5.1) • Use multiple tools for construction, composition, and creativity (5.2) • Build fluencies with graduated support for practice and performance (5.3) • Address biases related to modes of expression and communication (5.4)
Executive Function		
Design Options for **Emotional Capacity (9)**	Design Options for **Building Knowledge (3)**	Design Options for **Strategy Developments (6)**
• Recognize expectations, beliefs, and mativations (9.1) • Develop awareness of self and others (9.2) • Promote individual and	• Connect prior knowledge to new learning (3.1) • Highlight and explore patterns, critical features, big ideas and relationships (3.2)	• Set meaningful goals (6.1) • Anticipate and plan for challenges (6.2) • Organize information and resources (6.3)

Fig. 2. UDL Guidelines by CAST.

Multiple means of engagement

Learners differ greatly in the ways they can be engaged or motivated, and that external factors can impact on this. Thus, teachers need to ask: How can, and will, our learners engage? In order to facilitate learner engagement, variability needs to be considered. A variety of elements can influence how learners engage, including neurology, culture, personal relevance, subjectivity, and background knowledge. The diverse needs of learners requires that numerous engagement strategies are employed to support every learner in every context. For example, some students may not be interested or ready to participate straight away. Some will tire easily because of the physical or cognitive effort involved in achieving the learning goal whereas others will look forward to the practical elements. If teachers provide multiple, intentionally designed options for engagement, then each learner is offered a way into their learning (CAST, 2024).

Multiple means of representation

Learners perceive and comprehend information presented to them differently. Thus, teachers need to ask; how will learners perceive the content presented to them and how can the content be best presented in a way that provides access for each learner to engage with learning? Like engagement, there is not a one-size-fits-all means of representation. Some will not have sufficient access through text and will process information better through visual or auditory means. Others will enjoy independently exploring the content. Some will work better if they can access instructions in stages as they work through the content or task (CAST, 2024, Flood & Banks 2021)(reference(s) for this part).

Multiple means of action and expression

Every learner navigates their learning environment and expresses what they know differently. Thus, teachers need to ask; how can learners best act on their learning and demonstrate their knowledge, learning, values, and skills? Are learners given the opportunity to show their best selves? There is no one means of action and expression. Rather, it is about being clear on the goal of the task and providing those intentional options to learners that enable them to achieve. Some will not know how to start a task or how to express themselves clearly, or they may be unable to plan their actions. Others will have a system for planning their actions and will easily craft an essay, project, or presentation to display

their knowledge. Some may be able to express themselves well in writing but not speech, and vice versa. Thus, if only one act of expression is offered to learners, they may feel they will not accomplish the task well. (Cast, 2024; Flood & Banks 2021) (reference(s) for this part).

Designing for Variability

For teachers, there may be a fear around inclusive practices and how to design for the inclusion of every learner in class sizes of up to 30 learners. UDL encourages moving away from a learning approach which focuses on? lesson design, in terms of ability and disability, to one which promotes? variability. Through this UDL mindset, learners are not labelled by their disability, social background, gender, race, and so on, instead the approach involves all learners? Variability recognises not only the diversity in a group of learners but also the variability within each learner. It considers the 'jagged profile' (Rose, 2016) as a more comprehensive way of identifying a holistic view of our learners' strengths and areas for support. This jagged-profile approach to variability pays attention to context and the environment that facilitates intentional design to remove barriers to learning.

Neurodiversity

Variability is a dominant feature of UDL because it is the dominant feature of the nervous system (Meyer, Rose & Gordon, 2014). Neurodiversity in UDL recognises that there is no single way that a brain will respond to the learning environment. Because there is no 'average' brain and therefore no 'average' learner, teachers need to stop planning, teaching, and assessing based on that idea. UDL recognises that there are goals which drive the nervous system. Thus, the brain is divided into three strategic networks (see Fig. 3) that the UDL principles were designed around:

- The Affective Networks (Engagement), which is the how of learning
- The Recognition Networks (Representation), which is the what of learning
- The Strategic Networks (Action and Expression), which is the why of learning.

Fig. 3. The three UDL strategic networks by CAST.

Affective networks:	Recognition networks:	Strategic networks:
The **why** of learning	The **what** of learning	The **how** of learning
Engagement	**Representation**	**Action & Expression**
For purposeful, motivated learners, stimulate interest and motivation for learning.	For resourceful, knowledgeable learners, present information and content in different ways.	For strategic, goal-directed learners, differentiate the ways that students can express what they know.

based on CAST

The UDL Guidelines, and associated checkpoints, correspond to the nervous system and brain structure in order to help teachers address the predictable variability in learning that will be present in any environment (CAST, 2018; Meyer et al., 2014).

Key aspects

The following three main sections – Planning, Teaching and Learning, and Assessment and Feedback – provide a general overview of how UDL supports inclusive teacher practices. Each section follows the same structure. Initially, we briefly outline how these key aspects are conceptualised within the UDL-framework. Options are then considered in order to deepen understanding of each topic with relevant examples on how to enact the three UDL principles for both in-person and digital learning environments. For modelling UDL-principles, two alternative tables (A and B) will be provided for the two settings (in presence and online/hybrid) respectively, from which the readers can choose according to their own needs and/or interests.

Planning

A key priority is to understand that UDL is goal driven. Teachers need to focus on the learning outcome of a particular lesson or indeed a unit of lessons. Only once the goal

is clear and specific to the learning outcome, can the teacher identify barriers to learners achieving this outcome. In other words? once these barriers are identified, teachers can then design their lessons to remove them. This may appear as an onerous task involving planning for each individual learner separately, however, this is not the case. As UDL is designed around the connection between the three learning networks of the brain, variability can be predicted, hence learning can be intentionally designed for (Myer et al, 2014). A practical example of this is planning a lesson to debate the pros and cons of the plastic bottle. The teacher knows the goal is to debate/form an argument. However, writing a paragraph on the topic is the required goal. Consequently, students now face a barrier as the lesson plan has not considered the variability of the learners. There are barriers for students who may find writing a challenge, might have dyslexia, may be slow writers, or for whom English is not their first language. In this case, the teacher can create specific choices or pathways for students (e.g., an oral or poster presentation or a written presentation) which is designed to offer them a variety of means to meet the goal of debating.

It is also important to note that to support variability in learners' options for Engagement, Representation, and Action and Expression must be integrated at the planning stage so that they can be put into practice at the later stages.

Tab. 1a. UDL-Planning for in-person learning contexts.

UDL-Planning for in-person learning contexts
UDL planning is goal-driven. That is, once the intended learning outcome for a unit of lessons is defined, teachers will then need to consider how to address their learners' variability to remove eventual barriers to its achieving (Meyer et al., 2014). To do that, teachers must guarantee accessibility of teaching and learning and design different options for their learners to choose from. This includes methods, materials and assessments used to teach the lesson. In-person situations allow for a variety of solutions, given that learners can interact both with their classmates and with the physical environment surrounding them. In the following, we will see how teachers can apply UDL to their planning for in-person learning contexts in relation to its three underpinning principles. Remember that planning is about anticipating variability and removing barriers. It is about naming and sourcing the strategies and choices for the lesson to be prepared and applying them to teaching, learning, assessment and feedback. A helpful resource for planning with UDL in mind is this step-by-step lesson planner (Posey, no date).

Engagement

Practical approaches to engagement in lesson design include:

- Making sure that the goal, and tasks specific to it, are clear
- Making sure the strategies and choices planned for support the learning goal
- Using/understanding learners' prior knowledge of the lesson. Plan time to facilitate this. Use connecting sentences such as

- 'Remember in our lesson on X we learned Y. What do you remember? How can we use the learning here/ We are going to use that learning now to x'
- 'Today we're starting a new topic. Has anyone heard of/seen X?'

- Check your lesson plan for any barriers to learners achieving the goal
- Include one or two strategies that will increase engagement in the lesson. Examples include:

- Choice boards to get students' interest
- Options for collaboration to sustain effort
- Options for self or group reflection for self-regulation.

Representation

Practical examples for Representation include:

- Prepare visual, auditory, and written options for perception

  - Captions

- A sign, symbol, or image that represents the topic, a word, or concept. Images might be a representative image or can be something more concrete. For example, when talking about the Renaissance in History paintings from artists of the time might be on the wall for discussion
  - A voice recording or short video describing the topic, word, or concept
- A readily available resource appropriate to the topic, word, or concept. This might be a Powtoon, an analogy, an appropriate expert/role model talking on the subject, or a virtual tour of an environment

- Prepare different ways learners can access instructions

  - Instructions are clearly laid out in steps with visuals where possible
  - Screencast offers students the opportunity to watch and listen to instructions with a demonstration
    - Short video recording
  - Online version of written instruction to support learner who use Text-to-Speech
- Plan in time for learners to process the instructions using the option that works best for them

  - Identify language that may require clarification and build strategies into plan

  - Glossary of terms (text, auditory, visual)
    - Peer-to-peer support
    - Contextualising language

- Providing graphic organisers as an alternative to writing for comprehension. Some useful tips on Graphic organisers are available here.

Action and Expression

Practical examples for Action and Expression include:

- Have clear goal orientated plan to support students' executive functioning

  - Checklists to provide structure direction
  - Rubrics to provide information on expectations clearly related to the goal
    - Clear deliverables

- Flexible ways to communicate and demonstrate learning specific to the learning goal

  - Write
  - Record
  - Draw
  - Build

- Identify and provide the tools for physical action

  - Technology
  - Relevant materials based on communication methods offered
    - Physical space.

Tab. 1b. UDL-Planning for digital learning environments.

UDL-Planning for digital environments

To properly implement UDL, teachers must guarantee accessibility of teaching and learning and design different options for their learners to choose from. This includes the methods, assessments and materials used to teach the lesson. Technology provides wide support for teaching and learning situations that can take place both in hybrid or blended contexts (in-person and online) and in asynchronous and synchronous contexts.

Digital technologies can support, enhance, and facilitate in each stage of the three UDL principles.

UDL provides a frame of work to help teachers in their planning, enabling them to include digital resources to support students in achieving the intended learning goals. It is important to note that the application and use of UDL principles do not require a mastery of all technologies and digital resources available in the market. Purposeful, user-friendly digital tools are widely available. The aim is to choose one at a time, and work with essential tools that best support the access to the content, the delivery method, appropriate and timely feedback, and student engagement as well as the opportunity for students to show what they have learnt through mediums that best support their expression.

Planning is about anticipating variability and removing barriers. It is about naming and sourcing the strategies and choices for the lesson to be prepared and applying them to teaching, learning, assessment and feedback. A helpful resource for planning with UDL in mind is this step-by-step lesson planner (Posey, no date).

Engagement

Practical approaches to engagement in lesson design includes:

- Careful choice of the tool(s) that is going to be used and for what activity it may be useful
- Build in time to show students how to use the tool(s) and explain what it is intended for and how they will be interacting with it
- Avoid choosing tools that can overlap specific purposes. For example, using two different apps for collaborative learning when they essentially address the same type of activity
- Set clear expectations for what, why and how the digital tools and environments are used. This addresses boundaries for communication and supports possible issues of online security
- In the online environment it is possible to break down objectives into self-contained areas to guide students to achieve the objectives. This "chunking" will not necessarily take the same time online as it would in-person. Students can access resources in and at their own time
- When preparing for online or hybrid teaching, it is convenient to consider students' learning experiences:

- Signpost and plan the different activities (provide checks in?, checklists, negotiate deadlines for draft work). This will also help students to learn how to self-regulate their learning
- Consider timing? In that some units can be covered over short periods, while others may require a slow build up over a longer period with some in-person guidance, peer work and support

- These learning experiences can include activities/assignments that provide:

- Teachers' input (actual teaching)
- Activities that students do independently
- Activities that provide opportunities for collaboration

- Make the activities goal-relevant and use digital spaces and tools to:

- Include opportunities to find information online that relates to their studies, e.g., real life connections, pictures, videos, stories
- Connect to aspects of personal relevance for students such as home, culture, and community
- Create a space where students can communicate their own views and opinions, always respecting those who may not feel confident or comfortable in open bigger forums
- Allow students to share own interests, when relevant and appropriate, so they feel confident communicating about things they care about
- Provide opportunities for students to collaborate and teach each other concepts or topics. This can be done in small groups, and then shared more widely. Always keep in mind the means of representation, and students' level of comfort in bigger groups intervention

- Always try to identify any possible barriers for student engagement: equipment, keyboards, connectivity, etc.

Representation

It is important to make content-related input comprehensible.

- Content-related text materials and resources are websites, digital texts such as word documents, presentation slides, webpages, online reading materials and worksheets, audio and video content. Two examples of what they can provide include:

- Digital texts which provide features that enable students to look up vocabulary, highlight key concepts, consult hyperlinks that make available more information
- Digital graphic organisers offer support in organising and executive skills by providing tools for students to think, gather and organise information using multimodal elements (such as graphics and audio) to amplify the information

- When using audio and video it is important to make sure that they do not contain extraneous information:

- Make sure that the speech is clear and that the pacing of the audio or video is appropriate
- Provide the appropriate amount of information. For example: focus on relevant aspects, trim videos if needed or create banks of websites you have assessed first (a resource bank)

- Content-related information is the information provided by the teachers when presenting and discussing content online. Important points to consider are to:

- Provide step-by-step instructions on what is expected
- Minimise superfluous information
- Avoid the use of slang, idioms, irony or sarcasm, as there may be students who struggle with meaning and nuance
- Be clear and consistent in and with the medium through which you provide instructions and related information, such as, setting expectations, describing assignments, providing criteria for grading
- Maintain clear and consistent feedback and responses to student questions

- Through the various means of representation, always bear in mind the cognitive load. It is preferable to plan for less than more. It is also important to advance one little step at a time.

Action and Expression

Digital tools are the perfect medium to give students varied ways to express what they have learnt.

- Incorporate multimodal forms of expression. Allow students to develop their expressive skills and demonstrate what they know using text, photos, graphics, audio, and video
- Address student anxiety and stress. Digital tools allow students to scaffold their work, by working independently or by sharing and supporting each other in pairs or small groups
- Provide timely feedback. For students with disabilities, language learners or different cultural approaches, providing ongoing support and feedback enables them to develop their understanding and ultimately reach their learning goals
- Provide alternative ways to demonstrate what they have learnt. There are digital tools that support oral and visual production, and students can scaffold their work to feel how they progress
- Provide clear rubrics that can be applied across multimodal production of work
- Scaffold assessment according to rubrics.

Teaching and Learning

Firstly, teaching and learning must take into consideration the student, environment, curriculum, context, cognition and emotions. When planning for choice and flexibility, teachers need to ensure that the options planned will work in practice. Thus, teaching and learning follows on from intentional planning with the intentionality continuing into practice. Teachers will have a range of choices they can include in their lesson. Nevertheless, the teacher must clarify the goal and then intentionally choose the options that will work best in a specific lesson and context.

Think about this in terms of a GPS on phones. When we enter the destination, GPS provides an option that allows flexible routes to reach the destination. Firstly, it offers modes of transport. Then, it offers a variety of route options and highlights barriers or challenges – such as delays along the route. Once the preferred route is chosen there are options to preview the route in advance, use the written steps, visual map, audio directions, or a combination of options. Once enroute, GPS will adapt the journey. For example, if there is an unforeseen barrier e.g., a traffic jam, GPS will offer the choice of staying on the planned route or taking an alternative one. Regardless of the means, routes, and detours taken you still arrive at your destination. This method can be similarly applied to UDL in terms of teaching and learning. Furthermore, remember that the 'current location' or 'starting point' will be different for every traveller, as are the travel choices made. However, the destination goal remains the same, reinforcing the intentionality of choice?

Tab. 2a. UDL-Teaching and learning in in-person learning contexts.

UDL-Teaching and learning in in-person learning contexts
UDL teaching and learning reflects, and puts into practice, the intentionality of planning envisioned in the framework to address learners' variability and create barrier-free learning environments. As shown in the previous section, this intentionality translates into the design of multiple options for Engagement, Representation, and Action and Expression. Teaching and learning is about implementing these options in class and making sure they actually work. This involves facilitating the lesson, monitoring, and feedback on learners' progress (Posey, no date).

Engagement

Practical approaches to support learners' interest, effort, and self-regulation are:

- When dealing with an argument, provide choices between different sub-topics; for example, discussing a specific region/country in Geography, different workstations (one per subtopic) can be organised in the classroom to explore different aspects: e.g., landscape, history of the region, tourism offer, gastronomy, etc.
- Provide varied materials – i.e., with different degrees of difficulties – to offer choice to learners in the perceived challenge
- Use collaborative work to engage learners in the learning process (and choices may be offered in this case, e.g., allow learners decide the roles they will take within small groups, define their own norms of collaboration, etc.)
- Allow learners to move around the classroom during learning and make sure they have free and easy access to the materials and resources they need. For example, let them decide where to sit, or stand, in the classroom while working on their assignments (e.g., sitting at the desk, on a carpet, on a cushion, standing, etc.)
- To emphasise the importance of the goals and objectives, plan a time at the beginning of the lesson to discuss them with learners
- Make sure learning outcomes are clear and always available to learners. They may be displayed in a variety of ways in the classroom (on a poster on the classroom walls, written on the blackboard, posted on a shared platform, etc.)
- Role-play activities (letting learners choose their role) and/or problem-solving tasks (letting learners choose how to approach them) can be organised to simulate real-life situations and support learners' engagement.

Representation

Teachers should present the information in varied formats (e.g., when introducing a new concept, unit, etc.) which resonate with learners' different strengths and preferences for processing information – such as a lecture, activity-based exploration, or demonstration (Jackson & Harper, 2006).
Practical examples for presenting lesson content in class include:

- Using the textbook/other written materials (be aware that digital materials/texts allow for more flexibility than printed ones, as they provide many opportunities to customise how the information is displayed – e.g., in terms of colours/contrast, font style, character dimension, etc.)
- Listening a podcast or an audio file (also from learners' own mobile phones)
- Showing a video
- Manipulating concrete/physical objects

- Using posters or digital presentations (PowerPoint, Canva) also including visual/graphical elements (e.g., images, symbols, etc.) to support verbal instruction.

Additionally, teachers should always ensure to provide alternatives for perception (visual, auditory, and written) and to support students' understanding and decoding of language, symbols, etc.

- Auditory alternatives to visual information include:

- Podcasts
- Audio registrations
- Text-to-speech

- Tactile alternatives to visual/auditory information include:

- Texts in Braille
- Concrete/manipulable objects
- Videos should have captions and/or written transcripts of their content

- Verbal instruction (or in general auditory information) should be accompanied by written and/or other visual/graphical support (e.g., images, symbols, etc.)
- Practical strategies to provide support for all learners' comprehension and understanding are:

- Taking time for highlighting the most important features/aspects – e.g., writing keywords or developing a mind map on the blackboard (both analogically and digitally)
- Offering glossaries with difficult and/or important words (also with their translations in learners' first languages if necessary)

- Providing visual/non-linguistic support for vocabulary clarification (e.g., pictures, videos, symbols, etc.).

Action and Expression

Teachers need to provide their learners with a range of different assignments/tasks and tools to ensure flexibility in the ways in which they can demonstrate their skills, understanding and knowledge.
Practical examples for this include:

- Assigning tasks that can be done/completed in different formats

  - by writing (essay, poem, article for a newspaper, drama-script, blog, etc.)
  - through oral presentations (e.g., in person, through audio or video recording)
  - creative assignments (e.g., creating videos, posters, comics, recording podcasts, etc.)
  - projects that involve physically constructing something
  - creating a mind-map and verbally presenting it.

- The list of available options may be displayed in different ways in class (e.g., on the white/blackboard, on a handout with a rubric specifying task objectives and expected outcomes, posted in a shared platform, etc.).

- Creating tasks that allow for different paces and with different degrees of difficulty (e.g., offering multiple texts with a range of difficulty levels). This also includes providing different scaffolding options such as:

o   individual charts to follow the activity flow
  o   guide sheets explaining procedures
  o   subdividing the topic area into subtopics
  o   access to a peer expert

- Making sure that technologies (general/assistive) are available and that learners have alternatives to physically interact with materials and resources (e.g., by hand, voice, single switch, joystick, keyboard, or adapted keyboard)
- Providing a range of support tools. Digital tools provide flexible and accessible instruments that enhance learners' performance and participation. Some examples of this are:

o   spell and/or grammar checkers
  o   word prediction software
  o   text-to-speech
  o   speech-to-text software and apps (e.g., Voice Note)
  o   note-taking apps (e.g., SoundNote, Notability)
  o   concept mapping tools (e.g., Popplet).

Tab. 2b. UDL-Teaching and Learning in digital learning environments.

UDL-Teaching and learning in digital environments
UDL teaching and learning puts into practice the intentionality of planning envisioned in the framework to address learners' variability and create barrier-free learning environments. As shown in the previous section, this intentionality results in the design of multiple options for Engagement, Representation, and Action and Expression. Teaching and learning is about implementing these options and making sure they actually work. Technology enables people to meet and connect together synchronously (Zoom, Google Hangouts, Skype, Google Docs) and also allows students to work in their own time and place independently with asynchronous tools (Google Classroom, Seesaw, Edmodo, Canvas) and support hybrid and blended situations as well.

Engagement

Practical approaches to support learners' interest, effort, and self-regulation include:

- Ensuring learning outcomes are clear and always available to learners. Make them accessible and prominent in the learning platform you work with (Moodle, Blackboard, Edugo)
- Providing online bulletin boards such as Miro or Padlet which can illustrate information in a visual, written and collaborative way that enables students to choose between different sub-topics within a main topic. These boards can be used synchronously and asynchronously for teachers to provide banks of resources; students to engage in brainstorming, and sharing in a visual, written and audio form
- Providing varied materials – i.e., with different degrees of difficulties – not just in content but in format, scaffolding information to offer choice to learners while addressing the challenge. This can be done in written, but also through audio or visual formats (Screencast-O-Matic, Screencastify)
- Enabling learners to decide when and how they will be engaging with materials and completing tasks. Use asynchronous tools that will facilitate working independently and enable a check point with peers and with tutors. Tools for teleconferencing (Zoom) or student interaction (Google Hangouts) will facilitate both independence but with a link to collaboration with peers and access to the teacher
- Stressing the salience of goals and objectives, as well as planning (and recording) an introduction at the beginning of the course and in every lesson. Providing captions and transcripts (Screencast-o-matic.com, Zoom)
- Implementing role-play activities and/or problem-solving tasks to simulate real-life situations and support learners' engagement. Students can practise online and then record themselves or record and picture from around them and post them (Padlet, Miro).

Representation

Teachers should present the information in varied formats (e.g., when introducing a new concept, unit, etc.) which resonate with learners' different strengths and preferences for processing information – such as in the case of a lecture, activity-based exploration, or demonstration (Jackson & Harper, 2006).
Practical examples for presenting lesson content in class include:

- Using the textbook/other written materials with hyperlinks, vocabulary support, in audio and written form, using touch screens that allow to increase and change font size and font and background colour (Genial.ly)
- Listening a podcast or an audio file
- Showing a video

- Using narrated digital presentations (PowerPoint, Canva) including visual/graphical elements (images, symbols, etc.) to support.

Action and Expression

To ensure flexibility in the ways in which learners can demonstrate skills, understanding and knowledge, teachers need to provide them with a range of different assignments/tasks and tools they can choose from.
     Practical examples for this include:

   • Assigning tasks that can be completed in different formats. Students can create their own stories in written format with built in text-to-speech support, image options and graphics (Book Creator), and other tools that can be used to produce final work or for scaffolding writing towards producing longer texts
   • Provide a choice of tools that enable students to produce oral texts with visual aids for activities such demonstrating concepts, producing a professional looking product, interviewing peers, etc. (Voicethread, Explain Everything, Adobe Spark, Easel.ly)
   • Provide help for students to organise their ideas and information for stories, writing assignments, and science lab reports prior to writing (MyStudyBar, Readwritethink Storymap)
   • Plan carefully how to share the rubrics so students are tested and feedback on their progress to achieve the intended learning goals.

Assessment and Feedback

When the teacher is clear about the lesson? goal, and has facilitated flexibility and choice of how to learn, providing choice and flexibility in how to communicate this learning is a natural step. Assessment from a UDL lens means that teachers need to think about assessment and feedback from the students' perspective. They need to ask how learners can best communicate through language or actions, and facilitate their understanding, knowledge, skills, and values around the learning experience. The objective of an assessment is often a written exam. However, if the goal is not necessarily written?, then a written exam can be a barrier for many learners, with the result that teachers do not fully capture the learners' capability. By offering learners more choice such as writing or presenting an oral presentation, creating a movie or podcast, role play, learners can present their work in a way that best suits their needs and ability. An example of this is assessing a lesson on character development. The default mode of assessment would be to ask learners to write a paragraph or essay outlining how the character has developed throughout the play. However, if the teacher is clear about the learning outcome – understanding character development – then it becomes clear that just writing alone can be a barrier. Thus, the teacher intentionally offers other assessment choices; the learner can choose to write, role play, or create a poster. What if a learner approaches and asks for a fourth option, to do a comic strip. While it wasn't an intended choice it supports achieving the specific learning objectives. The outcome is that the learner can express their knowledge and learning according to what suits them. The teacher then learns the competency level of the learner and can readjust expectations or offer support based on this new understanding, rather

than what they previously demonstrated/attempted?. Additionally, the teacher may learn of a talent or interest of the learner that can be used to engage them in further learning experiences.

This example also highlights the value of feedback, particularly from students / and the importance of student input? When students feedback to teachers and the teacher acts on this feedback, it communicates to the learners that they have a voice in and responsibility for their own learning. It is important that feedback, like assessment, is formative which can be teacher or student led. Finally, it is important that feedback is constructed to support and challenge learners in a learning process, and not label their general learning competency based on a specific moment in time.

Tab. 3a. UDL-Assessment and Feedback in in-person learning contexts.

UDL-Assessment and feedback in in-person learning contexts

CAST (ref) highlights that methods and materials used in assessments often require skills and understanding that are not relevant to measure learners' knowledge, skills, and abilities, but which may also pose barriers. As such, they should be minimised by providing learners different supports and options on how to demonstrate what they have learned. Once the learning objectives – and thus the focus/construct for the assessment – are clear, then there can be flexibility in the assessment options insofar as they align to and measure the intended goals/constructs.

Thus, applying the three UDL principles to assessment means offering flexible options in how the assessment is represented, how learners can show what they know, and how they engage in the assessment process (CAST, 2015). This applies both to formative and summative assessments. However, UDL puts particular emphasis on the importance of formative assessment as an essential part of the learning process, insofar as it is intended to monitor learners' progress and to inform and adjust instruction during its course (Meyer et al., 2014). This kind of assessment is not only is useful for teachers to collect evidence about their students' progress, but importantly, allows students themselves to learn about their own performance and that of their peers. In this way, they become a proactive part in monitoring their progress and are encouraged to take responsibility for their own learning.

Feedback plays a crucial role in this respect and constitutes a key feature of UDL for addressing learners' variability. By being goal-oriented, relevant, timely and specific it is indeed meant both to guide each learner towards mastery and to inform teachers' instructional practice.

Engagement

Increasing learners' engagement in assessment can enhance their performance. Practical strategies to do this include:

- Involving learners in the choice of the ways they are going to be evaluated (e.g., allowing them to come up with new ideas/suggestions). For example, provide them a list of options and the last point should include this question: 'Do you think you would best complete the task in a different way? If so, discuss your idea with the teacher'
- Taking time to discuss with them the importance and the value of the evaluation (linking learning goals and objectives and assessment)
- Creating authentic/relevant/problem-solving tasks for assessment
- Explicitly expressing confidence that learners can meet high expectations
- Providing different degrees of (perceived) challenge in assessment tasks (e.g., providing different questions/topics so that students can choose the one they feel most prepared on; providing different response formats, etc.).

To engage learners in the learning process, ongoing, relevant and mastery-oriented feedback is also essential. Opportunities for feedback are:

- Teacher-to-student. Plenty of opportunities exist in class for teachers to provide feedback to their students during and after learning activities. Practical examples for this are:

  - Orally during/after an activity/assessment
  - Written after an activity/assessment (planning a time to discuss it together in person/in class)

  - Through informal check-ins
- Student-to-student. Use the peer group as a source of feedback; for example, this can be done at the end of an oral presentation asking the class to provide feedback on the performance, or in a shared platform online where the students post their ongoing works/projects and give and receive feedback from the others

- Student-to-teacher. Receiving feedback from the students allows teachers to reflect on what was done and eventually rethink and redesign strategies and activities. For example, at the end of each lesson, teachers can ask learners to give feedback on their progress (in whatever form they feel more comfortable with – orally, written, noted on a self-assessment journal, via mail/message, etc.).

Representation

Applying the principle of Representation to assessment means considering how the information and content of the assessment task are presented.
Options for presenting assessment items and instructions include:

- written (printed and/or digital)
- audio
- video
- mind map.

Alternatives for perception (visual, auditory, and written) and support for understanding and decoding of language, symbols, etc. should be offered in assessment too. Strategies for this include:

- Record and post the description of the given tasks/assignment to allow learners to listen to it again
- Providing graphical/visual support to written instructions
- Offering glossaries explaining keywords.

Action and Expression

To get accurate data regarding students' knowledge and capability, teachers should provide multiple means of response and multiple opportunities in varied media for them to demonstrate their skills, understanding and knowledge.
For example, written assessments may allow different question/answer formats, such as:

- Multiple choice
- Fill-in-the-blanks
- Short answer
- Analysis questions
- Essay questions.

However, if written production is not the measured construct, then alternatives should be offered to complete the assignment. These may include:

- writing a text/document
- preparing a presentation.
- creating a video
- recording a podcast
- creating an infographic
- drawing.

UDL assessment also provides support on construct-irrelevant dimensions. Examples of different support tools and scaffolds are:

- text-to-speech and speech-to-text
- hyperlinked multimedia glossaries
- online translators and spell/grammar checkers
- word prediction software
- calculators
- rubrics or checklist specifying relevant components
- models/templates
- graphic organisers.

Tab. 3b. UDL Assessment and Feedback in digital learning environments.

UDL-Assessment and feedback in digital learning contexts

CAST highlights that methods and materials used in assessments often require skills and understanding that are not relevant to measure learners' knowledge, skills, and abilities, and which may also pose barriers to learning. As such, they should be minimised by providing learners different means and a variety of options to demonstrate what they have learned. Once constructive alignment (Biggs 1996) and working through content provides a clear idea on how students can be assessed, the assessment is measured and the means of assessment production are supporting expression and individual needs. Thus, applying the three UDL principles to assessment means offering flexible options (and therefore choice) in how the assessment is represented, how learners can show what they know, and how they engage in the assessment process (CAST, 2015).

Feedback constitutes another key feature of UDL for addressing learners' variability. By being goal-oriented, relevant, timely and specific it is indeed meant to guide each learner towards mastery.

Engagement

Increasing learners' engagement in assessment can enhance their performance. Practical strategies to do this include:

- Involving learners in the choice of the ways they are going to be evaluated (e.g., allowing them to come up with new ideas/suggestions). Communicate this idea orally and in writing, and post in a clearly designated area within the syllabus and within the learning environment so that students can access it? synchronously (Zoom, Google Hangouts) or asynchronously (Google Classrooms, Blackboard, Moodle)
- Once students are clear on the why and when of the assessment (linking learning goals and objectives and assessment), propose tools that best suit them to prove their learning, in written, or an interactive electronic page, or through video, or written text with audio support (Microsoft Word or Powerpoint, Flip, Genial.ly, Pecha Kucha)
- It is important to create authentic/relevant/problem-solving tasks for assessment that have a meaning in the "real-world"
- No matter what tool or medium in which the assessment takes place it is important to provide different degrees of (perceived) challenge in assessment tasks and make sure there is a system to check in progress or allow consultation
- Feedback opportunities can be provided both via synchronous tools (Google Docs, Zoom) or asynchronously (Email, Forums, Voicethread, Flip).

Feedback is very important at every step of the course and in any lesson, in particular in online environments where physical presence of the teacher is reduced, mechanisms for following up, checking and supporting progress are needed.

Representation

Applying the principle of Representation to assessment means considering how the information and content of the assessment task are presented.
Options for presenting assessment items include:

- written (Microsoft Word, Book Creator)
- audio/video file; teachers may also record and post the description of the given tasks/assignment to allow learners to listen to it again (Voki, Lingt, Flip)
- mind map (MindMup, Readwritethink Storymap).

Action and Expression

Provide different options to complete the assignment:

- writing a text/document (Google Docs, Microsoft Word)
- preparing a presentation (PowerPoint, Prezzi, Canva)
- creating a video (Flip)
- recording a podcast (Soundtrap)
- creating an infographic (Infogram).

Written tests may allow different question/answer formats (Google Forms, Moodle and Blackboard assessment tools), such as:

- Multiple choice
- Fill-in-the-blanks
- Short answer
- Analysis questions
- Essay questions.

Both in-person and online (blended, hybrid, asynchronous or synchronous) teachers should always plan for different support tools to reduce the measurement of construct-irrelevant factors.

Closing

We began this chapter introducing UDL as a 'shift in mindset' which proposes the proactive and intentional design of learning environments which are responsive to learners' differences. Inclusion and participation in learning is thus enhanced in this framework via the design of methods, materials and assessments used to teach the lesson that are flexible and accessible for all learners. The focus on the accessibility of teaching and learning constitutes indeed a key feature of the UDL approach and reflects a shift of perspective from what students can/cannot do (with respect to the "average") to the contextual barriers that may prevent them from succeeding in learning. This marks a pivotal change, insofar as it implies the recognition of the role of the environment in hindering learning progress and learners' active engagement in it, moving beyond labels and categories (and thus overcoming a medical/deficit-oriented perspective on disability and difference; Meyer et al., 2014). Moreover, the emphasis on flexibility and choice enables the implementation of a differentiated instruction – and thus individual learning paths – for all, avoiding the risk for some children of being stigmatised for their need of special accommodations.

In this sense, the UDL framework can be seen as a driver of inclusion and equity. The inherent flexibility and choice allows a more equitable education by acknowledging,

embracing and celebrating students' unique identities (with all their intersections) and providing them with all they need to succeed in their learning (Chardin & Novak, 2020).

At the beginning of this chapter, we set out three questions to answer for teachers. The next step is for you to ask and answer this question in relation to your practice: 'How can I use UDL to support and challenge the learning of every student in my classroom?'

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

https://book.all-means-all.education/ama-2025-en/?p=144#h5p-7

Closing questions to discuss or tasks

- How does viewing UDL as a "shift in mindset" from deficit-based approaches to removing contextual barriers change the way you design and implement lessons?
- Looking at the example case provided, which specific UDL modifications (e.g., choice boards, alternative formats, varied assessment methods) do you believe most effectively bridge the gap between traditional and UDL-informed teaching?
- Considering the emphasis on formative feedback in the chapter, how can you use both student and peer feedback to refine and adapt your UDL practices over time?
- Reflect on a previous teaching experience where student engagement was lacking. Using the UDL framework, analyze what might have caused the engagement gap and propose concrete strategies or adjustments to overcome these barriers.
- Develop a plan for incorporating ongoing formative feedback into your teaching practice. Outline how you will collect, analyze, and act on this feedback to continually improve accessibility and inclusion in your classroom.

About the authors

Margaret Flood

Dr Margaret is an Assistant Professor in Inclusive Education and the MAP Academic Advisor for the Education Department. Her experience in inclusive and special education includes teaching, teacher professional learning design and delivery,

policy development and curriculum design. She is a leading expert in UDL. Margaret's research interests include contextual dimensions and the role of teachers in inclusive policy and practice enactment, teacher engagement with professional learning for inclusion and student voice. As a Fulbright Scholar, in 2021 Margaret worked with Lynch School of Education and Humanities at Boston College and CAST to explore equity, diversity, inclusion, and social justice through the lens of UDL. Margaret is the creator and host of the Podcast 'Talking about all things Inclusion'.

Anna Frizzarin

Anna Frizzarin has a PhD in Pedagogy and Didactics and works as a researcher in the field of inclusive education. Her research focuses on inclusive teaching and learning, inclusive development processes of educational contexts, attitudes and social representations in relation to perceived diversity and the resulting implications for students' participation in schools.

María Pilar Gray Carlos

María Pilar Gray Carlos was born and raised in Spain but spent over 20 years living and working in the United Kingdom, where she built a distinguished career in higher education. Her primary role was at the **University of Reading**, where she implemented, managed, and coordinated the Spanish program at the Institution-Wide Language Centre. Under her leadership, the Spanish program became one of the most successful alongside French and Mandarin Chinese.

Pilar also held notable academic roles as a visiting lecturer at **Oxford University** and as an external examiner for Spanish programs at the **University of Manchester** and the **University of Sheffield**. Beyond teaching, she contributed to university-wide initiatives, including the **Electronic Management of Assessment (EMA)** project, which streamlined and digitized the submission and evaluation of assessments across all schools and programs at the University of Reading.

Pilar holds a **BA in English Literature and Linguistics**, an **MA in Translation**, and an **MSc in Digital Education**, reflecting her commitment to both language and technology-enhanced learning.

Currently based in Spain, she has worked as a consultant for online Spanish language teaching start-ups and as an associate professor of Spanish at **IE University**. Currently she teaches part-time at the **Universidad Autónoma de Madrid** and the **Universidad Internacional Menéndez Pelayo**.

Her career has been enriched by her dedication to social impact. Pilar has worked on community development projects in Mexico, raised awareness about endemic violence against children and women in the Middle East (Lebanon, Syria, and Jordan), and created

programs for Spanish learners to enhance their language skills while participating in development projects with communities in Nicaragua.

Her current focus is on exploring the impact of technology on teaching and learning, particularly how shifts in delivery methods influence pedagogy, methodologies, and the experiences of educators and students.

COOPERATIVE LEARNING

Example Case

Two teachers, Nick and Eva, are in their office discussing their day in the classroom.

Nick: *"Today, I organised my class into 3 groups and asked them to work together and answer 3 questions about the impact of the pandemic on education. I don't know why but the groups didn't cooperate very effectively and in addition it took them too long to make decisions and come up with conclusions. Even when they decided and answered the questions on the worksheets, all of them were reluctant to present their work and the conclusions. Maybe next time they should work in a different way. They don't like working in groups at all".*

Eva: *"I am not sure about that. How many students are in your class?"*

Nick: *"Twenty-four."*

Eva: *"As I know, it's not very effective to work in large groups, especially if you want to work in the classroom within a certain time period. Smaller groups work more effectively. I usually organise groups between 3-4 people. I also make sure that everyone's role is clear from the beginning. For example, one student can take up the role of secretary, another can be the presenter, etc. In this case their roles are defined beforehand, and they don't waste too much time deciding on their responsibilities during the activity. Also, I always consider the skills and interests of my students when organising teamwork in the classroom."*

Nick: *"Oh.. Can you explain that? How do you arrange groups in that way?"*

Eva: *"I always make sure to create heterogeneous groups based on the skills and interests of*

the students. In this way, each of them complements the other, they help each other and the team works more effectively. Why don't you try it next time?"

Nick: *"I think you are right. I will try to arrange teamwork in my classroom next time in a different way. Thanks for the advice."*

Initial questions

In this chapter you will find the answers to the following questions:

- What is cooperative learning?
- What is the difference between group work and cooperative learning?
- What are the benefits of cooperative learning?
- What is the role of students in cooperative learning?
- What is the role of teachers in planning cooperative learning?
- How can equal participation be ensured in cooperative learning?

Introduction to Topic

Cooperative learning is the instructional use of small groups through which students work together to maximise their own and each other's learning (Johnson, Johnson, and Holubec, 1994). It can be defined as a variety of classroom management techniques in which students work in small groups on learning activities and receive evaluations based on achievement (Comoglio & Cardoso, 1996). Cooperative learning is related to collaborative learning, which emphasises that learning occurs as an effect of community (Johnson & Johnson, 1999). It is, however, contrasted with individualistic and competitive learning in which students work by themselves to accomplish learning goals that are not related to others, and compete with each other for grades (Johnson, Johnson, and Smith, 1998). Specific characteristics define interactions among students during a cooperative learning process, which is not only forming groups to discuss a topic or study a lesson, urging students to help each other, or assigning a written task to complete with a group work

(Comoglio & Cardoso, 1996), instead, it implies a change of both students' and teachers' roles, together with careful planning of time, space, materials and assignments.

Key aspects

From a teacher-centred to a learner-centred approach

Besides considering cooperative learning as a specific method, it can be seen as an aspect of a wide educational movement that promotes the development of learning settings as communities where cooperation and learning are strongly intertwined. Characterised by a long history, a prolific research and theoretical elaboration and vast literature, cooperative learning considers the relationship as an indispensable variable of the learning process (Comoglio & Cardoso, 1996).

Within this approach, the preservation of peer interactions as a means for knowledge co-construction requires that hierarchical teacher-student relationships are questioned. This means taking into account the issue of power in classrooms.

In teacher-centred classrooms there is a hierarchical relationship between the teacher and the students. Power is distributed asymmetrically: the teacher is expected to have control on interactions and consequently limit productive discussions with and between students.

Changing from a teacher-centred to a learner-centred classroom model does not mean that there is no difference of responsibility between teachers and students. In this case, the teachers' authority is not used anymore to take control, but to construct a space of participation for all. It is a responsibility of teachers to find a way to use the power of their role to promote a democratic learning environment, instead of perpetrating hierarchies (Hooks, 1994). The shift from a teacher-centred model of learning to a learner-centred implies several changes in the classroom practice, as represented in Table 1.

Table 1:

Teacher – Centred	Learner – Centred
Teacher is the only leader	Leadership is shared
Management means control	Management means guidance
Teacher talks and students listen	Teacher is a model, students interact with each other and interact with the teacher
Students work alone	Students work in pairs, in groups, or alone depending on the purpose of the activity
Teacher monitors and corrects every student statement	Students talk without constant teacher monitoring, teacher provides feedback/correction when questions arise
Teacher answers students' questions	Students answer each other's questions, teacher consults and moderates
Teacher chooses topics	Students have some choices of topics
Teacher evaluates student learning	Students evaluate their own learning, teacher also evaluates students' learning
Teacher is responsible for organising the class	Students collaborate with the teacher to organise the classroom
Rules are set by the teacher	Rules are negotiated in the group
A few students support teachers in classroom management	All students have the opportunity to actively contribute to classroom management
Students are allowed limited responsibilities	Students share responsibilities in the classroom
Classroom is quiet	Classroom is active

Table adapted and modified from Rogers and Frieberg (1994: 240)

In a cooperative learning setting the teacher delegates part of one's own power and authority in favour of students' multiple learning centres. This requires that the teacher goes beyond the concerns of losing control, to question existing structures and teaching methods. This means moving from an education in which the knowledge is transmitted only by the teacher, and students have just to receive and memorise the contents, to an idea of education in which learning is a research process with students having an active role. Instead of being just passive receivers of knowledge, they are now critical researchers, in dialogue with the teachers, who are also learners and critical researchers themselves (Freire, 1970).

In this way, teachers are thus required to be in an educational space of higher complexity, where great importance is given to the relationship between all learners. It means that they are active and support students to be more responsible, making the achievement of cognitive, emotional and motivational goals possible. According to Cohen (1994) if the

teachers delegate authority, there are more learning centres in operation, the percentage of students talking and working together is higher, and consequently the average learning results are increased. Students' talking and working together at multiple learning centres ensures higher learning gains.

Cooperative learning vs. simple group work

In literature, two of the most well-known authors on cooperative learning, Johnson and Johnson (1999), have identified five elements that help teachers understand when cooperative groupwork is really promoting learning processes. In this sense, "cooperative learning is the instructional use of small groups so that students work together to maximise their own and each other's learning" (Johnson et al, 1994: 812). The first characteristic of cooperative learning, and probably the most crucial one, is positive interdependence. It describes the situation where students depend on each other in the sense that they feel the work they are doing together is better than the work they would complete alone. And at the same time, everyone feels part of the group's success. The second element is about group and individual accessibility. It describes how, when cooperative learning is working in a successful manner, each member feels simultaneously responsible for the group and for their own learning process. The third principle is being face to face, promoting interaction. This means that, if cooperative learning is happening, students are really working together. Their joint task does not have the structure of a chain work, with single steps done by single students that are then assembled together. Instead, students share materials, encourage and help each other, and discuss; in brief, students construct knowledge together. In order to do that, students need to develop interpersonal skills, which is the fourth principle. For example, they need to learn how to listen to each other, but they also need to learn how to constructively critique the work being done and learn how to make joint decisions. This is why it is important that, when we practise cooperative learning, social competencies are a main focus which needs to be explicitly learned. Students need time to understand which behaviours are related to some specific social competences and need time to try these behaviours and to reflect on them. Lastly, the fifth element is about group processing. Here the group moves to a metacognitive level. Group members reflect on their own learning process, looking both at how they are managing the content-related task of the group work, but also looking at the way they are maintaining the relationship and their collaboration.

Students' benefit from cooperative learning

Cooperative learning is an effective strategy that contributes to the development of a wide range of social, emotional, and cognitive skills. Many researchers have explored the impact of cooperative strategies on learning during the last decade, and their benefits to students are well-documented in literature.

Research consistently indicates that when students work cooperatively, they are more

open to diverse ideas, not always coinciding with their own on many matters. Cooperative learning facilitates students to discuss, exchange ideas, and listen to their classmates' points of view. This process contributes to the enhancement of their oral and active listening communication skills (Al-Tamimi & Attamimi, 2014; Kirbaş, 2017; Namaziandost et al., 2019).

Furthermore, during cooperation and discussions, students realise that their classmates may have the same or different ideas and feelings towards the issues discussed, thus recognising the diverse aspects existing in their classroom. When students are able to understand their classmates' emotions, and can easily understand each other's points of view while working together, their empathy increases. Interestingly, cooperative learning was found to significantly reduce bullying among students, due to an increase of empathy (Van Ryzin & Roseth, 2019). While cooperating, social interactions are strengthened and increased, and socialisation is promoted . Students and teachers, build positive relationships during their cooperation to accomplish projects and assignments promoting a positive classroom climate and increasing wellbeing amoung students.

Besides the interpersonal skills developed in cooperative classrooms, students also become efficient in intrapersonal skills. When working together, they learn to offer suggestions and solutions to problems that occur, they learn to defend their opinions while respecting their classmates, and take responsibility for the tasks they work on. Therefore, self-confidence and ownership increase, benefiting students who work together cooperatively. In addition, when students can understand their own emotions and how these emotions influence their behaviour during groupwork, their self-awareness is enhanced.

The benefits from cooperative learning are not only related to social and emotional outcomes (Ferguson-Patrick, 2012). Empirical evidence demonstrates that students working cooperatively gain better academic outcomes in most subjects compared to those working individually in classrooms (Hsiung, 2013; Johnson & Johnson, 1987) and they also display more independent learning when studying (Slavin, 2010). High-order and reasoning thinking is especially promoted, when students work on challenging and demanding tasks (Gillies, 2014). Gillies and Haynes (2011) found that students exposed to challenging questions during cooperative learning offered more complete and detailed answers than those working individually. Furthermore, the implementation of cooperative learning was found to develop students' critical thinking in reading (Devi, Musthafa & Gustine, 2015) and also enhance problem-solving in elementary and secondary mathematics (Slavin, 2013; Slavin & Lake, 2008). In general, recent reviews show that when students are engaged in inquiry-based cooperative learning, they develop content knowledge and a rich repertoire of skills including cognitive, social, and emotional skills (Barron & Darling-Hammond, 2008).

Having said that, it is evident that successful cooperative learning can lead to significant cognitive, social, and emotional competences on both intrapersonal and interpersonal levels. Students engaged in cooperative learning can easily understand when you work

together you can achieve more. In inclusive classrooms, the respect towards diversity is one of the top achievements for successful cooperation.

The contribution of cooperative learning to a democratic inclusive classroom

For an inclusive classroom, participation and valuing diversity are crucial. This is only possible in a democratic classroom environment that views school as a community where students can develop respect and a sense of justice (Ferguson-Patrick, 2012). It implies a transformative understanding of education in the sense that it connects change in education with a broader change in society.

Participation

Through cooperative learning, students participate in activities collaboratively. They learn to co-construct knowledge through interactions. It is necessary to listen and support each other and to interconnect the different forms of previous knowledge. When working on tasks, students may need to explain their opinions and ideas to their peers, thus feeling that they are positively dependent on each other and that the learning experience as a group can be more successful than on an individual level. This promotes the development of a sense of belonging within the group.

In cooperative learning, the motivation to express one's own thoughts is encouraged, and through collaborative dialogue different students' perspectives are equally valued. Participation of all can flourish in a cooperative classroom.

Valuing diversity

Democratic classroom interactions require practices of respect, acknowledgment, and recognition of equal worth. In cooperative classrooms, all students' voices are equally heard and mutually respected.

Working in groups, students learn to discuss and negotiate varied topics in different group settings. They also learn to deal with diverse opinions and find ways to accomplish their group work. At the end of group activities, they have the space to reflect on their working process and learn how to give and receive constructive feedback. This may have a significant impact on their ability to manage conflicts and lead to a more democratic classroom.

Democratic classroom for a democratic society

It can be helpful to see the classroom as a mirror of society. The historical, social, economic, and political structures of society influence students' opinions and relationships in the classroom. Social patterns are reconstructed and have a greatly impact the behaviour of students. For a democratic stance in society the experience of a democratic class culture is crucial. Teachers can act as advocates promoting equality, freedom, and justice, and be a model for their students in taking responsibility for their actions in the classroom and in society. If students learn to be open-minded and understand the points of view of others, they are more likely to respond to diversity and develop civic and social engagement.

They are encouraged to stand up for themselves, but also for other students, and practise civil courage through intervening in situations where students experience discrimination. By means of cooperative learning, classmates are active protagonists of their learning community and can develop the commitment to shape it together. In cooperative classrooms participation is increased and there is less space for exclusion.

The role of teachers in successful cooperative learning for all

Teachers have different tasks, and each one is very important for a successful cooperative learning environment. In fact, teachers are still taking responsibility, in the sense that they create space and structures for students participation in the classroom. Firstly, teachers are designers and organisers of the learning environment and learning units. Together with the students they arrange the classroom in a way that encourages dialogue in an open space. Secondly, teachers are facilitators and moderators. When students are working in small groups teachers promote positive relationships and interactions. Furthermore, they have the role of consultants, advising students when needed. As role models they act in a responsible way in front of students, in the sense that they act coherently with what they say.

Teachers promote equal participation and are aware of their own power and authority in the classroom. They listen to all voices equally and reflect on their own actions in order to become more aware of their own prejudices. Dewey (1938) goes further and suggests that teachers are agents of change that contribute to improve and reshape society founded on democratic values. The classroom can therefore be seen as a microcosm of our wider society. This requires, firstly, a rethinking of the role of the teachers, who acknowledge their own role as a teacher-adult and at the same time carefully avoids setting up a hierarchical and transmissive relationship with students. Instead of reproducing hierarchies they try to reduce them and to contribute to the students' emancipation.

In fact, leaving learning and socialisation processes fully in the students' hands would not be beneficial in terms of emancipation. There is a risk of failing to overcome the problem of "consciousness between the oppressed and the oppressor" (Freire, 1970). Freire promotes a form of authority built within a cooperative group, where teachers and students together decide how to work. This facilitates the recognition of each one as a resource for the group and promotes a habit of living and deciding together. In this context, practices such as the children's parliament or students' assembly become fundamental. Additionally, teachers should be aware of the diversity in the classroom and of students' different experiences that may influence their attitudes towards school. Differences in society may turn to inequalities, and being aware of discrimination can help when understanding the dynamics of the classroom and students' behaviours. Especially, the acknowledgement that everyone has unique experiences of discrimination that can be intersectional is important. Students may be affected by different forms of discrimination at the same time (racism, classism, ableism, homophobia, etc). A heterogeneous classroom also requires teachers to be aware of geopolitical and historical events which have a great impact on social identities

of the students and their relationships. If we see the classroom as a microcosm that reflects society (Dewey, 1938), we will have a better understanding of relationships among students.

The role of students in successful cooperative learning for all

For a successful cooperative learning the enhancement of inter- and intrapersonal competences is required and these foster the students' role.

Interdependence and common responsibility

Students are responsible both for their individual task and the group's work. They help and encourage each other, trying to ensure that everyone learns effectively. Due to cooperative interactions an increased autonomy is promoted.

All students exchange information, materials, and accomplish the task together, growing their collaborative culture and limiting the effects of a competitive educational setting. In this environment, help and support are positive and support everyone's efforts to contribute to the common goal.

Some structures can support the feeling of interdependence (Johnson & Johnson, 1987; Johnson, Johnson & Holubec, 1998):

- Interdependence of purpose: students share a final goal, which can be the production of a drawing, a poster, or studying a specific topic, etc.
- Role interdependence: students play different roles that contribute to the accomplishment of the work.
- Interdependence of information and resources: students share information and resources with each other.
- Identity interdependence: students identify their group with a name or slogan.
- Fantasy interdependence: students imagine a fantastic scenario to set their work, together with the motivations of their choice.
- Context interdependence: the way students occupy the space encourages them to stay together. In this case the organisation of the environment is clearly explained by the teacher.
- Interdependence of evaluation: the evaluation of the group is based on each students' contribution.
- Celebration interdependence: students "celebrate" the successful achievement of the goal, enhancing the sense of belonging in the group.

Learning to do (and to be) with others:

In a cooperative group the leadership is shared among the students and they can all take up different, but equally necessary roles during the group work.

Here are some examples:

1. *Task Roles*

   - Speakers present the group's work.
   - Synthesisers take notes of the ideas emerged in the group.
   - Verbalisers write decisions made by the group.
   - Visualisers recap the ideas with drawings, concept maps, diagrams etc.
   - Readers read aloud the material provided by the teacher.

2. *Maintenance Roles*

   - Moderators manage the discussion.
   - Participation trackers facilitate group interactions, encouraging participation.
   - Time Controllers monitor the group's work progress on the planned timelines.
   - Voice Volume Controllers check the volume of the group members' voice.
   - Materials managers organise the materials to accomplish the activity.

In cooperative learning, students are committed both to achieve task-related goals and to foster positive relationships. They care about the difficulties and weaknesses of peers, celebrate their success, support each other with feedback and messages of appreciation and encouragement, since everyone's contribution is indispensable.

Due to direct and open communication among classmates, students learn to manage conflicts and solve them constructively, in order to make common decisions for the accomplishment of the work (Comoglio & Cardoso, 1996).

Planning cooperative learning

Teaching refers to a set of delineated actions that are organised during the design of the lesson plan before it takes place. Teachers who decide to implement cooperative strategies in their classrooms should know a variety of factors that may influence the learning of their students and the teaching process.

Plan the objectives of the learning unit:

One of the most important steps in designing a learning unit is to define its objectives, taking into account the content and what the students should learn and achieve at the end of it, both at the subject-related level and the socio-emotional goals. Objectives should be content-based and aligned with the desired students' outcomes to be achieved at the end of the cooperative learning. Precise objectives facilitate teachers to organise a successful instruction and communicate them effectively to students. In other words, it is important that both teachers and students understand what the purpose of the classroom cooperation and its goals are (Anderson et al., 2001).

Tips for planning objectives

- Decide the knowledge, skills, and attitudes you what to achieve through your teaching.
- Mention the target group of your teaching (students).
- Write down clear and precise objectives using active verbs (Anderson et al., 2001; Bloom, 1956; Gogus, 2012).
- Mention the degree of mastery the students should demonstrate.

The objectives should be achievable in the given time of your teaching, easily written, understandable, and challenging. An example of a learning objective based on Bloom's taxonomy is: At the end of this lesson, students will be able to describe in detail the steps for the design of an app and provide examples of its application.

Choose a cooperative learning strategy

For effective cooperative learning, teachers need to be aware of and confident to use multiple cooperative strategies in different circumstances based on the projects' objectives and the needs and interests of the students. Literature provides us with a variety of cooperative strategies that can be applied in classrooms. Indicatively, some of the most well-known and widely implemented are: Think Pair Share, Numbered Heads Together, Jigsaw, and Peer Tutoring.

Think Pair Share: There are three stages to this cooperative discussion strategy:

(1) Think: The teacher poses a question or gives a prompt to the class to get them thinking. Students take a few minutes to think about the question individually.

(2) Pair: Students discuss their answers / thoughts with a classmate, compare, reconsider them and come up with answers that are more convincing to them.

(3) Share: Students share and discuss their ideas /responses with other classmates in a four student group or larger groups or with the whole class (Lyman, 1987).

Numbered Heads Together: This is a cooperative learning strategy with four steps that aims for the maximum involvement of all students in the activity.

(1). Students are numbered usually from 1 to 4.

(2) Teacher informs them about the topic they will work on and the time limit.

(3) To complete the task, students put their heads together, think, discuss, and cooperate.

(4) Teacher calls out a number from 1 to 4 and the numbered student should present the group's work.

Jigsaw: This is one of the most popular cooperative learning techniques that promotes students' interdependence, socialisation, social skills, collaboration, listening, and academic growth. Although it can be found in different versions (Drouet et al., 2023), all of them share a common structure which is outlined below.

The teacher divides the day's lesson into five or six segments and creates Jigsaw groups of five or six students. Then, the teacher distributes each segment to each of the students in the Jigsaw groups. Next, students from different Jigsaw groups get together in "expert" groups to help one another get ready to teach their Jigsaw groups their individual pieces. Then, all students come back to their initial Jigsaw groups and "teach" their group the

assigned part of work. At the end, the teacher gives a quiz to the students (Aronson et al., 1978).

Peer Tutoring: It is a cooperative technique that promotes peer assisted learning. When this technique is applied, more experienced students act as tutors and assist less experienced ones on a specific task to learn the material (Topping, 2020).

Research suggests that these strategies, when used in classrooms, facilitate the promotion of students' learning and a rich repertoire of skills. The choice of which strategy will be chosen is definitely a professional decision made by the teacher who will take into account how the students will approach the material and develop their cooperation in order to fulfil the lesson's objectives.

Design assessment:

Both formative and summative assessment can be applied in a cooperative classroom. Formative assessment is used to provide teachers and students with feedback during the learning process, while summative assessment is organised to judge the final products and is highly related to the content knowledge. A successful assessment should be aligned with the objectives and the content of the activities that will take place during cooperative learning. It is highly recommended for teachers to differentiate the assessment keeping in mind the different needs, interests, background, and learning styles of their students. Different assessment activities can be implemented at different cooperation stages and can be conducted by teachers, the students themselves (self-assessment) or their peers in groups (peer-assessment). The evaluation results guide both teachers and students to consider factors that positively influenced the cooperative learning and also reconsider those that may have hindered it. The assessment informs the cooperative learning in subsequent lessons.

Tips for designing the assessment:

- Identify the objectives set for the cooperative learning.
- Select the appropriate assessment techniques for the cooperative learning.
- Decide at which stage of the cooperative learning each assessment technique will be adopted and by whom (teachers, students themselves or peers).
- Make sure that the assessment content is aligned with the objectives of the lesson.
- Design and differentiate the assessment, taking into account the different needs, interests, background, and learning styles of your students.
- Carefully read the results of the assessment, and share them with the student.
- Consider factors that may influence the success of the cooperative learning both positively or negatively.
- Adjust or improve your next lessons in your cooperative classrooms based on the assessment results.

Prepare material and means:

The materials and means used in cooperative classrooms are of great importance for successful learning. Teachers should decide on the format and the content of the materials provided during the cooperation in order to facilitate students to achieve the learning goals. It is highly recommended that the content of the material, its format, as well as the means that will be used are based on the diversity of the classroom. Teachers should take into consideration the attributes of the students, their needs, interests, background, and learning styles, offering them different learning paths. Furthermore, the preparation of the material should be based on the principles of cooperation providing all students equal chances to access different types of material and to work cooperatively.

Tips for preparing the material of a lesson:

- Prepare accurate and easy understandable material based on the students' competences.
- Prepare material in different formats that facilitate students with different learning styles, needs and interests.
- Check that your material is easily visible and accessible to all.
- Make sure that the material is aligned with both lesson's objectives and assessment.
- Choose the means that facilitate your students to have easy access to the material from different paths.
- Make sure that the means you choose are well maintained and in good condition.

Organise time.

There is not always adequate time to reach all our goals. This can depend on many factors, both external and internal. However, in the case of classroom activities, time may not be flexible enough, taking into account that school hours are fixed and set by the school administration for the whole school year. Time is an important factor that influences the flow of cooperative learning, and students' accomplishments at the end of the activities. To have a maximum didactic time enriched with meaningful cooperation among students, teachers should ensure that the lesson plan and the designed activities are in line with the time provided for the lesson.

In the cooperative classroom, at some stages, students can also contribute to organise time. The opportunity for example, to define the time spent autonomously for single steps of an assignment could be a way to meet the differences in learning pace.

Tips for planning the time:

- During the design of your lesson, estimate the time needed per each task.
- Make sure at the start of the lesson that you have access to an item to tell you the time, for example a clock or smartphone, or set an alarm, if needed.
- In order to engage the students in having a sense of time in relation to their assignments, ask one student per group to keep time (timekeeper).

- Advise the students of the time at regular intervals and continue or stop activities based on the needs and the interests of students, as well the learning objectives set.

Organise space:

Space is also one factor that can influence the success of cooperative learning in a classroom. Teachers who decide to organise a cooperative classroom should take care of the space based on the strategies that they will adopt. For example, the number of groups and numbers of members in each group will affect the arrangement of the furniture in a classroom and play an important role in facilitating easy and productive communications among students and teachers, as well as the group working at them. The layout of the classroom should be relevant to the cooperative strategy chosen and the groups using it. Ensuring adequate lighting, avoidance of distracting noises, easy eye-contact, and access to materials in the classroom are also crucial for a successful cooperative learning experience. The physical arrangement of the classroom will facilitate students to work effectively in groups. If there is adequate time, students could be involved in arranging the learning space, this might increase engagement and a sense of belonging.

Tips for planning the space:

- Arrange the desks and chairs in circles or half circles based on the cooperative learning strategy, the numbers of the groups, and group members in the classroom.
- Ensure that the classroom layout will facilitate the groups working.
- Make sure that all members of the group can have eye contact and listen to each other without difficulty.
- Make sure that the seating arrangements provide students with easy access to learning materials.
- Engage students in the process of arranging the space to enhance their participation and their feeling of belonging.

Ensuring equal participation in inclusive cooperative learning for all

The work by Elizabeth Cohen and her group, made visible how status characteristics affect participation in cooperative learning. At the initial stage of her work, in the US she compared the rates of interactions and the influence on the group decisions of white adolescents, perceived to be high status, and African-American or Mexican-American, perceived to be low status, and described how participation and influence of the high status members was significantly higher (Cohen, 1972; 1982). Aware of that, it becomes clear that the issue of ensuring equal participation requires challenging status hierarchies in the classroom. Cohen's group developed numerous intervention models and strategies that can be adopted by teachers to put this idea into practice and organised them in the approach of Complex Instruction (Lotan & Holthuis, 2021). In their collaboration with schools, scholars of the

group recognise that "to organise the classroom for equitable interactions among students, the teacher's task becomes increasingly complex, non-routine, and uncertain" (Lotan & Holthuis, 2021: 70). This is why the implementation of strategies can be seen as a complex learning process, both for students and teachers, that requires time, braveness to experiment, tolerance with errors, and patience to reflect on them in order to refine the intervention.

Grouping strategies.

A first crucial strategy is related to grouping. How shall small groups of students be composed? If the choice is left to the students, they will probably reproduce the spontaneous relationship network they have in the classroom. Reflecting on this in terms of status, this kind of procedure is connected with the high risk that some popular students are highly requested, whereas others are left out or reluctantly included, reproducing marginalisation processes.

In literature, besides preference groups, other two grouping strategies are described: randomly defined groups and groups defined by the teacher (Klippert, 2012). An example of a random grouping technique could be asking each student to choose a stone and then finding students with a similar stone to meet in a group. In this case, everybody has the same chance to work with each other and this fact clearly conveys the idea that the teacher trusts that each combination can be a good one for successful work to be completed on the assignment.

In other situations, the precise design of each single group by the teacher can also be an interesting option. Groups can be built along the criteria of homogeneity or of heterogeneity. For example, students could be grouped homogeneously according to common interests. It could be the case of an assignment that aims at the development of reading comprehension competences, where all groups work on the same competence but on texts that address different topics, according to their interests. In the event of intellectually challenging assignments, that need for example, problem-solving or the development of a project, heterogeneous groups can be a more interesting solution. In this case, it is exactly the coexistence of different talents, interests, social abilities, and ways of learning that facilitate the completion of the task (Lotan, 2014).

Mitchell's work on "What really works in Special and Inclusive Education" (Mitchell, 2014) underlines the limits of establishing homogeneous groups in terms of ability, especially for students that struggle or are hard to reach. Assigning students to low-ability groups communicates low expectations to students and reduces learners' opportunities.

Anticipating diversity.

A second possible strategy to facilitate equal participation is to anticipate diversity in the way the assignment and the materials for the groups are designed. This means that, following the principles of Universal Design for Learning (https://udlguidelines.cast.org/), teachers plan in advance with heterogeneity in mind instead of adapting for single students at a moment's notice. In practice, the teacher can design assignments that imply that

different students in different groups can activate multiple ways of learning within the same or different assignment(s). For example, students may have the option to present the result of group work both with a visualisation poster or with an oral presentation, depending on their preferences.

Another important aspect in anticipating diversity is the idea of getting access to multiple and flexible materials. So, for example, new knowledge that the group needs to understand in order to work on the group task, can be presented with the option of choosing between a video or a text. Again, students choose according to their preferences.

Role assignment.

A third strategy that can be adopted in order to facilitate equal participation is the assignment of specific roles to the single students working in the group (Johnson & Johnson, 1999). This can be seen as a way to structure shared leadership: assigning a role means making a member of the group responsible for a task that is necessary to the group in order to succeed. If this is not done, students will probably act according to the statutes they spontaneously have within the group. This means that those who are perceived as leaders will take up the leadership role. A person with a low status instead will participate and influence the group much less. Assigning specific roles becomes a way for the teacher to limit the impact that status has on participation and to question the status itself. In fact, assigning roles symbolically represents how each member is necessary to the group and contributes to the realisation of positive interdependence (Thomas, 1957).

Different kinds of roles exist (for example see the paragraph on the students' role in cooperative learning). To strategically challenge status the teacher can manage who takes on which role within the group. This might highlight a student's talent in the group, or it may limit the dominant influence of others. If the decision is accompanied by a reflection of their own strengths and weaknesses, the assignment of roles can be decided together with the students. The reflective process leads them to move beyond spontaneous status dynamics.

Adult's support.

The last aspect we would like to highlight is the fact that, even though cooperative learning is based on students being the protagonists of the learning process, adult's support can be very crucial and important, especially in order to facilitate and ensure equal participation. This means that every time students are excluded, discriminated against, or experience a form of marginalisation, the teachers' reaction is crucial. Teachers, in fact, can explicitly intervene and show that unfairness and exclusion is not accepted in the classroom environment. Or they can decide to act in a more indirect way praising the students' actions and explicitly acknowledging the contribution of students with a lower status (Lotan & Holthuis, 2021). In this way, they make it clear that in our inclusive classroom, every voice counts.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

- Collect examples of group work and try to identify which of them fostered cooperative learning and which did not. Use the five characteristics identified by Johnson and Johnson (2008) to explain your choice.
- Prepare a 5-minute speech to portray the benefits of cooperative learning to parents.
- Think of a concrete situation in your school, your experience as a teacher or as a learner, where equal participation during group work was really established. Considering the contents of this chapter, how would you explain it?
- Think of a concrete situation in your school, your experience as a teacher or as a learner, where equal participation during group work was not established. Considering the contents of this chapter, what changings would you suggest in order to facilitate equal participation of all group members?
- Do you think that the many structures presented for practising effective cooperative learning can become a limitation of the single learner's freedom in the learning process?

About the authors

Heidrun Demo

Her work centers on equity in education, with a particular focus on supporting diverse learners, fostering inclusive teaching practices, and

driving inclusive school development. She is deeply involved in research and teacher training, dedicated to creating and sustaining inclusive learning environments.

Vana Chiou

Vana Chiou loves teaching and training future teachers on contemporary teaching methods and techniques. Her research interests include contemporary methods of teaching and assessment, teacher training, inclusion and education. Her published work includes editing books, chapters in books and articles in Greek and international journals.

Miriam Cuccu

Miriam Cuccu, pedagogist and subject expert in general and social pedagogy at the University of Macerata (Italy). She is involved in projects focused on intercultural education with a community-based and arts-based approach. She collaborates in monitoring and evaluating interventions to counter educational poverty and in training for education professionals. Her main research interests include dialogue between cultures, community participation and empowerment through creative languages.

Özge Özdemir

Özge Özdemir works in extracurricular political education with a strong focus on anti-racism, anti-discrimination and empowerment. During and after her studies of political science and sociology in Frankfurt am Main, she specialised in working with young people and adults in educational work. Her activist experiences form the basis for both her practical educational work and her academic career.

(DIGITAL) MEDIA AND MATERIALS FOR LEARNING

Pamela February; Grit Alter; Jules Buendgens-Kosten; Frank J. Müller; and Alessio Di Paolo

One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ ama-2025-en/?p=365#oembed-1

Example Case

It is the first day of your practicum at a school. The first lesson you observe starts a bit late. The teacher later explains to you: "There was a queue at the photocopy machine – and I needed to print out different versions of today's worksheet, to take the heterogeneity of our learners into consideration". This makes you think about the role of media – analogue and digital – in contexts of inclusive education.

As you read this chapter, think about suggestions you can provide to the teacher to make this task easier.

Initial questions

In this chapter you will find the answers to the following questions:

- What is a (digital) medium?

- What are the affordances of digital media for inclusive educational settings?
- Which (digital) media is beneficial for inclusive classrooms?
- How can (digital) media be applied in a meaningful way?
- What are limitations to using digital media in inclusive educational settings?

Introduction to Topic

One of the many things we need to take into consideration when creating inclusive learning environments is the media and material we use. It seems to be the case that a lot of the materials that are used in classrooms are based on verbal and/or visual texts, depending on the grade, and textbooks which mainly consist of visual (primary school) and verbal text (lower and upper secondary school). There are, however, a number of students who find it difficult to access, and learn, with these texts. In this chapter, we discuss why it is important to create and use diverse (digital) media and material and how we can do this in inclusive educational settings.

In the title of this chapter, digital is put in parenthesis. This means that we will write about both digital and analogue media and material. In large parts of the chapter, the focus will be on digital media because digital media have become part and parcel in educational contexts, not only since the COVID-19 crisis (Timotheou et.al. 2023). Even so, it is important to mention upfront that digital media, or media in general, is not a panacea, and is not a magic wand that solves all problems. Dropping a digital device into learners' hands is not enough. On the contrary, there are many factors that can impact whether or not a student can fully benefit from a specific example of (digital) media. A wonderful app, a fascinating film clip or an impressive book that fails to meet learners' needs or is not a good fit with the curriculum and learning goals, is of little help in the classroom.

So, how do we go about creating an inclusive learning environment in terms of digital media? How can we make sure that the media and material we bring into classrooms provide learning opportunities for all learners? This chapter aims to provide some answers to these questions by addressing specific topics. The chapter introduces the concept of a medium and the need to design inclusive media and materials. The chapter addresses key aspects of digital and analogue media and materials that include theoretical aspects such as Mayer's Cognitive Theory of Multimedia Learning and the Universal Design for Learning, in addition to the use of Open Educational Resources (OER). In particular, the chapter provides practical considerations connected to the use of (digital) media and materials in classrooms and broader educational settings.

Key aspects

What is a medium?

Initially, we need to clarify what we mean by media and material. For the purpose of this section, we consider both to refer to the objects we apply to educational settings. There are several ways to define what a medium is. We can distinguish between a narrow and a broad understanding of media. For a narrow understanding, Schmidt and Strasser (2018, p. 212) suggest that :

Media can be defined as the means by which information is conveyed from one place to another. The most obvious characteristic of a medium is its technology, the mechanical and electronic aspects that determine its function and to some extent its shape and other physical features. These are the characteristics that are commonly used to classify a medium as a 'television', a 'radio', and so on (cf. Kozma, 1991, p. 2).

Added to this, we can include a time dimension as, in most cases, the media also allows access to the information they contain over time, through archives, which are easily accessible, either on the internet or in libraries? More broadly, the many forms of information available across time and space can be interpreted as media, even if they were not crafted by humans (as the word 'technology' implies). Marshall McLuhan is well known for taking a very broad perspective on what is encompassed under the label media. One of his examples is electric light. Electric light enables colours, but it "escapes attention as a communication medium just because it has no content" (McLuhan, 1964, p. 8). It is not until it "is used to spell out some brand name that it is noticed as a medium" (McLuhan, 1964, p. 9). Additionally, understanding something as a medium also depends on what one reads into the medium. A piece of driftwood, for example, can be a medium if you tell its story; whereas a cup of coffee can be used as an incentive to discuss sustainability. This indicates that using objects in specific contexts can turn these into media. Whether something is a medium depends on the negotiation between sender and receiver, and the intention which follows.

Another differentiation is often made in terms of the way a medium functions, or the means by which it is perceived. There is visual media (pictures and photos), audio media (podcasts and audiobooks) and audiovisual media (film and advertisements). Modes and codes can also be combined and result in multimodal/codal media such as picturebooks (see below). Another way of looking at media is their underlying technology: there is analog media such as books and newspapers, digital media such as ebooks, and interactive media such as apps or video games. Certainly, the human body is also a medium as body language carries meaning and conveys information. In other words, anything that communicates content and meaning can be viewed as a medium.

In educational settings, materials such as textbooks, worksheets, videos etc are considered a form of media. Teachers use these to teach content and develop

competencies. In inclusive education settings, we can benefit from different kinds of media that address different means of perception. Objects are also included as students often learn through touch, such as playing with toy animals or by building blocks, for example.

There are specific characteristics of media that make them particularly beneficial for educational settings. Most media are interactive, multimodal and, in the case of digital media, often hypertextual. If these types or characteristics are not available, teachers can use other tools at their disposal to enhance their use. Interactivity means that media can be used in an interactive way. Interactivity refers to at least two dimensions. Firstly, learners can interact with one another based on a medium, e.g., a picture. In a foreign language classroom, for instance, each learner could have a different version of the same picture and discuss how their pictures differ. Secondly, learners can interact with the medium itself, e.g., when using a language learning app where they match correct words and pictures or translate phrases. The app then offers feedback and the learners continue their work.

Multimodality refers to the simultaneous integration of several codes and modes. Media, such as newspapers, picturebooks, feature film, and most apps, combine different modes and codes to convey meaning and information. In newspapers and picturebooks, there's a combination of verbal and visual text while in feature films, it is visual and auditive text. In apps it is often a combination of verbal, visual, and auditive text plus the user's interactivity with tasks. When using media in inclusive educational settings, it is essential to be aware of the advantages of the various modes and codes, and their combination, that provides (to be explained in further detail below).

Hypertextuality refers to the way in which media are linked to one another. This is apparent in digital verbal text such as lemmas in lexicon in which terms and concepts that explain one idea are directly linked to their own lemmas (see more details below). While this line of argument suggests that teachers and learners can benefit from characteristics which make the content more accessible, it is certainly the case that interactivity, multimodality and hypertextuality make the perception process more complex. One of the main benefits of digital media and material, however, is their adaptability.

One particular medium that teachers automatically bring into classrooms is their own body and (often) voice. In inclusive settings, it is worthwhile thinking about body language and the use of voice and pronunciation as well, because the intricacies of both can have an impact on successful learning for all. Teachers can benefit from using their bodies consciously, both as a means to distinguish between the use of body language that supports students in following instructions and explanations, and by using body language that distracts or makes students nervous. One means of bodily supporting learners would be, for example, to orient themselves in space in a way that makes lip-reading easier, or by using their bodies and voices to express empathy and affection. Thus, consciously working with the body has the potential to increase students' awareness of their own bodies and how they work, thereby building students self-confidence,and personal identity and emphasising the diversity within the classroom.

Perceiving the body as a medium implies that teachers should not only be aware of their own body language but also be able to read the body language of their students. How do students signal that they are comfortable or uncomfortable? Are they lazily chilling in their seats or highly relaxed and able to pay particular attention to what is being presented? Certainly, activities that require movements, e.g., in-between activities or where students stand up and shake their arms and legs, can play a key role in maintaining engagement in the classroom. In inclusive settings we need to be aware that not all students may be able to participate in such activities. Anything that concerns embodiment needs to be sensitively considered, especially so in inclusive classrooms. There are common ways in which the body can be designed to work for different learners including drama activities, physical movement or methods such as marketplace and mingling around. This might also involve metaphorical movement in virtual spaces using avatars or in 3D (Morganti & Riva, 2006).[1]

The need to design inclusive media and material

When teaching, it is important to address, and include, everyone, and to ensure everyone benefits from the learning experience. This is especially relevant in inclusive settings where learners with different needs develop skills and competences at a different rate. When using media and material, it is paramount to do so in such a way that invites all learners to learn. For example, the delivery and design of media and material is important, and this is particularly the case for analogue and digital media and material alike. Digital media and material can be challenging for some students as a colourful design, fast pace, or means of accessibility could be overwhelming or distracting for them. Despite this, there are numerous benefits of using digital media such as:

- Developing skills and additional competencies that would not be possible without the technology, making details observable through slow-motion or zooming-in to images;
- Ensuring participation in classroom activities and beyond, e.g., participating in lessons remotely and online;
- Supporting students in solving tasks independent from teacher support, e.g., by conducting their own research.

Developing skills and competencies is necessary for all learners, regardless of their socio-cultural, economic and social background.. All students must acquire basic skills and knowledge that enable them to assess, produce, present, and exchange information, as well as the ability to choose the appropriate technologies to tackle real-life problems.

---

1. For more details please refer to ideas such as the inclusive body (Morin, 1999), educational corporeity (Sibilio, 2011) and embodiment (Shapiro, 2010).

As indicated above, digital media and material offers particular advantages to create teaching and learning scenarios for all. Teachers and learners can, for example, benefit from text-to-speech software and visual organisers. We can adapt the structure of the material and media, and also the content. Through the online world, information and material can immediately be accessed and included in teaching. Digital media can thus support differentiation and, as a result, inclusion.

Beyond media and material, the use of language also makes teaching and learning accessible to all students. We can ensure that learning materials are provided across different levels, and also supplement written texts with audio recordings.

There are a number of benefits for using digital media in the context of inclusion:

1. As a tool for learning (e.g., learning maths);
2. As a way to develop digitalisation-related competencies (functional and personal/critical);
3. To allow students to develop life skills needed in a society predominately shaped by the digital transformation.

We can create and design inclusive media and material, or increase access to given media and material by digitising it. Digitisation is the act of translating information into machine-readable formats. With the increasing digitisation of data, a process of digital transformation begins. Digital transformation does not refer merely to the ubiquitousness of digital devices, but to the changes caused by large amounts of data being easily searchable and digitally processable. For example, scanning an individual book is a form of digitisation. A book that was scanned can be uploaded and downloaded, shared and searched. The predominance of scanned books and digital repositories of research articles, (or electronic texts) has an additional effect, in changing the way we research . For instance, instead of searching in card catalogues or printed bibliographies, we can use search engines like Google Scholar to find information. While this is beneficial in one respect (by identifying side references to obscure topics) it also has drawbacks in that it can be difficult to assess the quality of a publication.

Many studies have analysed the potential of digital media for students with special educational needs (Florian, 2004; Joimur, 2018; Tohara, 2021). These highlight how digital media can support students not only in studying, but in acquiring life skills (Bryant et al., 2020). Digital media, therefore, becomes not only an information tool but also an educational tool. A teacher who wants to respond to everyone's needs (Sibilio & Aiello, 2015) faces the challenge in designing activities that meet the needs of each individual student, and respecting their personal way of learning. Where students encounter difficulties, their teachers can resort to different resources to support them. When we think of analogue media, these can be adapted to different needs by, for example, changing the

size of letters and images or the colours in a verbal text to make it easier to identify details, or adding verbal explanations to what can be seen in an image.

The blend of modern technology with the more traditional means of learning, offers even more options. For example, an image can be viewed on the Interactive Multimedia Whiteboard to allow greater magnification. Using software to work with maps (e.g., in Geography), in addition to textbooks, adapts the learning environment for students who are more motivated when using technology, allowing them to view images in more detail compared to the classic textbook. In fact, it is often the case that children who have little interest in studying exclusively from books, learn better using a computer whilst also sustaining their attention span. Providing students with choices supports their autonomy[2], and creates ownership and self-reliance.

(Digital) Media and Material in Inclusive Settings: Theoretical Foundations

There are various theories one may use to build a foundation for critically reflecting on applying (digital) media and material in inclusive settings. For the content listed here, we believe Mayer's Cognitive Theory of Multimedia Learning and the approach of Universal Design for learning are fundamental when designing digital or non-digital material for learning.

Mayer's cognitive theory of multimedia learning

In the first instance, we will discuss Mayer's Cognitive Theory of Multimedia Learning (Mayer, 2021). It assumes that learners actively construct their understanding from the material presented to them. This theory builds on research in deciding how best to support learners through design choices related to choosing what to include and how to arrange it. Mayer ascertains that our working memory is always limited. An individual's working memory capacity differs from person to person, but it will never be unlimited. The process of learning will place demands on the working memory. Everything that a person can learn has a germane load – in other words, is it relevant for the task at hand . However, the way in which this input is presented can increase the total cognitive load. By presenting good learning designs, we can keep the extraneous load low.

So, what is good design? A long, uninterrupted text, or a truly intimidating wall of text? Perhaps a video filled with images and animation and effects, with narration and music and

---

2. The idea of learner autonomy is not new, but it has been widely referred to in the field of ELT only over the last decade, also critically? (Schmenk, 2008). Learners should feel responsible for their own learning, which includes engaging with topics in a way that suits their interests and learning preferences. They should process content and find solutions for problems in self-reliant settings and also evaluate their learning process (Smith, 2008). Even so, the concept of learner autonomy needs to be approached sensitively, particularly in inclusive settings.

everything else under the rainbow? According to Mayer's Cognitive Theory of Multimedia Learning, both are not the ideal. Mayer's theory assumes that the processing of input has to go through different channels. Each of these channels has a limited capacity. In designing material, therefore we do not want to overburden either of these channels. As there are different channels available, we can use multimedia to transport some information through one of the channels, and other information through the other channels.

What are these channels? There are two approaches which the theory draws on; the verbal vs. the non-verbal channel, and the visual vs. the auditory channel. The verbal channel deals with language. It can be spoken or written or signed.f it is spoken language, it is processed by the verbal channel. The non-verbal channel deals with everything else. So, if there is a video that makes use of sign language and written text, e.g., subtitles, both would have to be processed by the verbal channel. However, if there is audio text and a drawing, only the audio text would be processed by the verbal channel and the drawing by the non-verbal channel. This means, instead of sending all your metaphorical boats down a single river and clogging it up, you are sending some boats down one river, some boats down another river, and everything can travel smoothly. Another approach involves the distinction between visual and auditory channels. If you have written text and animation, both will tax the visual channel. If you have spoken text and the animation, it will draw on both systems and may avoid overtaxing any one of these channels. Hence, teachers may also address corresponding channels to allow learners to follow instructions or content. They could use meaningful hand signs while explaining an issue, may show pictures while telling a story, or develop sketchnotes while referring to grammar phenomena.

From these, and more, assumptions, certain principles have been developed that can guide your design of teaching material. One of which is the coherence principle, which encourages us to only include what is needed, and leave out what is not needed. Extra detail that sounds interesting but is not necessary – for instance, music that does not contribute to the essence of the material can be left out in order to reduce the cognitive load. Another principle that is important here is the temporal contiguity principle. If you have a picture and a narration that explains the picture, present them at the same time. For example, if you designed a PowerPoint slide deck: present the picture and the corresponding narration on one slide.

Table 1: Design Principles to Minimise Extraneous Cognitive Load in Multimedia Learning

Goal	Representative techniques	Description of techniques
Minimize extraneous processing	Coherence principle	Eliminate extraneous material
	Signaling principle	Highlight essential material
	Redundancy principle	Do not add printed text to spoken text
	Spatial contiguity principle	Place printed text near corresponding graphic
	Temporal contiguity principle	Present narration and corresponding graphic simultaneously

Table based on Mayer (2001, p. 69)

Mayer's Cognitive Theory of Multimedia Learning is useful for designing material that works for students with different working memory capacities. Nevertheless, there are some caveats. First, the idea of using multiple channels can fall flat if some students simply cannot use one of these channels. It is often better to risk overtaxing one channel, than depending on a channel that is not available to your learners. A deaf student might profit more from written text or a sign language video, even if this text or video, in combination with a graphic or animation, might risk overtaxing the visual channel. We can still support them by presenting information in appropriately sized chunks, allowing them to pause the input, or to rewatch parts of it. Furthermore, when you are exploring language learning, all bets are off. When students are still acquiring a language – be it in the foreign language classroom, or in other settings – being able to hear and read the same words simultaneously can be a major advantage. Listening comprehension improves when students can read while listening. This is very noticeable, for example, when watching target language videos with subtitles. Košak-Babuder and colleagues (2019) investigated language learners with dyslexia and found that students benefited even more from the combination of spoken and written language.

So, what do you do? Should you follow Mayer's Cognitive Theory of Multimedia Learning or not? It is certainly a useful starting point, especially as these principles can guide you in designing material with an appropriate cognitive load and that avoids unnecessary, and potentially harmful, bells and whistles. On the other hand, and for accessibility reasons, you can include alternative methods for improving the presentation of information for students with difficulties. Ideally, these can be concealed by students who do not need them i.e., subtitles that can be switched on or off.

In this section, we have only discussed the parts of Mayer's theory that look at the two channels and aim to minimise extraneous processing. The theory goes much deeper, though. To offer you a concise summary of further principles, we present these in the following table.

Table 2: Design Techniques to Manage Essential and Foster Generative Processing in Multimedia Learning

Goal	Representative techniques	Description of techniques
Manage essential processing	Segmenting principle	Break presentation into parts
	Pre-training principle	Describe names and characteristics of key elements before the lesson
	Modality principle	Use spoken rather than printed text
Foster generative processing	Multimedia principle	Use words and pictures rather than words alone
	Personalization principle	Put words in conversational style
	Voice principle	Use human voice for spoken words
	Embodiment principle	Give onscreen characters human-like gestures
	Emotional design principle	Make onscreen elements prime positive emotion
	Generative activity principle	Provide prompts for learning strategies
	Guided discovery principle	Provide hints and feedback as learner solves problems
	Mapping principle	Ask learners to create a graphic organizer or concept map
	Self-explanation principle	Ask learners to explain a lesson to themselves
	Drawing principle	Ask learners to make drawings for the lesson
	Imagination principle	Ask learners to imagine drawings for the lesson

Table based on Mayer (2001, p. 69)

Universal Design for Learning (UDL)

Another theory is Universal Design for Learning (UDL). UDL is described as "a framework to guide the design of learning environments that are accessible and challenging for all" (CAST UDL Guidelines). UDL has developed a table with different principles, each containing guidelines, with accompanying checkpoints. This table is a wonderful tool for planning and reflecting on your teaching. Here, we will look only at a small part of it, i.e., the principle of

representation. (The full table, with hyperlinked explanations, can be accessed here: CAST UDL Guidelines).

Representation refers to the means at teachers' and students' disposal to learn content and information. UDL suggests we provide multiple means of representation. On the one hand, we should **design options for perception** and ensure that information is presented which includes students who are hard of hearing, blind or visually impaired. We should also ensure that students can **customise the display of information**. Do subtitles help you? Then switch them on. Do they take your attention away from the film? Switch them off. Each learner can choose for themselves what works best for them and how to make the content accessible.

Designing options for language and symbols understands that perception alone is not enough. If you use many complex technical terms, a simple process description might be incomprehensible to some of your learners. We need to **clarify how the vocabulary, symbols, and language structures** that we use are organised. When we have learners who speak more than one language, we can **cultivate understanding across languages and dialects** to support their learning. We can also help students by using **multiple media** to illustrate the same ideas.

Finally, just understanding a small piece of new information is not enough. **Design options for building knowledge** concerns how this information is processed. We can **connect prior knowledge to new learning**, or provide it to learners. Without that background knowledge, the new ideas might be meaningless or decontextualized. Do not overwhelm students with details but rather **highlight patterns, big ideas, and relationships**. For instance, guide students in how to process information and to use strategies such as visualisation and support them in **maximising transfer and generalisation** by giving them different opportunities to revisit ideas and apply them to different problems.

The idea is not to create special ways of presenting information that perfectly meets the needs of a single student (i.e., individualisation), but rather to design our teaching in a way that includes **multiple flexible options**, so that students can use include options that fit their needs and use the support that helps them in that specific lesson.

Using Open Educational Resources (OER) to address students' needs

The concept of OER

Looking at UNESCO's definition, Open Educational Resources (OER) can be defined as:

Learning, teaching and research materials in any format and medium that reside in the public domain or are under copyright that have been released under an open license, that permit no-cost access, re-use, re-purpose, adaptation and redistribution by others […] (UNESCO, 2019, p. 5).

This means that due to their open licence teachers and learners worldwide can flexibly and legally use OER. The material for the secondary level schools from the Norwegian OER

platform ndla.no (NDLA), for example, can be translated and distributed in other countries (Müller, 2019).

Interestingly, UNESCO explicitly highlights the potential of free educational materials for inclusive educational processes:

Information and communications technology (ICT) provide great potential for effective, equitable and inclusive access to OER and their use, adaptation and redistribution. They can open possibilities for OER to be accessible anytime and anywhere for everyone, including individuals with disabilities and individuals coming from marginalized or disadvantaged groups. They can help meet the needs of individual learners and effectively promote gender equality and incentivize innovative pedagogical, didactical and methodological approaches (UNESCO, 2019 p. 5).

Regarding the question of how OER might be used, we can turn to David Wiley's 5r's (2014) which outlines the advantages of using? OER:

- Retain – make, own, and control a copy of the resource (e.g., download and keep your own copy);
- Revise – edit, adapt, and modify your copy of the resource (e.g., translate into another language);
- Remix – combine your original or revised copy of the resource with other existing material to create something new (e.g., make a mashup);
- Reuse – use your original, revised, or remixed copy of the resource publicly (e.g., on a website, in a presentation, in a class);
- Redistribute – share copies of your original, revised, or remixed copy of the resource with others (e.g., post a copy online or give one to a friend).

In this respect, OER is not inclusive by design, but instead offers numerous potential to create more inclusive learning arrangements. The following sections show how OER can be made inclusive and its benefits for inclusive learning.

The benefits of inclusive OER for teaching in diverse learning groups

School contexts are characterised to a large extent by local circumstances such as curricula and languages, and yet overlap considerably in terms of content. Numerous OER initiatives therefore tend to operate at a national level (such as NDLA.no in Norway, Mundo.Schule in Germany). Cross-national search engines for OER, such as OERSI, are still in their infancy and do not yet take into account the requirements of inclusive education.

In inclusive education, the development and adaptation of materials to the needs of pupils has a long tradition. However, due to copyright issues, teachers usually keep their materials to themselves, with the result that they must start from the beginning each time. With OER, teachers can build on the materials developed by others, and save a lot of time.

Beyond the time issue, there are further reasons why OER should be used and self-created materials should be shared under a free licence.

One aspect is the understanding that there is no "one material to suit all" and there is no one material that is perfectly accessible to all pupils. The particular learning requirements at different levels means that the content must be constantly adapted either for a class or individual students. Therefore, publishing material as OER, under free licences and as free formats, allows other teachers and educators to adapt the material to their learners' specific needs and to their technological setup.

The new AI developments make it possible to adapt materials at an even faster rate and according to the needs of the learning group. For example, ChatGPT as a generative language model can generate texts in different language levels (e.g. also in easy/simple language). The use of generative AI for text simplification/differentiation can also help with materials that are under Creative Commons license (especially cc-0) and do not prohibit editing with AI due to copyright.

As will be further discussed below, digital formats also allow us to address the question of representation more easily. Unlike traditional textbooks, digital space is not subject to any significant space restrictions. This "more of space" in digital space can be used to include a "more **diverse perspectives**" (e.g., by involving people with different backgrounds in the development of content and how this content is represented). Because digital space offers this low threshold for the representation of diversity, OER should take the opportunity and benefit from it in both the production and design of material.

Another aspect that contributes to increased accessibility is the free usability of OER. Learners and teachers all over the world can use materials without requesting permission and without paying licence fees. This contributes to a democratisation of educational processes, as access to the material does not depend on the financial resources of the country, school, teacher, parents, or learners.

Many students in inclusive schools benefit from a variety of representations. This can be achieved by using images, videos, audios or real life objects. Obtaining appropriate and illustrative material is often a particular challenge for teachers. As videos and graphic material are even more complex and expensive to develop, it is more worthwhile to share illustrative content with others. With the proliferation of smartphones, laptops and digital cameras, teachers have access to digital content production tools. In this case, production quality is not necessarily the first priority. Appealing content, a vivid presentation and a reference to the reality of the students' lives can make a video attractive for students (Müller, 2019, p. 51).

Creating (more) inclusive OER

While dealing with licences is a rather dry topic for teachers, it is necessary to understand the restrictions and possibilities associated with a licence or a material. There is a wide

range of Creative Commons licences available to inform end users about the legal rights they have for a resource.

The modular system makes it possible to define exactly how materials may be used, for example:

- Attribution (cc-by): you are obliged to mention the name of the author, in the form he/she wishes;
- No commercial use (nc): you may only use the content in non-commercial contexts;
- No derivative works (nd): you may not create derivative works of the material;
- Using the same licence (share alike- sa): you may only distribute the material under the same licence.

Due to their extensive openness, two licence models are particularly suitable for schools: the cc-by licence and the cc-0 licence. To ensure maximum adaptability, teachers can make their materials as open as possible, so others can build on them without issues. For example, using a cc-0-licence (which creates no requirements) instead of cc-by (which requires the name and other information), maybe a better option?.

To create materials that are meaningfully editable, the ALMS-Framework (Hilton et.al., 2010) may be useful:

- Access to Editing Tools: use formats that do not require expensive specialised software for editing (instead of PDF use HTML, OpenOffice formats);
- Level of Expertise Required: use simple tools that are widely available and do not require 100 hours of training;
- Meaningfully Editable: avoid scanned text in protected PDFs and use editable format;
- Self-Sourced: hand over source files so that editing is possible and not just closed final products.

Another dimension of accessibility is to ensure that materials are easy to find. Using platforms that are more broadly used, for example, like YouTube, Spotify, Apple or Google Podcasts or (country) specific OER repositories, and to simultaneously provide them through portals that offer secure data privacy is preferable over country specific Learning Management Systems for example.

Inclusive OER may provide more clarity by adding additional channels with the same information, i.e., to provide text and audio, images, video (cf. Mayer's theory above). This includes offering descriptive alt texts to visuals and spoken text as well as adding alternative texts to graphics. To create more inclusive OER, NDLA aims to keep the end users in mind, for example by using fictitious descriptions of potential students (in Design Thinking terms so-called personas), which target the interests and needs of a diverse group of learners (Müller, 2021). For the educational context, it is important to keep in mind

both the needs of the learners as well as those of the gatekeepers (teachers, kindergarten teachers), in deciding which materials should be used in the school/kindergarten. Therefore, openness to pedagogical approaches, is a key factor for decisions on the use of OER in educational institutions.

A German example of inclusive OER is the website: Wort.Schule (https://wort.schule/), a free OER dictionary for learners which also provides cc-0 graphics that can be used for various other purposes without the need for attribution. The images aim to reflect a diverse group of people and are based on feedback from educators and learners. The images also allow learners from different backgrounds to identify with the material and at the same time sensitise all learners to the range of diversity. Furthermore the images make the platform more accessible for students who may benefit from a visual representation of words. As the source code and images are under a free licence, other countries can build on the material and do not have to develop it from scratch.

Common concerns of OER novices

In connection with publishing one's own materials as OER, some practitioners frequently express concerns.

"What if someone sells the material?"

If the material is published under a free licence (cc-by, cc-0), it is theoretically possible to sell it. To minimise this risk, you can include the website where the material can be found in the attribution. Since attribution is obligatory, all users are informed that the material is available free of charge. A positive aspect of commercial distribution is that buyers can use the material and thus implement your ideas as a guide to? good teaching. Offering the material for free can increase its use, whereas the use of restrictive licences (e.g., non-commercial) can cause uncertainties (e.g., regarding cooperation with printing companies, use in private schools) making it's use less likely.

"I don't want colleagues to shine with the material I have created!"

There may be instances where colleagues copy the information and and take advantage of others' creativity. Changing your perspective on this may help: imagine the students who will benefit from the material you created, and not just those in your own classroom. Furthermore, if colleagues choose your material to teach, they have clearly acknowledged, and recognised, your work?!

"Well, but this material is not good enough!"

This could indeed be the case, but also implies the potential for collaborative development inherent in the concept of OER. OER is not about publishing the perfect material, but instead is about allowing others to use good material, and develop it further. If the development of OER is integrated into the context of projects or institutions, extended quality assurance mechanisms can also be implemented. NDLA distinguishes between subject quality, production quality, technical quality, quality from the user perspective and

pedagogical quality (Müller, 2019, p. 49). The didactic quality of the material is the responsibility of the creators. For the production quality, however, it makes sense to have external support for graphics, video editing, etc. The technical quality depends in part on the form of distribution. The quality from the user's point of view requires feedback from pupils and teachers, which can then form the basis for further development. Pedagogical quality relates on the one hand to fundamental pedagogical issues, such as treating learners with respect and appreciation, but also to the openness to different pedagogical approaches, which can ensure that the material can be used in a variety of contexts.

Creating a culture of sharing

There are different pathways to accessing more materials that include the right to adapt to the needs of students and to redistribute within and beyond the community of practice. These include the development of materials on behalf of governmental platforms (e.g., by specifically paid teachers and/or external companies), but also the development of materials by teachers.

The core concern is to build on the work and effort that teachers bring to the development of materials and to motivate them to share their materials. The aim is to avoid reinventing the wheel and to have access to, and adapt, existing ideas and materials. Different approaches exist that can motivate and support teachers with publishing materials. One approach is through the collaborative development of materials in groups. These groups can be formed within a school or through teams of motivated teachers from schools with similar starting points.

Practical Considerations

This section of the chapter is about teaching with (digital) media in inclusive settings. We mentioned it at the beginning of this chapter, but as it is important, so it is worth emphasising. Digital media, or media in general, must be implemented in teaching scenarios in a meaningful way, so that using the media does not become a means in itself, but rather needs to be based on didactically and methodologically sound decisions that allow all learners to benefit from their use.

With this in mind we offer a way forward to put using digital and media in general in inclusive classrooms to practise. We address the digital divide, the needs of learners, the textbook as a specific case in point for widespread media, scaffolding through media, accessibility of media, parents and the potential and limitations of media in inclusive settings as a conclusion.

The digital divide

The "digital divide" (also known as the digital gap) is a metaphor that was used to describe

the growing gap between the technological "haves" and the "have nots", both within a single country or community, but also between different countries and communities that differ in technological access. In many countries today, this digital gap has been closed in some way. Access to digital devices is widespread. In Germany, for example, if you compare the JIM study from 2020 with the JIM study of 1998, the increases in access to digital devices and the internet are astonishing. While in 1998, there were significant numbers of teenagers who *never* accessed the internet, today this number is exceedingly small (Medienpädagogischer Forschungsverbund Südwest 1998; 2020).

At the same time, there are differences in quality and reliability of devices and infrastructure access, for example, Kevin might have a hand-me-down smartphone with a cracked screen and limited battery life, while Celine might have the newest laptop with lots of useful software. Kevin might be able to access the internet through a limited data plan, or through public WiFIat the library, while Celine might have reliable WiFi at home, as well as a working printer, in case the teacher wants the homework on paper. Also, while the concept of the "digital native" (Prensky, 2001) initially suggested that by just being born in the right generation (originally: 1980 or later), an individual would develop a more intuitive grasp of digital technology, whereas in fact, young people today differ very much in their Information and Communication Technology (ICT) skills. Let us imagine two students, Justus and Charlotte. Both use YouTube. Justus watches music videos on YouTube. Charlotte has her own channel, which she uses to upload "shopping haul" videos and reviews of cosmetics, advent calendars, and snack food. Both might say that they spend their free time on YouTube, but their skill sets will be very different. The International Computer and Information Literacy Study(ICILS) (Fraillon et al., 2018) looked at the ICT skills of teenagers and found that, a high number of teenagers struggle with basic tasks, such as deciding where to put a header, or how to crop an image, while there other students who are highly computer literate? And demonstrate high levels of ICT skills.

In summary, the goal is getting to know your learners really well and, based on this knowledge, providing them with access to appropriate media and materials and a path to acquiring the skills needed to critically use, navigate, and possibly transform the media and materials in order that meaningful learning can be achieved.

The learners and their media needs

When designing materials for learners, we need to pay attention to who they are as learners. This includes understanding the languages they speak, their competencies, their interests, and their way of accessing and processing information. Let us unpack this. The learners, their needs and learning objectives should form the basis of incorporating media and materials. Schools and especially teachers should carefully preselect the appropriate technology and plan its implementation so that the current learning and teaching is enhanced in a way that benefits all of the learners. It should simultaneously foster the

necessary skills that develop critical thinkers in this age where the digital world is constantly evolving. Even if students are equipped with skills that enable them to explore the (digital) media environment in such a way that strengthens their engagement in the task and ultimately their learning, we need to make sure that the teaching objectives take centre stage. Ultimately, the goal is that the use of multimedia should allow learners to act with as much autonomy as their competencies will allow, so as to support their development into critical thinkers.

Despite the constant emphasis on autonomy and individualisation in this section, a word of caution is necessary. We need to ensure that we do not only simply address students' needs and adapt learning to what they are comfortable with. This may miss the opportunity of them learning something new, of challenging them to move beyond their comfort zones and take risks. Learner autonomy is always to be encouraged? However, humans are social beings, and learning is a social process. Quoting Barbara Schmenk, we do not want to produce learners who, similar to autonomous cars, operate according to a pre-coded plan and only do what is within their programming (Schmenk, 2018, pp. 18-19).

In addition, digital competencies play an important role. As stated earlier, owning a fancy laptop or tablet does not mean that one knows how to use it to its fullest potential. Before requiring specific outputs from learners, teachers need to determine how effective and efficient learners are with regard to the use of their devices. Depending on the experiences of learners, the skills required for different tasks may vary across the classroom. As is true for any other teaching scenario, and if needed, additional support may be warranted for individual learners.

Inclusive representation in media and materials

One of the most important media types in the classroom today is the textbook and this deserves some extra attention as it impacts not only on what teachers do in classrooms, but also the learning gained from looking at textbooks, may also apply to other kinds of media used in education. Some authors have even argued that the textbook has more impact on day-to-day teaching than the official curriculum (Schmelter, 2011; Vielau, 2005). As the textbook is so important, it is essential that teachers have the skills to read textbooks critically, so they can decide what to use or not use, and where they need to add supplementary material. This is especially paramount in inclusive settings. As current research has shown, there are major deficits in textbooks regarding the visual representation of diversity (Alter & Köfler, 2021; Sunderland, 2019). In many textbooks, LGBTQIA+ characters are not appropriately represented (Bittner, 2011; Moore, 2020). Similarly, there are very few characters with visible disabilities, and even fewer with invisible disabilities (Alter, König & Merse, 2021). Even if they are visually represented, very often they lack agency and voice, and are mostly depicted as illustrations and decorations (Alter & Köfler, 2021; Alter, König & Merse, 2021) or in stereotypical contexts (Alter, 2021). This also

applies the methods and social settings which these textbooks prescribe. Unfortunately, other media are also at fault here? .

Additionally, the rise of AI-generated content in educational materials has introduced new concerns regarding diversity. Research has shown that AI models, such as text-to-image generation models, often amplify stereotypes, even when explicitly countered in the prompts. Studies have demonstrated that common AI-generated images often perpetuate stereotypical racial, gender, and social roles, by primarily associating certain professions or attributes (like software developers) with white males, or by depicting poverty through darker skin tones (Bianchi et al., 2023). This creates a challenge for inclusivity in educational content, as AI-generated images may inadvertently reinforce societal biases, making it critical for educators to assess not only traditional media but also AI-generated materials to ensure they represent diverse and equitable perspectives (Bianchi et al., 2023).

Why is this important? Let us take disability as an example of diversity. Jensen, Herrebrøden and Andreassen (2021) contend that there are five arguments why representation of disability in textbooks – and, by extension, in other media – is important:

- "Pupils must be able to recognise themselves in their learning materials";
- Representation "might positively influence their self-image and motivation";
- Representation can "influence peer attitudes";
- Representation can "contribute to both understanding and breaking down prejudices;
- Representation can "diminish the stigmatisation of people with disabilities" (Jensen, Herrebrøden & Andreassen, 2021).

It can also be argued that representation can help to reduce epistemic injustice. As Legault, Bourdon and Poirier (2020) explain in the context of a paper on marginalisation of neurodivergent people:

Epistemic injustices are situations where persons who do not belong to a dominant social group are denied (or simply not offered) access to or participation in the shared epistemic resources. The various concepts and knowledge base available do not represent their lived experience (hermeneutic injustice), and their testimony is given less weight to shape the collective epistemic resources (testimonial injustice). (Legault, Bourdon & Poirier, 2021, p. 12854).

To state this more simply: When people do not have full and equal access to the discourses in and beyond the classroom, their experiences are not recognized, and others cannot learn from their experiences. High-quality representation of different perspectives can change this.

Representation can further contribute to what Kumashiro calls "Education about the Other" (Kumashiro, 2000, pp. 31-35), which focuses on teaching students about the experiences and needs of marginalised individuals, while also potentially contributing to an "Education for the Other", where an "affirming space where Otherness […] is embraced,

where 'normalcy' […] is not presumed, where students will have an audience for their Othered voice(s), and where the Other will have role models" (Kumashiro, 2000, p. 28).

What can we do to improve representation?

In general, it is much easier for teachers to manipulate what the textbooks offer because they can simply tweak partner tasks by instructing their learners to "work alone, with a partner, or in a small group". This way, students with different needs and preferences can focus on the task at hand in the manner that they prefer. This is particularly important in settings in which the textbook is not accessible to all learners so that the teacher has to adjust it to ensure full inclusion. If needs be, the font should be able to be enlarged either digitally or through the use of assistive technology. For other learners, having books available in audio format is important for their participation in the classroom learning activities (cf. section 5.2).

In his book on representation in language teaching, Seburn suggests two approaches that teachers can use to increase representation: the utilisation approach and the disruptive approach. The utilisation approach is as follows:

One approach to creating more representation is to do so without highlighting the 'specialness' (or 'strangeness' rather) of individuals from marginalised groups and to spread their narratives alongside all others with regular frequency. When doing so through visuals, audio, and text, we increase exposure to a variety of members from these groups and a variety of voices. Here, we aim for everyone's identity to be 'usual' within a society. More clearly, the aim with this is not to highlight the specific characteristics of individuals within these groups as part of the target language lesson itself. Instead, the focus is on the linguistic aspects of the materials and on the lexical or grammatical situation (Seburn, 2021, p. 110).

This approach is fairly easy to implement, also in other subjects: Go through your materials and see whether, for example, the people in your worksheets have different body types and skin colours, the speakers in your videos speak different varieties of the language, that people of different genders are visible and voiced throughout, and that all kinds of families and relationships appear in the stories you read. Even so, this approach carries with it the risk of ignoring the actual experiences of marginalised groups and making them appear indistinguishable from the experiences of non-marginalised groups.

This is not the case with the disruptive approach, which highlights "particular characteristics and experiences of marginalised individuals to help learners make connections to themselves, question things we may take for granted, and suggest improvements to some of these things" (Seburn, 2021, p. 117). Instead of just having pictures of both straight and queer couples in a worksheet on "consent" (as you would with the utilisation approach), for example, you actually dig deep into how marginalisation happens, and what can be done to counter it.

One way to increase representation is to include stories about communities written by people from within these communities. These are a few recommendations to get you started:

Fritsch, K., McGuire, A., & Trejos, E. (2021). We move together. AK PR Inc.

A fantastic picture book on disability justice written by disabled authors, and featuring a diverse cast of characters. Supplementary material such as picture descriptions, ASL subtitling, etc. is available.
  Sidney, R. (2015). Nelson beats the odds. Creative Medicine.
  A graphic novel that tells the story of a teenager with ADHD, and his experiences in high school. The author has ADHD, too, and drew on his own life experiences.
  Johnson, C. G. (2019). The breakaways (First edition). First Second.
  This graphic novel about soccer and friendship features a diverse cast of characters, including a trans main character. The author is genderqueer herself.
  Oseman, A. (2020). Loveless. HarperCollins children's books. HarperCollins.
  An avid theatre fan realizes, in her first year at uni, that she is aro-ace (aromantic asexual). By the (asexual) author who is best known for her graphic novel series "Heartstopper", also adapted as tv series.
  McNicoll, E. (2020). A kind of spark. Knight Of Media.
  An autistic teenager gets angry that the women who were murdered as witches – just because they were different – seem to be forgotten in her hometown. She needs to get support from across her community – and her family – to change this. The book has also been adapted into a tv series, featuring autistic actors in autistic roles. The author, McNicoll, is autistic and has written a range of books that feature neurodivergent characters.

The sheer wealth of different kinds of media and material and the affordances this provides to create beneficial teaching and learning scenarios for all learners can be a huge advantage for teachers, but also a challenge. While they have media and material at their disposal with which they can address all learners, they need to make sure that they still have clear and transparent objectives in mind and do not implement media and material for their own sake. As we said earlier, if an app is not systematically contextualised in educational settings, we may entertain students but also miss the chance to actually foster the competencies we had in mind. Of course, we can play around with BeeBots and amuse ourselves with the way in which they run around the classroom, but even in such playful learning scenarios we should focus on meaningful play and playful learning. Thus, BeeBots can lead to combining coding competencies with giving directions in different languages or understanding the geographic coordinate system.

Using media to scaffold learning

Scaffolding refers to providing systematic support for learners that help them solve tasks (Wood, Bruner & Ross, 1976). As a metaphor, it implies that in order to solve a task, learners may need assistance with specific steps in solving a task independently. When teachers recognise that students have difficulty continuing with a task, they may prompt them with hints and advice on how to continue. Once the learners are on track again, the teacher can move away and let them continue by themselves. "Scaffolding is actually a bridge used to build upon what students already know to arrive at something they do not know. If scaffolding is properly administered, it will act as an enabler" (Benson, 1997, p. 28).

As such, the concept can be linked to Vygotsky's idea of the Zone of Proximal Development (1930). In a nutshell, it describes the distance between what students can do independently to what they cannot do yet. Within these zones, others can provide support so that learners can navigate this zone and develop competencies to reach a higher level from which they can explore the next stage. Scaffolding can be pre-planned or spontaneous. Pre-planned scaffolding refers to creating help sheets for learners in advance. Here, the teacher anticipates where they may have difficulties solving a task and thinks about ways to support them, for example by offering further content, advising them where to find information themselves, or giving hints on certain methods that can be helpful. This often appears in the contexts of free teaching and learning, such as in projects or working at stations. Spontaneous scaffolding is provided when a teacher recognizes that students get stuck while working on a task. It can also be provided by other learners. Scaffolding does not provide answers but helps learners through their zone of proximal development, so basically it guides them from the things they can do to the things they cannot yet do.

There are many tools teachers can use for scaffolding. One commercially available product is "qr Lernhilfen" (https://qr-lernhilfen.de/). It allows teachers to include QR codes on teaching material such as printed worksheets and allows students to individually scan and use these. Following these codes, students can find levelled or graduated support. A student who needs just a little bit of help can read the first hint, and students who need more help can open additional hints. As the help is available directly on the material itself, students do not need to wait for the teacher's feedback when they just need a quick reminder of a mathematical formula or a grammar construction, for example. The teacher, in turn, has more time to carefully observe student progress and to help students who need in-person support.

Adaptivity is a special case of scaffolding. Adaptivity means that a program or app responds to the current level of understanding demonstrated by a learner. The technology is able to track learners' progress and to manipulate the content it offers. For example, adaptive vocabulary learning means that the program spends less time on things the learner has already mastered, and more time on things the learner is still working on. Hypertextuality is another example of adapting texts to make them more accessible. In these texts, specific content is connected to further content. For example, a text that mentions Mozart's opera Mitridate, re di Ponto (1770), directly links this to an audio file that learners can individually access if they like to listen to it, a text on Caspar David Friedrich's paintings is linked to the paintings to see. If the text is enriched with links and connections to other hypertexts, the students will have the opportunity to navigate a plurality of different means to learn and develop a complex understanding of content. A good example for this would be digital glosses, which can support learners reading texts, but may also increase the cognitive load (for meta-analyses with a focus on language learning, see Abraham, 2008; Yun, 2011). In order for this to be practical, we need multimedia and hybrid settings to

actually provide pragmatic access to technology in the first place. Certainly, these need to be connected to clear tasks and instructions because hybridity can also be distracting and students may get lost in the wealth of information they find.

As we indicated before, teachers' competencies are central here as well. Independent of whether the material they use is analog or digital, they need to be able to guide students on their path to achieving the teaching and learning objectives they follow. No technology can substitute a sound methodology and beneficial planning and replace teaching. Certainly, these competencies need to match inclusive classrooms which are often considered to be very complex.

Accessibility of media and materials

As described above, a universal design in media is helpful for learners not only with different dis/abilities but also people of different ages, social and cultural backgrounds, different language skills and digital competencies or using different devices. It is therefore less about creating accessibility for individual groups than about a holistic approach that benefits all users. Nevertheless, adaptations for individual learners may be necessary.

One means would be to put content into easy or simplified language, or in general to adapt the language that we use so that it is easy to understand. Certainly, this is a whole science in itself, but elements such as short sentences or avoiding collections of sub-clauses can already make a difference to some learners. Some students may also find the material more accessible when key terms are given in other languages (especially their first language).

Easy-to-understand language

Adapting one's language to the people one speaks to often comes rather naturally. The way you address your neighbour might differ from how you address your grandfather, which might differ from how you would talk to a customer, a toddler, or the King of England. We adapt to our audiences in the way we speak, sign or write. Even though, there are some approaches to communication that are a bit more formalised.

- Easy English (in German: Einfache Sprache) follows strict rules. For example, it uses short sentences, and short, common words, and it puts images with every sentence or paragraph. Texts in easy English can be more accessible for many people who find it very difficult to read other kinds of texts. This can include people with intellectual disabilities, people who struggle with reading, or people who are still learning the language. Everybody can learn to write in easy English, but it is common that before texts are published, people with intellectual disabilities check these to make sure that they are indeed easy to understand.
- Plain English (in German: leichte Sprache) is also designed to be easy to understand. But, unlike Easy English (Einfache Sprache), there are no strict rules for how to write. You avoid long, complicated sentences and obscure, low-frequency words. You make sure you are clear in what you write. This kind of writing is helpful for all kinds of people.

Following standards such as the Web Content Accessibility Guidelines is essential for the creation of digital materials. These include a clear structuring through headings, sufficient contrasts, sensibly labelled links (in other words: actual descriptions of where a link leads

to, instead of "link/"here"), the size of buttons for motorised usability (also on mobile devices), easy-to-understand language, glossaries and lists of abbreviations, and visualisations via images and videos. Further options include:

- Alternative texts to illustrations and visuals are beneficial for people with impaired vision; these have also proved helpful for some neurodiverse users;
- Multiple ways to navigate, for example not just one way of swiping on the tablet, but voice control, if necessary, helps users with motoric limitations;
- Subtitles in videos (especially in foreign languages), and adjustable speed of audio or video also improve the accessibility of content;
- For content that is used over a long period of time, it can also be useful to offer it as sign language videos;
- Tools such as Immersive Reader can be very helpful for learners with dyslexia and dysgraphia. These hide distracting pop-ups and buttons and only show what is necessary to read the text;
- Read Aloud is another tool that allows you to listen to web pages, there are grammar tools that allow you to highlight all the nouns, all the verbs etc.

Another means is to offer multimodal support, as we outlined earlier, is by giving students verbal text on the water cycle and also illustrating, or letting them build, the water cycle with building blocks. It is paramount that teachers are aware how their learners benefit from these considerations.

Selection of media

Many points need to be considered when selecting media for the classroom:

- Multimedia and multimodal texts are typically beneficial because they combine different modes and codes to transport information. It is important, though, that these remain accessible for learners who cannot use all modes and codes included (e.g., by providing subtitling or picture descriptions);
- When we think of a picturebook, for example, we can read the verbal text but also look at the pictures and read the visual text. Learners can refer to the mode that is more accessible to them to understand the story. But then there are picturebooks in which both modes contradict each other, and these are then not as useful because learners who read the visual text get different information than those who read the verbal text (cf. Nikolajeva & Scott, 2000);
- In general, however, it is important that educators vary the modes and codes they bring into classrooms and offer visual, audio, audiovisual, and also kinaesthetic representations of content to allow everyone to benefit;
- Also a combination is important: audiovisual material connected with written text,

using other forms than oral and written methods of explanation, watching videos instead of reading a text, listening to music, and again, carrying out multimedia exercises.

(If you would want to know more about the use of accessible media and materials in the classroom, please consult the chapter, Accesible Media and Materials: https://docs.google.com/document/d/1GwCJdStzkV60JWXwJe6HOAq4acjz6ir2/edit)

The Role of parents and guardians as related to media

The homes our learners come from are just as diverse as the learners themselves. We need to be aware that learners are influenced by what they experience at home, or read/ listen through the media. Home experiences as related to media should be taken into account when considering the compatibility with the situation that learners may experience at school. A media-rich home environment has been shown to enhance learning. A study by Bonanati and Buhl (2022) shows that different aspects of the home learning environment concerning digital media influence the efficacy of the child's ICT experience. Aspects such as the positive attitudes of parents toward media and activities such as shared internet searches, for example, contribute positively to the child's efficacy. Consider the converse for children where there may be a lack of positive media experiences in the home learning environment and how they may struggle at school when these materials are unfamiliar to them. This brings us to the digital divide and how we can go about bridging the gap.

Let's discuss the issues surrounding the use of "acceptable/unacceptable" media. An example is given of a parent who bought Harry Potter books which everyone in the house could read including their 6th-grade child. When the child went to school on Readathon Day dressed as Harry Potter with one of the books to be discussed in the classroom, he was told by his teacher that this book was unacceptable as wizards and magic was unchristian-like and that the school was a Christian school. After determining that the teacher had not read any Harry Potter books, the parent asked the teacher to read one to see if she still harboured the same opinion. This may be an extreme (but true) example and most times it is the teacher who is in the position of challenging parents to broaden their child's horizons beyond what parents may feel comfortable with, and not the other way around. Thus, it is the responsibility of parents, guardians and teachers alike to minimise the tension between home and school and to do so in amicable ways for the sake of the learner. Analogue or digital media as one such aspect is no exception.

One means of avoiding this would be to invite caretakers to be on board by being transparent regarding media, methods, content and teaching objectives that are pursued in the classroom. Where needed, workshops can be arranged that include guidelines on how parents and guardians can support their children at home. In their study, Osorio-Saez and colleagues (2021) found that two things can positively impact parents' involvement in the

learning process of their children. Firstly, by schools providing or suggesting well-structured media tools and secondly, when parents see that other people around them are on board ("group norm"). On the other hand, if parents find the tools used to be too challenging, they are more likely to withdraw their engagement.

Teachers should also encourage parents and guardians who have the skills to use media in innovative ways to volunteer to work with the class or the school on special projects. Why not invite tech savvy parents or guardians as experts to conduct teacher development workshops? This may enhance the view and opinion critical parents may have regarding learning through innovative media.

Potential and limitations of (digital) media in inclusive settings

Despite the multitude of options, we should also be aware of certain challenges that are involved in using specific media and material. As teachers, we should not use technology for its own sake, but rather explore the advantages of our teaching objectives? A specific piece of technology can be of great benefit for some learners, but not for all. To some, the light from screens can already be a distracting issue, for others pop-ups and the many buttons one finds on a webpage can be distracting. Here, we can make use of adaptable settings that technology provides. Immersive Reader, for instance, allows you to hide pop-ups and buttons, and limit web pages to only show what is necessary to understand a text. This can be very helpful for students with dyslexia. Read Aloud is a tool that automatically reads out written text and can support students in their own reading processing. Grammar tools allow you to highlight all the nouns or verbs in a text which can make it easier for readers to navigate and understand a text. So, next to the multimodality that modern technology provides, such forms of manipulating resources or adapting them to individual needs can be very beneficial.

We should also keep in mind that learning is usually considered to be an interactive process. We should try to implement collaborative and cooperative settings and invite learners to solve tasks by communicating, discussing, and engaging with one another and the content. Even so, when we think of inclusive classrooms, we may need to relativise this assumption. There are some students for whom interacting with others is actually a huge challenge. They may have to use so much energy into managing and navigating these interactive settings that it is then lacking for actually solving a task. As emphasised above, choice can be a solution here. Instead of having all students work in the same setting, teachers can leave this open and suggest to students to work by themselves, in a pair or small group. Simultaneously, we indicated that we should not limit learners to their needs but also encourage them to try something new and move a little outside of their comfort zone. So here, think-pair-share can be a good idea because it allows learners to first think for themselves and prepare the pairing and sharing not only content-wise but also regarding the coming social interaction.

Finally, although this may have changed with the experience of distance teaching and learning, dealing with technology can be a challenge as well. We certainly need to ensure that everyone involved in teaching and learning, the teachers, learners, and also parents and guardians, are familiar with using the media and materials that are introduced in educational settings. Having a rough idea of how media works and its educational potential, benefits both teachers and learners. This may not necessarily be at the level of knowledge regarding the cable connections of boards and chips, but being up to date regarding apps, programmes, and software can be useful, particularly in terms of inclusive classrooms. When looking for apps, for example, we may still have some kind of average student in mind, but there are numerous programmes that specifically cater for inclusive settings as well. This can be compared with selecting literature, for instance, about ten years ago, very few teachers may have considered diversity in the selection of the literature they bring into classrooms. Now, however, with the growing public presence and awareness of diversity, literature that addresses diversity has moved front and centre. This awareness should be extended to the affordances of technology as well.

Recent and upcoming AI tools can also help pupils on an individual level to overcome barriers to learning and support personalised learning processes. They also offer potential for use in the classroom, for example by supporting creative media productions and presentations. For teachers, AI tools facilitate school diagnostics and lesson organisation. At a societal level, AI can contribute to media literacy and participation by teaching pupils how to deal with the risks and challenges of technology.

Local contexts

Closing questions to discuss or tasks

From the analysis conducted in the various sections of this contribution, some key aspects emerge:

1. Media is now a fundamental part of society and, for this reason, it is the teacher's task to foster digital competencies in all of their learners.
2. Digital media, according to the various dimensions presented here, can be meaningful to develop critical digital competences which address a critical approach to how media can manipulate users, but also productive competences such as critical thinking, problem solving, researching information and distinguishing reliable from unreliable

information. The aim is to create a teaching-learning environment in which all learners acquire the skills that are meaningful beyond school.

3. Digital media can be an inclusive tool if it succeeds in involving all students in the learning process and if it becomes a tool for making contents more accessible by providing different ways to access information.

4. Media, therefore, can generate inclusive environments of learning and growth for all.

In order to process the content provided in this chapter: Choose a certain type of media you use in the classroom. Think about how the design of it impacts its accessibility for different learners. Look at things such as readability, accessibility for blind students, costs, representation, and others.

Consider the notion of "accessibility friction": The fact that some design features can make something more accessible for some, but less accessible for others. Do you know any examples? How can you, as teacher, deal with such friction?

About the authors

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early

Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

Grit Alter

Grit Alter is a Professor of Teaching English as a Foreign Language at the University College of Teacher Education in Innsbruck, Austria. Her research focuses on using picturebooks in English language teaching, diversity education, teaching methodology and digital literacy in the primary English classroom as well as critical pedagogy. She is currently involved in research projects on critical textbook studies, teaching in Canada and the development of school quality.

Jules Buendgens-Kosten

Dr. Jules Buendgens-Kosten is a researcher and teacher educator at Goethe University Frankfurt. Their research interests encompass computer-assisted language learning and inclusive education.

Frank J. Müller

UNIVERSITY OF BREMEN

https://www.uni-bremen.de/en/fb12/arbeitsbereiche/abteilung-c-inklusive-paedagogik/sekundarstufe/team/prof-dr-frank-j-mueller

Prof. Dr. Frank J. Müller is a professor for "Inclusive Education for Learning and Intellectual Development Impairments in Secondary Schools" following his work as a special ed teacher at the Grünauer Gemeinschaftsschule in Berlin.

He works on support structures for teachers in heterogeneous learning groups through inclusive open educational resources, research-based study programs to make the history of inclusive education accessible to future generations, and questions of including more dimensions of diversity.

Alessio Di Paolo

Alessio Di Paolo is a PhD candidate in "Didactics, Special Pedagogy, and Technology for Inclusive Education" at the University of Salerno. His research interests focus on the inclusive potential of music in teaching-learning processes and the educational aspects it can have in formal and informal contexts, all following the theoretical framework of simplexity.

INCLUSIVE BOOKS AND LEARNING MATERIALS

Example Case

In an upper secondary school classroom in Sweden, the teacher had taught the mandatory course in History for a couple of years and the main resource used in the teaching was a textbook which was written specifically for the Swedish context and with the Swedish curriculum in mind. Even if additional resources were used in the course, the main themes of the textbook were used as the basis for planning and structuring the course since they covered the main objectives as they are presented in the Swedish curriculum for upper secondary school.

The teacher decided to investigate the representation of diversity together with the students as part of the teaching, so they decided to do a revision of the textbook in that they focused on the representation of gender diversity in images in the book. The teacher and the students decided that they would count the images in order to detect how many images of non-binary people, women and men are depicted in the book. To do so, the students labelled and counted each image which was found in the book according to the labels: image containing one/ several non-binary people, image containing one/several female people, image containing one/several male people, image containing one/several non-binary, female and male people, and image without people. The results showed that there were no images found in the book which depicted non-binary people. Also, there were very few images which portrayed both women and men in the same picture. Furthermore, the vast majority of the images portrayed

men whereas less than a quarter of all images were images which depicted one or several women.

This exercise allowed the students and the teacher to see the inequality of representation of gender in that particular textbook. The students not only developed their visual and critical literacies but also worked on other cross-curricular contents, such as the mathematical competence needed to calculate percentages. Since this was the textbook that was used throughout the course, this enabled the students and the teacher to reflect on and suggest what additional material would be needed within this course to present a greater diversity of voices. Also, the results served as a starting point for discussing *why* there were more pictures of one particular gender represented. Subsequent questions such as "what parts of our history are we generally focusing on in teaching?" and "who decides what areas are selected?" enabled the students to approach the subject of History with a more critical perspective rather than accepting this single perspective on history or narrative. Finally, as this study focused on gender representation exclusively, the students were asked to suggest further identity markers; in other words, what other variables apart from gender can be taken into consideration when analysing images? The next step could therefore be to do a similar study which considers, for example, the representation of ethnicity to further reveal whose voices and stories are told.

who, Institution, Country

Initial questions

In this chapter, you will find answers to the following questions:

- What is meant by *diversity in books and learning materials*?
- Why is it important to consider diversity?
- How can we approach diversity and the notion of giving fair representation in our teaching and learning materials?

Introduction to Topic

Books and learning materials are vital didactic tools for your teaching. As a teacher, you

may have access to an array of resources, depending on your subject, age group, budget and where you are in the world, or you may have very little variety of materials at your disposal. What you need to think about is how these materials can help you engage students with your subject and increase levels of student achievement, and what you need to do for this to happen. Also, bear in mind that learning is a process and not simply the transfer of information from the teacher to the student. It is, therefore, worthwhile spending time, and paying attention to, the content of your materials and how it is represented and consider the implications of your choices. Classrooms are changing and becoming more multicultural and diverse, and this is something we must be aware of because, we as teachers, have a commitment to support all learners.

Maybe you are already familiar with the Ted Talk "The danger of a single story," by Chimamanda Ngozi brug (2009). In this talk, Adichie discusses the idea that we need a wide variety of telling's of people's stories to give a realistic and authentic portrayal of society. The classroom is a representation of said society, where pupils from a range of different backgrounds and identities, meet and interact, in other words, a place of intersectionality. Like society, the classroom is not homogeneous and, therefore, books and materials should reflect the diversity that is found in today's society and schools. That is why, in this chapter, you will be introduced to the importance of the representation of diversity in books and learning materials. By this, we refer to books and materials used for general education, not for specific contexts or needs, and these include textbooks but also literary texts, illustrations, photographs and images that appear in them, as well as media resources such as films and websites, etc.

The chapter starts with a description of the concept of the *hidden curriculum* and the impact it may have upon our perceptions. Then, we consider the issues that arise from this impact, such as whose voices are allowed to be heard or represented, and the danger of othering marginalised minorities and other particular groups. It is our responsibility as teachers to ensure that we are aware of the biases and prejudices we unconsciously reproduce in our teaching, especially within the changing educational landscapes. We need to create a paradigm in which diversity is a sustainable, integral component and not an occasional activity that is done in order to tick off a list of topics, only to then return to our usual teaching. We can achieve this by diversifying our teaching material, for example, exposing students to a multitude of perspectives or to a more diverse literary canon and thus allowing them to read about people from other backgrounds and inspire them to read more through which they may increase their empathy with and awareness of others.

The chapter will also provide some guidelines on how to select books whose contents cater for diversity, how to critically assess the books and learning materials you have or plan to use in your classroom, and how to approach problematic texts that are obligatory in your teaching context. Finally, we will present some discussion questions that will enable you to reflect on these issues in relation to your particular teaching context and provide some suggestions for further exploration.

Key aspects

Hidden Curriculum and Othering

The term *hidden curriculum,* coined by Philip W. Jackson (1968), refers to the social, cultural, and behavioural messages that are implicit in teaching materials and practices, and that usually reflect the dominant culture in the context in which the materials are produced, and the teaching and learning are situated. For example, educational policies that vary depending on the political party in power will reproduce the latter's ideological values and beliefs, and these will seep into the production of curriculum materials. In terms of diversity, the hidden curriculum is very relevant as political agendas and ideologies also bring with them preconceived notions on gender, age, religion, sexuality or nationality that inform the visual and verbal construction of people in learning materials, and that may create, reproduce or reinforce stereotypes and prejudices (Kamasak et al., 2020).

For example, a study coordinated by UNESCO in 2009 analysed twenty-four mathematics textbooks used for Primary Education in four French-speaking African countries: Cameroon, Côte d'Ivoire, Togo and Tunisia (Brugeilles and Cromer, 2009). It revealed that female role models rarely appeared in those textbooks (21.4% of characters were female in Togo, and 28% in Cameroon, for example) and that "the exclusion of girls becomes more marked in the course of the curriculum. As learning becomes more complex, female characters are phased out" (Brugeilles and Cromer, 2009: 33). Consequently, this absence of female examples in the textbooks offered female pupils little foundation for identification and projection, and also male pupils could not find role models from the opposite sex. This, together with the prevalence of male teachers for that subject, favoured that, eventually, all pupils together with their parents and their teachers developed the understanding that knowledge, in this case mathematics, was legitimate for the male students only, and did not address female students. The textbooks thus contributed to perpetuating the traditional stereotype of 'maths = male,' and were unlikely to ever encourage girls interested in learning mathematics (Brugeilles and Cromer, 2009). Although recent studies have reached more positive conclusions as to the quantity and quality of female presence in textbooks in other contexts (Alter, 2019; Demir & Yavuz, 2017), there is still room for improvement in order for books to achieve a balanced representation, not only of female and male characters, but also of characters with other markers of identity such as disability, age, or ethnicity (Alter, 2019; Alter & Köffler, 2021; Bulut & Arıkan, 2015; Hawthorne, 2020; Jensen, Herrebrøden & Andreassen, 2023).

As regards the latter, you can see different ways that othering may occur in the research done by Liese in 2010 on the representation of the ethnic and cultural "Other" in Primary textbooks in Germany and Ireland. Despite both countries sharing their cultural diversity and experiences with immigration, their representation of the "other" in their teaching materials is approached in opposite ways. The analysed Irish textbooks include a few

implicit representations of ethnic and cultural diversity that avoid the stereotype and portray the "other" as an integrated part of Irish society, but they tend to underrepresent the "other" and do not engage with the challenges or affordances of interculturalism in the society they depict but seem to shy away from tackling them. On the other hand, German textbooks offer more numerous and overt references to the ethnic and cultural "other", with several explicit examples of xenophobia and prejudice that, without further reflection or criticism on the students' part, can nonetheless contribute to creating a "we/they ¨ setting and reinforcing rather than counteracting the stereotype (Liese, 2010: 173).

Another instance is offered by the World Bank's Executive Summary on *Disability and Inclusion in Latin America and the Caribbean* (García Mora et al., 2021: 17), which affirms that "[t]o have an inclusive education system, for example, countries must strive to change the mindset of teachers, school staff, parents, and students," and a way to do so is to "design a curriculum and learning materials that positively represent persons with disabilities." They report, however, that people with disabilities only appear in 83 out of 5,100 images of a selection of 40 official or officially recommended textbooks of history and language courses in ten Latin American countries studied (and 65 of those 83 images correspond to only one Ecuadorian textbook). The effect of this invisibility and of "stereotypical representations of disability in learning materials weakens the sense of belonging and dignity of learners with disabilities and inhibits the teaching of noncognitive skills such as tolerance and empathy in the classroom" (García Mora et al., 2021:11). Thus, although it may not be the explicit aim of the learning materials, they still play a part in the discrimination against this group of learners.

These examples of the effects of the hidden curriculum show that history, political ideologies, and traditions can all influence the content of our materials. This can mean that certain groups of people are not included or represented in learning materials because they are different and do not fit in with the norms of mainstream society. As a result, these groups are treated differently and may be discriminated against. In some cases, they may even be perceived as posing a threat. This is a phenomenon known as *othering*, which divides groups of people into *us* and *them*. People can be othered due to their race, sexuality, religion, gender identity, disability, nationality, ethnic background, or other identity markers. This can lead to isolation, bullying, shaming or abuse. Therefore, even if "it should be the responsibility of text-book developers and publishers to avoid reflecting the biases of the real-world and to use textbooks as agents of 'social reform'" (Goyal & Rose, 2020: 8), studies such as the World Bank's, and Brugeilles and Cromer's prove that there is still a long way to go, and we as teachers should be aware of the risks of othering and should approach our materials in a critical way, so that we may not contribute to the perpetuation of such prejudices and injustices that cause othering.

The opposite of othering is belonging, so it is important that we think about how to make students feel that they belong, that they are included and valued, and that their differences are appreciated and celebrated. We should consider how we can incorporate differences in

a way that encourages a sense of belonging, whilst avoiding othering. We should also be aware of falling into the trap of believing that when we do include minorities or marginalised groups, our practices are in fact more than a box ticking exercise. For example, there are opportunities throughout the school year, such as Black History Month, World Autism Day, Indigenous People's Day, etc. which are often used to teach students about, and highlight awareness of, social injustice and difference. Although this may initially seem positive, it can still turn into a form of othering, as the way in which we approach difference is separated from the standard curriculum. We should also be aware of how we display books in our classrooms or libraries, as to avoid othering and making the subjects appear separate and not belonging to the main group.

Selecting and Evaluating Books

We should create a diverse canon of literature and materials. For example, with literature the aim should be to widen the canon of literary texts, not to remove or replace it. One way to start is by conducting an audit. This involves counting and then analysing the number of representations of diversity (race, gender, etc.) in your existing materials, for example the number of texts written by people of colour or the presence of characters from minoritised groups.

For example, the *Teen Services Underground* website suggests different ways to do a diversity audit of your class library or school library (Frencham, 2018). The most basic one is list checking:

- Conduct an internet search to find ready-made lists of award-winning diverse titles or titles that are considered canonical within diverse literature, and
- Double check the titles listed to see if your library already has those titles.

Another method is randomised shelf checking:

- Start at the beginning of your book section and count your shelves, leaving a post-it note on the fifth shelf, then the tenth shelf, then the fifteenth, etc. You don't have to count by fives, you can always choose to count by another number if it works better.
- The shelves you have marked with a post-it note will be the ones you are going to audit.
- Look at the books that are on the marked shelves, and make tally marks in a chart, to represent each diverse title. Then calculate what percentage of the total books on the shelf appears in the chart: for instance, if the shelf has 30 books and 6 of them have made it into the chart, it means you have 20% of diverse books.

If you want to be more exhaustive, carry out a thorough check of your entire collection: download all the titles in your collection onto an Excel document, create a column for each

diversity category and mark the columns for each individual title. Although the process is time-consuming, "this will give you an idea of how many books you have in your collection and overall, how many books you have for each diversity category" (Frencham, 2018).

Using the information gathered from the audit, we can then evaluate how well diversity is represented by revealing the dominance of particular groups or diversity categories, and the absence of others. We can also consider the textbooks we use and how diverse the images or illustrations are, and critically reflect on the consequences that using such examples may have upon your students and their learner identity. For example: how is gender represented in scientific, technology or home economics textbooks? How are different ethnic groups represented in history textbooks? What are the implicit messages that students receive due to these images? The next section will cover all these aspects.

Finally, if after the audit you realise you need to incorporate new books and materials to your teaching, be active in your search for these materials by contacting regional or national educational organisations, activist groups, or local libraries, and by keeping updated on the recent research in your field. You can find some suggestions and links at the end of our chapter, for example, diversity-friendly book lists.

- Quantitative evaluation of diversity

In order to know whether a book, textbook or teaching material represents diversity adequately, we may apply two complementary approaches: a quantitative and a qualitative one. In the quantitative analysis, we must identify the presence or absence of references to diverse communities and identities both in the materials' verbal and visual texts like in the Example Case that opens this chapter. Brugeilles and Cromer (2009) offer examples of charts or grids to count characters and record their characteristics both in their visual representations and in their textual appearances. We may ask questions such as:

- Can we find any examples of characters of a variety of ethnicities, abilities, and/or social classes who show different identity markers as regards sexuality and gender, culture, and age in our books?
- Are there images of different models of families, or religious practices, or is it always the same types that are represented?

In this last regard, we should consider whether there are any intersectional examples, too, where several identity markers are combined, for instance:

- Do the examples of people of colour mostly belong to the same gender and the same age?
- Are the majority of families white, middle-class, and heteronormative?

Also, regarding the writing, we should check:

- Whether the texts are narrated in gender-neutral terms or if they use the male pronoun to refer to both males and females.
- Whether there are any terms whose meaning or use may bear negative or derogatory connotations for a particular group, for example, talking about "primitive" customs of current minority cultures or "perverted" or "abnormal" behaviours of non-heterosexual people.

This initial quantitative revision will help us discover whether there are "invisible" groups in our materials, such as single parents or same-sex couples, blue-collar workers, transgender people, people of minoritised religions, etc. Although the pertinence or relevance of these and other groups may be different depending on our teaching context, all these individuals are part of our societies and should have their representation within our classrooms, even more so if the latter comprises students who share backgrounds or identity markers with them. Remember that this does not mean that we must devote one lesson, activity or particular material to each of these groups, in order to tick a box: the balance in their representation in our books and materials should be a sustainable component of our teaching and not an occasional activity.

- Qualitative evaluation of diversity

After detecting the absence, or presence, of examples of diverse voices and images, we must carry out a qualitative approach that will evaluate how those identities are represented and take into consideration the context they are presented, because their mere presence is not enough: "[u]sing pictures of kente cloth on a poster about textiles would be inclusive; using a photo of a woman in Ghanaian dress to illustrate a poster on maths, just to raise the number of pictures of black and minority ethnic people on the classroom wall, would be tokenistic", that is, a superficial attempt at representing diversity only to prevent criticism (Pilgrim, 2020).

We must therefore check on the one hand, whether the materials' verbal and visual texts depict all people as individuals with distinctive features rather than stereotypical ones. We should look out for stereotypes: are strong, independent girls and women described as "manlike", or sensitive men as "feminine"? Are people of a particular ethnicity always depicted in traditional clothing? Are people with disabilities portrayed as not independent or to be pitied? Are low-income families depicted as passive or needing help?

On the other hand, we should also consider whether the diverse characters have a central or participant role in the stories: if they are present for a purpose or if instead, they are simply used for "decorative" reasons – like the Ghanaian woman in the example above. For instance, we must pay attention to who the "heroines" or successful protagonists in

the stories are, and ask questions such as: do they always belong to the same social class, ethnicity, or gender? In which context are they introduced, for example, are people of colour included only in pieces dealing with migration, poverty, or sports? Do characters of a particular ethnicity or gender need the help of characters from other, more dominant groups, to succeed or solve their problems?

For example, the quantitative revision of gender representations in the images of a contemporary English reader series used in primary schools in Hong Kong carried out by Lee and Chin (2021) concludes that female characters appear more often in the illustrations than male characters. However, the qualitative analysis reveals that those women – and the men too – are usually depicted in stereotypical ways: mothers are busy feeding their families, whereas fathers appear at a greater distance from their children and are portrayed as less nurturing compared with mothers; girls receive pink presents and boys blue ones, and "girls are presented as more emotionally vulnerable carriers and behavers than boys." For instance, in one of the illustrations "three children are hungry, but Bella and Katarina [girls] are in tears while Steve [boy] looks shocked but tries to seek a solution" (Lee & Chin, 2021: 21). Thus, although the sheer numbers of female representations in the books give a positive first impression, the critical analysis of those representations show the prevalence of traditional gender stereotypes.

Lee and Chin's study highlights the importance of critical visual literacy when analysing the presence of diversity in our books and teaching materials. Usually, we as teachers and our students "do not read visual images critically and may not be aware of how illustrators use visual elements such as gaze, backgrounding, etc. to create meaning and signal relations and power" (Short, 2018, qtd. in Lee & Chin, 2021: 14). To interrogate this role of images in books and textbooks, we can use the following seven question framework, used both by Giaschi (2000: 37) to analyse gender and by Hawthorne (2020) to analyse race:

1. What is the activity of the image(s)?
2. Who is active (the "protagonist") in the image(s)?
3. Who is passive (the "receiver") in the image(s)?
4. Who has status in the image(s)?
5. What does the body language communicate?
6. What does the clothing communicate?
7. Where are the eyes directed?

The answers to all these questions, and to all the others above, will help us reveal the underlying biases and prejudices that our books and materials may be reflecting and that our students are being exposed to.

Dealing with Problematic Books

Sometimes teachers are not able to select suitable books and teaching materials themselves, either because the curriculum states that certain literary texts should be studied or because the school that they are working in has already bought a large number of textbooks for a particular course or class. Often schools use the same textbooks for several years even if those books feel out of date. Sometimes it is the case that schools pay expensive subscriptions to online material, which therefore restricts teachers to using this material primarily before turning to other resources. In other words, teachers often must make use of books and teaching materials at their disposal, regardless of whether the materials are suitable in terms of the stereotypical images they contain or whether they represent diversity at all.

What we as teachers should do then, is to make sure that such stereotypical images and texts are not left uncommented upon. If we must use a particular textbook when teaching chemistry, for example, and all the images in this textbook show people of a certain age or ethnicity, we must bring this to our students' attention by engaging in a critical discussion with them. We should also reflect on what images may have been left out and need to be added.

One may argue that scrutinising images in a chemistry book has got nothing to do with the teaching of chemistry, but, in fact, students' ability to engage in subjects and show their understanding and perspectives of different school subjects, whether it is chemistry, language studies or mathematics, can actually increase students' motivation and encourage critical thinking. Also, having role models who the students can identify with is a crucial aspect that can determine whether students develop and maintain interest in that particular subject and essentially perform better.

For instance, in the article "Teaching Between the Lines: Representation in Science Textbooks" (Simpson et al., 2021), the authors refer to a study in which second grade pupils were prompted to draw a picture of a scientist. The results showed that most pupils drew a stereotypical picture of a white man in a lab coat. When asking students at university to do a similar test the results revealed that the majority still had that very same image in mind. The authors thus conclude that pupils' perceptions of who is allowed to be part of the scientific community; or to be a scientist, is established early and this mental image is very difficult to change as the students' progress within the educational system. Therefore, the authors argue that it is important to provide a wide range of role models in the course material to make sure that all students feel that they are allowed in the scientific community. Also, the article presents a study which shows that ninth grade students whose perceptions of scientists were positive performed better in those particular subjects compared with students who did not share these positive views (Simpson et al., 2021). In short, students' performance within different school subjects is not only related to the teaching and learning of the content of those particular subjects, but it is also related to whether you see yourself

as belonging to the community or group of people who you believe have the right to access and achieve something within that subject.

Therefore, if we find that the textbooks we must use in our teaching are not particularly suitable in terms of diversity, we need to add complementary materials which include, for example, information about scientists of other ages, genders, or ethnicities that have also contributed to the topic being learnt. As a starting point, we advise you to make use of the resources that your school library, colleagues, and students already are familiar with. If you find that searching for additional material for your courses is an overwhelming task, remember that adding one new text, film, or any type of resource, per year is better than not doing anything at all. Revising and updating your teaching material is after all an open-ended process and something that you should do throughout your entire teaching career. Our *Further Resources* section offers some resources to help you begin this process.

Lastly, when writing instructions or creating assignments or exams yourself, regardless of whether they are in writing or presented orally, you also need to reflect on the type of language and type of instructions you use. The United Nations' *Guidelines for gender-inclusive language* may be used as a starting point when reflecting on how to make your texts as gender neutral as possible so as to avoid using stereotypical descriptions of gender. The guidelines have been produced in several different languages, such as English, Arabic, French and Spanish, and even though some of these guidelines may not apply to the language used in your teaching context, they can still serve as an important reminder or eye-opener of what areas may be problematic when referring to and addressing students of different genders.

Local contexts

Closing questions to discuss or task

Questions to consider after "Hidden Curriculum and Othering"

1. Remember what type of books and learning materials were used when you were a student in primary, secondary, or upper secondary school. Which voices and images were absent, and which were heard and shown?
2. Reflect on whether your teachers addressed the question of representation of diversity in books and learning material when you were a student in primary, secondary or upper

secondary school. What did the teachers do right? What did they do wrong?

3. Scrutinise your own reading habits. For example, when you read novels, magazines, blogs or other types of media, what types of texts do you usually read yourself, and who were they written by? Which voices are you most often exposed to? Which voices are you not exposed to?

4. Can you give an example of an occasion in which you have witnessed or experienced *othering*?

5. In your context, do you celebrate "Awareness Days", weeks, or months, about certain social groups or conditions? What do you do during that time? What do you do during the rest of the year to make students of those groups or conditions feel included?

Questions to consider after "Selecting and Evaluating Books"

1. What does your curriculum say about the representation of diversity in your teaching context?

2. Use the qualitative and quantitative questions above to analyse one or several texts or images from a textbook that you use in your teaching. What are the main strengths and weaknesses when it comes to the representation of diversity in that text?

3. How could you approach the materials that you mainly use to cater for a greater representation of diversity?

4. If you were to ask your students what texts and learning materials they would like to use in their classes, what suggestions do you think you would receive?

Questions to consider after "Dealing with Problematic Books"

1. Consider the type of books and learning materials you use in your teaching context. Do you mainly use books and learning materials that are provided by the school where you work, or do you use other resources?

2. As a student or as a teacher, have you encountered any books or materials that you have identified as biased or prejudiced? How have you handled them? If you had to use them in your teaching, what would you do to offset their negative representations?

3. Reflect on what your particular language/s restricts you to or allows you to do when it comes to addressing students in a gender-neutral way. For example, do you have to refer to your students as *she* or *he* or are there other possibilities?

4. Revise some of your assignments and/or task instructions considering the UN's *Guidelines for gender-inclusive language*. What could you improve to make them more inclusive?

Further Resources

In this section you will find more academic research on diversity in books and learning materials but also some useful guidelines which help you check whether your textbooks are free from prejudice and stereotypes: for example, the UNESCO's publication *Making Textbook content inclusive: A focus on Religion, Gender, and Culture* offers an in-depth analysis and guide to check whether textbooks are free from prejudice and stereotypes based on religion, gender, and culture by looking at their employment of inclusive language,

their representation of diverse identities, and their integration of human rights. Furthermore, there are links to websites that offer checklists to detect prejudiced and biased materials and book lists of diversity-friendly literary texts.

Studies on diversity in books and learning materials

(If you are interested in the studies that we reference in this chapter – for example, the study on the representation of gender in mathematics textbooks that was mentioned in the section about the hidden curriculum, you can find their bibliographical reference in the Works Cited section of the book.)

About the authors

Tracy Fletcher

Tracy Fletcher is a teacher in the subject of English, and researcher, originally from the U.K but has been based in Sweden for the last 14 years. She has experience of curriculum planning and management, co-ordinating CPD for teachers, as well as working to support newly arrived immigrant students integrate into a new school

system. Her research interests include anti racist education, inclusive education, and student mental health. She is also an activist for autism awareness and trans rights.

Laura Torres Zúñiga

Laura Torres Zúñiga is a lecturer and teacher trainer at the Department of Philologies and Didactics of the Universidad Autónoma de Madrid (Spain), where she teaches English Language, Syllabus Design and Children's Literature in English to pre-service teachers of all educational stages. Her research interests center on contemporary short narrative forms, English language teaching and active learning methodologies.

Lisa Johansson

Lisa Johansson is a lecturer of English within the teacher training programs at the University of Gävle. She teaches courses in proficiency, language structure, didactics, and world English across primary, secondary, and upper secondary school levels. She has a teacher's degree in English and history for upper secondary school and her interests cover sociolinguistics, language and gender dynamics and language and power.

ACCESSIBILITY OF MEDIA AND MATERIALS

Example Case

A School-wide application for Accessible Documents

Mx May had a student with low vision join their class and required all class media and materials in an accessible format. Mx May had realised that she had never really considered making her curriculum accessible before, so she decided she would make a concerted effort to change the structure of her digital content to support this student.

Mx May followed the Accessibility Resources and Know-How (ARK) online resource by the Association on Higher Education and Disability and learned how to create accessible content. She began to add headings to her documents, alternate text for images and include descriptive links. She also added accurate captions to all her video content.

However, Mx May noticed that other students in the class, not just disabled students, began interacting with the documents. She realised that the learners could navigate and engage more with the material she was providing. She also noticed that students who used assistive technology voices, including screen readers, and text-to-speech, could access the material more readily. For one student with a disability who used text-to-speech, found this new approach had been a life-changing event.

Mx May also witnessed that learners who were learning in a language that was not their first language also seemed to benefit. They commented that the captions on videos had made it so much easier to comprehend what was discussed in the video content.

Mx May had not foreseen the wide-ranging benefits of introducing accessible materials. Mx

May felt obliged to share this information with her peers and the broader school network during staff training. Mx May saw it as pivotal to developing inclusive culture within her school.

Initial questions

In this chapter you will find the answers to the following questions:

1. What are the benefits of providing accessible media?
2. How can educators create accessible media?
3. How does stigma on technology affect accessible media?
4. How can we expand the communities of practices to the broader community?

Introduction to Topic

Every classroom is unique, with learners from various social and cultural backgrounds demonstrating different abilities and exhibiting diverse interests and preferences for engagement. As a result, educators need to be cognisant of the needs and supports of this diversity if they are to create a more inclusive classroom environment. Moreover, the level of diversity in our classrooms has never been so prevalent. For example, over 15% of people in the European Union, almost 80 million people, have some form of disability (Mehigan et al., 2022). However, disability is only one aspect of our inclusive sphere. Globalisation due to migration, conflict, political differences, and commercial and social opportunities has resulted in increasingly diverse societies (Rios & Markus, 2011). These changes have significantly impacted the diversity within our school environments, as schools tend to be microcosms of society (Bialostocka, 2016).

Increasingly socio-ethnically diverse classrooms are also reshaping classroom interactions (De Schaepmeester et al., 2022). This socio-ethnic diversity can also impact the need for accessibility and more accessible practices. Parton (2016) echoes this sentiment noting a link between diversity and accessibility where accessibility can impact learners from every nationality. Accessibility is also about equity of access, no longer a niche requirement solely used by learners with a disability (Edyburn, 2010). Therefore,

policies and practices in teaching and learning must be reviewed to guarantee that education is inclusive to everyone, not focusing simply on one cohort, the learners with a disability (Moriña, 2017; Zorec et al., 2022).

Although equity of access in education is a human right, there is a lack of emphasis on assistive technology and accessibility across the continuum of teacher education. There is a particular need for more training in accessibility and assistive technology in Initial Teacher Education (Michaels & McDermott, 2003; O'Sullivan et al., 2021; Van Laarhoven & Conderman, 2011; Wynne et al., 2016). While educators may have a moral and ethical rationale to develop accessible media and materials, it is often policy and legislation, both domestic and international, that drive accessible practice. Examples like the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) from 2006, an internationally recognised and supported treaty, includes sections specifically related to accessibility and equity of access under Article 9. This well-supported convention additionally commits member states to support people with a disability so that they receive the necessary support within the mainstream education system under Article 24, including instruction on assistive technology.

More recently, the European Union Web Accessibility Directive (WAD) 2016, requires all new public sector websites and mobile applications to be accessible by 2021. This EU directive has two primary objectives, one which focuses on the promotion of accessibility and the inclusion of everyone, and the latter which targets the reduction of litigation based on issues related to accessibility (Lewthwaite & James, 2020). Interestingly, the WAD is not disability-specific legislation, instead reinforcing the benefits of accessibility for everyone. This directive has the potential to significantly impact accessible and pedagogical practices (O Shaughnessy, 2021). The WAD also aims to ensure EU citizens can participate in society on an equal basis while guaranteeing member states must amend their laws to meet the need of this legislative framework (Mehigan et al., 2022). The Web Accessibility Directive requires Member States to report on the results of their monitoring activities every three years (European Commission, 2023).

In addition to the WAD, policies such as the Digital Education Action Plan (DEAP) also impact accessible practice (European Commission, 2020). This European Union (EU) policy initiative supports the sustainable and effective adaptation of EU member states' education and training systems. The DEAP noted how the global pandemic highlighted several existing challenges and inequalities in education and confirmed the need for improved levels of digital capacity in education and training (European Commission, 2020). The DEAP, which has inclusivity embedded across many of its key actions, was seen as a cooperative long-term strategic vision for high-quality, inclusive, and accessible European digital education. European Agency for Special Needs and Inclusive Education [EASNIE] (2022a) reiterates the Digital Education Action Plan commitment to include the accessibility of technologies and digital content. However, they also note the strong influence of the Web Content

Accessibility Guidelines (WCAG) on both accessible design and accessibility-centric legislation.

However, the DEAP is not without its critics. Some emphasise the DEAP's lack of financial strategy for implementation, while others highlight concerns about its language and remit (European Agency for Special Needs and Inclusive Education, 2022a; Mauraille, 2020). Despite this, the DEAP has begun to influence and shape practice and policy. For example, the release of the Irish Digital Strategy for Schools to 2027 refers explicitly to its alignment with the Digital Education Action Plan, acknowledging its European expertise and suggesting it as a valuable tool to guide and assist approaches in Irish education (Department of Education, 2022). Accessibility is also an integral part of the inclusive teacher role. EASNIE's 'Profile for Inclusive Teacher Professional Learning' includes valuing learner diversity and concepts of inclusion, equity, and quality education and supporting all learning (European Agency for Special Needs and Inclusive Education, 2022b). Despite a lack of specific reference to accessibility within this professional learning, the approaches within the publication entwine with a universal whole-school approach to accessibility, one which targets inclusion, equity, and access for all.

Divided into several sections, this chapter adopts a holistic approach to accessibility. The first section begins by discussing accessibility and assistive technology. The subsequent section examines the accessibility of media and materials, providing examples of how they can make their classrooms more accessible. The following section discusses the benefits and opportunities created when educators ensure that the media and materials used in schools are accessible. The next section will focus on the barriers educators encounter when creating accessible media and materials and will show some solutions to these barriers. This chapter shows what is currently available, although this is an area that is constantly changing with the availability of technology and new developments, this availability differs geographically, and access may vary depending on the technology currently used within the educational setting. The chapter then discusses the role of communities of practice and school management in shaping the inclusive culture within schools, which supports and promotes accessible media and materials. The chapter concludes with a summary of the chapter and possibilities for the future.

Key aspects

Accessibility & Assistive Technology

It is challenging to discuss accessible media without first mentioning what is meant by accessibility. Accessibility can have a range of meanings and is often used in an educational context to signify availability rather than ease of access, inclusion, or assistive technologies. Even when used within this context, the literature identifies varying definitions of accessibility (O Shaughnessy, 2021). Several authors have defined accessibility as

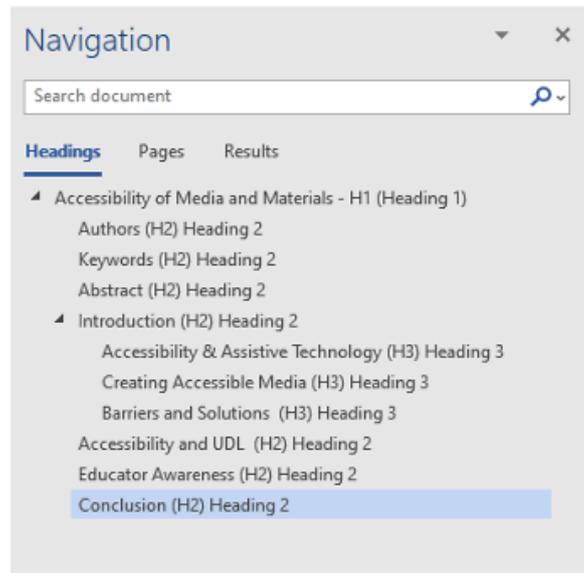
providing equitable services and systems that support everyone and prevent practices from excluding anyone (de Witte, Steel, Gupta, Ramos, & Roentgen, 2018; Shachmut & Deschenes, 2019). However, given the increasingly socio-ethnical diversity of today's classrooms, the authors have decided to embrace a more open view of accessibility. They draw on a publication from 2015 which discusses accessibility as a 'celebration of diversity' which ensures all learners are included within the learning process (Ahmad, 2015: 73).

There is also an intrinsic link between assistive technology and accessibility. This link exists because assistive technology is decisive in promoting accessibility and inclusive education (Ismaili & Ibrahimi, 2017). However, the definition of assistive technology provokes widely varying responses from the education community (Boone & Higgins, 2007). The U.S. Assistive Technology Act (2004) defines assistive technology as both the device and a service where assistive technology is "any item, piece of equipment, our product system, whether acquired commercially off-the-shelf, modified or customised that is used to increase, maintain and improve functional capabilities of the child with a disability" (U.S. Department of Education, 2004: 8). A common thread within the definition of assistive technology is its role in 'increasing the functional capabilities' of a person with a disability (Bowser et al., 2015; World Health Organisation, 2019). However, in terms of supporting a social approach, this chapter broaches assistive technology more as accessible and inclusive tools that may increase functional capabilities and as tools that can promote access, foster collaboration, and enhance productivity. These tools include text-to-speech, speech-to-text, graphic organisers, and inbuilt accessibility tools. These tools are often used as basic arguments behind classroom requirements for accessible media and materials. This chapter's approach to accessibility and assistive technology is rooted in the knowledge that equity of access is no longer a niche requirement solely used by disabled learners (Edyburn, 2010; Moriña, 2017).

Creating Accessible Media and Materials: Benefits and Opportunities

Creating accessible materials may seem like a daunting task to many educators. Often, they may not even know how to start the process. Of course, creating accessible content may depend on the technologies available to educators within a particular school. However, a simple start in supporting accessible media lies in creating documents and materials with structure. Materials, including long documents, especially books, are much easier to navigate for everyone when they have structure applied to them. There are multiple ways to do this, depending on the platform and software being used. In this example, Microsoft Word, a common word processor used across educational institutions from primary to postsecondary is used. However, alternatives like Google Docs and OpenOffice have similar supports around accessibility. Document structure in Microsoft Word is achieved by applying headings throughout your document using the Styles section on the Home ribbon. Screen readers, voice recognition, and keyboard users rely heavily on document structure

for access and navigation, but Headings also allow everyone to engage efficiently. Applying Headings using a tiered approach creates a document tree, allowing all users to move up and down the headings contained within the document (as shown on the left in Figure 1). This makes navigation easier for both learners and educators.

Figure 1: Headings in Microsoft Word


Outside of the structure, other factors can affect the accessibility of a document (see Table 1). For example, font type, font size, and bullet/numbered lists are essential to enhance accessibility and are easy to apply. In terms of font size, word processor documents should be a minimum of 12 points (pt). Accessible font types include Century Gothic, Tahoma, Calibri, Helvetica, Arial, and Verdana. All these fonts are plain sans-serif fonts. The decorative nature of serif fonts can make them much more difficult to access and read. However, Comic Sans font, sometimes prescribed for students with dyslexia, can make documents inaccessible to assistive technologies used by some dyslexic students. When making lists in Word, always use the bullets and numbering feature. Marking items as a list informs the reader that there are a set of steps or a numbered sequence to a process (McGinty, 2020).

The appropriate use of alternative text, link descriptions, and tables all play a role in creating accessible Word documents. Alternative text (alt text) is a text-based substitute for non-text elements, including images and tables. The alternative text aims to describe relevant information contained within non-text elements concisely. When applying alternative text, there is no need to begin the text with 'Picture of' or 'Image of', as it is superfluous and automatically assumed by the user accessing the alternative text. When describing the image, context is everything, so there is no need to include every piece of information within the non-text elements. Instead, the educator should focus on conveying the insight, the main trends, or the point of the graph or image. Link or hyperlink descriptions allow the user to understand the context of where the link will take them. While this is

essential for screen reader users, its logical approach provides clarity and should benefit everyone, not just those using specific technologies. Poorly labelled links include common non-descriptive links 'Click here', 'Learn more' or 'link'. Moreover, document or page links with a long and complex link name with special characters may also create access barriers. Providing descriptive naming conventions or utilising link shorteners can alleviate these accessibility concerns (Chee, Davidian & Weaver, 2022).

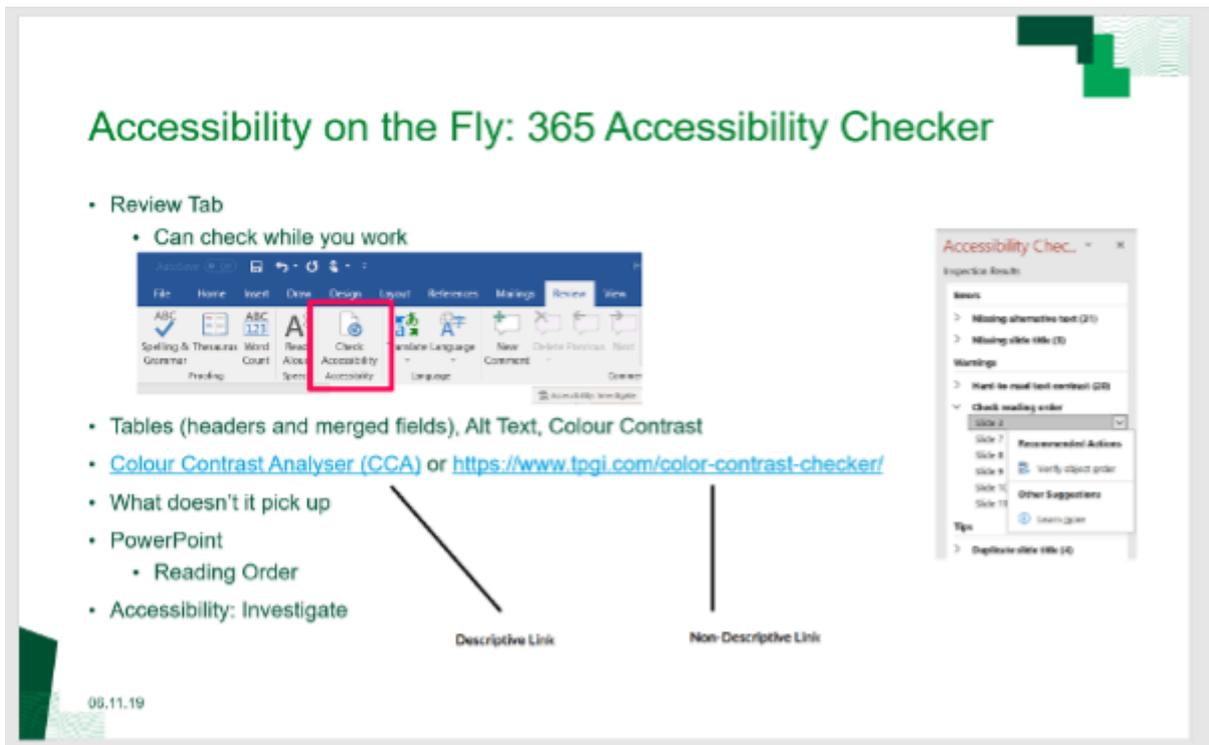
Figure 2:Accessibility in Microsoft Office


Table accessibility is usually more specific to screen reader users. Tables are read by the screen readers using header column cell and row cell to give the user context, especially if the user is blind or has low vision. Therefore, each cell in a table needs to have an associated header cell, so that when a screen reader user reads cell by cell the appropriate header data is read and the data within each cell is read. For more information see here an Introduction to accessible tables and a screen reader demo. If a header row is not applied, this creates an access problem for screen reader users. A similar situation occurs if fields within a table are merged as the screen reader cannot correlate the header column cell with the correct row cell. For more information see JAWS Reading Combined Tables.

By applying accessibility throughout your content, educators make it easier to create more accessible alternative formats, for example, braille files, audio files including DAISY files, portable document format (pdf) files and HTML files. Web services like Robobraille at https://www.robobraille.org/ offer free format conversions for learners.

PowerPoint works on a similar premise to those mentioned above. However, reading order can play a vital role in this presentation tool. Screen readers navigate through slide content based on a structured order beginning with the title and then working through the

slide in the order elements were added to the slide. If a teacher adds content outside of the template layout the reading order may be affected and require fixing. The Reading Order Pane can be accessed via the Check Accessibility drop-down pane in the Review Tab in PowerPoint. To enhance PowerPoint accessibility further, educators can use verbal descriptions of non-text elements when presenting their slides to support a more diverse audience. The application of colour is another integral part of accessible practice in Word and PowerPoint. Applying sufficient colour contrast ensures learners can visually access educational content. Although accessible colour contrast can be difficult to gauge, downloadable tools like TPGi's Colour Contrast Analyser (CCA) offer learners and educators a contrast support solution. This tool allows you to compare colours and provides pass/fail results based on WCAG standards for colour contrast. For accessibility, colour contrast ratio between the text and the background above 4.5:1 and 3:1 for large text. This ratio can be checked using the CCA. Regarding accessible font size in PowerPoint, 24 pt should be the minimum applied. PowerPoint also allows educators to search for pre-designed accessible slide templates which utilise accessible colours for contrast and reader-friendly font styles. For many reasons, including for learners with low vision and colour blindness, educators should never use colour to convey meaning alone. Moreover, when emphasising a point, it is best practice to use plain text where possible and to not use colour or bold font as a sole way for relaying important information as this can create barriers for a range of learners, for example, screenreader users, learners who have low vision, and learners with colour blindness (Arch & Abou-Zhara, 2008).

The issue of time is sometimes a factor when it comes to creating accessible media and materials. Schools, management, and educators need to develop school environments where implementing accessible practice is the new norm. Tools to support this initiative already exist, for example, Google Docs has an option to turn on screen reader support. Microsoft has the Accessibility Checker, a tool in a range of Microsoft products, including Word, PowerPoint, and Outlook. When applied correctly, it can offer real-time accessibility-specific feedback. Furthermore, the Accessibility Checker can take a lot of pressure off educators when checking for accessibility and makes accessibility checking easier for everyone (Fichten et al., 2019). Educators can significantly reduce the work needed to ensure their content is accessible by actively screening in real-time. However, the Accessibility Checker does not spot all accessibility issues, for example, subjective meaning in links and headings means that incorrectly labelled links can go unnoticed. Therefore, educators need to be knowledgeable in accessible practice, even when these tools are available.

Educators must also be aware of all these practices which are more conducive to supporting accessibility. Educators also need to understand the application of Optical Character Recognition (OCR) to scanned media and materials and how it aids a range of diverse learners. The OCR process converts an image of text into a machine-readable text format. OCR allows technologies to select and interact with individual words and characters

within a document. The application of OCR can be highly beneficial to students using assistive technologies, including text-to-speech or screen reader software. A study of 143 students with low vision and 29 blind students noted how almost 90% of students who were blind and a third of those with low vision used scanning with OCR software (Fichten et al., 2009). The application of OCR is usually a quick process. However, it can depend on many factors, which include the quality of the original text, the font and spacing used, and the quantity of scanning required. The complexity of the content is also a factor, i.e., graphics, images, maths, and scientific notation.

As we move into a more mobile age for technology, new solutions are beginning to emerge. Students and educators no longer have to rely on large scanning devices to apply OCR across media and materials. Microsoft Applications, including Seeing AI and Lens provide a free, flexible, and mobile way to scan OCR documents and materials. While these apps are free, they often require a mobile hardware device to operate. The Lens app also allows users to open scanned documents in an 'Immersive Reader' view, a feature that allows for personal customisation and text-to-speech application. Other mobile apps also facilitate learner autonomy, for example, the free application Adobe Fill & Sign enables learners and educators to capture a picture of a paper form and fill it in digitally. This can provide access to a range of learners who struggle with traditional class workbooks and require technology to access the curriculum.

Table 1: Accessible Issues in Microsoft Word & PowerPoint

Accessibility in Word & PowerPoint	Good Practice	Bad Practice	Accessibility Checker Detects
Headings	Apply Styles in logical order – Helps Define structure	Bolded Headings, no structure	No
Alternative Text	Succinct and meaningful or decorative	Auto Description or use of 'Picture of' or 'Image of'	Yes
Link Descriptions	Describe link succinctly	Click here or a long address	No
Table Header & Merged Cells	Include Header and exclude Merged fields	Merged Fields & Missing Headers	Yes
Use of Colour	Use Colour Contrast Analyser & High contrast	Low Contrast, Emphasise with colour	Yes
Font Size and Type	Minimum 12 pt Sans Serif / 24 pt in PowerPoint	Commonly used Font 11 with Serif	No
Reading Order (PowerPoint only)	Set Reading Order properly	Add content without checking the Reading Order	Yes

PDFs are often a contentious point regarding accessibility (Fichten et al., 2009). The dilemma with PDFs is that their accessibility depends on how it was created. Ensuring PDFs are accessible can be difficult but providing a PDF with OCR already applied is a good start for those relying on text-to-speech. However, a PDF that has OCR is potentially inaccessible to a screen reader unless the PDF is tagged correctly. Each PDF tag identifies the type of content and stores some attributes (for example, paragraphs, headings, lists, and tables), creating a hierarchical tree structure within the document. The tag tree forms the logical reading order structure making the document easier to access and navigate. However, tagging PDFs can be a time-consuming and arduous task.

There are a range of free applications for OCRing PDFs that exist; some are web-based others come in the form of a free feature in paid tools like Adobe Pro or literacy software including Read & Write or ClaroRead. Microsoft's Edge Browser with Windows 10 and 11 allows learners and educators to open PDFs, although it does not apply OCR to inaccessible documents. However, Edge empowers learners to read OCR'd PDF documents using text-to-speech and offers them various editing features.

Creating accessible media and materials can sometimes be laborious and costly. One example is the creation of transcripts and captions for video and audio content. Mainstream applications like Microsoft Stream and YouTube offer this auto-captioning service, including post-editing solutions. However, the accuracy of the original auto-caption dictates the amount of time needed to edit the captions. Unfortunately, auto-captions are limited and often depend on factors which include the microphone's quality, the speaker's voice, and the content. Significantly, the time taken to edit the captions may often exceed the time required to create the original video/audio content. However, tools exist that provide real-time human-based captioning solutions. These real-time human-based captioning solutions are often complex for students who need captioning services. The cost and logistics issues of acquiring a stenographer can be challenging. These stenographers/captioners can integrate within common online platforms like Zoom and Microsoft Teams (organised through the meeting administrator settings). However, they can also operate through third-party software for face-to-face interactions.

Newer paid solutions like Caption.Ed software by CareScribe allows for a more mainstream and flexible approach to real-time captioning while supporting several international voices. Despite using auto-captions, this software has quite a high accuracy rate and can be applied to any audio or video content on your device. It also provides a transcript in conjunction with the captions and therefore provides for real-time classroom notes. While this may provide a real-time, time-efficient solution, it is a subscription service which also requires some financial outlay. Caption.Ed also supports a range of different languages. Another tool, OtterAI, also works on a similar premise and may be more financially viable, it has a monthly subscription, and it also has a free version. It can also provide a transcript of the captions.

For shorter video content, apps, including Clips (free) and Clipomatic (paid), can offer quick video creation with editable captioning options. There are also post-production human-generated captions solutions. These solutions are often expensive and outside the budget of most schools. Companies like Cielo24 and Rev offer these solutions to allow educators to upload content to the cloud and receive back caption files within 12-72hrs. They also support translated captions and a range of standard file types like SRT or WEBVTT. However, for these solutions, the quicker the turnaround, the more expensive the cost. Ultimately, utilising captioning services that require time-sensitive approaches requires significant financial outlay from educational institutions. The alternative is a time-consuming process where educators must manually edit the auto-captions. However, a new captions-based solution is becoming mainstream in the form of Live Captions for Windows 11. Live Captions will allow all captions to be automatically generated from any audio content. Live Captions will also allow the captions box to float in a window or be exhibited at the top or bottom of a screen.

Although this is one of the newer accessibility features inbuilt in Windows, the inbuilt accessibility features across the main operating systems like ChromeOS, iOS, macOS,

Windows and Android devices are continually improving. Accessibility and assistive technology features now come almost as standard with new appliances. These features include text-to-speech (for example, iOS Speak Screen, Safari Reader, Immersive Reader), speech-to-text (for example, Dictate, Google Voice Typing), voice assistants (for example, Siri, Alexa, Cortana, Google Home), screen readers (for exmaple, NVDA, VoiceOver, Narrator), screen magnification, contrast customisation including dark mode and night light. Moreover, a range of additional tools and features exist within the accessibility and access settings of almost every well-known operating system.

Another method for supporting accessible content is the creation of braille. Braille is a tactile writing system used by people who are blind or who have low vision. Despite the well-documented value of braille literacy, braille literacy is declining (Hoskin et al., 2022). From an education perspective, there is also a low incidence of learners who read braille in schools (Herzberg & Stough, 2007). Moreover, braille production requires specialised technologies, which are unavailable to many if not most schools. As a result, the production of braille in schools is often the remit of organisations set up to support students who are blind or who have low vision. Euroblind provides information on access to these resources in each country within continental Europe. To produce braille, educators or learners usually need access to a braille embosser. Braille embossers emboss braille characters onto paper for tactile reading. Before the braille can be printed, the device attached to the embosser must perform braille translation from text. This translation occurs through specialised braille software such as the Duxbury Braille Translator. This software supports over 170 languages, and it supports literary, mathematics, and technical braille. However, produced braille texts are often quite bulky and regularly need to be divided up into more manageable volumes.

Electronic texts are more transportable and less burdensome than these large braille volumes (Suzor et al., 2008). As a result, more people who are blind or have low vision are moving towards technology-driven braille solutions. Hoskin et al. (2022) agree, claiming that many braille readers also use technology such as refreshable braille displays to access braille. These braille displays provide access to data on a computer screen by electronically raising and lowering different combinations of pins in braille cells. They can show up to 80 characters from the screen, which refresh as the cursor moves around the screen. Braille displays have their advantages over traditional braille by allowing for a more practical solution for the digital age that engages more readily with electronic-based reading environments (Russomanno et al., 2015).

During the COVID-19 pandemic, digital solutions provided access for those requiring remote sign language interpreting. This remote approach was seen by many as a flexible and efficient way to facilitate sign language interpreting services (De Meulder & Haualand, 2021). Interestingly, this practice is still being employed in educational settings today. However, to enable more inclusive access to media, educators need to understand how best to support remote sign language interpreting services, for example, the Center for

Excellence in Universal Design states a list of directions and techniques to ensure an interpreter is easy to see and read (National Disability Authority, 2022). These include capturing the entire signing space and ensuring the signer is the required size and visibility. Moreover, the provision of content-specific terminology for the interpreters before the class is essential and reduces the potential for complex translations.

Another accessible solution centres on the growth in audiobooks and text-to-speech-based solutions. Audiobooks can support a range of diverse learners, and it has been shown to improve language and reader competence while also increasing school performance, attitude, and motivation (Alcantud-Díaz & Gregori-Signes, 2014; Milani et al., 2009; Padberg-Schmitt, 2020; Whittingham et al., 2012). Free text-to-speech tools, including Balabolka, can create audiobooks, but professional audiobooks are also available through Bookshare and professional services like Amazon's Audible. Available in many countries, Bookshare is an accessible digital library for all people with print disabilities. Unfortunately, Bookshare is only available for individuals with a qualifying reading or perceptual disability, a visual impairment, or a physical disability affecting their ability to read printed works. The Bookshare library, which supports over 34 languages, has over a million titles, including books for schools has the largest collection of accessible digital books in the world.

Alternatively, Amazon's Audible is an online audiobook and podcast service that allows users to purchase and stream audiobooks. This platform will enable users to download and stream content from Audible's substantial online database of audiobooks and podcasts. Similar to Bookshare, Audible utilises professional human voices to narrate its products. However, it is limited in terms of educational material. Audible can also be synced with Kindle to provide a human spoken text-to-speech with highlighting known as WhisperSync. For flexibility and to support different learners, WhisperSync lets users readily switch between reading the text and narration. While time can be a barrier to providing accessible solutions like captioning, there are additional barriers to creating accessible content.

Barriers and Solutions

There are many barriers and challenges that educators can face when promoting accessible media and materials in their classrooms. These barriers, in addition to time, include cost, knowledge, and other social factors, including stigma.

Finance and sustainability solutions are high priorities in most of today's schools. However, accessible technologies, including many assistive technologies, invariably come with a high price tag (King & Allen, 2018). This high cost can deter schools and educators from utilising assistive and accessible technologies. Additionally, in many low-income countries funding may not be available to ensure access, and even less so in rural areas within the countries (Gulati, 2008). However, inbuilt accessibility and assistive technology features across most mainstream operating systems and applications may alleviate some

of this cost associated with procuring assistive technology. Assistive technology freeware and open-source technologies also provide alternative options instead of expensive bespoke technologies. Many of the technologies available also have a free version, which in some cases may not be as effective. Trialling examples include Inspiration , Read & Write and LightKey. However, these free versions allow for the trialling of technologies to test their effectiveness. Therefore, educators can experiment with a program to see if it meets the needs of learners before investing in expensive technology that may not be suitable.

Another significant barrier throughout much of the literature is the time required to learn and support these technologies (Ault et al., 2013; Courduff et al., 2016; Flanagan et al., 2013). However, time does not only impact on these inclusive technologies, as many educators do not have enough time to explore, experiment, research and implement mainstream educational technologies (Khlaif et al., 2021; Polly et al., 2020;). Priority must be given to inclusive technology across teacher education, from pre-service and in-service training to whole-school approaches to inclusive education. This may alleviate some of the time concerns noted in adopting and understanding these technologies.

Learner barriers are also an issue for educators. Stigma can prevent people from using accessible or assistive technologies and accessible media and materials by garnering unwanted attention (Zapf et al., 2015). Learners who experience learning disabilities can feel ashamed about their learning difficulties. The stigma may not emanate from an individual learner's functional limitations but from societal and social responses to disability. In that respect, stigma is caused by framing the conversation around disability, accessibility, diversity and not the use of technology itself. As a result, young people using specific adaptive technologies might feel that this makes them different to their peers, and additionally, their peers may see them as 'other' (Barbareschi et al., 2021; McNicholl et al., 2023).

Integrating accessible technologies into daily school life creates a new norm and reduces the stigma attached to these technologies, for example, smartphones either come equipped or require the download of applications which allow them to support reading, writing and organisation, text-to-speech, and dictation technologies. Having these technologies in a device everyone uses may hide the fact that the learner relies on a particular tool. Moreover, if assistive technologies like these mentioned above are used by many people using the same device, this can significantly reduce the stigma. Interestingly, newer mainstream technologies that support assistive technologies and accessible practices are already perceived to be more acceptable in this regard (Ok & Rao, 2017). The mainstreaming of assistive technologies across Microsoft applications under the umbrella of inclusion for all learners may further reduce the stigma associated with such tools.

Support for assistive technology and its implementation are known barriers to access for some learners (Ault et al., 2013; Bell et al., 2010; Donne & Hansen, 2016). Educators are often inadequately equipped to consider and implement the types of support (Naraian & Surabian, 2014). Moreover, keeping abreast of these changes can also be daunting and

overwhelming for many educators (Dawson et al., 2016). The number of technologies available and changes in accessible practice can significantly impact educators and therefore emphasises the need for hands-on teacher training on accessibility tools, and technologies, for both initial teacher education and through lifelong learning and continuous professional development (Alkahtani, 2013; King & Allen, 2018; Michaels & McDermott, 2003; Schaff, 2018; Van Laarhoven & Conderman, 2011). However, social media is another potential way for educators to upskill and stay alert to changes related to accessible practice. Many teacher networks are already utilising social media which can influence teaching and learning practices (Willems et al., 2018).

Many of the barriers related to accessibility discussed previously can be addressed through training or more open and inclusive approaches to supporting learners. Whole-school and whole-classroom approaches can also mitigate some of these concerns. However, knowledge and information sharing is key to an inclusive culture and creating an accessible environment for everyone. In addition to knowledge, adopting frameworks like the Universal Design for Learning (UDL) framework allows schools and educators to promote accessibility as a tool that supports everyone.

Accessibility and UDL

Accessibility and the provision of accessible media and materials complement more inclusive frameworks, including Universal Design for Learning (UDL). A full chapter also exists on UDL elsewhere in this book. An innate bond exists between UDL and accessibility, a relationship educators need to understand if they are to support more inclusive practice (O Shaughnessy, 2021). After all, a universal approach must be an approach that aims to cater for everyone, including those with accessibility needs. Moreover, assistive technologies make UDL more accessible, efficient, robust, and financially sustainable (Griful-Freixenet et al., 2017). While UDL is not a technology-based framework, the flexibility offered by technology-enhanced learning options means that technology often plays a significant role in implementing UDL practices. By combining technology and UDL, schools can deliver more profound, accessible, and engaging learning environments for everyone, including those with diverse learning needs (Rose & Meyer, 2002). However, there is still a need for Initial Teacher Education programmes to emphasise UDL, instructional practices, and technology-enhanced pedagogy (Basham et al., 2010).

A UDL-based approach also creates opportunities to address potential accessibility-related issues (Al-Azawei et al., 2016; Zorec et al., 2022). Importantly, UDL emphasises both the accessibility of learning and the accessibility of educational material (Scott et al., 2015; Tobin, 2014). The application of accessible practice across the UDL framework is evident, for example, guaranteeing that teaching materials are usable, structured, and accessible is pivotal in promoting the UDL representation principle (Boothe et al., 2018). This approach ensures that all learners, including those using assistive technology, have

access to the necessary materials. Nieves et al. (2019) also note how the UDL principle of action and expression facilitates accessible options for demonstrating learning and knowledge expression. By supporting learners with accessible content and using accessible systems, educators can support learner autonomy and paths that promote self-directed learning. Through regarding multiple means of engagement, accessible, and assistive technology tools can support and foster collaboration, facilitate coping skills and provide a range of options to minimise threats and distractions.

Adopting a UDL approach for educators, schools or institutions can sometimes be intimidating. However, the key to success can reside in taking a small-steps approach. By starting small, the UDL process becomes more manageable, and educators reduce the risk of becoming overwhelmed (Boothe et al., 2018; Novak & Rose, 2016). Tobin and Behling (2018) promote a similar approach called 'Plus One', a process that advocates adding one small thing each time along your UDL journey. O'Shaughnessy (2021) posits that an increased focus on accessibility can be that 'Plus One' or that first small step in an educator's UDL journey. However, when introducing UDL, planning for accessibility needs to happen from the outset due to difficulties that often come from trying to retrofit UDL, for example, using accessible templates in PowerPoint increases the accessibility of the slides, this saves time and effort in trying to edit slides for accessibility afterwards.

Educator Awareness of Accessibility & School Culture

While designing from the outset may not always be possible, schools and educators can take steps to ensure staff are aware of tools and technologies to make lessons more exciting and grant better access to more learners. This section discusses two approaches: training for educators and communities of practice.

In terms of inclusive education, assistive technology and accessibility training must be included in Initial Teacher Education (Drelick, 2022). However, there is a need to address assistive technology and accessibility across all facets of the teacher education continuum. This need is reflected in the CPD needs of educators, where technology and special education needs loom high on the list of teacher priorities (Murphy & De Paor, 2017). Moreover, educators need to stay abreast of new approaches to instruction to meet the demands of today's classroom (Thurlings & den Brok, 2018). Training for educators on accessibility should include practical tips and solutions with simple strategies for integrating within the classroom. Hands-on training should enable educators to experiment and become comfortable accessing, creating, and using accessible materials. Training should include giving educators guidelines to critically select and evaluate the available media and materials regarding the relevance for their learners and the topic at hand. To encourage and promote more accessible practice in schools, the development of a more cooperative peer learning approach is proposed in the form of a Community of Practice (Lave & Wenger, 1991).

Communities of Practice have the potential to provide educators with information about the use of accessible media and materials (Lewthwaite & Sloan, 2016; O Shaughnessy, 2021). Their cooperative approach facilitates the dissemination of knowledge and personal experience, which can be highly beneficial in education. Educator Steven Anderson states on Twitter that "alone we're smart, but together we're brilliant" which captures the essence of communities of practice and their potential role in education (Anderson, 2013). Belonging to a group, using whatever means, be it in person or virtual, via some shared social space enables educators to create connections and discuss common issues surrounding the accessibility and use of media and materials. They also provide options for reflective practice, assessment, and ways to enhance student engagement (O'Shaughnessy, 2021). Establishing what worked for a colleague and what should be avoided can save a lot of time for educators. Moreover, these communities can play an integral role in the professional growth of educators (O'Sullivan, 2008).

A Community of Practice is just one approach that can benefit educators in promoting an inclusive agenda regarding accessibility. The whole-school approach to inclusive practice demands that senior management take proactive steps to ensure educators' continuous professional development through workshops and seminars. Accessibility begins with creating an inclusive school culture. In keeping with this inclusive school culture, principals and senior management must invest in school-wide licences for technology that will enable universal access to media and materials. These technologies can promote learner independence and reduce the need for individualised accommodations and differentiation while supporting a more UDL-based approach to education that empowers the learner. A shift in focus from educators to a whole-school approach supported by school management may impact the inclusive culture within a school.

Principals also play a pivotal role in fostering inclusive schools (DeMatthews et al., 2021). This influence can be even more critical because educators may sometimes not know the right course of action when promoting inclusive education (Spratt & Florian, 2015). Communities of Practice and buy-in from senior management are vital components of inclusive culture in schools. Teotia (2018) argues that an inclusive culture's diversity and unique perspectives enhance the school community including parent-teacher perspectives. Through the lens of the parent-teacher perspective, it is important for educators to be sensitive to the parents, as they can play an important role in inclusive education (Mann & Gilmour, 2021). Parents can create a platform that they can use to support each other and support their learners and their use of technology. Parents' communication platforms support communication from schools regarding the progress of their child, school meetings, homework, and important notifications. Additionally, parents can communicate with each other on common issues that affect them. Communication and sharing are integral to inclusive school culture and promoting accessible practices. Inclusive cultures empower stakeholders, drive inclusive change, and break down barriers. Communities of

practice, school management, and other stakeholders each play their own part in driving an inclusive agenda that supports and fosters accessible practice.

Conclusion

The evidence presented in this chapter highlights the importance placed on educators providing accessible media and materials. The advantages of accessible practice, while essential for access and the promotion of learner autonomy, benefit far more learners. Moreover, while technologies including screen readers, speech-to-text and text-to-speech require material to be accessible, creating an accessible structure behind accessible media and materials makes it more engaging and navigable to every learner.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:

Closing questions to discuss or tasks

- How could you make the media you create daily more accessible?
- What tools could you integrate into your classroom to make your media and materials more accessible?
- Describe the communities of practice (COP) you already engage in which enhance your practice in accessible media and materials.
- How could you improve these communities of practice so that they operate more effectively?
- If you do not have any communities of practice which enhance your practice in accessible media and materials, how can you establish these? Think of COPs among staff, parents, learners, etc.

About the authors

Thomas Joseph O Shaughnessy

Thomas is a graduate of the University of Limerick at both undergraduate (BSc. in Computer Systems) and postgraduate level (MSc. in Software Engineering). With a background in accessibility, teaching and assistive technology, Thomas has extensive experience promoting and facilitating inclusive practice in primary, post-primary and post-secondary education. Thomas has experience guest lecturing at undergraduate and postgraduate levels in assistive technology, accessibility, and Universal Design for Learning (UDL). Thomas's interests include wider institutional approaches to inclusive practice, the role of third space professionals in higher education and the use of communities of practice in fostering and promoting more inclusive practice.

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

Sam Blanckensee

Sam Blanckensee (they/he) is a equality, diversity and inclusion practitioner based in Ireland with extensive experience in equality in Higher Education through their role as the Equality Officer at Maynooth University. Sam holds an MA in management for the nonprofit sector. Sam has worked within Irish LGBTQ+ organisations in voluntary and professional roles since 2013. Sam's work covers a broad range of equality, diversity, inclusion and interculturalism initiatives including LGBTQ+ matters, gender equality, anti-racism, disability awareness and access for those within the international protection system. Sam is a non-binary trans person who is also neurodivergent and queer, All Means All is a project where the personal meets professional for Sam.

BRIDGING LEARNING AND TEACHING: POSSIBLE PATHWAYS TO MORE INCLUSIVE EDUCATION

Hermione Xin Miao; Akshita Rawat; and Brian Lynam

Example Case

Aditi is a teacher in a public school. Her students belong to low-income, working-class backgrounds and are from marginalised communities. These students reside in the nearby neighbourhoods, as ghettoisation is a common feature and their parents are blue-collar workers. Aditi joined the school as part of an NGO intervention. She teaches all subjects to students in grades 1 and 2. In her teacher education and induction for the NGO she was trained in several 'progressive' methods of teaching, using interaction and dialogue and introduced to theories on pedagogies and child psychology. Like her peers in the NGO, she is privileged, upper-class, and university-educated. This also makes her very different from her students in terms of her socio-economic background.

For the short time that she is there, she is highly motivated to engage students and push them to see their potential. Students from marginalised communities had internalised a 'culture of silence', being conscious of their class and caste position. Her main goal is to retain them in school by developing an interest in learning. Being trained by the NGO, she follows an interactive method of teaching, using gestures and prompts to encourage students to participate and speak up. However, in the classroom, there are several challenges as well. The main challenge is the asymmetrical power relations as she is an upper-class English-speaking

individual who teaches in a low-resource school to disadvantaged students. She is far more privileged than the students she teaches. Therefore, for dialogue to be effective, it is also important that she understands the social conditions in which the thoughts and language of the students have developed. She makes efforts to be aware of the reality and worldview of the students. In her methods, she attempts to connect the local and the immediate to the larger concepts. She picks topics and lessons to align them with the students' worldview.

In this chapter, we start the first three sections by describing one structural disadvantage in learning and teaching, then suggest one possible pathway to bridge learning and teaching. By doing so, we can discuss how to address and even prevent disadvantages. In the final section, we put together different pathways to encourage more inclusive educational spaces. We have summarised three questions which guide us in structuring the chapter:

- How can learning and teaching methods foster cross-cultural understanding and create a more inclusive educational space?
- What challenges arise when bringing diverse perspectives into educational practices?
- How can teachers utilise inquiry-based learning, critical pedagogy and feminist approaches to engage students more meaningfully?

Initial questions

First, before reading the chapter, we invite you to think about three initial questions:

1. Past experiences: Based on your school experiences, what teaching strategies did teachers use (if any) and what opportunities (if any) did you have to investigate critical social issues in and beyond the classroom?
2. Future projections: What would you imagine as the benefits and challenges that you may face when bringing diverse perspectives to learning and teaching methods?
3. Current situations: In your case, what difference would be made if learning and teaching methods are designed to foster cross-cultural understanding and make educational spaces more inclusive?

Introduction to Topic

Introduction to the topic

This chapter brings learning and teaching methods together instead of separating them into two processes. Education needs learning, teaching and their interactions to take place. If there are only learning methods, the danger of 'learnification' (Biesta, 2009, 2022) is that learning can become empty if educators do not rediscover the gifts of teaching. If there is only teaching without learning, it is also problematic as the teaching becomes a one-person show, which is not showing education as a dialogue between teachers and students.Hence, learning and teaching methods have to come together.

We have no intention of providing an exhaustive list, and we also see the problem of being prescriptive. As an alternative, we provide three heuristic case studies from our different expertise to give examples of what diverse learning and teaching methods can look like and what they can enable. These include inquiry-based learning, critical pedagogy and feminist approaches.

The purpose is to provide alternative pathways to replace the traditional authoritarian model of teaching. We explore education's liberating potential through transforming learning and teaching methods. These alternatives are more than technical methods which aim for higher scores in assessments. None of them can be developed in one day. They are not magic cures. They take time, but the time you spend with yourself, classmates, colleagues and students on diversifying learning and teaching towards inclusion also brings you a sense of achievement.

We are fully aware that you and we all live in a society where institutional settings and school structures shape learning and teaching practices. By pointing at alternative pathways, we are not denying these, but also remind you, educators and future educators:

You also hold the power to make learning and teaching more just, democratic and inclusive.

What makes you different from artificial intelligence is your subjectivity, which is the key for a human being to develop the transformative potential of learning and teaching methods. You can think for yourself and talk to people, and be empathetic with others. This also creates a space for you to think about your own biases, prejudices and privileges along with the students to learn and unlearn by indulging in an interactional relationship.

In this chapter, we urge the readers to think about the purpose of education and not be limited to within the school. Classrooms and schools do not exist in a vacuum. They coexist with a society which is unequal and riddled with issues of class, religion, gender, caste, etc. When we come together in the classrooms as learners and teachers, we bring along with us differences based on our identities, along with levels of privilege and disadvantage, ways of thinking, perspectives, biases, and opinions. Various aspects of our lives come together. Through this chapter, we propose approaches that can enable teachers to modify

their learning and teaching methods accordingly to meet the requirements of the learners and to make the process more engaging and inclusive.

Checking our privileges

In this section, we share personal reflections to illustrate how our identities, privileges, and lived experiences shape the way we view the world and approach our work. Positionality is not static; it evolves over time and across contexts, influenced by the intersecting dimensions of our identities. As an additional resource on positionality and intersectionality, the OpenTextbook *Universal Design for Learning (UDL) for Inclusivity, Diversity, Equity, and Accessibility (IDEA)*, features a video of Kimberlé Crenshaw—who first introduced the concept of intersectionality—that can further enrich your understanding of these dimensions.

As educators and researchers, understanding these dynamics is essential to fostering empathy, equity, and inclusivity in our practices.

Through our stories, we aim to offer a window into how power and marginalisation operate in complex and multifaceted ways. These narratives serve as examples of how privilege and disadvantage can coexist, shift, and intersect in unexpected ways. They also reflect our commitment to ongoing self-reflection as a cornerstone of inclusive education.

We hope that by sharing these accounts, we not only demonstrate the value of examining positionality but also encourage you to reflect on your own. The following examples highlight how our unique journeys have shaped our perspectives and continue to inform our contributions to education and research.

Hermione Miao

When I came to study for my PhD in the United Kingdom, someone shouted at me: "Go back to your country". Now sometimes when I share my views with people in China, I get criticised for being "too westernised". I have no choice but to live in this in-betweenness, being considered as outsiders in both scenarios by some people 'loyal to their traditions'. This was not something I would experience if I stayed where I grew up. I was born and bred in rural China in a Han (major) ethnicity family. Revisiting my encounters made me notice that I was born privileged in one place, but disadvantaged in another, then being dismissed in the first place as I had been to other places. In addition, the more I grew up, I also faced more situations where people told me "Good girls/women should not do this…". I gradually realised that I was not born but rather became a woman. However, I would also never think like 'some typical' feminist, not just due to my other social-economic and cultural backgrounds, but also I chose to recognise these intersectional dimensions. I have significant roles to achieve what I want to see as a feminist.

I am now also more aware of my privilege to study for my PhD with my mother's financial

support. Not every emerging scholar would have the luxury of studying full-time, I am grateful for mine. Back in the 1990s, my parents took the opportunity to start a small business by migrating from a rural village to a mega city in China. I was one in millions of left-behind children in rural areas when their parents migrated to the cities as breadwinners. By then, the household registration system in China allowed internal migration (mostly from rural to urban), but their children could not access these urban state-owned schools. I grew up with my maternal grandparents and later reunited with my parents through studying higher education in the city in which they live. Then I followed my passion to study abroad, trying to find possible routes to make education more inclusive and accessible to all. Over time, the lack of power and privilege in my school days has transformed to motivate me in reducing and ultimately preventing education reproducing social injustices.

Akshita Rawat

In India, I belong to a majorly privileged group. Privileged in class, caste, language, and education but not in gender. Up until my school and also graduation, I was in a more homogenous crowd where I was in the majority as most students were from the upper or middle class, upper caste, English speaking, born in the city, etc. Or at least they were the ones who were "visible". I did not become aware of my privilege until I was in my post-graduation (university level) where the crowd was heterogeneous with the majority of the students being from various parts of India, villages and cities, lower economic backgrounds, 'lower' caste, differently abled and who were from marginalised communities. It was during this time that I was made aware of my privilege, of how deep inequalities still are even in education, and how upper caste people (who are a minority) hold positions of power and have even made educational institutes exclusive spaces. It also made me see that education is a right and even premier and top universities can also be made truly inclusive. However, when I moved to Europe to pursue my PhD, I became disadvantaged in several ways due to my race, ethnicity, and language, and the inequalities are more visible to me than to my peers who are privileged in terms of their race. However, compared to other people in India or even other minorities here, I am still privileged as it is due to my social, cultural and economic capital, which is due to my caste and class, that I am able to pursue a PhD from abroad. I am still privileged but also have several disadvantages in Europe due to being from South Asia.

Brian Lynam

Living in the Netherlands for the past number of years, I have regularly been excluded from conversations in Dutch, due to not speaking the local language. This becomes very apparent in larger groups of people, even though English is very widely spoken and understood. In contrast, in Ireland I am regularly complimented on being multilingual, which

gives me extra clout in social interactions. In one country I am linguistically disadvantaged and in the other, I am quite privileged.

In addition to this, over time, and through my travels across continents mainly in my early twenties, I became increasingly aware of my socio-economic advantages of being able to spend long periods of time in countries and cultures that were very distinct from my own. I have first-hand experience of having minimal difficulties travelling between borders in Asia and Africa, visa exemptions and unrestricted access to beautiful parts of the world. The question of citizenship became quite interesting to me, and when I read news reports of the issues and stress refugees or immigrants face when moving countries, I became cognisant of the value of my Irish passport and the rights and opportunities it afforded.

These trips abroad, and my life-long interest in meditation and spirituality, have also made me closely examine my own identity and place in the world, particularly regarding who we are and where we come from. I am acutely aware of the privileges that have been given to me in my life, and how it has impacted my upbringing and life experiences in a generally very positive way. In meditation practice I often focus on deconstructing the thoughts, ideas and concepts that are most closely related to me, and seeing reality in a more objective manner.

Case Study 1: Critical Pedagogy in Low-Resource Classrooms

As introduced at the beginning of this chapter, Aditi's classroom offers a compelling example of the challenges and possibilities within low-resource schools. Her experience as a teacher working with students from marginalised communities highlights the tension between privilege and disadvantage, as well as the transformative potential of dialogical teaching methods. This case study builds on her story to explore the principles of **critical pedagogy**, a liberating approach to education that emphasises dialogue, reflection, and action. By revisiting the dynamics in Aditi's classroom, we examine how educators can address structural disadvantages, foster inclusion, and empower students to challenge systemic inequities. Through this lens, we invite you to consider actionable pathways for bridging the gaps in privilege and creating more equitable educational spaces.

What is critical pedagogy?

Paulo Freire was a Brazilian educator who played an important role in laying the foundations of critical pedagogy. In his book, *Pedagogy of the Oppressed* he describes critical pedagogy as a liberating form of education that involves praxis which is "reflection and action upon the world in order to transform it" (Freire, 1970, p.51). It begins with problematising the social and economic structures and social relations that shape the lives of the people, and in which schools also function. It views schools as ideological sites, as an embodiment of the normative values, relations of power, and larger social structure and complicit in reproducing dominant social relations and structures but also, potentially, as sites of

emancipation and for challenging the taken-for-granted nature of knowledge (Roberts, 1996). It also means looking critically at our role within the social structure, the asymmetrical power relations in the society and our privileges, as well as the role we might play in knowingly or unknowingly challenging or reproducing the values and ideologies of a repressive and exploitative system (Bartolomé, 2004).

For teachers and students in the classrooms, critical pedagogy is about remaking their perspectives and lives by critically reflecting on the world, including multiple perspectives, knowledge structures, and also enabling the students to learn "academic" or "scientific" knowledge. Within this approach, learners and teachers are encouraged to critically view their relations with others and their position in the world, and think about the forces that shape their consciousness (Giroux, 2010). This involves the act of constant remaking, where teachers and students reflect and critically perceive their social position, not from abstract ideas and concepts, but from their social position and lived experiences (Freire, 1970).

Critical pedagogy moves away from a more authoritative model of learning and teaching, which Freire describes as the **banking concept of education.** In the banking concept, the learning and teaching methods are dominated by practices of rote learning, a hierarchical teacher-student relationship, and a prescriptive model of learning and teaching wherein students are thought of as empty vessels to be filled by teachers (Freire, 1970). It is inherently anti-dialogical, where knowledge is unchanged and the social reality is treated as outside the purview of education. By not questioning the nature of reality and the inequalities in the world, this kind of education serves the interest of those in the position of power, the oppressors, and contributes to maintaining the status quo. It also kills the creativity and critical imagination of students and discourages them from posing questions about what counts as knowledge (Roberts, 1996).

Why do we need critical pedagogy?

Critical pedagogy emphasises the liberating and emancipatory potential of education. By its very nature, it is **problem-posing**.

Participants pose problems and begin to question. It is also not limited to classrooms and has liberation as its purpose through the process of posing and addressing problems (Roberts, 1996). It introduces the participants to new ways of thinking and gives them the tools to question dominant ideas, biased and discriminatory social practices and knowledge to intervene and restructure them (Giroux, 2010).

Critical pedagogy is particularly important for teachers and students who teach and learn in a diverse context which includes students from lower social and economic backgrounds. This is because the **central characteristic of critical pedagogy is dialogue.**

"Only the dialogue, which requires critical thinking, is also capable of generating critical

thinking. Without dialogue, there is no communication, and without communication, there can be no true education" (Freire, 1970, p. 73).

Here, we would like to introduce Gayatri Chakrovorty Spivak's ideas. Dialogue or the act of speaking is so important especially for students who are from non-dominant social groups, especially for the marginalised "other" as they are usually spoken for (Spivak, 1989). They are usually the object of knowledge for others to be appropriated and dialogue is essential when aiming to learn bidirectionally. It connects education to a larger context of our identity, social position and power relations. It allows both the teachers and the students to **learn and unlearn** their own privileges by entering into a dialogue. This dialogue allows us to engage with marginal or subaltern communities in a learning process that does not just result in academic knowledge about the 'other', but is useful in developing theoretical insights about one's own positionality.

Another reason why critical pedagogy is important is because education is not a neutral process. It is a reflection of the larger social structure and the inequalities that are present in the world. In a classroom, the students' and teacher's position in the social order are important factors that interact with how they learn and teach (Bernstein, 2004; Hoadley & Muller, 2010).

In Aditi's classroom, the difference in the social class and caste position of the teacher and the students was significant and it was one of the barriers that prevented them from having open communication. The students are more used to studying through a lecture-based approach and have internalised silence. Here, it is important to point out that schools not only contain an instructional aspect i.e., content taught, what is categorised as knowledge, how it is taught, etc. but also a moral aspect which includes teaching values, behaviour, and ways of thinking which are considered as essential and appropriate to exist in a society (Bernstein, 2004). This shapes what students learn and how they perceive the world around them and also themselves.

While it is important to take note of the power held by institutional structures, rules and regulations over classroom processes, it is important to remember that the **teacher's subjectivity** also plays an important role. Teaching is a political act. Often teachers believe in "meritocracy" that is, if you study hard, you succeed (Bartolomé, 2004). Often teachers have a deficit lens through which they especially view students who are linguistic minorities, low socio-economic background or disadvantaged in any other way. It has been described as a lens of educability i.e., learning potential. Teachers construct a generalised notion about marginalised students associated with a learning deficiency due to their lower socio-economic background (Bartolomé, 2004; Majumder & Mooij, 2011). When the model of teaching is authoritarian, which is based on hierarchising students as "weak" and "intelligent" and based on a non-dialogic student-teacher relationship, it can lead to the internalisation of a self-deprecating image wherein the students become fearful of any pedagogy which pushes them to think freely (Nambissan, 2010).

It is important to point out here that the criticism is not directed towards individual

teachers but towards a system of education and the attitudes and social relations that underpin and hold it together (Freire, 1970).

The teacher's subjectivity interacts with the material realities of the schooling context which shape the classroom pedagogy. So, an interactional relationship between the structure of schooling (curriculum, resources used, assessment and evaluation) and also the subjectivities of teachers and students, creates a space to challenge, learn and unlearn their own privileges, prejudices and asymmetrical power relations, while at the same time understanding how students make meaning. In the above-mentioned case study, the teacher uses the context that students are familiar with to introduce them to new concepts and ideas. She begins with their immediate surroundings and believes that they already know things and need help in giving them shape.

What can teachers do to develop this perspective?

The answer is dialogue.

Education is an act of co-creating and making knowledge, but it does not mean that 'anything goes'. Teachers give direction and structure to learning (Roberts, 1996). They are interventionists (Freire, 1970). It also does not mean imposing their views on students. The teacher's view is not the only view and asking questions is an essential part of the learning process. They 'relearn' their subject continuously. The liberating teacher welcomes questions and sees them as a sign of critical engagement. Students should critically engage themselves but there are "inductive" moments where the teachers take initiative to redirect, take charge and assist. It has to have a clear structure and purpose (Freire, 1970).

The teachers drive the learning process and encourage students to see that reality can be altered to problematise their current situation (Freire, 1970; Roberts, 1996). The teacher's role includes asking probing questions and providing important information, that will enable them to begin to ask one another questions, to perceive either former perceptions, and timorously place in doubt the opinion they held of reality, replacing it with a more and more critical knowledge.

Through critical pedagogy teachers also realise their important role as defenders and advocates for students. They hold the power to create self-empowering conditions in which students can play an active role in their own learning and have a voice in the process. They also have a responsibility to ensure that all students are able to participate in the dialogical process without feeling forced to speak up. All ideas and views are open to question, either advocated by teachers or students. This perspective helps both teachers and students arrive at a critical view of reality and question their own biases and prejudices (Bartolomé, 2004).

Case Study 2: Inquiry-Based Learning in a Multicultural Context

Imagine an International School in Amsterdam, the Netherlands, which is a very multicultural and diverse city, and famous for attracting a diverse community from around the world. The school is located in the suburbs of the city, and is known for offering high-quality and inclusive education to almost 900 students from varied cultural backgrounds between its primary and secondary programmes. The school is partly government funded and partly privately funded, with a management board that is also involved in key decision making, appointments and the broader concerns of the school.

Here are seven key features of the school.

Curriculum

The international school follows the International Baccalaureate Primary Years Programme (IB PYP) for its younger students, and the International Baccalaureate Middle Years and Diploma Programme (IB MYP and IB DP) for its secondary school students. It is a challenging curriculum, offering an internationally recognised education and one that has been specifically chosen to meet the needs of the local community. It is a student-centred approach to education, with a clear emphasis on inquiry-based learning and promotion of student agency in and outside the classroom.

Inclusive Education

Being a safe, welcome and inclusive school environment is at the heart of the mission and vision of the International School. Students come from diverse backgrounds, nationalities and socioeconomic backgrounds and the school ethos is based on creating and maintaining an atmosphere of respect, collaboration, openness and compassion, in fact, the 3 C's of Curiosity, Connection and Compassion are the core values of the school. The students are encouraged to engage with their own cultural identities, while at the same time developing intercultural dialogue and cross-cultural understanding between their peers.

Multilingual Education

In this international school, multilingual education and language diversity is celebrated and within the context of the school, some educational programs aim to teach students in their own native languages. Combined with this, there are many opportunities for students to engage in learning additional languages. Throughout the school year, there are specific weeks whereby a certain language is spoken and promoted throughout the school, including staff and students using basic phrases and greetings in the building. This atmosphere inspires all members of the school community to be aware of their own

linguistic identity whilst at the same time, sets the backdrop for more communication, open-mindedness and cross-cultural collaboration in a complex and diverse world.

Staff

The international school regularly has representation at job fairs, and has been able to employ very qualified and dedicated teachers and staff who are very experienced in international education. Staff members come from a wide range of cultural and linguistic backgrounds, bringing a rich collection of teaching resources, approaches and perspectives to the daily life of the school in terms of application, atmosphere and perspectives. In addition to this, staff are expected to engage in ongoing professional development learning during their time at this international school, and many of these workshops and learning programs and certificates are inextricably linked to inclusion and diversity within a school setting.

Community

The international school community is very strong and united, with a strong connection between the school, parents and the wider community, with active involvement and regular communication between all parties. Other local organisations and small businesses are also willing to participate in school related activities. Some of the ways that this happens in practice are through parents actively getting involved in school events and activities, acting as guest speakers on specific topics and local businesses offering to showcase, teach and inspire students to make their first steps in engaging with the wider community outside of school. A core belief of the school that is embedded in learning from kindergarten through to diploma level, is the emphasis on taking action, drawing conclusions and making connections with the world around them, that is not solely limited to theoretical focus in the classrooms.

Co-curricular Activities

The school offers a wide range of co-curricular activities for the students, which complement the academic subjects that are being taught, including chess, taekwondo, drama, music and many others. Students are encouraged to explore and develop their interests and talents, and build relationships with their peers while doing so. The school community is invited to join students when there are exhibitions, competitions or other activities whereby the school's students are being represented, all the while ensuring that school morale and participation is celebrated and valued in a variety of forms and settings.

School Environment

There is a clear anti-bullying policy in the school, which aims to ensure that all its students feel protected, respected and most importantly safe. This is communicated clearly on the school websites, to all students and parents, and actively discussed and visible throughout the school premises. Students feel valued, they know what is expected of them and there is a convivial atmosphere based on respect and inclusion. In addition to this, safeguarding students and child protection is a key aspect of the school's accreditation standards, meaning that all staff need to obtain and submit a police clearance regarding suitability to work in education.

One of the main goals of the international school is to provide an education that is both holistic in nature, but also prepares students for the increasingly complex global world. The aim is to guide students to take ownership of their learning and be active participants in their community, to be open-minded, caring, respectful and knowledgeable, and armed with the skills to be critical thinkers and clear communicators in their interactions and connections with the world.

Inquiry-based Learning

Curious minds and eager to learn, inquiry-based learning aims to place learners in the centre of the learning process, and to encourage students to explore, discover and question. It is a student-centred pedagogical approach that gives students the opportunity to construct knowledge and understanding throughout a learning process (Bonnstetter, 1998). In doing so, they make greater connections between themselves and world, and between ideas and concepts (Wang et al., 2010). To achieve this, students are encouraged to follow their interests and passions, research and investigate problems and draw conclusions based on evidence, all the while interacting and socially collaborating with their peers (Tal et al., 2019). It is a key component of modern educational practice across many international schools and educational settings, and with this in mind, will be explored further in relation to case study 2 above.

Clearly based upon the ideas of constructivism, and indeed the ideas and methods of scientists to construct scientific knowledge, in inquiry-based learning students use a learning model or cycle that first inspires them to question, observe a phenomenon, investigate and test, solve problems and reflect, before eventually reaching a conclusion or discovery (Keselman, 2003). The levels of inquiry in terms of the degree of autonomy afforded to students will be explored shortly, but understanding the role of the teacher is also critical, as is the importance of a positive and open rapport between the teacher and student (Uno, 1990). One of the main proponents of inquiry-based learning, Kath Murdoch states, "As an inquiry teacher, you lead and guide, but you must also be prepared to be led and be guided in turn" (Murdoch, 2015, p. 16). To lead a full inquiry cycle in a school

setting, encourages learners to develop thinking capacities and internalise skills (Öztürk et al., 2022) that allow them to take ownership of their learning, and this is done through an active learning approach (Levy et al., 2009).

MacKenzie (2018) describes four types of inquiry: controlled inquiry, structured inquiry, guided inquiry and free inquiry, in which different levels of inquiry, autonomy and structural approaches are designed for a learning cycle or unit. Within all of these approaches, students are introduced to new resources and materials, ask key questions, investigate, share and make connections.

Controlled inquiry

In this inquiry process, it is the teacher who creates the questions to be investigated by the students, including the resources and learning engagements. While students' input is limited, there is more autonomy and independence in the research and analysis stage and the students are responsible for making and sharing their own findings to the topic questions.

Structured inquiry

This level of inquiry involves the teacher managing the full inquiry process in the classroom, the type of engagement, materials, activities, questions and methods of assessment. Students are engaged in the process but have minimal say into the direction or scope of the inquiry process.

Guided inquiry

In guided inquiry, the emphasis is on student ownership and autonomy as the driver of the inquiry process, as it is assumed skills and knowledge have been internalised to such a degree that students can inquire and investigate accordingly. It stops short of being full free inquiry as the teacher still provides the initial research questions to be used, but the students will choose the resources to find the answers and ultimately decide how to demonstrate and show the findings.

Free inquiry

In free enquiry, there is complete autonomy and student ownership of learning. Students select their own questions to be investigated, find and choose the resources that will help them answer the questions and finally understand, reflect and share the findings of the research. In free inquiry, the role of the teacher is to facilitate the student on the learning journey, to support and ask appropriate questions that will drive their learning. In order for free inquiry to be effective, students should already be familiar with the inquiry cycle and

have built up the self-management and research and analytical skills to be comfortable with this approach to learning. In turn, this will maximise their learning experience and stimulate learning and connections of ideas and concepts, including their own place in the world around them.

In case study 2, inquiry-based learning is intended to encourage students to think and act critically, be engaged learners in the classroom and beyond in their lives, all the while being an inclusive space whereby students have the opportunity to express themselves without the traditional elements of indoctrination. In this student-driven process, with a clear focus on problem-solving skills and research, students explore deeply and make connections with each other in a collaborative manner. Students inquire and discuss, as well as reflect on what they have learned in the process. Student skills increase as they progress in an inquiry-based curriculum, with a more inclusive attitude and respect towards fellow learners, in addition to greater levels of empathy of learners.

In order to implement inquiry-based learning in case study 2, the International School in Amsterdam follows a particular inquiry cycle for all schoolgoers, as part of the IB curriculum. The cycle varies between each phase of learning in terms of language and accessibility but the common core elements of investigation, research and exploration are constant. In the early years, students are encouraged to take initiative and ownership of the learning, build foundational knowledge and build conceptual understanding of transdisciplinary themes and ideas. The inquiry cycle is clearly designed and synchronised throughout the school, and once students reach the end of the DP programme, the skills and abilities to succeed and be prepared for life are very evident in learners. In practice, the students are inherently familiar with collaboration with other students and groups, the principles of investigation, research and reflection, and many other facets of an inquiry-based, student-centred curriculum. The students who graduate from Case Study 2 school are independent and critical thinkers, the result of initiatives that place the student as the focal point of the learning and teaching process, and are ready and able to engage with people in an increasingly globalised, complex and rapidly changing world.

All students should have access to the same inquiry process regardless of their background, abilities or diversity, and the role of the teacher is to support students on this journey, through knowing their students' needs and guiding their students in the most effective way deemed possible. It is worth discussing the benefits of inquiry-based learning, not solely in terms of student satisfaction and inclusivity, but also in terms of the abilities and skills that students develop through its effective application, many of which are lifelong skills that remain vital throughout a student's development in later years. There is substantial literature and studies that highlight students are supported in developing creativity, reflection, analytical and critical thinking skills (Agrusti, 2013; Friedel et al., 2008). When this is achieved, and with the required amount of training and professional development given for staff and teachers (Öztürk, Kaya & Demir, 2022) the inquiry cycle and more broadly, inquiry-based learning, is an important instructional tool to develop critical

thinkers for the 21st century and encompassed in the broader scheme of inclusion of all learners in the learning process and a more equitable society for all.

Case Study 3: Feminist Approaches to Geography Education

Imagine a **geographer** in your mind. What would they look like? What do you think would be their daily routines? Why would you imagine them in this way? Yang (2017) asked Chinese teenagers to draw a geographer and found that students prominently imagined: a Han Chinese male exploring nature with maps and a magnifying glass. However, university geography in China is "a field of knowledge imported from the West" (Qian and Zhang, 2022, p.29). Sun et al. (2020) described the foreign impact on Chinese geography as "inescapable" (p.105). This result reflects several dimensions to re-think inclusion in education: gender, ethnicities, social and cultural backgrounds, language, etc.

Geography as a school subject is widely taught in most countries (Lambert, 2017). However, school geography may include knowledge about different parts of the world, but does not always prepare teachers and students to ask the question on whose knowledge is visible and what knowledge is chosen. The structural disadvantage is that students may learn the knowledge as "given" if teachers assume their teaching is "delivering" what is already there in the curriculum. One way for a teacher to tackle the structural disadvantage is to actively engage in curriculum making. See the Inclusive Curriculum Making chapter for more details. Here we provide how to apply feminist approaches in geography education as an example of a possible pathway.

What can feminist approaches do to make geography education more inclusive through learning and teaching methods?

Firstly, instead of imagining, teachers and students can look up geographers who contributed to their textbooks, such as book authors and geographers mentioned in the textbooks. This is just a beginning as we no longer live in a time where educational materials are just given textbooks. The International Geographical Union and national, regional geographical societies and associations have started to recognise women geographers and geographers from minor ethnicities, and tell their stories with their inspirational work. There is no need to 'reinvent the wheel' if some resources are already there. For example, Hermione (one of our authors) initiated a Mapping Inspirational Women project in 2023, brought together resources on a Google world map, interviewed inspirational women geographers and released them as free podcast series.

Secondly, many secondary geography teachers already knew more geographers than most students, either from their educational backgrounds (e.g., have degrees in geography) or professional networks (e.g. subscribe to subject or discipline related associations, like the International Geographical Union). Teachers must not just see themselves as givers,

but also learners who are curious to know more about geography, then share their findings with other learners (e.g., their colleagues and students), as well as listen to what they have found. The learning and teaching methods became toolboxes one takes along the learning and teaching journey.

Thirdly, as Freire (1970) argued, schools exists in a society, but can also be the place where changes begin. Hence, "imagine geographers" would still be appreciated as a creative method to learn and teach geography for its potential in forward-looking prospects. However, if we consider a feminist approach to re-design and update our methods, teachers and educators could identify what is missing in students' imagination, and share more diverse and inspirational real life stories with students. In addition, the boundaries of geography as a subject can also be crossed. For example, many school geography curricula include the content of plate tectonics and use the map of the ocean floor to prove the theory of continental drift. However, the brilliant geologist and oceanographic cartographer Marie Tharp who mapped the ocean floor was not often credited. Studying geography, as with other school subjects, does not necessarily mean we expect them all to become geographers, or specialists in one subject.

To educate is to practise freedom (hooks, 1994), finding ways to transform the world towards a better place for everyone to feel connected and seen. We assume everyone reading the chapter does not want to encourage racism and sexism in their classrooms, but are we actually dealing with this well when all the examples we could show to students are 'classical examples of scholars'? In the age of multiculturalism, teachers and students are not necessarily only familiar with one country, one culture, and so they are potential agents of change to rethink and personalise the learning and teaching journey they experience. For example, Shetterly (2017) told the stories of black women scientists in her nonfiction book ***Hidden Figures: The American Dream and the Untold Story of the Black Women Who Helped Win the Space Race***. It was later adapted to a film by the same name. It is not possible nor necessary to give all examples in this chapter, but rather we wish to point out that a person can write and add more layers to histories as a feminist approach. Instead of becoming the only authorised narrator, feminist approaches to learning and teaching invites everyone to have the will to become a narrator in their own life, and make connections to what they already know, and what they would like not to be hidden any longer. In other words, it is an approach to embrace diverse voices which ultimately leads us to the understanding that education is for everybody.

By bringing the feminist approach to imagine and enact in learning and teaching methods, we expect new horizontal dialogical relationships could emerge between learners and teachers (the two roles actually could be fluid, mixed, and definitely not fixed). If you do not reproduce racial and gender hierarchy, or any kind of privilege in your classroom, then you have begun to navigate your journey.

More about and more than feminist approaches

In this section, we start by introducing two scholars who could provide insights to diversify learning and teaching methods, then move to possible ways to get inspiration from their work in the classroom and other educational scenarios.

Starting from her first major book *Ain't I a Woman? black women and feminism* (hooks, 1981), Gloria Jean Watkins became known by readers across the world by her pen name, bell hooks, a name intentionally not capitalised. Now one can get to know her more through the bell hooks centre.

In *Teaching to Transgress: Education as the Practice of Freedom* (hooks, 1994), the Brazilian educator Paulo Freire who developed the critical pedagogy approach explored above, is mentioned. Paulo Freire and the Vietnamese Buddhist monk Thích Nhất Hạnh are seen by hooks as two "teachers" who have touched her deeply with their work. She summarised their influence on her in the name of "engaged pedagogy" (hooks, 1994, p.13), summarising their similar emphasis on "action and reflection upon the world in order to change it" (hooks, 1994, p.14). This progressive and holistic education, requiring engagement in emancipatory pedagogy is not easy, and hooks recognises that this is even "more demanding than conventional critical or feminist pedagogy" (hooks, 1994, p.15).

Then why would teachers still consider taking this approach for their learning and teaching methods? One of the reasons hooks gives is its emphasis on wellbeing, not just for students but also an active commitment to promote teachers' self-actualisation. Teachers' wellbeing is promoted if they teach in a way that empowers students, which echoes Thích Nhất Hạnh' phrase: teachers as healers. It embeds a Buddhist philosophy that if the one who helps others is unhappy, they cannot help many people. In other words, if teachers do not take up self-responsibility to become self-actualised human beings, how could they help many students to also become self-conscious and go through the process of self-actualisation?

This is similar to a Chinese saying: "To give people fish is not as good as to teach them how to fish". If a teacher intends to teach students to learn in a manner of inclusion, it would not be possible if they did not learn and learn to teach with a sense of inclusion. The journey to liberatory education for inclusion is challenging, everyone would struggle, but the reason to keep it going is that the belief in education should be liberatory for all, should tear down the power of privilege and authority to empower and inform everyone of their right to an education. Instead of reinforcing existing systems which lack inclusion, teachers can learn to embrace their roles as learners, joyfully walking along with their students to make their way through the world.

However, we do not call the chapter learning and learning methods as we are fully aware that the risk of transforming an educational vocabulary into a language of learning is empty (Biesta, 2009; 2017; 2022). Teachers have a unique role by rediscovering teaching. First, teachers can give what students did not ask for, or something students did not even know

they could ask for (Biesta, 2022). Some students may never think about checking their privilege, or think that power in one scenario could be changed into lack of power in another. These are examples of where teachers can have a gesture to say: hey, look at this! What do you think?

Second, teachers can give double truth to help students understand the complicated world. It means that there is not necessarily ONE truth that is universally applicable. For example, people growing up in East Asia are likely to act differently to someone who has never lived outside their town in the middle of England. But if they happen to live in each other's countries for a while for education or jobs, they are more likely to see each other and why they have formulated different habits. However, it is unlikely that everyone would have this personal experience to live in a different country to experience cultural differences and embrace cultural diversity. Teachers could use existing resources such as The Human Library Organisation to challenge stigma and stereotypes. By showing that there is one true knowledge or one way of understanding certain things, teachers show knowledge as well as the frame in which knowledge is recognised and appreciated. Sometimes either teachers or students could be in the frame and not realise it, that is why teaching is important to get someone out of a frame which limits their thinking.

Thirdly, teaching is a practice of giving yourself. Learning, to some extent, is absorbing what is given. If everyone is only absorbing, then what is taught would be something given and fixed. Hence, the gesture of teaching matters. When a student in their life has never got a chance to be exposed to inclusive education, then a teacher does not teach by giving, how could the student learn? This does not mean the teacher would be always giving themself. It is likely that the teacher has to first give themself and help students open up to the meaning of inclusion, which could then be considered engaging. To a certain extent, it would be very rare for a human being to never experience them being powerless and marginalised. If a teacher could be an open book to talk about their transformative experience, then it is likely that this could encourage students to also make connections to their experiences and appreciate that inclusion in the end, means everyone will benefit from it. It changes some people's privilege to power shared by everyone.

In the last part of this section, we would like to introduce a Chinese woman, educational theorist and reform practitioner: Ye Lan and her Life-practice Educology (2020). Although her theory's English translation was published in 2020, her theorisation started in 1983 and is still in process today. In addition, Ye could be considered as a 'wild' feminist (Ye, 2007) for her reading in gender and feminist studies and her own reflexivity on her career with a lens of gender. The reason we put 'wild' is because Ye is not widely recognised as a feminist scholar, but known for her theorisation of education and practice wisdom, and reform she led in Chinese schools. We will not go into much detail about this. The point to make is that we hope our spotlight on Ye can help you open up your mind on what feminist approaches could be.

In 1982, Ye went to Yugoslavia and her mentor there showed her that their education

ideas focus on personal development.By then, the popular idea in China was that education serves society (Ye, 2013). From then, Ye began to challenge the role of genetic factors in human development. In 1986, she published an article in Chinese to propose that an individual as a conscious being has a say in their own development, emphasising that the genetic factors' influence fades as one grows older, but one's agency gets strengthened (as cited in Ye, 2013). As one's capability to choose and change their environment is improving, the final decisive factor is the person themself (Ye, 2013). This is where her life-practice educology started to emerge.

If the purpose of education is to help one take ownership of one's life, then classroom teaching should be considered as an important life experience for both teachers and students. From 1994, Ye started to collaborate with schools. In the classroom, the reform focused on exploring how to re-organise textbooks, how to teach, and centring on how to help students to take an active role. In each class, this reform encourages classmates to organise their class activities, and manage their class by rotating their 'managerial role' to lead. It was not until 15 years later when she had 10 schools as life-practice schools that Ye felt that she had confidence to say there is a difficult but possible route for schools to reform in the existing conditions (Ye, 2013). The fundamental view of Life-Practice Educology is rooted in a Chinese expression of education, which considers teaching the knowledge of nature and society to cultivate a self-consciousness of life (Ye, 2020).

From hooks to Biesta then Ye, there is a clear thread of involving teachers as the change-makers in the classroom. If the teacher does not want to consider engaged pedagogy, rediscover their gift of teaching, or cultivate self-consciousness, all these ideas would just be texts on the shelf. The same for our chapter. The learning and teaching methods shall be explored by teachers first, then in communication with students, and hopefully back to us and professional communities for further discussions. This cycle of reflection and action are what we can do together to make learning and teaching methods exploration part of our life-practice.

Discussion and Concluding Remarks

If we look at all three approaches closely, we will see that all are advocating a type of educational approach or perspective that treats learners as "subjects" instead of objects in the learning process. All are interconnected and wish to develop education as a process of freedom and move away from an authoritarian model of learning and teaching. In case study 2, students in the international school belong to varied socio-economic and linguistic backgrounds and nationalities. Even the teaching staff reflects this diversity and the school tries to be inclusive by adopting a curriculum suited to the needs of the learners and the context through an inquiry-based approach to learning and teaching methods. You may have noted that what Paulo Freire describes as the principles of a liberating education can also be seen being practised in this school. The school aims to promote

student agency and takes account of the students' identity and social location. They reflect critically on their own position in the world and also of their peers. Instead of trying to create a uniform space, the school celebrates the diversity of the students. In this manner, it creates a self-empowering space with the help of teachers and students wherein the knowledge structures and the skills of minorities are also presented as academic material. This school also questions the dominant pedagogic practices and promotes working together by engaging not just with textbooks within the schools but with the outside world as well.

The overlap between critical pedagogy and feminist approaches is evident as bell hooks refers to and takes inspiration from the works of Paulo Freire. In case study 3, we use the example of geography education to highlight the possibilities of using dialogue within a feminist approach. Teachers hold the power to change how learning and teaching take place within the classroom. They can exercise their autonomy and agency by using dialogue. Teachers have access to academic knowledge and give direction and structure to learning and teaching. In this case, teachers can relearn geography along with the students and also share their own knowledge about diverse geographers to enable students to develop a comprehensive understanding of geography. This will also help students look critically at what is geography, what it includes and it excludes. Dialogue which flows both ways makes it possible to evolve this subject, make connections with other subjects and also with other cultures and include what might be missing from the official curriculum of geography in the school.

Inquiry-based learning can be universally applied, indeed one of the main tenets of this approach is for the teacher to create a safe and supportive learning environment, whereby students feel comfortable to express themselves openly in groups, to discuss and explore, all the while with the support of a knowledgeable teacher(s). In case study 1, in an inquiry-based learning approach, the teacher, may use resources and materials that all students can relate to and understand. At the start of a unit or inquiry cycle, the teacher, despite her privileged position, can engage the students with a provocation or learning engagement that can motivate and interest the students in a meaningful way, that will serve to encourage the students to investigate, question, research, learn and share. It is not a process that would happen instantaneously, but allowing the students to ask questions and investigate can give them a sense of ownership of their learning. With inquiry-based learning, and even with a young class of students from a disadvantaged background, a teacher who is open to sharing and empathetic, can radically aid the students to be more critical thinkers over time. It is important to note that the students may need help with some basic skills to make these investigations and inquiries happen, but with an effective school policy and curriculum, learning and teaching will become substantially more effective. This is the very same point that is relevant to case study 3 and the feminist approaches that we believe are instrumental in creating learning environments for students that are not only inclusive and stimulating for the students, but also highlight the importance of the teachers being aware

of their own role in the learning and teaching process, being willing to lead, as well as being guided by the students (Murdoch, 2015, p 16).

When we bring feminist approaches to look at case study one, one of the connections is that the teacher does not want to remain in the status quo, but rather wants to take action. She intentionally finds alternatives to engage children in her classroom from their lives, and open up pupils' minds about their potential in education. By doing so, her agentic move as an individual challenges the whole 'culture of silence'. However, it will not be possible if pupils do not respond to her gestures in dialogues. In other words, learning and teaching emerge in dialogues between teachers and students. There is no doubt that teachers need to prepare teaching by themselves, students need time to learn by themselves. Nevertheless, the difference between self-taught and our scenario (learning and teaching methods) is that even when teachers and students are by themselves, they have each other in mind. They know they will contribute their part, take the ownership of learning and teaching, and trust the other will also do their part. Teachers know that they can ask students for their thoughts, and students can ask teachers more questions. The thread between feminist approaches and critical pedagogy is that they both see the human beings behind their role as teachers and students. By bringing their subjectivity into educational dialogues, privilege could be transformed as 'catalyst' for empowerment.

By using a feminist lens to investigate case study two, we can see that inquiry-based learning again highlights teacher-student collaboration. It may start as teachers being more curious and guiding students to inquire, but as students grow their curiosity and get more familiar with inquiry-based learning, teachers can take a back seat. We are aware that the international school may not fit all students and teachers. Quite a few features look like a luxury only accessible for those who can afford tuition fees as well as living expenses in a megacity. Many schools may sit in between case study one (have NGO teachers to support) and case study two (equipped with dedicated teachers). That is why feminist approaches are helpful to interpret case study two and inquiry-based learning in a different way. Rather than dreaming of your school changing into the Amsterdam one overnight, consider tiny changes that you as a teacher can make in your classroom. It is possible to turn two to three minutes of your lecture into **genius minutes** for students to imagine what they would like to learn in the subject you teach, or encourage them to just search something they would like to know and share with their classmates and you next time. For example, start your class with a three-minute 'ignite talk' by one student sharing what they are interested in regarding the subject. The links between feminist approaches and inquiry-based learning is to recognise that an individual teacher has been given the gift to teach their students, not by their words, but their gesture to encourage students.

For example, a geography teacher can say: "Hey, I am so happy that you are also so interested in delicious food. So am I. Would you like to share some of your favourite dishes with me?" After students share theirs, a teacher can also share. Then the teacher can relate this to geography, asking if students know where these dishes are originally from, and how

they travelled to our places. If they know, they are already knowledgeable to share. If not, the teacher can encourage students to search and share next time. In return, it would be better if teachers also share some of their knowledge.

Overall, we hope our three examples and their connections to each other can spark your ideas on updating learning and teaching methods in your scenario. There are no fixed routes for you to learn and teach, and it is helpful to know what has been explored, then you can start to create your own ideas. It is not easy to have no step-by-step guide, however, it is also an opportunity to find what suits you the best.

The message we hope that you can take away from our chapter is this: It is important for us to acknowledge that the institutional setting and the structure of the school play an important role in shaping the learning and teaching practices However, the teacher's subjectivity also holds the possibility of transforming learning and teaching and working together with students to help overcome obstacles that lie within the schools and outside. This allows teachers to work towards a more inclusive approach to education.

Local contexts

Closing questions to discuss or tasks

Choose three to four questions to discuss.

1. Reflecting on the Case Studies provided:

   ◦ How do the teaching strategies in the case studies demonstrate the principles of inclusive education?
   ◦ Which aspects of the case studies do you find most applicable to your future teaching practice? Why?

2. Personal Application:

- Reflect on a recent learning experience where you felt included or excluded. How did the teaching methods contribute to this feeling?
- Identify one area in your teaching where you can apply the principles of inquiry-based learning, critical pedagogy, or feminist approaches. What specific actions will you take to enhance inclusivity and student engagement?

3. Strategies for Teachers:

- What are some practical ways teachers can provide meaningful choices to students in their daily routines to foster a sense of autonomy and inclusion?
- Discuss how you can use dialogical methods to address and incorporate students' diverse backgrounds and perspectives in your teaching.

4. Overcoming Barriers:

- Think about potential barriers to promoting inclusive education in your context. What strategies can you use to address these barriers?
- How can teachers manage and respond to students' negative emotions effectively to support their self-determination and engagement?

5. Evaluating Impact:

- How do you think fostering inclusive education impacts long-term student outcomes, such as their career choices and personal development?
- Discuss how the principles of critical pedagogy, feminist approaches, and inquiry-based learning can be applied beyond the classroom to foster lifelong learning and social justice.

About the authors

Hermione Xin Miao

Dr Hermione Xin Miao was born at a rural village in China, raised by her maternal grandparents since she was eight. She stayed in her hometown for schooling while her parents migrated to a big city to make a living. She was one of millions "left-behind children" who experienced exclusion in education. Hermione is a first-generation university student in her family. She has developed research interests in curriculum making, teacher agency, climate change, inclusive education, and intersectional feminism. She has degrees in both geography and education, and a PhD degree from University of Stirling (2024). Hermione has been involved in creative and participatory methods in both research and community building, in particular early career researchers'

network communities. Hermione also has started an Mapping Inspirational Women initiative from 2023 as open educational resources to re-tell women's contribution to the world.

Akshita Rawat

Akshita Rawat is a PhD researcher at the University of Vienna. Her research focuses on social inequality and education in India. Her research interests include teaching-learning practices in classrooms, sociology of education and qualitative research methods. Her research aims to inform policies and practices that promote inclusivity and equity in education.

Brian Lynam

Brian Lynam was born and raised in Ireland and has experience of working in international education, specifically in the PYP International Baccalaureate program and International School Teacher training. He is passionate about inquiry based learning, inclusive education, UDL and the role of technology within education.

DIFFERENTIATION

Example Case

Sarah, a novice teacher, is confronted with a very heterogeneous class: some pupils have already fully mastered much of the proposed content, while others are struggling. She realizes that the "one size fits all" formula is not only counterproductive, as it demotivates some and leaves others behind, but also ineffective.

She turns to a colleague for advice and receives some suggestions on how to approach differentiated instruction. Instead of proposing a series of adaptations, which, while meeting the needs of some, tend to stigmatize, she decides to revolutionize classroom teaching by relying on the principles of differentiation. Her gaze quickly turns to the potential and uniqueness of each pupil's learning profile rather than their deficits. Instead of offering a single approach with minor adjustments, she introduces a wide variety of options in her lessons: hands-on, visual activities like building models, videos, and artistic expression through drawing and coloring. Throughout the activities, she moves between the groups, offering personalized guidance and feedback. Sarah understands that students do not all learn the same way, so she allows different ways to express their understanding: some students write reports, others give verbal presentations, and some create posters or models.

Not only are the tools available multiplied, but also the opportunities for pupils to interact with the content and demonstrate what they are learning. More than anything, the teacher notices the excitement in the eyes of the pupils, who are motivated and more self-confident, less concerned about measuring up or comparing themselves with their peers. By the end of

the lesson, every student has engaged with the material in a meaningful way that suited their strengths and interests. The class finally begins to appear as a learning community. Initially, the change in perspective requires a planning effort on the part of the teacher, but this is amply rewarded.

Initial questions

In this chapter you will find the answers to the following questions:

1. What is differentiation, and how does it support all learners?
2. Why is differentiation crucial for inclusive education?
3. How can teachers implement differentiated goals to address diverse needs?
4. What strategies help teachers adapt content, process, and product for all learners?

Introduction to Topic

Differentiation is a pedagogical approach to instruction that embraces the various needs of students, increases meaningful learning, and encourages motivation. It is an important practice for teachers at every level and subject area to develop consistently, because it fosters a positive learning environment, as well as, students' self-determination and engagement in the learning process.

The term "differentiation" is frequently mentioned in international pedagogical literature, although it does not always convey the same meaning (Graham et al., 2020; Lindner & Schwab, 2020). It is often, erroneously, associated with individualisation strategies for students with disabilities and other special educational needs or to curriculum differentiation for gifted and talented students. With differentiation we, instead, refer to all classroom teaching strategies planned, taking into account the characteristics, abilities, interests, talents, experiences and needs of all students, and based on the main principles of inclusive education: respecting and valuing diversity, encouraging participation, and fostering active and meaningful learning of all students (UNESCO-IBE, 2021).

The most recognised author in the field of differentiation is Carol Ann Tomlinson, a former teacher who has developed not only a conceptual framework but also an operational model, showing its applications in all school levels, from preschool to upper secondary school, and in multiple subject areas, as well as in classroom management (e.g. Tomlinson, 2001, 2014; Tomlinson & Cunningham Eidson, 2003; Tomlinson & Imbeau, 2010). Other authors dealing with differentiation tend to refer to Tomlinson's model to develop guidelines for teaching planning (e.g., Gregory & Chapman, 2013; Renzulli, 2015).

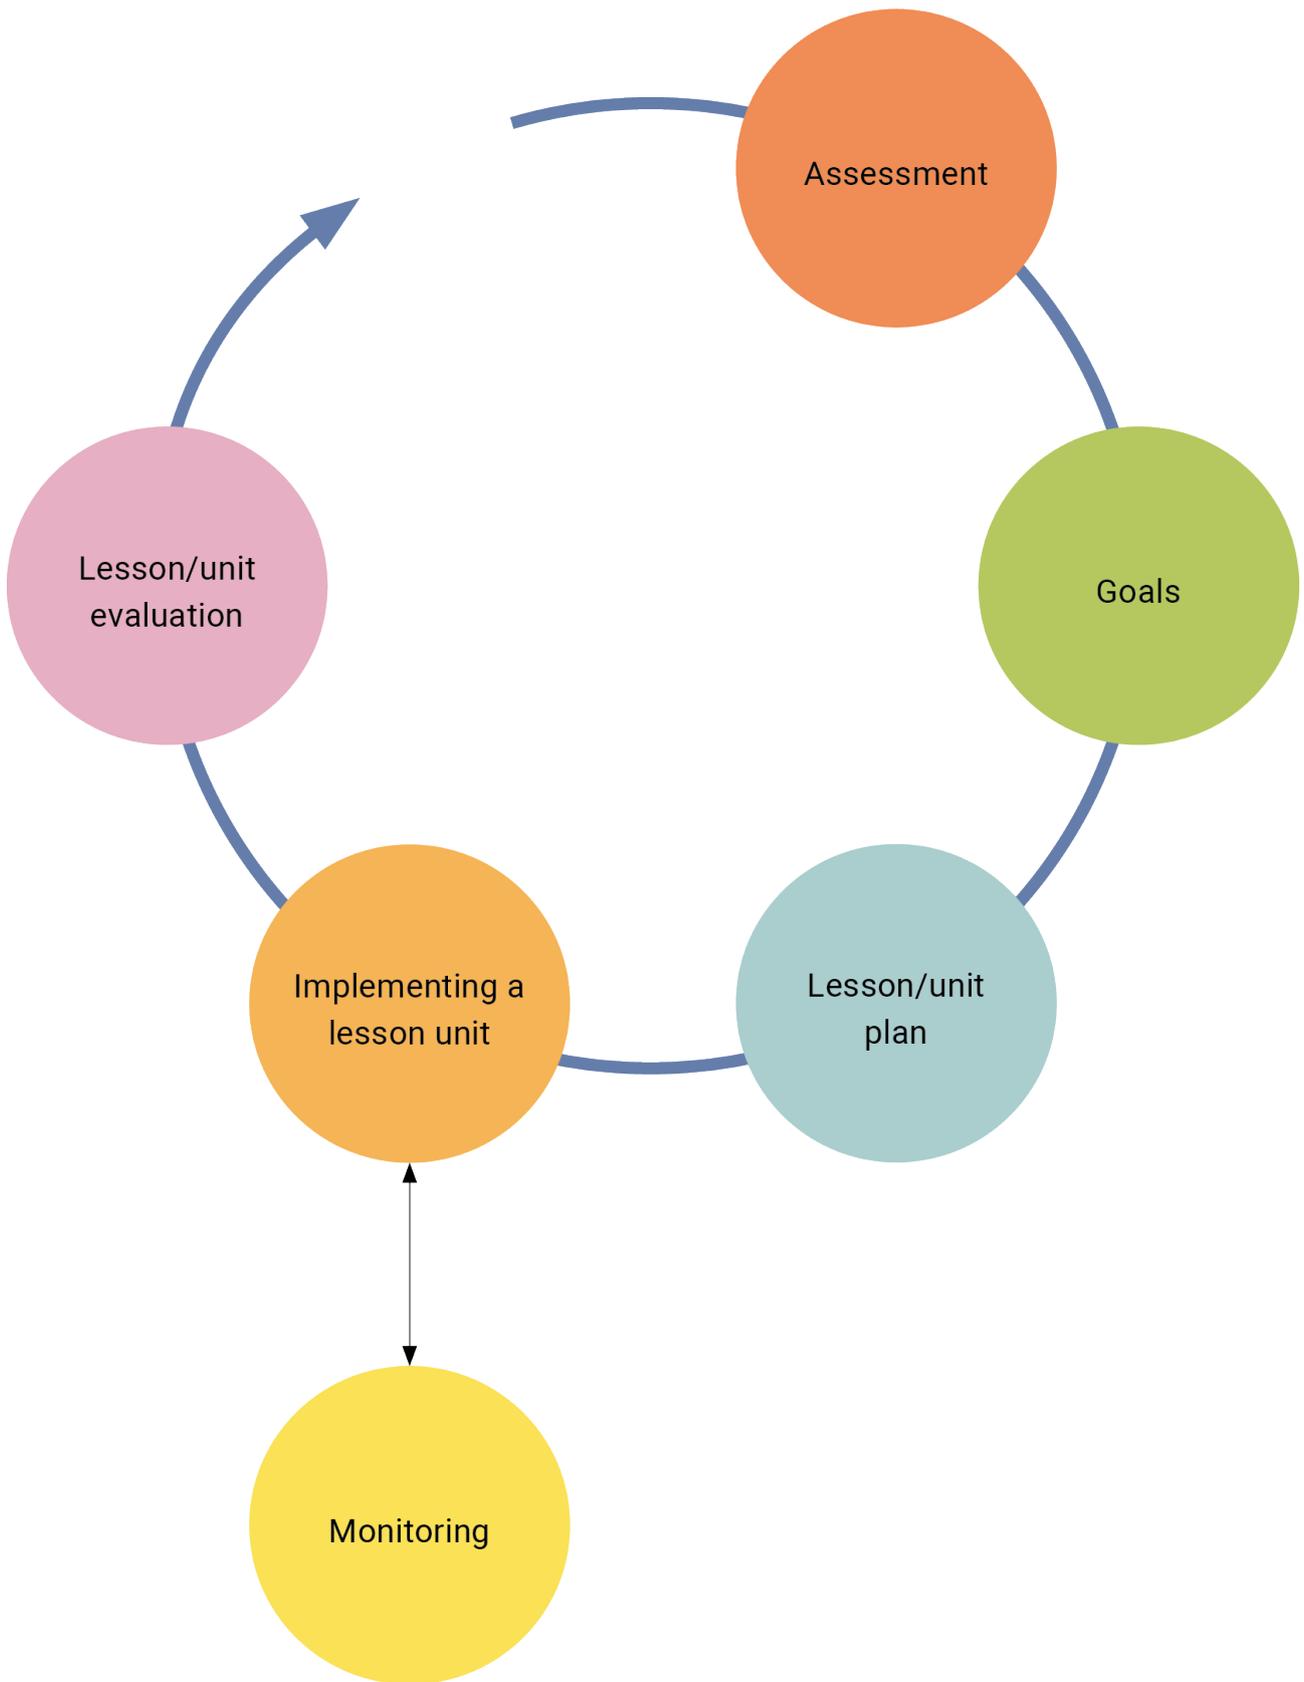
Tomlinson (2017) presents differentiation as a philosophy of instructional design based on two main principles: the recognition of all students' differences and, therefore, the importance of tailoring learning for all; the acknowledgement of commonalities within the class group, needed to create a community of learning. According to Tomlinson's model, teachers can differentiate through content, process, product, and assessment.

This approach aims to overcome both the traditional model "one size fits all" and the "micro-differentiation" strategies, which design instruction for a hypothetical average student and provide support and adjustments only for students experiencing difficulties (Tomlinson, 2001, 2017).

The application of this 'philosophy' of instruction requires a set of knowledge, awareness and self-reflection on the side of teachers. Tomlinson (2017) affirms that differentiation needs to be 'proactive' (planned in detail in advance), 'qualitative' (requiring a transformation of the assignment and not only its mastery levels) and 'multiple' (in terms of content, process and product).

Approaching this teaching model means transforming one's set of beliefs about learning and teaching. Planning differentiated instruction for a specific class group requires multiple techniques of pre-assessment, ongoing monitoring and summative assessment. Moreover, to ensure full implementation, teachers need to consider contextual constraints and available resources. First of all, teachers need to collect information on their students, in order to define individual profiles for each and to acquire a deep knowledge of the relational dynamics of that specific class. These documents provide for each student a detailed description of their characteristics and learning profile, information which are needed to plan the most appropriate teaching strategies and to offer relevant learning contents.

Based on these profiles, teachers exercise their instructional strategies to meet all needs, experiment with them and, at the end, verify their effectiveness to constantly improve the quality of their instructional proposal.

Figure 1 – The cycle of differentiation (inspired by Chapman & King, 2013)


inspired by Chapman & King, 2013

The planning cycle in differentiation therefore involves a self-reflective effort on the part

of the teacher who, aware and informed of the heterogeneity of their class (interests, skills, expectations, preferences), takes this into account at every stage (planning, implementation, evaluation), and considers this data as an opportunity for monitoring and self-improvement, in order to make the proposals increasingly effective and personalised.

Why is differentiation important?

Differentiation is a perfect example of an approach that puts the principles of inclusive education into practice. This is true for two main reasons. On the one hand, it considers the globality of each student's learning profile, encompassing not only curricular competencies but also social-emotional skills, life skills, motivation and interests. This way it ensures full accessibility of educational activities, it responds to individual needs and supports the overall development of the individual. On the other hand, differentiation tries to balance individual needs with the effort to build and maintain unity in the learning community represented by the class group or school context. Therefore, attention is also paid to social participation and the quality of relationships in the classroom(Linder et al, 2019).

Is differentiation always inclusive?

An educational proposal tailored for a specific class group, which proves to be effective and inclusive, may not be successful for another class. At the same time, some teaching proposals that may, apparently, fall under the concept of differentiation, such as ability grouping, are not necessarily consistent with the principles of inclusion and may lead in opposite directions to those initially pursued.

Planning "with all students in mind" (UNESCO-IBE, 2021, p. 17) might not be sufficient to plan inclusive teaching strategies, even when the teacher has tried to take into consideration all the information at their disposal about the students. So, every time you try to apply the principles of differentiation to your teaching proposal, question their ability to ensure not only learning but also participation and well-being for all students. It is a delicate balance between the needs of each individual student and that of the whole class, where students share meaningful learning experiences and build a community with a sense of belonging (Norwich, 1994).

How is differentiation the same or different from accommodations or modifications?

Any tailoring that is made to the general education curriculum is considered differentiation. Both adaptations and modifications fit under the umbrella term differentiation. When a

student's needs go beyond differentiation to the general curriculum, then that student, or group of students, requires specific changes to how the learning happens. Those students have moved into a more targeted kind of differentiation called accommodations (Education Service Center, 2020).

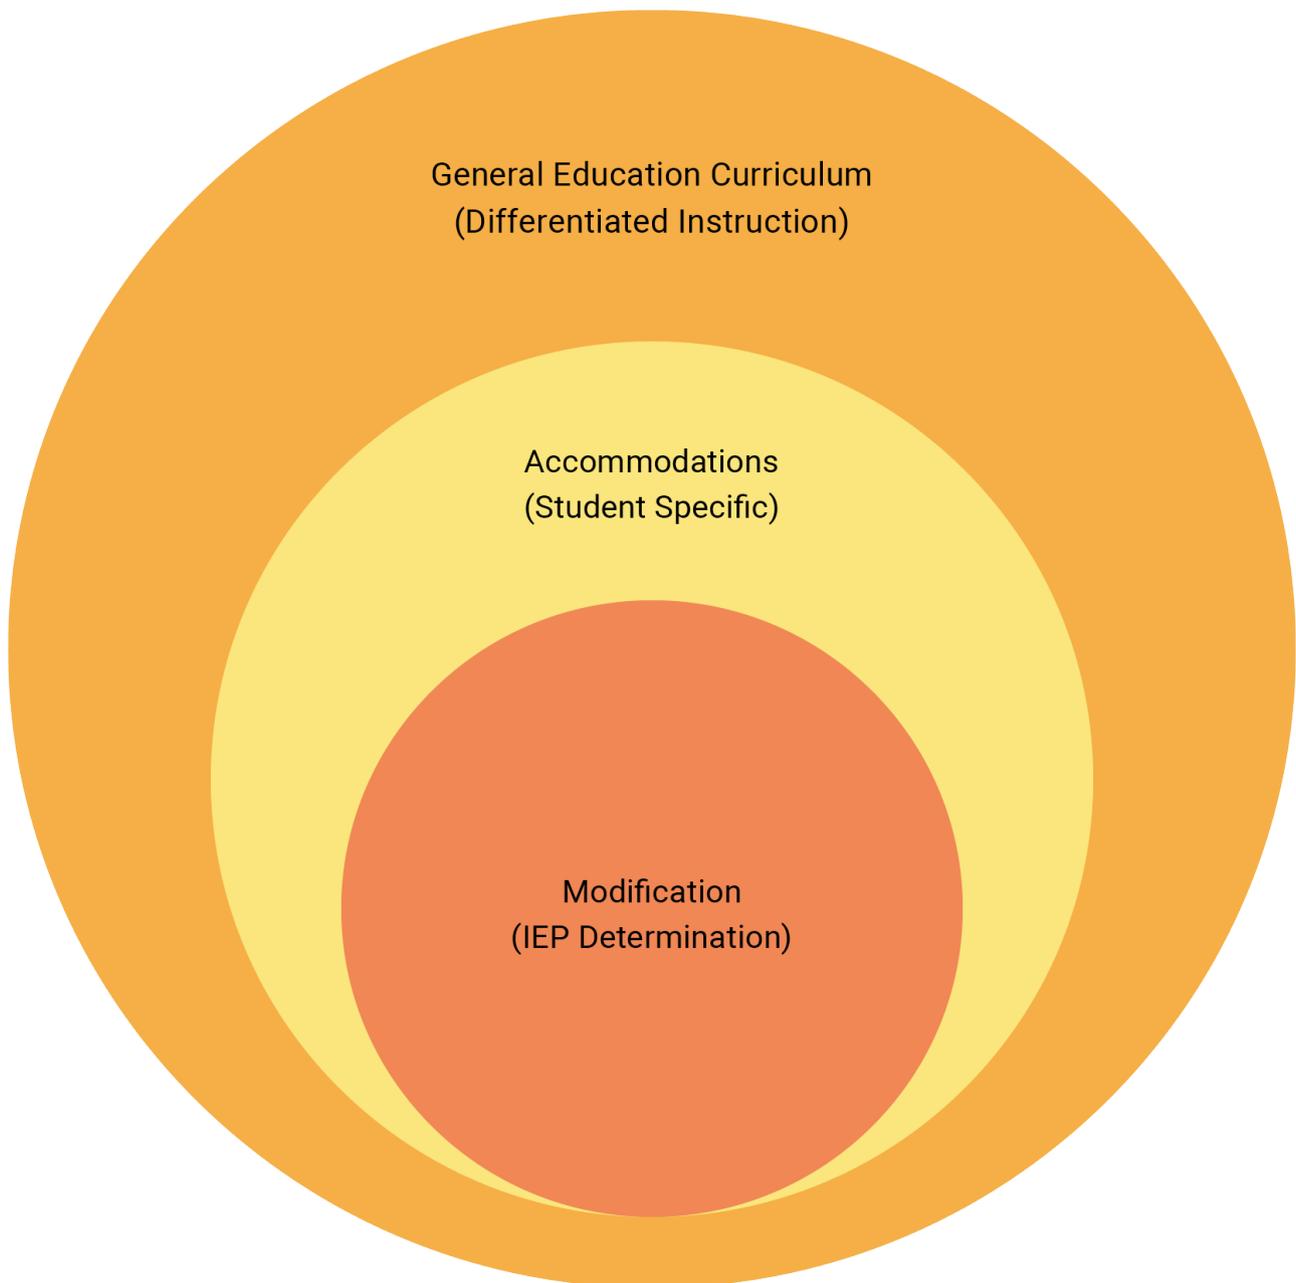
If general differentiation and specific accommodations to the learning environment do not allow the student to reach their full potential, then that student may need targeted modifications that actually alter what the student is learning. Whether it is changing the learning targets to reduce the amount of content that the student needs to know at the end of the year or teaching the student at a lower grade level, if the goals are different than the curriculum, that is considered a modification (McGlynn & Kelly, 2019).

As seen in Figure 2, differentiation, accommodations, and modifications have their place in supporting student learning. They fit together to provide the appropriate amount of support to create optimal student learning.

Figure 2 – Differentiation versus accommodations or modifications

General Education Curriculum
(Differentiated Instruction)

Accommodations
(Student Specific)

Modification
(IEP Determination)


Region 10 Education Service Center (2020)

When we consider how specific accommodations and modifications fit within differentiation, it becomes clear that differentiation is essential for all students. Every learner has unique strengths and areas of potential that can be built upon, and differentiation provides the opportunity to nurture these. Students with disabilities require tailored approaches, just as neurotypical students or those working at grade level do. Similarly, all students possess areas of 'giftedness'—whether in academics, creativity, social skills, or other domains—and these talents can flourish with differentiated learning opportunities (Seitz Pfahl, 2013). By embracing this inclusive perspective, differentiation benefits everyone, ensuring each student is challenged, supported, and engaged in meaningful ways.

How can teachers provide differentiated learning opportunities?

How can teachers approach differentiation for the first time?

Tomlinson (1999, 2001) affirms that all teachers differentiate, with different modalities and gradations. Some teachers differentiate only some aspects but do it for all students (e.g., learning contents, learning materials), others differentiate only for some students.

A good way to approach differentiation for the first time could be to ask yourself what you are already differentiating (content, processes, product) and for whom (for the whole class, some students or only for one student), and then to define what are your goals in this matter. What would you really like to improve in your teaching strategies to make them more inclusive? What are the aspects that do you perceive as most important to your class group right now? Define a short list of goals for planning according to differentiation model, such as establishing new routines in classroom management, organising learning groups or assigning learning materials. When you are clear about what you would like to accomplish, you start thinking about what information you need about your students and your classroom.

How can teachers use assessment for differentiated instruction?

According to the differentiation approach, assessment is a key element in instructional design. To plan effectively differentiated instruction, many authors suggest relying on multiple forms of assessment (Tomlinson et al., 2009; Chapman & King, 2013). Specifically, we can distinguish three main phases of assessment:

- pre-assessment or diagnostic assessment: to know students, define initial competences and needs and plan goals;
- on-going monitoring and formative assessment: to monitor students' progresses and well-being, and to provide constant feedback;
- final (summative and/or formative) assessment: to inform students about their outcomes and to provide useful feedback on the whole unit learning experience.

Moreover, this information constitutes a significant indicator of teaching effectiveness, as they allow teachers to reflect on the appropriateness of the learning objectives and teaching strategies chosen, as well as enabling an update of the students' profile and more careful and targeted future planning.

What data are teachers going to collect for initial multidimensional assessment?

To consider the globality of each student's learning experience and needs, teachers need information not only on academic but also social-emotional and adaptive skills, as well as motivation and interests. Tomlinson (1999, 2001, 2014) underlines, in particular, three aspects: readiness, interests and learning preferences. Based on the principles of inclusive education, we believe that the list could be more extensive and articulate (see Table 1).

Table 1 – Collecting information on your students

Academic readiness	Knowledge (know and understand)
	Skills (do)
Socio-emotional competencies	Self-awareness
	Self-management/Self-regulation
	Social awareness
	Relationship skills
	Responsible decision-making
Social relationships in the class	Friendships
	Collaboration
	Marginalisation / Bullying
Attitudes towards…	School / Learning (motivation)
	(Specific) subjects
	Diversity
Learning profile	Preferences about learning materials (e.g., reading, listening, watching a video)
	… about the learning environment (e.g., outdoor learning, silence/music, light, etc.)
	… about types of activities (e.g., verbal/linguistic, visual/spatial, bodily/ kinaesthetic, musical/rhythmic, logical/mathematical)
	… about preferred product (e.g., oral presentation, written task)
	… about relations during class activities (individual/pair/group)
Interests	Interests in curriculum areas
	… related to out-of-school activities (e.g., sports, music and other free-time activities)
Basic skills	E.g., using scissors, going to the bathroom, …
Others	Critical thinking
	Self-determination
	Ambitions (e.g., further education and training, working career)

Not all of this information is essential for all students and all situations. Each teacher decides what is relevant for that class group, for that specific context, for that specific subject. Therefore, the list could be even longer or include only a couple of elements.

Teachers approaching differentiation for the first time may choose to select a few items and, as time progresses and the experience accumulates, continue to enrich the individual student records and class group descriptions.

As differentiation tries to balance individual needs with the effort to build and maintain unity in the learning community represented by the class group or school context, attention is paid to individual aspects but also to social participation and the quality of relationships in the classroom. For example, in a poorly cohesive class a teacher might give priority to social-relational aspects and attitudes, in another where there are many students who show little interest and behavioural problems, to motivation and hobbies, in another where there are multiple levels of readiness to analyse curricular knowledge and skills.

This way, on a case-by-case basis, teachers ensure full accessibility of educational activities, respond to individual needs and support the overall development of the individual.

How to collect data for initial multidimensional assessment?

Teachers have a variety of tools at their disposal to obtain this information, such as individual interviews, questionnaires or observation, and can select the most appropriate ones according to the situation and the type of information needed. For example, when working with small children, teachers may opt for observation, while when working with adolescents could prefer questionnaires. They may also decide for a certain type of instrument according to its ease of administration (e.g., time and resources constraints). Much therefore depends on the teacher's decision, on their considerations and on their creativity. Teachers can take inspiration from tools proposed in the literature or develop their own. The same applies to the choice between instruments that are more quantitative (e.g., standardised tests) or qualitative (naturalistic observation, class discussion). To ensure reliability of information, however, we suggest combining several different instruments.

Furthermore, for qualitative instruments or for instruments aimed at understanding classroom dynamics, we suggest a comparison with colleagues, who might offer a different perspective (e.g., observation, Moreno's sociodrama).

Table 2 – Instruments for gathering information on your students

Instrument	Examples
Standardised test	Entrance test in maths, science, English, …
Class/group activities	Brainstorming on initial competencies (e.g., defining a concept and making concrete examples), know/want-to-know/learned, …
Questionnaire	Self-evaluation of initial competencies questionnaire, questionnaire on attitudes, questionnaire on wellbeing, …
Playful activities	Ice breakers games, …
Observation	Structured observation with a grid during individual or group activities, recording critical incidents, …
Sociogram	Sociograms to identify popular and isolated students, clusters and/or group dynamics.
Self-representation	Glyphs, drawings about learning preferences or learning environment, ….
One-to-one meetings with the students	E.g., to discuss individual challenges and competencies, ….
Group discussion	E.g., about relationships and wellbeing in the classroom, about interests, …
…	…

Let's take an example. At the beginning of a new school year and cycle, such as the first year of middle school, a teacher may need to assess his or her students' study strategies, self-regulation and collaboration skills, and motivation. The quickest and simplest way might be to administer a brief self-assessment questionnaire and, afterwards, organise a short class discussion on the students' answers. This could be a good opportunity to identify possible strategies to support each student's learning and motivation.

EXAMPLE 1 – Self-evaluation questionnaire

	1 (rarely)	2 (sometimes)	3 (often)	4 (always)
I can ask for help if I am having difficulty				
I can handle stress and frustrations at school				
I can be self-motivated when I learn				
I can work in groups and collaborate with my peers				
I can organise myself effectively when studying alone (e.g., timing, strategies)				
I listen to and respect opinions different from my own				

Example inspired by Tomlinson, C.A., & Imbeau, M.B. (2010). Leading and managing a differentiated classroom. Association Supervision for Curriculum Development.

Let us take another example. Suppose that a teacher wants to organise group activities but, the first time, encounters difficulties in managing the class group. She/he could set up a semi-structured observation grid to monitor each student's difficulties and the relational dynamics in the classroom during group activities. She/he could also ask a colleague to apply the same instrument during his/her group activities with the same class, to understand whether the problem concerns specific students, who need more support or specific adaptations, or if the challenges are due to unsuitable instruction strategies or materials. This would represent an opportunity to enhance collaboration between teachers, to share perspectives on a group class or on specific students, and to exchange ideas on classroom management and learning material design.

EXAMPLE 2 – Semi-structured observation grid (author-created example

Group activity STUDENT: _____					
	1 (rarely)	**2 (sometimes)**	**3 (often)**	**4 (always)**	**Notes**
Communication/Interaction					
Collaboration					
Focus on task					
Self-regulation					
Autonomy					
Time management					
Activity engagement					
…					

How can teachers make use of differentiated goals?

Often national or local curricula provide an orientation framework, which is then adapted to the respective context in school-internal curricula. The selection of appropriate targets should be based on the current competencies and interests of the students and the requirements of the national/local curriculum and the school's internal curriculum. The conditions of learning recorded in the assessment play an important role in ensuring that learners are not over- or under-challenged. When students with completely different learning needs learn together, it is important to keep in mind that some of the goals might be different. At the same time, it is important to realise that the goals of students with very different starting points do not have to be different. As we will show in the section on teaching and learning strategies, changing framework conditions (support systems, time, space) can also contribute to achieving essentially the same goals.

How do the goals relate to the curriculum and class objectives?

At the same time, it is important to keep in mind that some learners will not be able to achieve certain goals regardless of the support they receive. These learners will especially benefit from differentiated learning goals. Even with differentiated goals it is important to offer everything to all learners (materials of all levels) to prevent limiting them and to support them to reach their highest potential. Also, learners might jump ahead or take more time to reach essential goals.

How can goals relate to social skills?

In some countries, social, personal and action competences have been included in the curricula alongside subject-related competences (e.g., Germany, Ireland).

For inclusive education central goals, that are not subject related is to ensure children are:

- able to relate to others,
- can communicate and work together with others,
- can express their needs and
- can ask for support to reach their goals as tools to develop autonomy.

These social skills may need differentiated goals for some learners as well. The individual goals might be related to the different dimensions of social skills (Figure 3).

Figure 3 – The empirical-adapted "Dimensional Model of Social Skills – DMSS".

- Questions
- Common exchange
- Communication on eye level
- Talk to each other
- Plan & moderate conversations
- Listening

- Provide assistance
- Seek assistance
- Accept assistance

- Positive interaction
- Responsibility
- Solidarity

- Group atmosphere
- Establishing contact
- Group cohesion
- Motivation
- Respectful interaction
- Appreciation
- Friendships

Assistance & Support

Team spirit

Communication

Relationship Shaping

Cooperation

Social Skills

Conflict Ability

Empathy

Feedback

- Identify & solve conflicts
- Assertiveness
- Compromise ability

- Personal feelings
- Sensitivity
- Adoption of perspectives

Based on Struck and Franz (2020)

The dimensions of social skills outlined in Figure 3 provide a structured framework for understanding and addressing these goals within inclusive education. For example, the ability to relate to others connects directly to the "Relationship Shaping" dimension, which includes elements like group cohesion, motivation, and respectful interaction. Effective communication and collaboration align with the "Communication" dimension, emphasizing skills such as common exchange, planning and moderating conversations, and listening. Expressing needs is supported by the "Empathy" and "Feedback" dimensions, focusing on personal feelings, sensitivity, and adopting perspectives. Finally, the ability to ask for support is encompassed within the "Cooperation" dimension, with components like providing, seeking, and accepting assistance. Differentiated goals for individual learners

can draw on these dimensions to create tailored pathways for developing autonomy and fostering inclusive environments.

How can teachers include students' perspectives (needs and interests) into the selection of goals?

Teachers can use 1:1 interviews, group feedback, and mentoring models to understand students' perspectives. It is essential to be mindful of power dynamics within the group and between students and teachers, creating structures that enable all students to voice their thoughts freely—including the opportunity to question and critique teaching practices—without fear of negative consequences.

For students who do not communicate verbally, augmentative and alternative communication (AAC) tools such as visual aids, communication boards, or speech-generating devices can enable expression. Observational methods are equally crucial—teachers can analyse gestures, facial expressions, and engagement during activities to understand preferences and needs.

Collaborating closely with parents and caregivers is essential, as they offer valuable insights into the child's communication style, interests, and behaviors across different contexts. Regular exchanges of information through meetings, communication logs, or informal check-ins help build a comprehensive understanding of the student's needs and preferences, ensuring consistency between home and school environments.

Incorporating multisensory activities and tools like eye-tracking technology can further reveal students' choices and interests, even in the absence of spoken language. Teachers can also collaborate with parents and caregivers to leverage shared knowledge about the child's communication style and preferences. Frameworks like the SCERTS model (Social Communication/Emotional Regulation/Transactional Support) and the Mosaic Approach provide structured ways to include diverse forms of communication, helping teachers interpret nonverbal cues and create opportunities for students to express themselves. By combining these strategies, teachers can meaningfully include all students' voices in goal-setting and ensure their needs and interests are prioritised.

By adopting these strategies, teachers can create learning environments that are responsive to individual student needs and promote active participation in setting learning goals. This student-centered approach is reflected not only in daily classroom practices but also in broader educational models.

One example from progressive secondary schools in Germany, such as Stadtteilschule Winterhude, illustrates how structural changes can support student agency. In these schools, structured learning modules are offered for each subject in dedicated rooms (e.g., one room for Math, one for German, and one for English), allowing students to choose daily which room to attend and which subject or topic to focus on. Students set their own

daily learning goals based on their interests and needs, which they document in personal logbooks. This practice encourages self-reflection and helps track progress over time.

To ensure balanced learning and prevent any subject from being overlooked, students participate in bi-weekly evaluation talks with teachers. These reflective conversations provide an opportunity to review progress, discuss challenges, and adjust goals as needed. Assessments are tied to individual modules and can be taken multiple times, emphasising the documentation of learning and understanding rather than serving as a judgment of abilities. This approach fosters a growth mindset, where learning is seen as an ongoing process rather than a one-time performance.

How can we balance the curriculum and the needs and interests of the students?

Achieving a balance between the structured curriculum and the diverse needs and interests of students is a critical aspect of differentiated instruction. This balance can be attained by adopting a flexible approach to curriculum delivery, where educators integrate student interests into the framework of the existing curriculum. Teachers can start by identifying core learning objectives and then explore creative ways to connect these objectives with students' interests and experiences. For instance, a lesson in history could be linked to contemporary issues that resonate with students, making the subject more relevant and engaging. Additionally, incorporating a variety of instructional strategies, such as project-based learning or inquiry-based approaches, can cater to different learning styles while adhering to the curriculum standards. It is also vital to create a classroom environment that values student voice, encouraging them to express their interests and learning preferences. This ongoing dialogue helps educators to continually adapt and refine their teaching methods to suit the evolving interests of their students. Through such practices, educators can not only ensure curriculum fidelity but also create an inclusive and stimulating learning environment that motivates all students to engage deeply with their education (Schiefele, 1991).

Can the computer select the goals?

In the realm of differentiated instruction, the role of technology, particularly computers, in goal setting is a nuanced topic. While computers offer immense potential in analysing student data, providing personalised learning paths, and even suggesting learning goals, the selection of these goals should ideally remain a human-driven process. This is because computers, despite their advanced algorithms, may not fully comprehend the complexity and subtleties of individual student needs, interests, and socio-emotional factors. Teachers, on the other hand, can interpret data with a deeper understanding of the students' context, backgrounds, and classroom dynamics.

Additionally, the process of goal-setting should actively involve students, empowering

them to take ownership of their learning. When students collaborate with teachers in defining their goals, it fosters self-regulation, motivation, and a deeper connection to their educational journey.

It is also critical to consider the ethical implications and potential biases in algorithms. Decisions based solely on computational suggestions could unintentionally reinforce inequities or overlook the diversity in classrooms. Teachers, therefore, play a vital role in ensuring that the ethical dimensions of goal-setting are addressed, aligning technological inputs with inclusive, equitable practices.

The fluid nature of classroom environments and the broader contexts of students' lives—such as their emotional states, cultural backgrounds, or personal experiences—further underscore the limitations of technology in this area. Computers, despite their precision, cannot fully account for the dynamic and multidimensional aspects of human development.

As technology continues to evolve, teachers' roles may shift, requiring them to act as critical facilitators who assess and adapt technological recommendations to align with the holistic needs of their students. Preparing teachers for this evolving role through professional development and equipping students with the digital literacy necessary to critically engage with AI tools is essential to maintaining a balanced and future-ready approach.

Even in times of multimodal AI and the rise of multimodal robotics, the selection of goals should remain in the hands of students and teachers. This ensures that while benefiting from technological advancements, educational goals stay rooted in a holistic understanding of student development, encompassing academic, social, and emotional learning needs.

How can teachers differentiate content in their classrooms?

Content is what students need to know, understand and be able to do as a result of a section of study (IRIS Center, 2022; Tomlinson, 2001). That is, it is the "stuff" we teach and want students to learn (Tomlinson & Cunningham Eidson, 2003). National, state, and local standards for teaching content provide teachers with guidance on what they should teach. However, a set of standards is unlikely to provide complete and consistent content. The content is therefore defined also by local curriculum guides and textbooks. Content is typically derived from a combination of sources. However, one of the most critical factors in determining the content is the teacher's knowledge of both content and students (Tomlinson & Cunningham Eidson, 2003).

Content knowledge refers to the body of knowledge (facts, theories, principles, ideas, vocabulary) that teachers must master to be effective (UNESCO, 2022). Although effective teaching relies heavily on a deep understanding of the subject matter, mastering this alone is insufficient. Shulman (1986) emphasises that teaching requires not only knowledge of

the facts and concepts but also a comprehensive grasp of how the subject fits into its broader discipline and curriculum (UNESCO, 2022). In addition, he also states that teachers need to understand why a particular subject is particularly central to one discipline, while another may be somewhat secondary (Shulman, 1986).

According to Shulman (1986), in addition to content knowledge and curriculum knowledge, teachers need pedagogical content knowledge. "Pedagogical content knowledge is a type of knowledge specific to teachers and is based on the ways in which teachers relate their pedagogical knowledge (what they know about teaching) to their subject knowledge (what they know about what they teach). It is the integration or synthesis of teachers' pedagogical knowledge and subject matter knowledge that constitutes pedagogical content knowledge." (p. 14). Pedagogical content knowledge enables teachers to "know how to organise and present content in ways that make it accessible to increasingly diverse groups of learners" (Shulman, 1987, as cited in Cooper & Alvarado, 2006, p. 5; UNESCO, 2022). The link between content and pedagogical knowledge determines teachers' decisions about materials, teaching approaches, assessment of students' learning, and feedback, among others (Cooper & Alvarado, 2006; Bold et al., 2017; UNESCO, 2022). In this context, pedagogical content knowledge is "a conceptual map of how to teach a subject" (Villegas-Reimers, 2003, p. 39).

Another critical factor in determining the content is teachers' knowledge of their students. Content can be differentiated in response to the student's readiness level, interests, or learning profile, as well as in response to any combination of readiness, interest, and learning profile (Tomlinson, 2001). Because students' readiness, interest, and learning profiles vary, it is important to diversify or differentiate content in response to these students.

Building upon these foundational concepts, the Technological Pedagogical Content Knowledge (TPACK) framework extends Shulman's idea of pedagogical content knowledge by incorporating technological knowledge (Mishra & Koehler, 2006). The TPACK framework highlights the dynamic interplay between content, pedagogy, and technology, emphasising that effective teaching requires not just expertise in these areas individually, but an integrated understanding of how they interact to enhance student learning.

Technology plays a pivotal role in differentiation by providing diverse and adaptable tools that meet the varying needs of students. Digital tools such as interactive simulations, educational software, and learning management systems allow teachers to present content in multiple formats, catering to different learning styles and preferences (Koehler, Mishra, & Cain, 2013). Additionally, technology enables the creation of adaptive learning environments where content can be personalized based on students' readiness levels and progress, offering both remediation and enrichment opportunities as needed (Tomlinson & Strickland, 2005).

Moreover, technology facilitates differentiated assessment practices, providing immediate feedback and data-driven insights into student learning. Formative assessment

tools, such as online quizzes and e-portfolios, allow for real-time monitoring of student progress, enabling teachers to adjust instruction accordingly (Puentedura, 2013). This continuous feedback loop supports a more responsive and inclusive approach to teaching, ensuring that all students receive the support they need to succeed.

In summary, the integration of technology within the TPACK framework is essential for implementing differentiated instruction effectively. By leveraging technological tools in conjunction with strong content and pedagogical knowledge, teachers can create flexible, engaging, and inclusive learning environments that address the diverse needs of their students.

How do teachers differentiate content according to student readiness?

Readiness refers to a student's level of knowledge and skill regarding the given content and is a student's proximity to learning goals at a given time (Tomlinson, 2014); it is the place where the student is according to where the learning objectives say the student should be (Hockett, 2018). Students' readiness levels can be affected by their background knowledge, life experiences, or prior learning about a course or content, and their readiness levels may also vary according to courses or content areas. Student readiness is not a fixed factor. Sometimes a student who has a marked difficulty in learning one subject may have a surprisingly large amount of background knowledge on another subject. In this case, the student may be ready for more advanced studies than is usually expected. On the other hand, students who are usually quite advanced may miss some prerequisites in a subject or be distracted by other subjects in their life. In this case, they may need more solid experience to be successful. For this reason, teachers should use various assessment methods in order to determine the readiness level of students for any content and differentiate the content according to student needs based on the assessment data they have obtained.

How do teachers differentiate content according to student interests?

Another student characteristic considered in differentiated instruction is interest. Interest is what the student enjoys learning, thinking and doing and is a great source of motivation. Students' interests are topics and/or processes that arouse curiosity and inspire passion (Santangelo & Tomlinson, 2009; Tomlinson, 2005a, 2005b). The purpose of interest differentiation is to help students connect with new knowledge, understanding, and skills by promoting intrinsic motivation by uncovering connections to what they already find attractive, intriguing, relevant, and valuable (Tomlinson, 2003). Differentiation by interest means creating instruction based on the interests students bring to the classroom, or offering students options within an instructional stack that they want to dive deeper into (Tomlinson, 2001) and this allows educators to connect students and engage them in a lesson (Tomlinson, 2001, 2003).

For example, environmental pollution, global warming, recycling, etc., which constitute a unit related to the environment. The student's choice of topics will reveal the student's interest in any of these topics.

How do teachers differentiate according to learner profiles?

The learning profile, on the other hand, refers to the wide variety of ways in which students differ in how they prefer to deal with the content, process, and product, according to Tomlinson (2003). A student's learning profile is a complete picture of their learning preferences, strengths, and challenges. According to Tomlinson and Imbeau (2010), a student's learning profile is shaped by four elements and the interactions among them: learning style (a preferred contextual approach to learning), intelligence preference (a hard-wired or neurologically shaped preference for learning or thinking), gender (approaches to learning that may be shaped genetically or socially for males versus females) and culture (approaches to learning that may be strongly shaped by the context in which an individual lives and by the unique ways in which people in that context make sense of and live their lives). The purpose of differentiation by learning profile is to help students learn in the ways they learn best and to expand the ways in which they can learn effectively. Because students are more productive in their learning when they are allowed to work in ways that are comfortable for them.

The three basic characteristics of students, briefly described above, are critical in differentiating the content. Strategies such as tiered content, learning contracts, compacting, providing a variety of materials, presentation styles, scaffolding are used to differentiate content (IRIS Center, 2022).

What kind of strategies could teachers use to differentiate content?

Tiered Content

The strategy of tiering content is based on students' readiness levels. The purpose of differentiating content according to readiness levels is to match the material or information students are asked to learn with their reading and comprehension capacity. Tiering content according to student readiness levels encourages students to start learning from where they are at the moment and allows students to work on challenging tasks in a way that suits them. When teachers differentiate content, all students complete the same type of activity (e.g., worksheet, report) (IRIS Center, 2022), but the difficulty or complexity of the content varies.

A task matched to student readiness takes the student's knowledge, understanding and skills slightly beyond what the student can do independently. A good readiness match pushes the learner slightly outside their comfort zone and then provides support in bridging the gap between the known and the unknown. Tomlinson and Cunningham Eidson (2003,

p. 30) provide examples of small group experiments based on preparation and interest as follows.

Divide students into groups of three or four and give each group the instructions for its assigned experiment. There are seven experiments in all, designed at varying levels of complexity and listed here from most complex to least complex:

- Experiment A: How can we determine relative humidity? (version 1)
- Experiment B: How can we determine relative humidity? (version 2)
- Experiment C: How can we determine the direction of the wind?
- Experiment D: How does air move?
- Experiment E: Does air have weight?
- Experiment F: Does air take up space?
- Experiment G: Does air have movement?

Each group carries out its experiment based on the question. Students are provided with a recording sheet as a place to collect their data as they work towards answering their questions, which has different levels of scaffolding. For students who need more support they have more specific steps or sub-steps versus students who are ready for a greater challenge who have just questions and space for documentation on their worksheet. They record all of the information required to sufficiently answer their science question. The ways that students can record their knowledge may also differ depending on how comfortable they are with scientific measurements and quantities or if they are explaining themselves using more common words. Lastly, students create a plan for how they will share their work with the rest of the class including the methods that they used and what they found in their research. Ultimately, the class will want to know if they answer their questions and what proof they have. Each group will have the opportunity to share their work and their experience based on the level of learning that they accomplished.

Differentiation Through Open and Closed Tasks

Differentiation through open and closed tasks is an effective instructional approach (Tomlinson, 2021, 48) across subject areas, including mathematics, sciences, and humanities, that caters to diverse student needs and abilities. This method involves using both structured (closed) and flexible (open) activities to engage students at various levels of understanding and skill. By blending the strengths of both types of tasks, teachers create inclusive classrooms that value student diversity and provide multiple entry points into learning.

Closed Tasks

Closed tasks are structured with predetermined outcomes and clear instructions. They are

particularly effective for assessing foundational knowledge and skills, benefiting students who thrive on structure and need concrete guidance (Tomlinson, 2021, 48). These tasks are widely applicable across disciplines.

Examples in mathematics include:

- Multiple-choice questions (e.g., "What is the sum of 15 and 9?")
- Fill-in-the-blank exercises (e.g., "Solve for x: x + 7 = 12.")
- Step-by-step math problems (e.g., "Simplify: 2(3x + 4) − 5.")

Examples in other subjects include:

- Labeling tasks in science (e.g., labeling given parts of a plant or an ecosystem).
- Identifying elements of a story in English literature (e.g., "Identify the protagonist and setting in the story.")
- Timeline tasks in history (e.g., "Place these historical events in chronological order.")

Open Tasks

Open tasks, in contrast, allow for multiple solutions and approaches. They encourage creativity, higher-order thinking, and problem-solving (Bahar & Maker, 2015), making them particularly effective for fostering deeper engagement (Hertzog, 1998). Open tasks also provide opportunities for students to showcase their unique abilities and strengths, making them a powerful tool for differentiation in inclusive classrooms. Unlike closed tasks, open tasks do not require the creation of separate materials for different levels of readiness; instead, they can be used by all students, allowing them to engage with the task at their own level and in their own way (Zohrabi & Hassanpour, 2020).

Examples in mathematics include:

- Finding multiple fraction pairs that add up to 7/8.
- Constructing rectangles with a given perimeter using various dimensions.
- Creating word problems using a specific fraction but allowing for different correct answers. (e.g. Create a story problem where 3/4 of something equals a number you choose. Solve for the total.)

Examples in other subjects include:

- Designing a poster for a historical event, including important figures and outcomes.
- Writing a diary entry from the perspective of a character in a novel or a historical figure.
- Creating a piece of artwork inspired by a theme discussed in class, such as "community" or "change."

- Developing a science experiment to explore how light travels through different materials.

To help students orient themselves and succeed with open tasks, teachers can provide examples of possible approaches, offering inspiration while leaving space for individual creativity (Tomlinson, 2021, 48).

Medium-Open Tasks for Balance

Medium-open tasks provide a balance between open and closed tasks, offering enough structure to guide students while still allowing for creative expression. These tasks are particularly effective for scaffolding students into more open-ended problem-solving.
Examples include:

- Drawing (of) an ecosystem and labeling all the parts the student knows (without blanks).
- Creating a timeline with optional categories for additional historical events.
- In mathematics:
  - Turning a closed question into an open one:
    - Closed: What is half of 20?
    - Open: 10 is a fraction of a number. What could the fraction and the number be?
  - Removing constraints:
    - Closed: There are 12 apples on the table and some in a basket. In all, there are 50 apples. How many apples are in the basket?
    - Open: There are some apples on the table and some in a basket. In all, there are 50 apples. How many apples might be on the table?
  - Using adaptive tasks:
    - These tasks contain multiple starting points and solutions for students of different levels, allowing every student to participate and be challenged appropriately . For example: "Here you have 24 wooden cubes. Which cuboids can you build with them? Make a note of the ones you have already found. How many can you find?" (Leuders & Prediger, 2016 in Bardy et al., 2021, 33)

Benefits of Open Tasks

Open tasks are a versatile and effective strategy for differentiation. They:

- Accommodate mixed abilities by allowing students to engage at their own level.
- Empower students to make decisions and develop their own thinking processes.

- Encourage students to make connections, generalise ideas, and justify their reasoning.
- Provide opportunities for creativity and self-expression across a variety of subject areas.

Balancing Open and Closed Tasks for Differentiation

Using a combination of open and closed tasks enables teachers to:

- Cater to diverse needs: Closed tasks ensure foundational skills are addressed, while open tasks encourage creativity and exploration.
- Support different learning profiles: Students who thrive on structure benefit from closed tasks, while those who enjoy autonomy excel in open tasks.
- Encourage inclusive participation: By providing both types of tasks, all students can engage meaningfully and demonstrate understanding.

By combining these approaches, teachers foster an inclusive learning environment that values both structure and flexibility. This ensures all students can engage meaningfully, build confidence, and express their strengths in unique ways.

Differentiation matrix

The differentiation matrix developed by Ada Sasse (2014) offers a structured tool to design lessons that address the heterogeneity of a learning group. This matrix enables educators to balance cognitive and thematic complexity in their lesson planning, fostering inclusive learning environments where students with varying levels of ability can work collaboratively on the same topic.

Figure : Differentiation matrix for the "Europe" lesson plan for a mixed-age class with grades 1 to 4

Abstract operations	– Mountains – Places of interest	– Capitals of neighbouring countries – Flags	– Greek yoghurt – French cheese – Italian pasta – Dutch cheese	– Famous Italians, footballers	– Famous Frenchmen
Symbolic operations	– Map work: Berlin, Thuringia	– Location of the capital and flag	– Meaning of the word European Union	Presentation	Presentation
Fully imaginative action	– Saale, Jena – Rivers, lakes, seas, transport routes	– Assignment of certain countries to individual colours (material)	– Buy goods from other countries with different money, export different goods from other countries	– Capital city: Places of interest	– Capital city, sights
Partial imaginative action	– Federal states on a map Thuringia and its neighbouring countries	– Assignment of countries via colours and plot	– European puzzle, assignment via colours	– Prepare something from Italy, Count to 10 in Italian	– Prepare something from France, Count to 10 in French
Practical and illustrative action	– Jena in Germany – Germany puzzle; capital city	– Germany puzzle and its neighbouring countries	– Money from the EU, Differences commonality (play money)	– Food from Italy – Italian vocabulary	– Food from France, French vocabulary
	Germany	**Neighbouring countries**	**Europe**	**Presentation topic**	**Country 2**

Source: Sabine Lada and colleagues at the Maria Montessori State Community School in Jena (Sasse 2014)

For instance, the "Europe" matrix used at the Maria Montessori State Community School in Jena illustrates how teachers can tailor activities to different cognitive levels while maintaining thematic unity. Practical actions, such as recreating Italian dishes or building puzzles of Germany's neighbors, are paired with more abstract operations, like analyzing famous figures or creating presentations on capitals and flags. This layered approach allows students to engage with content at a level appropriate to their skills while exploring the same overarching theme. By enabling collaborative planning among teachers and emphasizing student agency—students select tasks aligned with their interests and abilities—the matrix ensures both individual and social connectivity. This dual focus supports inclusive education by providing equitable access to meaningful learning experiences across diverse student profiles.

Learning Contracts

"A learning contract is a written agreement between teacher and learner that outlines mutually agreed upon goals, tasks, and expectations" (adapted from Greenwood, 2003,

p. 1). These contracts are inherently collaborative, involving both parties in a negotiation process that respects the student's voice and learning preferences. While the teacher brings expertise in curriculum and pedagogy, the student contributes vital insights into their own learning style, interests, and goals. In a well-structured learning contract, both the teacher and student make commitments. The student typically agrees to complete specific tasks, meet certain quality standards, and adhere to agreed-upon timelines. The teacher, in turn, might commit to providing necessary resources, offering regular feedback, or adapting instructional methods to suit the student's learning profile. Contracts can contain both skill and content components and are well suited to a differentiated classroom as the components and terms of the contract can vary according to the student's needs (Tomlinson, 2017). Through this process, teachers can differentiate the curriculum based on student readiness or learning profiles, while students gain agency in their learning journey (IRIS Center, 2022). During the negotiation process, both parties collaboratively determine:

1. The tasks to be completed
2. The timeline for completion
3. The quantity and quality expectations of the work
4. The evaluation criteria
5. The support and resources the teacher will provide

This mutual approach not only motivates students who may have difficulty accomplishing academic tasks but also empowers them by giving them a voice in their education. By jointly committing to specific, positive study and learning behaviors, both teachers and students create a more engaging and personalized learning experience (Frank & Scharff, 2013).

Compacting

Teachers can differentiate instruction by compressing the curriculum for advanced students who already master certain content or skills. Curriculum compacting is a technique for differentiating instruction that allows teachers to make adjustments to curriculum for students who have already mastered the material to be learned, replacing content students know with new content, enrichment options, or other activities (NAGC, 2022; Renzulli & Reis, 2014). Curriculum compacting allows students to skip content they know or to proceed quickly through content. This strategy targets students' readiness levels and it can be applied to any subject and at any grade level (IRIS Center, 2022).

How do teachers use differentiated teaching strategies in their classrooms?

What does differentiation look like in the classroom?

How differentiation looks in the classroom depends on the age group and profiles of the students, the content area, and the unit of study. As there is an endless variety of possibilities, we know that no two differentiated classrooms look the same, though we can see common strategies and practices. The following strategies are some possibilities to look for in the learning process of a differentiated classroom.

Proactive

Instructional strategies in the differentiated classroom are, first and foremost, proactive. They are carefully designed in advance based on assessments data, student feedback, and class or student goals. Seen in the previous sections, the importance of collecting data and formatting goals is critical to ensuring objectives are clear and appropriate strategies are chosen (Carolan & Guinn, 2007). The next step is to verify what content pieces are being taught and choose the strategies by which students will interact with the information.Using a clear and concise planning template helps to see the connections between assessment, goals (based on student assessment data), and curriculum.

Figure 4 – Example of a Differentiated Lesson Plan(self-created)

Teacher Name:					Class/Subject:
Differentiated Lesson Plan					
1. Standard/Concept/Unit/Topic/Subject:				**2. As a result of this less/unit, students will Know (facts, vocabulary), Understand (concepts), and/or Be able to DO (skills):**	
3. Pre-assessment:					
4. Grouping Decisions and Choices:					
5. Learning Experiences	**Instructional Resources**	**Content**	**Process**	**Product**	
					Exceeds Standard
					At Standard
					Approaching Standard
6. Post-assessment:					
7. Notes/Reflection for future reference:					

Flexible Groupings

As shared in the content related section, groups play an important role in a differentiated classroom. There are opportunities for whole group instruction around concepts, important vocabulary, or at the introduction to a topic, but the majority of the time students are working in other groupings – small groups, pairs, individually, or another combination. The classroom allows for opportunities for the group to come back together as a whole class to address questions or clarify instructions before breaking back into other groupings again (Sousa & Tomlinson, 2011; Wormeli, 2007). The differentiated classroom is one in which students are rarely all working whole-group settings.

Example

A classroom of grade 2 students (7-year-olds) are starting a unit of study on the life cycle of a frog. The teacher begins her instruction with a whole class discussion of what the students know about frogs already. She prepares the students to work in pairs on documenting questions that they want to answer through their unit of study. Considering her learner profiles and the level of student readiness, she has chosen to start in pairs to allow time for students to process their questions. She has considered the needs of 4 students that she has with different learning disabilities and how they could best interact with their peers as the unit begins. She circulates the room as the pairs work to list or record their questions. The teacher makes observations regarding the students' engagement and attention to their task. Once each of the pairs has a series of questions the pairs find another pair to look for any similarities in their line of questioning. The process continues for the small group of 4 to find another group of 4 and repeat their search for similarities in their questions. Then their group of 8 looks for another group of 8, and so on until the whole class comes back together to review the questions that will lead their inquiry into frogs.

In this example, the teacher uses different groupings to meet the needs of her students and is able to support them to work on critical thinking towards their unit of student. There may be more physical movement than a traditional, didactic classroom and the volume of noise produced by students busily working on an engaging project might be greater, but a differentiated classroom is meeting its students' needs.

Inclusive classrooms use these groupings to encourage peer interaction and promote social integration, enabling students with diverse abilities to work together and learn from one another.

Time & Space

Flexibility also allows for changes to framework conditions like support systems, amount of time spent, or use of space which also contributes to achieving essentially the same goals. Allowing a group of students longer time to finish their work or providing multiple physical spaces for students to do independent work or have multiple check in points with one student are ways to create opportunities for flexibility throughout the school day (Sousa & Tomlinson, 2011).

Opportunities to differentiate through space can be about where groups work and how students have access to materials, but it is also about the feeling of being in the classroom space. Do students feel welcomed and comfortable in the space? Are there places for calm relaxation versus more active group work? Are there places that students are invited to explore independently? How does the space invite the students to participate in their learning? Flexible learning spaces are ones that reflect the student population that use them regularly (Gregory & Kuzmich, 2014).

Another chance to show flexibility is how we allocate time in our classrooms. Following a consistent routine with a structured schedule is an important part of managing a classroom. When we look at our schedules, we can see where our priorities lie as those are the activities that we have allocated the most time or in some cases the most opportune times slots. We know that students are more ready to learn in the earlier part of the school day versus the later part, so how do we structure our time accordingly?

Presentation Styles

Students' learning profiles are taken into account in the presentation of any content. The term learning profile refers to a student's preferred learning mode, which can be influenced by a number of factors such as learning style, intelligence preference, gender and culture. The learning profile is shaped by these four elements and the interactions between them (Tomlinson & Imbeau, 2010). Students' learning profile includes learning preferences (for example, is the student a visual, auditory, tactile or kinaesthetic learner?), grouping preferences (for example, does the student work best individually, with a partner or in a large group?) and environmental preferences (for example, does the student need lots of space or a quiet area to work?).

Students learn better when students' learning profiles match teachers' presentation styles. Therefore, teachers need to consider students' learning profiles when presenting any content. Various methods such as narration, discussion, asking questions, reading aloud, verbal explanation, picture/graphic, transparency, whiteboard, headings, thinking aloud, taking action, creating/constructing, using manipulatives can be used in content presentation. While presenting teachers' lessons, multimedia and formats also allow students to develop a deeper understanding of concepts by providing opportunities to interact with these concepts in a variety of ways (IRIS Center, 2022).

Materials

The choices of materials are as varied as there are projects in the classroom. As a teacher develops or collects materials for student learning, there are classic examples, such as texts or workbooks. Shared ideas will become catchier when teachers use materials suitable for the students that can attract the attention of the students in their lessons. Thus, sound (for example, the voices of others, sounds that make a term or concept clearer, music), pictures, stories, charts or figures, models, photographs, works of art, body language, movement, and other things that engage the senses and engage the mind. Elements should be integrated with the content (Tomlinson, 2001). When we work to differentiate our classroom for learners, we are looking for opportunities to create a varied collection of materials for our students to engage with over specific topics. We can expand our classrooms to include magazines, newspapers, posters, and advertisements in our literacy work. We can think about access to IT tools, emails, web-based searches, and online libraries. We can expand our thinking further to bring content area materials to our students through videos, zoom interviews, and virtual field trips. We want to ask ourselves, in how many different media can I get my student access to this information? Using multiple texts and combining them with a wide variety of other supplementary materials increases all students' chances of accessing content that is meaningful to them. Such differentiation allows students to access information in the way that suits them best. The point to be considered here is to match the complexity, abstraction, depth, breadth and similar levels of the source materials used with the learning needs of the student.

Teachers can build in materials that support students without having to ask the teacher directly.

Example

The teacher divides the class into four workstations where the three are student-run and the teacher is leading a fourth group, he needs the students to be autonomous in order for the other three groups to run successfully. Each of those workstations can have written directions, visual cards, or choice options to guide student learning. Maybe the teacher sets up a question group who is ready to problem solve and answer questions for other groups so as not to disturb the teacher during their workstation. Each of these strategies needs to be explicitly planned beforehand and taught to the students. Practising these processes and procedures increases the chances that students will be able to successfully operate them autonomously.

Building these opportunities into the classroom is a win-win situation. The teacher benefits from the students working independently and the students benefit from being in control of their work. Differentiating materials also requires teachers to consider access to materials (Sousa & Tomlinson, 2011). Who might struggle with this material and what are the ways that I can facilitate better access through that struggle? A language learner might need more vocabulary reminders with a text than a dominant language student. A student with specific learning needs might need a text-to-speech option or an audio recording to enhance their reading comprehension.

When teachers include varied resources like videos, tactile models, or interactive digital tools, they increase the likelihood that all students can engage with the content in ways that resonate with them. This variety reflects a commitment to honoring diverse learning needs and experiences.

Choice

One way to ensure that students are highly engaged in their learning is through allowing choice. When students are given options, either structured by the teacher or freely chosen by the students, they are given multiple means through which to process and show their learning (Carolan & Guinn, 2007). For example, students are allowed to choose a final project instead of taking a written exam. They are given the options of giving a presentation, performing an original piece, or writing a story.

Choices that take into account students' interest inherently push student thinking towards engagement as it makes the learning feel more relevant. To create authentic experiences in the classroom, and therefore make learning meaningful, we need to consider why students have to know this information and the ways that they may have already engaged with this knowledge in the past.

Scaffolding

Scaffolding refers to the process by which the teacher provides additional support to enhance learning and assist in mastery of tasks for students struggling to learn a new skill or content. It is a basic support to "enable children to independently perform tasks that they could only perform with the help or guidance of the teacher" (Gibbons, 2002, p. vii). Scaffolds facilitate the learner's ability to build on prior knowledge and internalise new knowledge. An important aspect of the scaffolding strategy is that scaffolds are temporary. As the learner's abilities increase, the scaffolding provided by the more knowledgeable is gradually withdrawn. As children's skills develop with support, scaffolding decreases and children are eventually able to perform on their own (Bıkmaz et al., 2010; Chang, Sung, & Chen, 2002).

The scaffold teaching strategy is often used to focus more on the learning needs of

an individual student during the completion of a teaching lesson or specific task rather than on a group of students, so differentiation and core teaching strategies can be used simultaneously to better meet students' individual teaching needs (Ray, 2022).Many different facilitative tools can be utilised in scaffolding student learning. Among them are: breaking the task into smaller, more manageable parts; using 'think aloud, or verbalising thinking processes when completing a task; cooperative learning, which promotes teamwork and dialogue among peers; concrete prompts, questioning; coaching; cue cards or modelling. (Elandeef & Hamdan, 2021). Scaffolding is "a supportive instructional structure that teachers use to provide the appropriate mechanisms for a student to complete a task that is beyond their unassisted abilities" (Lipscomb, Swanson & West, 2010, p. 19).

For example, for a student who has difficulty multiplying two-digit numbers, after the teacher has done a task analysis, he can divide the task into manageable steps and model each step in the task, giving the student time to practise. Support is gradually removed as the student masters the task.

Another example of scaffolding can be seen when teachers use questioning to guide students' work. Based on the students' skill levels, the teacher can develop lines of questioning that challenge students appropriately.

Example

A teacher working towards an objective in secondary maths classes around using statistics and creating visual representations to explain information. She has identified student specific goals to support learning. For one student the goal might be to be able to interpret visual representations of statistics accurately and the teacher's line of questioning might be, tell me about what you notice in the graphic, or which part of this visual is important information and how do you know? While another student's goal is to come up with two alternative ways to represent the same information, the teacher is going to have different lines of questioning. How do each of these visuals illustrate the same information? Which way is easier for a reader to interpret? Why?

Product

If we have clearly differentiated the process of learning and yet require all the students to take the same test to demonstrate their knowledge then we are not following our obligation to support all our students. To differentiate the final product of a unit of study, we need to ask ourselves how can students show their learning? What formats are required for

students to demonstrate their learning? What choices are there? How often is it done? Is it always done individually or in a group? What are the ways that you will measure students' success (Carolan & Guinn, 2007)?

For example, a teacher can offer students a choice board of options she/he has pre-selected to match the students' learning profiles and complete a final project. Another teacher can pose four questions and ask students to answer them in four different ways based on their own choice.

Figure 5 – Tools and strategies for designing inclusive differentiated classrooms for diverse learners

As you can see in Figure 5, there are a wide range of ways to differentiate teaching instruction and make use of strategies to ensure that students are working at their readiness level. The selections in this chapter are a few of many different ways to use differentiation in the classroom. There are other models, such as inquiry-based models, that lend themselves to differentiate because of how they incorporate students' knowledge and allow for different points of entry into learning. Exploring more about inquiry models,

authentic learning, and project based/problem-based learning are other avenues for developing differentiation practices in your classroom.

How do teachers determine what strategies to use?

Teachers determine which strategies to use based on their student data – completed assessments, either formal or informal, that demonstrate students' feedback. Having already collected this information and determined the appropriate student goals, teachers are familiar with their learners' profiles and readiness. Therefore, they select strategies that offer the best opportunity for students to reach success. The access to materials, support, and a varied experience in the process of learning are also important determinants in choosing strategies. Strategies should be chosen to enhance access to the process as well as the product by which the students demonstrate their learning.

Finally, teachers determine useful strategies for their group through trial and error. We can find the best selection of strategies for students on a given day by approaching the process of differentiation through the constant collection of feedback (Renzulli, 2015).

How can teachers monitor learning progress?

Generally, teachers tend to design whole units of learning and check learning progress at the end of the whole course. Differentiation, however, requires activating monitoring procedures throughout the unit as well. Since activities are highly personalised, according to students' learning preferences, interests, readiness and needs, teachers need to collect data about each student's learning path. Normally, these monitoring activities are incorporated into the design of learning activities. For example, when teachers structure different learning materials regarding the same content. Teachers can let students choose or they can assign tasks but, in both cases, they need to monitor whether the type of activity completed by the student is adequate.

EXAMPLE 1 – Activity options

Lesson about	
	Structured learning materials and supports Multiple options regarding the type of task/activity Multiple options for support Multiple options in terms of additional learning materials**Options are structured according to** Mastery level Learning preferences Interests**Options are** Assigned by the teacher Chosen by the student

EXAMPLE 2 – Activity options

Listening	Reading	Writing	Speaking
Listen to a song and summarise the content of the lyrics.	Read a short narrative text and identify key words.	Write a dialogue between two characters.	Play a scene from a film.

Example inspired by Tomlinson, C.A., & Imbeau, M.B. (2010). Leading and managing a differentiated classroom. Alexandria, VA, Association for Supervision and Curriculum Development.

EXAMPLE 3 – Activity options

Verbal/ Linguistic	Visual/ Spatial	Bodily/ Kinaesthetic	Musical/ Rhythmic	Logical/ Mathematical
Make a presentation. Write a text.	Draw a comic. Paint an illustration.	Simulate an experiment. Organise a role-play game.	Record a song. Invent a choreography.	Create a diagram. Write down the sequences of an experiment procedure.

Example inspired by Gregory, G.H., & Chapman, C. (2013). Differentiated Instructional Strategies: one size doesn't fit all (3rd ed.). Corwin.

Similarly to the planning phase, teachers can opt for multiple instruments to collect information on the adequacy and effectiveness of learning tasks. For example, they can make observations, administer self-assessment questionnaires or organise brief class discussions at the end of the activities to obtain some feedback.

Here there are two examples of possible instruments to monitor individual learning.

EXAMPLE 1 – Self-evaluation questionnaire

Individual task STUDENT: _____	1 Strongly disagree	2 Disagree	3 Agree	4 Strongly agree	Notes
The task was challenging for me					
I was able to focus during the activity					
I was not motivated during the task					
The time assigned to complete this activity was enough for me					
…					

EXAMPLE 2 – Monitoring mastery

What I have learned STUDENT _____	1 I am beginning to understand	2 I could use more practice	3 I need some help	4 I can do it alone	5 I know it so well, I could explain it to anyone.
Designing a PowerPoint presentation					
Writing a summary					
Creating a flow chart					
…					

Examples inspired by Gregory, G.H., & Chapman, C. (2013). Differentiated Instructional Strategies: one size doesn't fit all (3rd ed.). Corwin.

How can teachers evaluate the effectiveness of teaching practices?

At the end of the learning unit, the teacher collects, within the student profiles, the materials gathered throughout the lessons on students' progress, difficulties and preferences. Again, as it would usually happen, they may administer a common final test. Or, even for the final summative assessment they may foresee differentiated products, allowing students to demonstrate what they have learned according to their preferences.

It is important to point out that the differentiation model does not impose minimum levels of differentiation or specific types of differentiation. It only offers guidance on how to design. Teachers can choose which ones to implement and to what extent, depending on their skills, experience and preferences, and also depending on the specific situation of the class they are working with. What is critical for an effective deployment of the model is to maintain, throughout the whole process, a strong link between instructional design and the procedures of assessment, monitoring and evaluation. Lastly, differentiation requires an aptitude for professional self-training. Each implemented unit is one more building block toward more effective future unit planning.

Conclusion

This chapter has examples of some of the ways to strengthen your differentiation practices in the classroom. At times it might feel overwhelming to consider all the elements at play in a differentiated classroom, but remember to start at the beginning of the 'differentiation circle'. Always begin first with collecting information on the needs and interests of students. Use that information to plan goals accordingly. There will not necessarily be the same goals for everyone. That information will inform how to differentiate the content and the

materials. Finally, evaluating the practices and strategies used is always the appropriate way to complete a session, activity, or project.

As this system is used, there will be more and more ease and confidence with applying differentiated strategies in the classroom. Note that not all forms of differentiation are helpful for inclusive education. There are ways that differentiation can be used which actually limit students in their learning. For example, by using Artificial Intelligence (AI) based computer programming to challenge students without an opportunity to consider the knowledge in other ways, or when students are continually offering the same strategies over time without an opportunity to assess and reevaluate student needs.

A final point to know about differentiation is that it is constantly changing. As students learn and change, a teacher needs to be adapting to those changes. There is not a perfect material or strategy that you can use effectively forever. There is not a final point of arriving at "doing" differentiation. It is an ever-evolving, a way of thinking, a framework that shifts and moves as students do. Be prepared to move with them.

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=363#h5p-11

Closing questions to discuss or tasks

Choose three to four of the following tasks:

- How do you currently differentiate instruction in your classroom? In which areas (content, process, product) do you feel most confident, and where do you see opportunities for growth?

- After reading this chapter, how has your understanding of differentiation evolved? Were there any concepts that challenged your previous beliefs about inclusive teaching?
- In what specific ways will you apply the principles of differentiation in your next classroom experience? Consider both small adjustments and broader changes in your teaching practice.
- Can you provide an example from your own teaching or observation where differentiation was implemented effectively? What made it successful?
- Reflect on a practice you have encountered that seemed to be differentiated but did not truly meet diverse student needs. What could have been done differently to enhance its inclusivity?
- What tools and strategies will you use to monitor and evaluate the effectiveness of your differentiation practices over time?
- How can incorporating student voice and choice further enhance your differentiated instruction strategies?
- Considering the role of technology in differentiation, how might you leverage digital tools to support diverse learning needs in your classroom?
- Choose one topic from a subject area you teach or are familiar with (e.g., Math, Science, History, Language Arts). For your chosen topic, design three tasks:

  1. Closed Task:
     Create a structured activity with clear instructions and only one correct answer.
  2. Medium-Open Task:
     Develop an activity with some structure but allow for multiple correct answers or varied approaches.
  3. Open Task:
     Design an activity that encourages creativity, critical thinking, and has no single correct answer. Students should be able to explore different methods or perspectives.

About the authors

Silvia Dell'Anna

Silvia Dell'Anna is a postdoctoral researcher in inclusive education, working at the Free University of Bozen/Bolzano. Her primary research areas include the evaluation of the quality of school inclusion, the design of inclusive teaching strategies, and the prevention of educational poverty, underachievement, and early school leaving.

Jessica Lament

Jessica Lament is a specialist in inclusive practice, especially for students with disabilities. She has worked in schools in the US, Singapore, and France supporting teachers – from pre-k to secondary school to teachers in higher education training programs – always with the same goal, to increase the implementation of research-based inclusion.

Frank J. Müller

UNIVERSITY OF BREMEN

https://www.uni-bremen.de/en/
fb12/arbeitsbereiche/abteilung-
c-inklusive-paedagogik/sekundarstufe/team/
prof-dr-frank-j-mueller

Prof. Dr. Frank J. Müller is a professor for "Inclusive Education for Learning and Intellectual Development Impairments in Secondary Schools" following his work as a special ed teacher at the Grünauer Gemeinschaftsschule in Berlin.

He works on support structures for teachers in heterogeneous learning groups through inclusive open educational resources, research-based study programs to make the history of inclusive education accessible to future generations, and questions of including more dimensions of diversity.

Yasemin Acar Ciftci

After working as a primary school teacher and principal for 20 years, Yasemin Acar Ciftci has been serving as a teacher educator for the past years. She is a faculty member at Istanbul Yeni Yuzyil University in the Child Development and Youth Services Department. Yasemin holds a PhD in Educational Sciences with a specialization in Curriculum and Instruction. Her PhD thesis focused on multicultural education and teacher competencies, and her academic work is primarily guided by critical theories.

FORMATIVE ASSESSMENT FOR/OF LEARNING

Eva Kleinlein; Valerio Rigo; and Alessandra Imperio

📄 *One or more interactive elements has been excluded from this version of the text. You can view them online here: https://book.all-means-all.education/ama-2025-en/?p=373#oembed-1*

Example Case

Example of Learning Unit where learning and assessment co-occur in a perspective of formative assessment (both assessment for learning (AfL) and assessment as learning (AsL)).

Learning framework of reference: Thinking Actively in a Social Context (Wallace, 2001).

Topic: Counting with the help of the hand's fingers.

Class: primary school – 1st grade.

Previous knowledge: numbers from 1 to 20, the concept of addition, counting on fingers to solve an addition with numbers from 1 to 10.

Lesson Plan

Table 1. Planning was designed and implemented by Dr. Alessandra Imperio in her classroom.

N.	Stage	Activity
1	GATHER/ORGANISE What do I know about this?	What do you know about counting with your fingers? How do you count with your fingers when you do addition? Students reflect on their previous knowledge and respond. The teacher reports the collected information on the blackboard.
2	IDENTIFY What is the task?	The teacher explains that today the children will find out how to count by helping themselves with their fingers when the two addends do not fit together on their fingers. e.g., 7+5=
3	GENERATE How many ideas can I think of?	Try doing 7+5 with your fingers. Since we only have ten fingers, think of all the possible ideas to solve this addition problem, still helping with your hands. Children think individually about all the possible solutions.
4	DECIDE Which is the best idea?	Pairwise comparison of the solutions found and choice of the best one.
5	COMMUNICATE Let's tell someone!	Pairs tell the class about the decided solution. Real solutions found by the children were: – I use my hands and feet. – I keep the first number in mind and place the second in my hands, then count. – I pretend that 7 is a 2 and put both 2 and 5 on my hands, then add up. – I use two hands and then use one hand again.
6	EVALUATE How well did I do?	Children experiment with the proposed solutions and assess them in terms of effectiveness (does it work or not work?) and efficiency (is it convenient? is it practicable?). Voting.
7	APPLY Let's do it!	Children use the chosen method (I keep the first number in mind and place the second in my hands, then count) to perform some sums.
8	LEARN FROM EXPERIENCE What have I learned?	What have we learned? Children reflect on what they have learned and how they can reuse it with other operations.

In the example given, children were guided and supported in the co-construction of new knowledge anchored in prior knowledge, which is the identification of a method for solving addition with fingers with numbers whose sum reaches up to 20. The teacher assessed the pair's work during learning without formalising it, taking notes of evidence and feedback provided to each couple to document each student's progress. Indeed, the learning plan allowed children's thoughts and their progress in acquiring a new strategy to be visible without the need to schedule a written test. The teacher helped the children self-assess their solutions in terms of effectiveness and efficiency, supporting each one's work with the feedback needed to understand the strengths and weaknesses of each proposal (see the paragraph "Purposes" for a better understanding of how inclusion can be supported). It is a clear example of formative assessment with the twofold purpose of assessment for learning (AfL) and assessment as learning (AsL). Indeed, the teacher used feedback and ongoing support to provide clear direction for students' learning improvement (AfL). At the same

time, she helped students develop and master thinking skills (AaL) to reflect on the task and solutions.

Dr. Alessandra Imperio, Free University of Bozen-Bolzano, Italy

Initial questions

In this chapter you will find the answers to the following questions:

1. WHY do we do assessments?
2. WHEN should assessment take place in the learning process?
3. HOW are assessment processes generally structured?
4. WHAT are the possible focuses of assessment in education?
5. WHO should be involved in the assessment processes?

Introduction to Topic

The chapter maps out different aspects and concerns of assessment in education. However, it does not claim to cover all the issues that such a complex topic can address but only offers insights from where to start and which need further study. We highlight five areas of interest: First, we distinguish three distinct purposes of assessment (as, for, and of learning). Secondly, assessment can occur at different learning moments (before, during, and after learning). Thirdly, assessment processes are to be divided into three key steps (strategies, criteria, and outcome). Furthermore, it is essential to line out the overall focus of the assessment (competencies, environment, and capabilities) and to consider the various actors that can be involved in assessment processes (teachers, parents, students, peers, and other "experts"). We portray some of the most essential aspects, inherent questions, concerns, and potential within each area. By doing this, we conclude by elaborating on the role of inclusion in every subsection of the assessment process.

Building upon an example from teachers' practice and experience with assessment, we will describe inherent challenges and risks that must be addressed as a crucial part of ethical considerations. Initial questions will then guide the structure of the chapter.

Following the introduction of the topic, critical areas of assessment in education will be presented in detail. We will conclude the chapter by suggesting some closing questions for further discussion.

Ethical considerations

Ethical considerations must be addressed when elaborating on educational assessment. The following subsections outline the specific potential of formative assessment strategies for inclusive contexts, difficulties, dilemmas, and challenges. These must not be neglected but critically and carefully examined. First, it is crucial to keep in mind the societal system that schools are part of. Schools follow allocative functions within a society where performance and achievements are of great importance, like in meritocracy (Trautmann & Wischer, 2011). Therefore, schools significantly impact the social placement of learners in the greater society (University of Minnesota Libraries Publishing 2010: 602). In practice, the social order of individuals is influenced in some countries by the division of pupils among different types of schools and by the distribution of differently valued school degrees. These practices within the school system led to unequal opportunities in a meritocratic society. Even though these aspects counteract the overarching aim of community and school for all, they must be considered pre-conditions framing the topic of assessment in education.

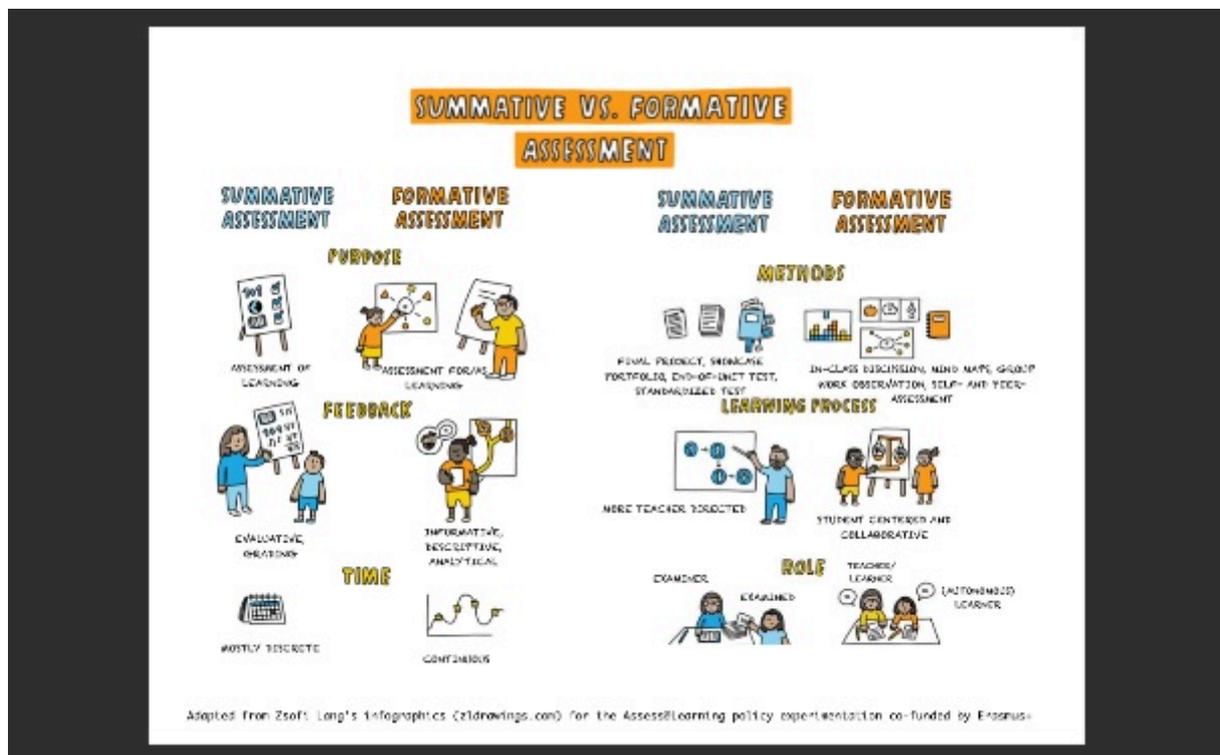
   In addition, questions on the fundamental aim and necessity of assessment and education arise within ethical considerations regarding assessment in education. Possible underlying and relevant questions in this context are, for example: 'Why do we do an assessment?', 'What is learning, education, and development?', 'How can we measure learning and development?', 'What role does assessment have in education?' While some of these questions are tackled more directly in the following subchapters, others can be understood as questions for (self-)reflection, and discussion and their careful consideration may promote more equality and justice within the field of educational assessment.

Assessment – What are we talking about?

Assessment is a contested and highly debated field, especially regarding inclusive education. To provide a comprehensive overview of related terms, concepts, and assumptions, it is first necessary to focus on the concept's meaning and distinguish it from other associated words like diagnostics and evaluation. On the one hand, following Ingenkamp & Lissmann (2005), educational diagnostic aims to identify individual pre-conditions and learning processes through diverse diagnostic activities to optimise individual learning. On the other hand, depending on the source, assessment and evaluation can be treated as synonyms or as distinct concepts (Apple, Ellis & Hintze, 2016; Hus & Matjašič, 2017). We understand evaluation in education as the "process used for judging quality" (Apple, 1991, as cited in Apple, Ellis & Hintze, 2016: 53) which determines the extent

to which goals have been achieved based on a standard (Apple, Ellis & Hintze, 2016; Surbhi, 2017).

Assessment, instead, can be described as "the process of finding and interpreting evidence to be used by learners and teachers to enable them to establish exactly where the learners are in their learning, where they have to focus, and what is the best way to get there" (Hus & Matjašič, 2017). Thus, assessment is process-oriented as it is based on continuous observations to provide feedback and identify areas of improvement, while evaluation is more product/outcome-oriented, for example, success and failure (Apple, Ellis, & Hintze, 2016; Surbhi, 2017). Therefore, even if the main focus of this chapter is the assessment, while talking about assessment these conceptual constructs (evaluation, diagnostics) are alsotaken into account. Furthermore, assessment can in general take place at an individual, classroom, school, regional, or even internal level; this chapter however mainly concentrates on the individual and classroom perspective.

Building upon these considerations, two main types of assessment can be differentiated: summative and formative assessment. While summative assessment mainly serves "the purposes of accountability, ranking, or certifying competence by the judgement of students' achievement" (Schellekens et al., 2021: 1), formative assessment primarily "supports and improves students' learning" (Schellekens et al., 2021: 1). Therefore, especially formative assessment is of great relevance for inclusive education and education for all. The formative role of assessment supports overcoming comparative and stigmatising perspectives on the students and thus has the potential to enable a more inclusive assessment. The picture below summarises the main differences between them.


Key aspects

Purposes − WHY do we do assessments?

As suggested by Earl and colleagues (2006), the first question a teacher should ask himself/herself is not "how do I assess?" but "why do I want to assess, or do I need to assess?" Therefore, this means identifying the purpose of assessment since this has several implications: the role played by teachers and students, the teaching-learning process, and the choice of assessment methods. All these mentioned aspects are directly related to the <u>Teacher Habitus</u>. Three distinct but interrelated purposes of assessment are highlighted in the literature: Assessment OF Learning (AoL), Assessment FOR Learning (AfL), and Assessment AS Learning (AsL). There are several definitions of the three, and, more generally, each purpose simply corresponds to a type of approach to assessment (Schellekens et al., 2021). For teachers, it might be more practicable to reflect on the three as purposes in order to guide their actions and consequently, their approach to assessment. Arguably, following this route is easier to handle the many definitions and nuances in the literature. Moreover, by thinking of them as purposes, it is relevant to be aware that it is difficult to fulfil the three purposes at the same time; however, it is valuable to know them and to recognise the need to find the right balance between them (Earl et al., 2006). The following information on the assessment of/for/as learning is a brief compilation that has considered some of the existing resources in the literature (Alberta Education, 2003; Earl et al., 2006; Harapnuik, 2020; Schellekens et al., 2021).

Assessment OF *Learning*

AoL is the best-known purpose of assessment, as it reflects the traditional assessment perspective for most of the 20th century. AoL aims to certify competence or inform parents or other stakeholders about the student's proficiency concerning the learning outcomes of the curriculum. It is a <u>summative assessment</u> in nature, it is formal, and it usually occurs at the end of a training or a learning unit. It consists of collecting information on what extent students can apply knowledge, skills, and attitudes against a standard. There are many methods to collect this information, but they are not exclusive to this assessment purpose. For instance, they can be tests, presentations, or other written, oral, or visual methods. The assessment finishes with the assignment of a mark or comment on the product or performance. The role of the teacher is to grade achievement by considering students' products and processes and reporting this information. Usually, the teacher's grade or comment is used as an indicator of the student's level of success.

Assessment FOR *Learning*

When the purpose is to improve learning, it is called AfL. It is a <u>formative assessment</u> and is an integral part of the learning process. Thus, it is an ongoing process involving formal and informal assessment activities designed to modify teaching according to students' needs and to provide students with specific feedback that they can use to improve learning.

Therefore, to adjust and target teaching planning to move students' learning forward through precise feedback, it becomes necessary to make student learning visible. The main elements are descriptive feedback, as an example of what good work looks like, ongoing support, and peer collaboration. Feedback provides clear direction for improvement but also recognition of achievement. For gathering pieces of evidence, focused observation, videotapes, or audiotapes may be helpful; several strategies and methods can also be employed to make learning visible, including Cooperative learningactivities. Teachers and peers play s central role in this.

Assessment AS *Learning*

Finally, when the assessment aims to give opportunities to students to critically reflect on their work, to understand how to independently pursue their acquirements or, in other words, to promote deeper learning, develop metacognitive strategies and learn how to learn, in that case, we are talking about AaL. AaL is also considered a formative assessment. Students use formal and informal feedback and self-assessment to figure out how to continue learning. Since it is a reflective process, it should take place continuously. There are many methods for students to reflect on their learning, such as criteria, rubrics, and checklists. This approach to assessment involves each student and their peers. In this case, the teacher's role is to help students develop, master, and feel comfortable with these metacognitive strategies.

How can these assessment purposes sustain inclusion?

We can plan and employ inclusive assessment strategies with all three assessment approaches. In the case of AoL, assessment can be inclusive, for instance when you allow each student to decide in which form they want to show and make their learning visible. For example, a student can choose to show his/her learning in a written, oral, visual, or dramatic form. AfL might be more inclusive if the feedback is provided to each student individually or in a group since it is individualised for everybody in the class. Each student or group may receive specific material and guidance they need to progress. Finally, AaL gives you the foundation to be inclusive since students develop metacognitive skills that can help them become creators of their learning, with their own times and individual strengths.

Moments – WHEN should assessment take place in the learning process?

Time management is one of the most important things to remember when it comes to formative assessment. As the French pedagogist Philippe Perrenoud reminds us, we cannot introduce formative assessment in schools without a radical change in traditional educational institutions (Perrenoud, 2005, 1999). In fact, one of the crucial changes in this regard is related to time management. In the assessment process, we can identify three central moments in which assessment can take place: "before," "during," and "after" the learning process. How we give meaning to these three steps is different for each teacher and reveals the reasons why we decide to conduct an assessment and, more generally,

why we teach. We can see the initial phase as a diagnostic phase, in which the teacher considers the level reached by the pupils and their needs. However, analysing needs as a diagnosis carries a risk: privileging the selective dimension of evaluation over the formative one, thus limiting oneself to giving a static interpretation of a given moment. We must encourage a dynamic and open understanding of the processes that take place within the classroom and are in constant flux. In this phase, the assessment process must establish the learning objectives and the criteria for success (Black and Wiliam, 1998). If we do not establish criteria, students are disoriented and do not understand what they can gain from this learning experience. Furthermore, the "before" phase is also the planning phase, which is also the phase we should refer to at the end of the learning process. The planning phase is not a simple conception of activities but aims to identify the final goals and the means we can use to achieve them. Planning is always a contextualised phenomenon in the classroom and, therefore, always starts from the needs of each student. It is not something implicit, and it is not something clear only from the teacher's perspective. Still, it must be as explicit as possible to communicate to the pupils where they are in their learning journey and what gap separates them from the point they want to reach. Furthermore, the design must be open to new contributions and possible modifications throughout the school year. Finally, assessing is for learning and creating new learning opportunities. Therefore, the teacher must learn from the assessment journey and return to the planning to understand its possible developments and improvements. The 'before' phase is also a time when teamwork can take place (Teamwork in the classroom). Teachers at this stage can share their views on the planning and the objectives. In this sense, the possibility of having an interdisciplinary perspective is valuable for all those involved in the evaluation process. From an AaL perspective (@Purposes), for students, the "before" phase may represent an occasion to conduct self-assessment to better understand the level of knowledge already possessed when fragments of memory are collected and organised. They will eventually anchor this knowledge to the one they already acquired.

The "during" phase is the part of conducting activities, the stage in which pupils play an active role that can provide the teacher with an opportunity to gather evidence (Carr, 2012, 2001; Giudici & Rinaldi, 2011). It is not enough to have strong listening or observational skills, and the teacher must no longer be the leading actor in what happens within the classroom. If we want to gather evidence about what our pupils can do, it is first necessary to allow them to act freely. Celestìn Freinet (as cited in Bottero, 2021) reminds us that everybody wants to be allowed to choose their work freely, even if such a choice sometimes is not convenient. Leaving pupils free to choose allows them to discover more about their tastes, inclinations, and needs. At this stage, it is essential to rethink the value of observation and documentation. These tools allow teachers to gather evidence in a completely different way from a simple test or homework assignment. To observe, the teacher must ensure that the pupil can act freely without depending on the adult's guidance. However, there is a second aspect that we must bear in mind when we speak of observation

and documentation, namely the fact that it is impossible to observe and, therefore, document everything that takes place within the classroom. It is, therefore, necessary to have already prepared the time and way to conduct the observation in the planning phase.

The most characteristic phase to consider when reflecting on different moments is what we refer to as the "after." There are several possible "after" types: we can mean the end of a unit of learning, the end of a school year, or the end of a study cycle. By and large, only if assessment becomes a tool that follows the student even after the learning journey can we call it formative. A purely summative assessment usually ends with the final return of the test result. In contrast, a practical formative assessment should pose as a continuous process that allows students to find in the assessment a functional element for any other future learning. In this sense, all learning never ends in itself but stimulates the search for new horizons of growth. One example of the "after" phase can be the simple use of the "ticket to leave" teaching strategy. It can reinforce new knowledge, provide a time for reflection, and/or allow the teacher to evaluate what students will take home. It will help the teacher decide whether to dwell on the topic further. Before students leave, they hand in a "ticket" with an answer to a question about what they learned (for example, what do you think you learned today? Do you have a question to ask about something you didn't understand?) The exit tickets help you plan the next lesson or unit of learning.

How can these assessment moments sustain inclusion?

Of the three stages reported here, the last one, the after moment, is the one that would be most appropriate to look at from an inclusive perspective. On the one hand, this perspective allows teachers to look beyond the hindrances or difficulties encountered by pupils with special educational needs; on the other hand, it allows them to reconsider learning objectives from the student's own needs   (Lepri, 2021). The idea of adopting a long-range evaluative perspective that looks at students' personal futures and their need for self-determination is an essential step if we are to ensure that schools truly help each student cultivate his or her potential. From this perspective, any assessment that claims to be formative must necessarily take time, seeking to understand learning processes in their complexity   (Vertecchi & Bonazza, 2022).

Structure – HOW are assessment processes generally structured?

Even though assessment processes can have many different focuses and approaches, it can be noted that there is an overall structure of assessment that tends to stay the same: We apply certain *categories*, use certain *strategies*, and aim for a certain *outcome* of an assessment. These structural aspects of assessment are not only the same for educational assessment processes but can also be found in other disciplines that work with assessment, for example, in health care, medicine, and psychology (Madden et al., 2007; Schliehe & Ewert, 2013; World Health Organization, 2021). In the following, an overview of categories, strategies, and outcomes of assessment in education is provided. Within each

of these aspects, a huge variety of embodiments that consequently lead to different kinds of assessment can be identified. The chapter aims at giving an overview of educational assessment by presenting how an inclusive structure of assessment could look like in theory and practice.

Categories of Assessment

Firstly, categories are one of the main issues of assessment processes. As the use of categories raises many concerns "such as stigmatisation, peer rejection, and lowered self-evaluation [as well as] […] problems of reliability and validity" (Florian et al., 2006: 37), a careful reflection of this aspect is important. Despite these concerns, it must be noted that categories are necessary for thinking, in general, and assessment, in particular (Katzenbach, 2015). With regard to assessment "systems of classification [thus] remain an important way of organising information so that it can be passed to others, and they provide a framework to guide intervention" (Florian et al., 2006: 37).

Therefore, especially in assessment, categories that suitably describe what has been or what will be assessed are necessary. The suitability of these categories, nevertheless, can vary in many ways. On the one hand, *categories of assessment can be standardised, pre-defined*, and for example, based on curricula or certain diagnostic tests. These types of categories can therefore be considered deductive categories, as they arise from theories or specific category systems, for example, ICD or ICF of the World Health Organization 2001, 2005. Deductive categories, in general, promise somewhat higher comparability as the same set of categories is used in different contexts and assessment processes. Hence, they are, for instance, used to justify the allocation of resources (Florian et al., 2006: 39). On the other hand, inductive categories can also be used. These kinds of *categories of assessment arise during the assessment process* and teachers, as well as students, can be creators of these categories. Consequently, their experiences and practices have a direct impact on the development of these kinds of categories. Therefore, inductive categories might generally be considered to be more accurate and precise, but at the same time, their specificity and individuality might complicate comparability.

With regard to *categories for inclusive assessment*, a critical examination of enabling and stigmatising effects thus is crucial (Florian et al., 2006: 39). While there are deductive criteria like those from the ICF (World Health Organization, 2005) that can contribute to inclusive assessment, other deductive criteria that focus on disabilities, for example ICD (World Health Organization, 2001) tend not to support this perspective. However, inductively generated criteria can support inclusive approaches as they are developed very flexibly, individually, and are practice-based. Nevertheless, this kind of category tends to bear the risk of overseeing aspects that are not at the centre of attention and generating new, possibly stigmatising criteria.

Overall, it is possible to assess development and learning with a variety of open, flexible, and inductively generated criteria as well as with pre-fixed, theory-based, and deductively generated criteria. While all these options go along with certain advantages and

consequences, it is particularly important to keep the inevitable risk of categories in general in mind (Florian et al., 2006). As Boger (2017) points out, inclusion can always only fulfil two of the three basic propositions that are crucial for inclusion: empowerment, normalisation, and deconstruction. Following this, empowerment and normalisation are impossible when not using some kind of category (Boger, 2017). And as long ascategories are in place, there is a risk that they are used in discrediting ways (Katzenbach, 2015). In order to prevent and counteract stigmatisation, this risk must be considered when using standardised as well as more open categories.

Strategies of Assessment

In addition to the critical examination of appropriate and meaningful assessment categories, also a reflection on the suitability of possible tools of assessment, respectively assessment strategies are crucial. Within assessment strategies, we can broadly distinguish between two modes. Firstly, strategies of assessment can be designed in a *rather obvious and standardised* way and for instance rely on (multiple-choice) tests, quizzes, dictations, and examinations (Schäfer & Rittmeyer, 2015). Secondly, strategies of assessment can also be *rather open and flexible* and thus rely on the collection of evidence during the learning process for making learning visible (Mughini, Panzavolta, 2020). Materials such as students' drawings, texts, or classroom observations could thus be of interest (Earl & Katz 2006: 17). Moreover, materials that develop in the contexts of students' demonstrations, discussions, projects (ibid.), Inclusive Play, or on the basis of (Digital) media & materials for learning can be included in the assessment process. This way, learning and assessment processes take place simultaneously, as promoted by the formative assessment perspective.

In the light of *inclusive assessment strategies*, many of the before-mentioned forms are generally conceivable and verifiable if connected to suitable categories and outcomes of the assessment. While some situations, contexts, or needs might give valuable reasons to use standardised assessment strategies (for example, for official documentation or resource allocation), assessment strategies that are more flexible and student-oriented can especially be considered important for inclusive settings, as they provide very individual information on the student. Even though rather open approaches and inductive analyses might not withstand the quality criteria of standardised tests, they are of high relevance for inclusive assessment as they enable the collection of rich qualitative data on the student's learning and development process. The flexible and reflected use of assessment strategies in light of the particular situation and aim of the assessment is thus necessary to gain deep and meaningful insights and conduct a suitable assessment, or as Bourke and Mentis (2014: 395) state: "Ultimately, teachers' choices about the assessment practices they use for learners […] reflect their views about teaching, assessment, and learning and must therefore be both a conscious and informed decision, while weighing up ethical dilemmas that arise."

Outcome of Assessment

The third aspect that must be highlighted when elaborating on the assessment structure is the outcome of the assessment. The main focus that is generally put on assessment outcomes is *feed-back*. Feedback is a crucial part of the process, as it provides an overview and insight into what has been done and what has been reached in the past process. Therefore, written and oral feedback, structured and semi-structured, as well as standardised and open feedback, can be used (Bastian et al., 2018; Halverson, 2010; Ibrahim et al., 2021). Very common assessment outcomes are marks and grades, whereas learning reports and other more open feedback formats are still used but these are used primarily in lower grades. In this respect, it is interesting to look at a specific case.

As of the school year 2020-2021, the Italian Ministry of Education has proposed a new, more formative-oriented mode of assessment in the final report. Instead of numerical grades, so-called 'descriptive judgments' have been introduced, which require the teacher to ask about four dimensions relating to achieving the set goals. These are the continuity with which learning occurs, the autonomy with which it is conducted, the type of resources the pupil uses spontaneously, and whether the learning situation was previously known or unknown. This tool allows pupils to reflect much more deeply on their learning-to-learn competence, enhancing metacognitive processes in a formative perspective.

In light of inclusion, feedback should provide a resource-oriented perspective with detailed information about the learning process, and achievements (Brooks et al., 2019). While feedback is a crucial part of the assessment process, one outcome that is often neglected is a form of *feed-forward*. Feedforward can be understood as the outcome of assessment contributing to the improvement of the situation that has been found in the past assessment process (Brooks et al., 2019:10). In order to promote the learning and development of students, feedforward thus plays a key role. It provides information about possible next learning steps and related ideas, adaptions, and interventions that could be considered to improve students' learning and development. In this way, a feedforward can help to shift the view from the past and the question of 'what has been reached or done?' to the future and the question of 'what could be reached or done?'

In order to develop *inclusive assessment outcomes*, it is generally important to not only provide meaningful feed-back but also feed-forward, as "the provision of feedback is no guarantee of it being used" (Brooks et al., 2019: 7). Therefore, the outcome of the assessment can be considered the most supportive for inclusive education if it is process-oriented and provides information that can be considered for the arrangement of future learning and development processes and thus promote learning (Brooks et al., 2019). Moreover, it is necessary to reflect on the question of to whom feed-back and feed-forward are addressed? The shape and content of the outcome must be aligned with the expected recipients in order to fulfil the aims that were fixed in advance. Building on that, the outcome should provide meaningful information for the involved actors on how future learning processes could be designed and what adaptations and changes can be done.

How can this assessment structure sustain inclusion?

With regard to an *inclusive structure of assessment*, it is necessary to carefully consider the inclusivity and suitability of all three before-mentioned aspects: categories, strategies, and outcomes must correspond with the addressed student(s) (for example, Relationships, Sex/Gender, interests, needs, prior knowledge,…), the situation, and the aim of the assessment. Only if all three structural aspects are extensively elaborated and mutually consistent, can assessment promote learning and thus can be considered as inclusive and wholesome.

Focus – WHAT are the possible focusses of assessment in education?

One of the main aspects to consider is, "what do we want to assess?" This is usually competencies. Competencies involve the individual in a holistic perspective and are related to skills and abilities; these three help convey a broad idea of what a student can do to activate cognitive, meta-cognitive, emotional, social, and physical processes. Precisely because of its multifaceted nature, we can only observe the manifestation of competence when the student is in action and is enabled to act and mobilise different types of personal resources (for example, knowledge, skills, and attitudes). Moreover, competence is not reducible to an abstract concept but is always related to specific social, cultural, and operational contexts. Content knowledge accounts for only a tiny part of these processes, but it is often the element teachers promoting purely summative assessment tend to value most. Conversely, students should be able to understand their strengths and weaknesses, be encouraged to act autonomously, and face new challenges and unknown problematic situations, which means to "know what to do when you don't know what to do" (Claxton, 1998). However, we cannot limit ourselves to considering skills and competencies as the sole object of evaluation. The quality of the learning environment must be kept in mind when we look at all the potential inherent to the learning process. If it does not guarantee the student the fundamental elements for their development and growth, we must reflect on this aspect and try to change the learning situation. There are no neutral choices in education. To take care of the learning environment means reflecting on how students are enabled and supported to interact with each other, how free they are to explore the school environment and how they can be open to new knowledge and modes of exploration. Assessing a student without considering the potential offered by the learning environment and the obstacles it may pose does not help us fully understand the resources available to our students.

Now, let's take a step back and ask ourselves for which purposes we assess. Undoubtedly, one of the main tasks of the school should be to help students discover their interests and passions. However, the possibility of making such a discovery should not be taken for granted. Although a student may have an idea of what they like as early as primary school, it may not necessarily manifest itself. Often, a child needs a long time to explore the world around them to understand what they like. The assessment process plays an

essential role in this possibility of discovery and can inhibit or facilitate the exploration of yet unfamiliar activities and contexts. Self-assessment is a tool for students to gain critical awareness in this regard. To this end, we may use the so-called narrative assessment. This tool allows the pupils to recount what they consider to be the strengths and weaknesses of something they have experienced. Finally, it is possible to see the focus on the learning environment and the competencies in a new light, which is the development of capabilities. When we think about assessment, we must also ask ourselves what our pupils are capable of being and doing. This perspective would be helpful in considering well-being, happiness, and self-realisation as possibly essential acquisitions of the whole assessment process. Capabilities are the most important opportunities the learning context offers the students to start realising a kind of life they have reason to value. Assessment could be a powerful leverage to help them understand such opportunities' existence and potential.

How can these assessment focuses sustain inclusion?

From the perspective of inclusive pedagogy, the development of capabilities provides for greater involvement of students' voice to achieve personalised learning objectives. We should not forget that assessment on the one hand determines the balance of power in the teaching-learning process and, on the other hand, establishes what is important within it, giving relevance to one learning content over another (Cottini, 2021). Giving voice to the aspirations, goals, and life plans of students with special educational needs means recognising the pluralism of values that should be an indispensable element of democratic learning. It also means, above all, recognising people with their emotional and existential experience, truly making room for diversity.

Actors – WHO should be involved in the assessment processes?

Last but not least, the question to be tackled in this context is about who is and who should be involved in the assessment processes? As assessment processes are very complex, numerous actors may be involved. In particular, it is important to keep in mind that it is not only about who is contributing to the assessment and considered to have valuable information but also about who is being assessed. In order to line out more clearly which actors could, and possibly should, be involved in the different stages of assessment processes, the following subsections address this question in more detail.

Students

The first group of actors that must be considered in the assessment process is students. Especially in light of inclusive assessment, it is necessary to focus on all instead of focusing on some students (Florian & Black-Hawkins, 2011). Every student brings particular competencies, interests, capabilities, and needs towards their environment to the classroom. In order to address this diversity (for example, language, Sex/Gender education), and enable active and meaningful participation of all, it is necessary to consider each student. Therefore, group assessment, as well as self-assessment strategies, can

be valuable. Students thus must not only be considered as the centre of assessment but also as valuable actors in assessment (@assessment as learning). According to the Social Childhood Studies paradigm, children take on the role of expert actors and main informants in their own lives and for this reason, they should be consulted and involved in decision-making processes that affect them (Kampmann, 2014; Levin, 2013; Melton et al., 2014). This paradigmatic shift through students' voices and active participation can also have interesting implications in assessment practices. Alongside, in the case of students in higher grades and school orders, according to the Student Voice Movement (Grion & Cook-Sather, 2013), it is about empowering them to have a voice in the life contexts they experience. Active involvement and participation of children and teenagers in assessment practices can be realised not only in assessment and peer assessment activities, indeed, just students can, for example, co-construct checklists, assessment rubrics and, more generally, define assessment criteria with their teachers (or independently) (Grion, 2014; categories of assessment). They can also choose how to demonstrate learning and thus have a voice in the choice of the assessment tool (strategies of assessment). A helpful tool for stimulating pupil participation is what Celestin Freinet (Bottero, 2021) called *brevet* (patents), a term he took from the scout movement founded by Baden-Powell. It is a kind of certificate of acquisition of a skill or competence that the pupil demonstrates having acquired following a specific performance and comparison with the class group. The pupils freely choose when to try to achieve such recognition based on what they feel they have learned so far. This free choice allows pupils to gain an essential awareness of what they can do, or not, by facilitating the self-assessment process.

Teachers

In addition to the students, another critical role is played by teachers. Teachers interact with their students on a daily basisand have an immense impact on their students' learning and development process. Therefore, their role in the assessment process is also crucial. All teachers should be considered here: class teachers, subject teachers and special educators.Depending on the aim and context of the assessment, it can be helpful and reasonable to involve only specific teachers, for instance, certain subject teachers or a wider group of teachers and educators (Galloway et al., 2013). In order to gain a broad overview of possible restraining factors and barriers for learners, and obtain a more holistic view of the situation, consultation and involvement of a wide range of (pedagogical) actors is often necessary. Therefore, also a reflected decision on Strategies of Assessment is crucial, and especially with regard to Relationships and Teamwork in the classroom, the inclusion of perspectives of different educators can be helpful.

Moreover, teachers' self-reflection and habitus (see Teacher Habitus) play a crucial role in assessment. Teachers, but also other actors that are involved in the assessment processes inevitably maintain certain presumptions or even biases that, as a consequence, can affect the assessment, if it is not critically examined and reflected upon. In addition, also trust between the different actors plays a crucial role in assessment processes. Teachers

especially are thus asked to establish a mutual and trustworthy relationship among the involved actors. Another aspect to be considered here, is the possibility to assess teachers from the perspective of students, parents, and legal guardians. While teachers mostly are in the role of assessing students, it is thus also possible to assess the teachers' work. This is especially of high importance, as teachers' ability to provide meaningful learning opportunities has a great impact on the student's learning and development process and thus should also be assessed. In particular, it must be borne in mind that if an assessment is indeed formative, then the responsibility for a negative outcome of the teaching-learning process no longer lies with the students. In an effectively formative perspective, those who must question their choices and ask why students did not achieve the desired results therefore are the teachers. Accordingly, teachers should rethink their design choices and improve the learning environment for their students' learning in the future.

Parents & Legal Guardians

Another important role in the assessment process is played by parents, caregivers, and legal guardians. These actors often have another and very important perspective on the childs' competencies, interests, capabilities, and needs towards the environment. As parents and legal guardians mostly interact with the child in situations and ways that are to a great extent contrasting to the teacher's perspective, their knowledge and opinion are highly valuable for the assessment process and for a wholesome comprehension of the situation (Bastian et al., 2018; Galloway et al., 2013). Therefore, it is necessary not only to involve parents and legal guardians in the assessment, but to carefully pay attention to their views and experiences, to involve them equally, and to ensure favourable communication. A careful consideration of eligible Strategies of Assessment, and Outcomes of Assessment, therefore, are necessary to ensure good and purposeful cooperation.

Other "Experts"

In addition to the aforementioned groups of actors, also other "experts" can be involved in the assessment. The involvement often not only depends on regional or national rules and regulations for educational assessment, but also on the specific case, situation, and aim of the particular assessment (Galloway et al., 2013). Actors that are frequently considered experts for assessment processes are, for example, medical doctors, psychologists, social workers, and youth welfare workers but also health care workers, teaching assistants, and physiotherapists can and are valuable contributors to assessment. The benefit of contributions of the different kinds of other experts must be carefully reflected upon in order to include all views and opinions that are necessary to enable a comprehensive and meaningful assessment process.

How can these actors sustain inclusion?

With regard to *actors of inclusive assessment*, equal involvement and careful consideration of diverse groups must be stressed. Therefore, it is essential to pay attention to different perspectives and experiences that are in place and to enable communication and decision-making. This is especially crucial for the involvement of students and peers,

as well as of parents and legal guardians, as their experiences are often not considered and valued enough in assessment processes. Moreover, it is necessary to keep in mind that the described actors are not only part of the assessment process but also of the learning and development processes that precede and follow. Careful consideration of the actors' different positions, contributions, and demands thus is important in all steps of learning and assessment.

Closing questions to discuss or tasks

While the chapter on assessment certainly provides a broad overview of the topic and outlines key aspects that must be considered, the flexible and reflected use of assessment in light of the particular situation and aim of the assessment is thus necessary to gain deep and meaningful insights and conduct suitable assessments in specific situations. In order to support this reflective process we provide questions for discussion and reflection that can be addressed individually or as a team. The questions tackle the various aspects that were mentioned in the previous sections and help teachers to develop specific assessment strategies for practical use in their everyday practice.

WHY: Why do we do assessment?

- Why do I want/need to assess?
- May I fulfil a summative and a formative assessment at the same time?
- How can I make assessment of learning inclusive and fair?
- How can I make assessment for learning inclusive and fair?
- How can I make assessment as learning inclusive and fair?
- Which of the three purposes/approaches to assessment should be pursued most? For what reason?

WHEN: When should assessment take place in the learning process?

- What happens before the assessment?

- What happens during the assessment?
- What happens after the assessment?
- Which role does planning play in the different phases of the assessment process?

HOW: How are assessment processes generally structured?

- Do I have a clear and well-founded aim and focus of assessment and what is it?
- Should I work with inductively or deductively generated categories and why so?
- Which categories can I use and what are possible risks and side-effects?
- Which strategies and tools of assessment can I use to gain deep and holistic insights?
- How do the assessment strategies compliment or overlap with one another?
- Is the outcome of assessment a feedback, a feedforward or both?
- What outcome is necessary to improve the student's situation?
- Which categories, strategies, and outcomes are necessary to reach the pre-defined aim of the assessment?

WHAT: What are possible focuses of assessment in education?

- Which role do competencies, abilities, and knowledge play in the assessment process?
- Why is it important to consider hindrances and opportunities related to the classroom environment?
- How can the interests of every single student be better involved in the assessment?
- What kind of contribution could a capability-based perspective offer to the assessment process?

WHO: Who should be involved in the assessment processes?

- Who or what is in the centre of assessment / who or what is assessed?
- Which actors can contribute valuable information to the assessment?
- How can I establish a trustful atmosphere with all the involved actors?
- Are all necessary perspectives considered or did I inadvertently omit something or someone?

Moreover, it might also be interesting to reflect on or discuss the following questions that were posed at the beginning of the chapter:

- What are learning, education, and development?
- How can we measure learning and development?
- What role does assessment have in education?

Overall, careful consideration of all the above-mentioned questions is necessary to ensure and strengthen equality and justice within the field of educational assessment.

About the authors

Eva Kleinlein

Eva Kleinlein is a university assistant and PhD student at the Centre for Teacher Education at the University of Vienna, Austria. In her research and her work she mainly focuses on inclusive education in an international comparative / transcultural perspective. Moreover, she is engaged in topics such as inclusive assessment, digital methods in qualitative research, inclusive teaching practices, and teacher diversity.

Valerio Rigo

Valerio Rigo is a PhD student at the Free University of Bozen/Bolzano and works on formative assessment from the perspective of the capability approach. He has a master's degree in philosophy and a second master's degree in education. He is coordinator of the Evaluation Team of the Movimento di Cooperazione Educativa (MCE, a movement inspired by the pedagogy of Célestin Frenet).

Alessandra Imperio

Alessandra Imperio has a Ph.D. in General Pedagogy, Social Pedagogy, General Didactics, and Disciplinary Didactics. She has been a primary school teacher for about 18 years and is currently a research assistant at the Free University of Bozen-Bolzano, Faculty of Education. Her main research interests are formative and inclusive assessment, pedagogy of the question and dialogic teaching/learning, learning approaches for inclusion, and life skills development.

FORMATIVE ASSESSMENT PUT INTO PRACTICE

Example Case

"Leah has just graduated and is a novice teacher who was given a grade 7 class at the beginning of the year. She has 32 learners in her class, and she is excited to work with her first class. From what she has learned so far, they come from diverse backgrounds with different interests, learning abilities, and needs. Their diversity is not an issue for her as she really wants to accommodate all her learners and create a safe, welcoming, and inclusive learning environment. Leah would like to try more formative assessments to assist her in catering to all her learners, but she has heard from others that it is time-consuming and difficult to execute in larger classes."

Initial questions

In this chapter you will find the answers to the following questions:

- Why should we employ formative assessments in inclusive classrooms?
- How can teachers be encouraged to use formative assessment in their classrooms?
- Can this be done in small steps without disrupting the class?

Introduction to Topic

Leah's perception of formative assessment is similar to that of many teachers, be they novices or more experienced teachers. Formative assessment has been around for as long as summative assessment has and is regarded as essential to education. However, the implementation of formative assessment appears to create "assessment tension" in teachers, according to Chan and Tan (2022). Assessment tension is created when education policies and reforms around formative assessment appear to be "required" of teachers and they may not be ready for these changes. They may also see formative assessment as being time-consuming. In addition, teachers see large classes as a barrier when implementing formative assessment because the perception is that the activities related to formative assessment take even longer with larger classes. So how do we address these perceptions of teachers? According to Widiastuti and colleagues (2020), a positive belief by teachers in formative assessment is the result of having a strong understanding of the benefits of using formative assessment in the classroom. In turn, these beliefs impact the way teachers implement formative assessment and how they make decisions regarding the learning outcomes achieved by learners. Thus, the successful implementation of formative assessment depends on the knowledge and skills teachers have on the topic, their attitudes, and beliefs towards the value of using formative assessment and whether their classroom practices regarding formative assessment enhance the learning outcomes for their learners.

This chapter aims to unpack formative assessment as a concept, delve into five key strategies, and show its connectedness to classroom practices and ideologies that well-trained teachers already believe in. Furthermore, the chapter links these key strategies to success criteria that teachers use in their daily teaching. What makes the chapter distinctive is that it links the success criteria to formative assessment techniques that enhance these criteria. Specifically, each of the five key strategies will highlight a formative assessment technique, discuss how teachers can use it in the classroom practically, and pinpoint pitfalls (if any) that teachers need to note, for example, as related to classroom management. The aim is to demonstrate how teachers' simple adjustments to assessment practices can lead to increased classroom participation, learners who are aware of their learning, and typically a more fun classroom experience for all.

It is believed that when teachers are willing to make changes to their current classroom

practices regarding formative assessment, in small incremental ways, the learning and teaching experience can be enhanced. These small steps for a teacher can lead to greater learning opportunities for their learners and hopefully, encourage the teacher to venture into more complex formative assessment techniques (Yan et al., 2021). The chapter provides several formative techniques for each of the key strategies that range from the simple, quick, and easily implementable to the more complex techniques that may span over a longer time and require more input from both the teachers and learners. In addition, student/future teachers can also make use of the added resources provided at the end of the chapter.

This chapter can be read in conjunction with the chapter, Formative Assessment For-Of Learning (All Means All).

Key aspects

UNPACKING FORMATIVE ASSESSMENT

How do we define formative assessment?

Two evaluation methods that teachers frequently employ to gauge students' understanding of new content and compliance with learning goals are formative (assessment for/as learning) and summative assessment (assessment of learning). While summative assessment uses the information to determine students' knowledge level upon the completion of a learning unit or sequence, formative assessment entails obtaining data to improve students' learning (Dixton & Worell, 2016).

Formative assessment is a continuous, ongoing, and "forming" process that goes alongside teaching. Although there is not a commonly accepted definition in literature, it is widely acknowledged that this type of assessment occurs while teaching and learning are taking place and is considered a crucial component of the instructional process. Interestingly, formative assessment, as mentioned by Dodge (2009), is a part of learning. That is, we cannot regard it as a distinct phase but rather as a key piece of the learning and teaching process.

The main goal of formative assessment is to provide teachers with information on their students' needs and learning progress during the instructional phase. It is a useful feedback source that empowers teachers with data and gives them a clear picture of their students' learning journey toward the achievement of the learning goals. In addition, formative assessment can also provide students with information regarding their work and development throughout the lesson. Formative assessment typically has little to do with assigning grades to students. It aims to identify students' needs in the classroom about the learning goals set by the teacher and the potential areas that need to be improved. Robert Stake's maxim (Figure 1) describes formative assessment as taking place when a

cook tastes the soup and summative assessment when the guests taste the soup. In the first scenario, the objective is to make adjustments while there is still an opportunity to do so, whereas in the second scenario, there is a sense of finality that accompanies the act of judgement (Tomlinson & Moon, 2013).

Figure 1: The difference between formative and summative assessment

1-rmdQussDcqRJohuce5NoRQ.jpeg (558×418) (robmcentarffer.net)

There is a wide repertoire of activities, tasks, tools, and resources that can be used in the classroom to implement formative assessment, including observations, exercises, conversations, visualisations, and so on. In the classroom, two types of formative assessment can be implemented: spontaneous (indirect/informal) and planned (direct/formal) (Dixson & Worrell, 2016). Spontaneous formative assessment typically refers to unplanned, unstructured tasks because they require no dedicated instructional time to compile the data for each student and they provide teachers with information about their students' development. Discussions, body language signs, question-answers during classes, and so on are indicative examples of such tasks. In this way, teachers learn about students' interests, working styles that appear to help some students or hinder others, subjects or abilities in which some students are very proficient, or areas in which some students are lacking and use this information to plan for upcoming lessons. Planned (direct/formal) formative assessment refers to more structured tasks that are designed to provide information about students' comprehension and require sacrificing instructional time for the sole goal of collecting data at the student level (Tomlinson & Moon, 2013). Pretests with paper and pencil, diary entries or writing exercises, quizzes, self and peer assessments, home assignments, and log entries are a few forms of planned assessments.

Formative assessment as an inclusive assessment method

The value of formative assessment in inclusive classrooms cannot be underestimated. Inclusive education aims to ensure equal opportunities for participation in education and learning processes for all students. The primary aim of inclusive pedagogical approaches is to avoid marginalisation in classrooms by applying strategies designed exclusively for specific individual needs (Florian & Beaton, 2018). Using formative assessment strategies provides opportunities whereby students are involved in similar assessment activities which are differentiated for their specific needs. This type of engagement with students can be a driving force to ensure an inclusive learning environment for all students regardless of their diverse needs, levels, and backgrounds.

The question that arises is why employ formative assessment in inclusive classrooms. How can it contribute to inclusion and what can be its impact on teaching in inclusive classrooms? Interestingly, Florian and Beaton (2018) mention that the key assumption for formative assessment is that it supports the engagement of all students in the learning process. In other words, we assume that formative assessment, when used consistently and methodically to enhance all students' learning and understanding, may contribute to inclusion in classrooms by engaging all learners and teachers in the learning process.

Moreover, by engaging all students in the assessment process, teachers can also encourage them to take responsibility for their own learning, feel independent and included, and improve their metacognition skills and their sense of self-efficacy. Formative assessment can promote self-assessment and guide students to self-monitor their own learning and comprehension. Students may feel more involved in the learning process this way. Furthermore, formative assessment can help students demonstrate what they know, and offer their teachers helpful information so that they can tailor the instruction to their needs (Yan et al., 2021).

In addition, as previously mentioned, by using formative assessment, teachers gain valuable information about students' needs and progress to adjust their instruction to their students' needs and leverage their understanding and mastery of the content. This allows them to reflect on their teaching and better organise their instruction to meet the different needs of all students. It is important to highlight at this point that the formative assessment should be aligned with the learning goals to deliver accurate and clear feedback to the engaged learners and teachers. All formative assessment activities and tasks should be designed, pre-organised or spontaneously implemented with the learning goals set regarding the content area of the lesson (Andrade et. al, 2019).

Cizek (2010) provides a list of ten fundamental characteristics of formative assessment that should be considered when designing it.

Formative assessment:

1. Focuses on goals that represent valuable educational outcomes with applicability

beyond the learning context

2. Communicates clear, specific learning goals

3. Provides examples of learning goals, including, when relevant, the specific grading criteria or rubrics that will be used to evaluate the student's work

4. Identifies student's current knowledge/skills and necessary prerequisites for the desired goals

5. Requires development of plans for attaining the desired goals

6. Includes frequent assessment, including self-assessment, peer assessment, and assessment embedded within learning activities

7. Includes feedback that is non-evaluative, specific, timely, related to the learning goals, and provides recommendations to improve

8. Encourages students to self-monitor progress toward the learning goals

9. Promotes metacognition and reflection by students on their work

10. Encourages students to take responsibility for their own learning.

Adapted from Cizek (2010) in Andrade et al. (2019, p. 8)

The aforementioned characteristics illustrate the multifaceted and multi-level opportunities that formative assessment can provide in an inclusive classroom, a classroom that welcomes all students.

HOW CAN WE PUT FORMATIVE ASSESSMENT INTO PRACTICE?

Now that we know what formative assessment is, how do we put it into practice in our classrooms? The next section will provide a step-by-step guide to doing this.

Step 1: Get to know your learners!

All good teaching starts with getting to know your students: knowing about their culture, gender, their well-being, their interests, prior knowledge, language level, organisational skills, the way they learn, etc. Tomlinson (2017) explains these aspects in 3 categories:

1. Pre-assessing student readiness

Readiness is about students' knowledge, understanding, and skills of the content (Santangelo & Tomlinson, 2009). Teachers can learn about students' prior understanding of the content that the following learning goals will build upon via the pre-assessment of student readiness. Leah, in our example case, can assess her students' readiness by asking questions, observing the points they find difficult or easy, conducting pretests using pen and paper, writing prompts or journal entries, interviews like think-aloud sessions, using graphic organisers or concept maps, problem sets among others. By assessing students' readiness, it is possible to spot their misconceptions as well as their knowledge and

skill gaps (Tomlinson & Moon, 2013; Tomlinson, Moon & Imbeau, 2015). Students are not blank slates. They might already have some level of knowledge of the new subject, even though teachers have not taught it to them. Due to this, it would be useful for teachers to discover the topics or skills that some students may have already mastered, or possible misconceptions or learning gaps (Tomlinson & Moon, 2013). Through the assessment of readiness, Leah as a teacher adjusts instruction by designing diverse learning tasks that are adequately challenging for her students' readiness, allowing them to enhance their knowledge, comprehension, and abilities beyond their current comfort zones (Tomlinson & Imbeau, 2010).

In addition to assessing students' readiness to learn new content, a pre-assessment of interests and learning profiles is also important.

2. Pre-assessing for Interests

Students' interests are the topics or processes that provoke curiosity and inspire passion and, thus, promote attention, facilitate motivation, and encourage the involvement of students (Tomlinson & Moon, 2013). In this way, students can connect what is being taught with things they already value. For instance, Leah may choose to differentiate key skills and materials by aligning them with particular students' interests in several areas, such as music, sports, books, films, etc., which in turn affect motivation, creativity, as well as productivity (Tomlinson & Moon, 2013). To make instruction more accessible to more students, it is essential to assess student interest (Tomlinson & Moon, 2013). Leah as a teacher can make several links between the subject matter she teaches and the interests of her students. For instance, math is easily related to architecture, construction, cooking, and video games. Literature's themes are clearly visible in history, current affairs, art, and music. Politics, civic engagement, and international cultures are just a few areas where social science can be related. In this way, teachers improve student motivation, achievement, and the relevance of the curriculum.

3. Pre-assessing for Learning Profiles

A learning profile describes how students learn most effectively (Santangelo & Tomlinson, 2009). Students often have various learning preferences, such as different preferences for learning environments, cognitive styles, intelligence preferences, and group orientation (Tomlinson & McTighe, 2006; Tomlinson & Moon, 2013). In this sense, some students may prefer to interact with groups, the whole class, or work alone; in workspaces that are quiet, or with music playing; and/or workspaces with tables instead of desks (Tomlinson & Moon, 2013). In addition, some students are visual or kinesthetic learners; others are verbal or auditory learners (Santangelo & Tomlinson, 2009); and another group of students might prefer learning through courses that take multiple intelligences into account (Tomlinson & Moon, 2013).

Leah as a teacher must pre-assess her students' readiness, interests, and learning profiles because they make it possible for teachers and students to relate new learning to prior information, individualise learning, remind students of essential skills and knowledge,

and support their metacognition. Teachers also use this information to change the teaching methods, the learning environment, and the assessment procedures.

For further resources on how to pre-assess your learners, see IRIS | Page 3: Know Your Students (vanderbilt.edu)

Also consult the chapter on Differentiation (All Means All)

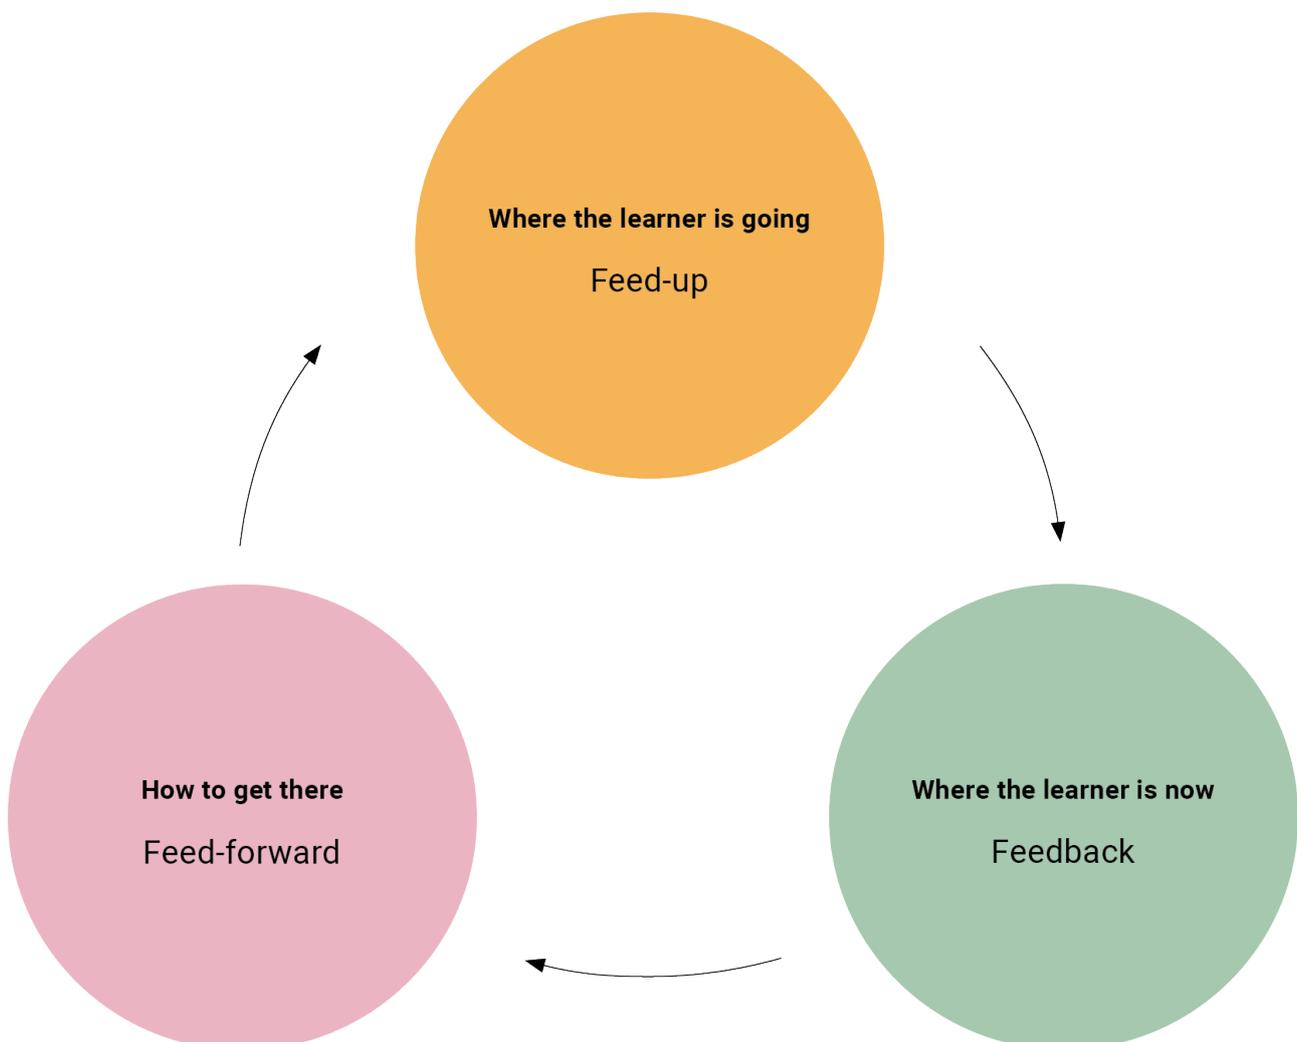
Step 2: Getting to know key formative assessment strategies!

Because every single student has their own individual challenge(s), as teachers we need strategies to assess all students' learning towards the intended learning outcomes in an efficient way. Thanks to Dylan Wiliams' work (2018) and others, we have five key Formative Assessment strategies, addressing the earlier mentioned ten characteristics (See sub-heading, How do we define formative assessment?), which we can use in an inclusive classroom to assess all students' learning. These strategies incorporate the idea that learning is an ongoing, cyclic process, learners working on goals (feed-up), looking at how far they are towards these goals (feedback) and what next activities should be done to make progress (feed-forward) (Hattie & Timperley, 2007).

Figure 2: Formative assessment is one cyclic process with three key questions

Where the learner is going
Feed-up

How to get there
Feed-forward

Where the learner is now
Feedback


Source: Adapted from Sluijsmans, 2020

In general, teachers share learning goals with their learners (feed up) and provide feedback, but sometimes the real feed-forward is missing, implicit, or not clear for learners. However, they should know what to do to successfully complete the task and achieve the learning goal(s). Additionally, when learners are actively involved in this process, it implies that they have more awareness about what and how they learn, which will support their learning. This leads to the five key strategies below, which are all interrelated. Looking at the cyclic character of the five strategies, you can use different techniques in different orders, but keep in mind that the learning intentions and success criteria should always be leading and that your teaching activities and assessment activities are constructively aligned with the intended goals (Biggs, 2006).

Figure 3: Five key strategies of formative assessment

	Where the learner is going	Where the learner is now	How to get the learner there

Student		Activating students as owners of their own learning	

Source: Adapted from Leahy et al. (2005) in Wiliam (2018, p. 52)

Before we dive into practical formative assessment techniques, we will explain the five key formative assessment strategies and how they are interrelated.

Key Strategy 1: Clarifying, sharing, and understanding learning intentions and success criteria – FEED-UP

Without clear learning intentions, where are we heading to? And if we do not know where to go, how should we assess progress? This seems obvious, but very often students do not know why they should learn something, what quality will be expected, or how to get there. Of course, most teachers will share learning objectives at the start of the lesson, but unfortunately, at that moment they might be meaningless for learners.

Think about how and when to share learning intentions and how to relate them to so-called big ideas, referring to real-life issues and addressing students' feelings as well. Separate the learning intentions from the context of the activity in order to work on sustainable goals. Discuss what quality will be expected by working with success criteria, related to the learning intentions: key steps or ingredients to be covered to fulfil the task successfully.

Key Strategy 2: Eliciting evidence of learning – FEEDBACK

At different moments, based on learning intentions and success criteria, you would like to know where all learners are in their learning process. For instance, by checking their prior knowledge, checking the impact of your explanation, or halfway through a task. The challenge is to see in one go where all learners are, what progress all learners made, and to engage all learners. This could be done by engineering effective classroom discussions and making use of all-student response systems, digital or non-digital.

Key Strategy 3: Providing feedback that moves learning forward – FEED-FORWARD

Wiliam (2017) states that feedback should be more work for the recipient than the donor because it should cause thinking and not an emotional response. In addition, that feedback should be a recipe for the future. In other words, get learners to think about how to improve their work. To avoid a lack of motivation, there are some 'rules' to take into account: limit your feedback, be specific in your feed-forward and praise effort rather than ability, and use comments instead of grades. It is not the summative test yet! Do not forget to provide time to work on it, and check any improvements made.

Key Strategy 4: Activating students as learner resources for each other – FEEDBACK/ FEED-FORWARD

As a teacher, you can provide feedback and feed-forward, but for both practical and educational reasons, it makes sense to ask learners to assess their peers' work, to make them feel responsible for their peers' and own learning. Bear in mind, that if learners are not used to this way of working, you should teach them how to do this in a safe manner and to engage all of them. This can be done, for instance, by making use of protocols, marking grids, and structured cooperative learning activities.

Key Strategy 5: Activating students as owners of their own learning – FEEDBACK/ FEED-FORWARD

Self-regulated learning, metacognition, self-efficacy, and agency are fundamental concepts in education. While these terms may seem complex, simple yet effective techniques can help learners articulate their understanding, identify challenges, and express when they require additional support. Establishing these routines within a safe and structured learning

environment creates a foundation for deeper engagement. Once this groundwork is in place, more advanced strategies, such as the use of learning portfolios, can be introduced to further enhance student autonomy and reflective practice.

Step 3: Let's practice formative assessment!

For each key strategy discussed above, we will now:

- List the main success criteria,
- Provide you with several practical techniques you could use,
- Give examples of how to embed it in an inclusive classroom, and
- Address pitfalls you may encounter when using a particular technique and how to cope with these.

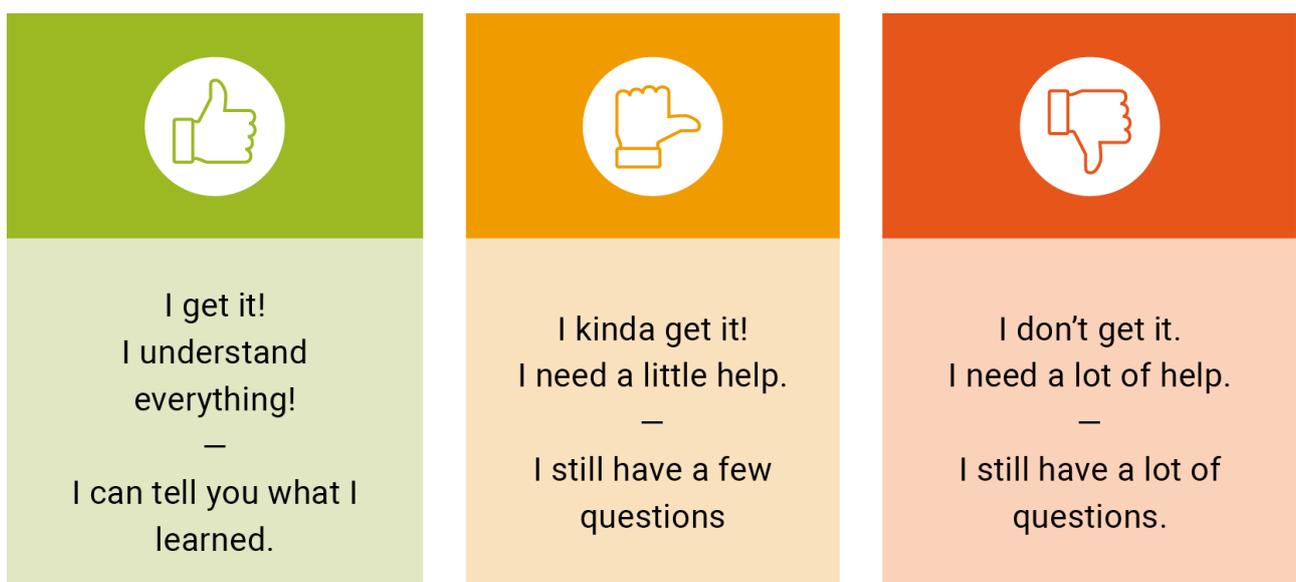
There are a lot of informal techniques you can use in order to check students' progress and provide information about what to teach next. For instance, thumbs up (I understand), sideways (I may have difficulties in some areas), or thumbs down (I do not understand). There are also more formal techniques, which should be planned in advance and take more time, for example, if you ask students to work on a reading log with the use of a template you created (Tomlinson & Moon, 2013). But do not make it too difficult because we know that with simple, small techniques, you can highly impact students' learning and that 'the shorter the assessment-interpretation-action cycle becomes, the greater the impact on student achievement' (Wiliam, 2018, p. 51).

Figure 4: Thumbs check for understanding

I get it!
I understand everything!
—
I can tell you what I learned.

I kinda get it!
I need a little help.
—
I still have a few questions

I don't get it.
I need a lot of help.
—
I still have a lot of questions.

https://www.teacherspayteachers.com/Product/Thumbs-Check-for-Understanding-268414?st=6ae8a472b0edda86d5f57deea54e1c53


All the techniques mentioned can be found on the internet, in Wiliam's work, as well as other sources, see the list at the end of this chapter.

Key Strategy 1: Clarifying, sharing, and understanding learning intentions – FEED UP	
Success criteria: • Discuss learning intentions with learners and be creative about when and how you share them. • Keep the context of learning out of the learning intentions. • Show, if relevant, the 'big picture', the big ideas behind the learning objectives. • Start with different samples of work, rather than rubrics, to communicate quality. • Make use of success criteria: key steps or ingredients students need to fulfil the task and the learning intention	Practical techniques: • Strength and Weaknesses Discussion by comparing and contrasting samples of work from different quality • Showing Model Papers • Ask students to list success criteria based on samples • What Not to Write (what to avoid) • Immediate and Delayed Post-Tests • Daily Sign-In • Ongoing reference to the coverage of the unit of work and the why of it (use pictures, big questions, main concepts, etc.)

Example 1

Leah starts a unit of work about marketing and the role of advertisements. She wants her students to analyse techniques used to seduce people to buy something. Students are tasked to create, in groups of 3-4, a tempting advertisement for a product of their choice.

Instead of immediately sharing the learning intentions and explaining the task, Leah starts off by asking the students which advertisements made them think: 'I would like to have this!' and why. Next, she uses the Strengths and Weaknesses Discussion technique that shows her students four different samples of advertisements and asks all students to think individually about which one is the best. Students are then asked to write down at least two arguments to motivate their choice. After a few minutes, the students are told to pair up and compare and contrast their answers. They then come up with the two most important criteria for tempting advertisements, to be written down on two different Post-its. 32 Post-its are then collected on the wall, and the students are invited to walk around and order the Post-its by looking for the same criteria. This leads to a joint list with four success criteria for a high-quality advertisement, with some help from Leah:

• Visuals are used
• Related to the interests of the target group
• Including a quote you will never forget
• Including funny, unexpected elements

After this activity, Leah shares that this unit is about analysing techniques used to seduce people to buy something and asks why it might be important to be aware of how people are manipulated to buy things.

Reflecting on her teaching activity, Leah is happy with the drafted success criteria, but it took her a long time to find good samples of different quality adverts. Fortunately, next year it will be better because then she could ask students to allow her to show their work, of course, anonymously. She also realised that not all students were engaged in the classroom discussion. Some students were so eager to share their experiences that they started yelling and did not listen to the other students. In addition, some students looked distracted and did not come up with any ideas. Also, the final Post-it activity was a bit messy. These are some of the issues that Leah must keep in mind for a smoother classroom activity next time.

What would you do differently if you were in Leah's shoes?

If we look at the second formative assessment strategy, we will find techniques promoting all students' engagement in a classroom discussion, and practical techniques to use to elicit all students' learning in a structured way.

Key Strategy 2: Eliciting evidence of learning - FEEDBACK	
Success criteria: • Engineer classroom discussions, related to learning intentions, engaging all learners. • Use a wide range of questions, at the right level, not only to check understanding but to inform what to teach next. • Make use of questioning strategies in order to make all learners think, i.e. wait time, no hands up, no opt-out, etc. • Encourage learners to develop their own questions and to ask them, as well as peer students. • Make use of 'all-student-response tools': digital or non-digital.	Practical techniques: Classroom discussion: • Cold Calling • Hot-Seat Questioning • Think Pair Share • Say It Again Better • Probing Questions • Model your thinking; ask learners to think aloud • … All-Student-Response tools: • Thumbs up, -sideways, -down, etc. • Fingers: 1, 2, 3 • ABCD Cards • Mini Whiteboards • Exit tickets • Post-its • Learning logs • … Digital all response systems • Padlet • Kahoot! • Socrative • Mentimeter • Lesson up • Jeopardy • Gimkit • Blooket • Google Forms • …

Take note: We are aware that not all schools and/or learners have access to digital tools and thus the following example may not be applicable to them.

Example 2

Reflecting on the Post-it activity, Leah decided to use the digital tool Padlet to make all students' thinking visible instead of the physical Post-its. Using Padlet, a digital board where all students can upload their Post-its by name or anonymously through the use of nicknames. This avoids students having to walk around, and Leah would be able to move the Post-its to make groups/clusters, which supports her classroom management.

In addition, Leah might use one of the student response systems such as Kahoot, Socrative, Quizzes, Quizlet, etc. to assess her students' readiness, interests, learning levels

and misconceptions through surveys, quizzes, and dialogues. In this way, all her students are part of the classroom conversations and question-answer sections by using their mobile phones and publishing their answers. Through these game-based learning platforms, the motivation and interests of students to learn the topic are increased. Also, her students can examine their conceptual comprehension as well as compare it to that of their peers since they can see how they are doing in comparison to their classmates.

Engaging all students in a classroom discussion might even be more challenging. Leah asked some experienced colleagues how they do this and received different answers. Some of them make use of strict rules, such as asking a question, waiting for a few seconds, and then the students should raise their hand if they want to say something. Other teachers were more inclined to randomly pick students, using the Cold-Calling technique, so that they must pay attention. Leah agrees that this might be good to do but is wondering what to do with students, not really knowing what to say. She decides that in cases like this, she should bounce the question to other students, but will come back to the first one with a question easier to answer. Leah also noticed that she should not pose two questions in one, but that it would be better to start with one, and then ask a follow-up question to the same student or another student.

When Leah applied her ideas in the next lesson during a recap activity, starting with telling students not to raise their hands, they were pretty shocked. Some of them still did, and Leah struggled with being consistent by not rewarding their input and ignoring it. She decided to give it a try for a couple of weeks, realising that both she and her students need time to get used to it, and to make it a routine.

Key Strategy 3: Providing feedback that moves learning forward – FEED-FORWARD	
Success criteria: • Use comments only as grading. • Give students task-involving feedback rather than ego-involving feedback; praise learners for effort rather than ability. • Balance your feedback, i.e. not too much, not too general, context-specific, and focus on learner response rather than the feedback itself. • Make feedback into detective work. • Give learners time to make improvements to their work.	Practical techniques: • Keep comments positive and specific • Add questions, but not too many • Make use of improvement prompts • Highlight (some) things to improve • • Ask learners to find it and fix it • Let them 'buddy up' • Provide time to redraft or re-do some parts and check again • …

Example 3

Before starting with the final advertisement to be created, Leah asks the groups to submit the set-up of their advertisement: product, target group, and ideas about how to make it attractive and convincing, based on the listed success criteria. She composed heterogeneous groups of 3-4 students with different academic levels and different ways of learning so that they could support each other (Buddy-up technique).

All groups came up with a topic, but the target group for the advert was not always well-defined where some groups were a bit more creative than others. Instead of immediately improving their work or giving ideas, Leah decided that it would be good to add improvement prompts leading to the next step or level. For instance, 'define who should buy your product'. For one group, struggling with the activity, she gave some examples, making use of scaffolded prompts.

She also noticed that in some groups, one or two students did all the work, whereas some others were not as involved as they should be. Reflecting on this, she intended to make sure that all members of the groups were working in the next lesson. To do this, she needed to figure out what might hinder students from coming up with ideas and materials.

Additionally, she thought that it might be good to make use of a cooperative learning activity, structuring group work and addressing students' individual accountability.

Having nine groups of students with nine products to check in total, it took Leah quite some time to provide proper feed-forward to help students working on creating a good final product. After discussing the main feed-forward plenary, and returning the specific feedback to the groups, Leah asked the students to work on improvements and to show what they had changed. This went well, but Leah noticed that it might be better if the students were tasked with assessing their work and/or that of their peers, which may increase their agency, making them more responsible for their learning. This would also improve her class time management.

Key Strategy 4: Activating students as learning resources for one another – FEED BACK/FEED-FORWARD	
Success criteria: • Train learners, in stages, to mark their own work and each other's work and model how to provide feedback and feed forward. • Discuss ground rules of peer feedback with learners in order to avoid anxiety. • Let learners focus on success criteria, mainly as a checklist and identify where they need support. • Make use of cooperative learning activities to organise peer feedback and emphasise individual accountability within group work. • Make use of feedback tools and protocols to organise peer assessment, e.g. 'sentence starters', templates, mapping tools, etc.	Practical techniques: • C3B4ME (see three before me) • Homework Help Board • Group-Based Test Preparation • Peer-marking • In groups (2 -4 learners), organise peer-feedback in a guided way, by working with: • Two Stars and a Wish • Post-its • Sentence Starters • Structured Protocols • Preflight Checklist • I-You-We • …

Example 4

One lesson later the students drafted their advertisements and Leah decided to organise a peer-feedback/feed-forward activity by asking the groups to pair up twice with another group to compare their work. Aiming for high-quality feedback and feed-forward, Leah first did a recap on the four success criteria with the students, which she stuck on the wall since starting to work on the advertisement task. In her work instruction, she indicates that each group has two minutes to show their advertisement including motivating choices made. After these four minutes, the groups are tasked to discuss in their own groups two things they really appreciate in the advertisement of the other group and one thing that could be improved (Two Stars and a Wish) and then share it with the other group. She tells the students to assign a timekeeper. To increase the quality of the feedback and feed-forward Leah created some sentence starters to be used: "What went well? And better if…". She re-emphasises that the feedback and feed-forward should be based on the success criteria. For this part of the activity, she planned to spend ten minutes in total.

Before starting it, she asked if all students understood what to do, by using thumbs up

(Yes, got it), thumbs sideways (I am not completely sure), and thumbs down (I do not understand yet). Most students indicated that they know how to approach the feedback/feed-forward activity, but some showed that they were not sure yet. She asks some students who put their thumb up to repeat the work instruction in their own words (Say it Better Again) and checks all students' understanding by randomly picking one student to explain it again.

After the two rounds, the lesson is almost done, and she asks the students to collect their received stars and wishes, to be used for the upcoming lesson. Before leaving, she asks students to individually reflect on the received feedback and feed-forward and to write down one thing they really would like to improve (Exit Ticket). All students submit their exit tickets while leaving the room, with Leah standing in the doorway.

After class, Leah reads all exit tickets and is happy with the planned actions about what to do next. She summarises them and plans to use them at the start of the next lesson. She realises that, thanks to this more structured cooperative learning activity, it was easier to manage the classroom. The only thing Leah is not sure about is how far individual students are in their learning. That makes her decide to conclude the unit of work with an individual activity to assess what students gained from it and make students aware of what they developed and how.

Key Strategy 5: Activating students as owners of their own learning – FEEDBACK/FEED-FORWARD	
Success criteria: • Be aware that independent learning is probably difficult for learners. Teach them how to learn and how to organise their learning by modelling, (guided) practice, and evaluating. • Give learners challenging tasks that are achievable with effort, and make clear that failure is not only acceptable but also expected (otherwise the work is too easy). • Make use of self-report tools (and be careful to check the accuracy of reporting) and let them create learning portfolios that focus on their progress. • Embed self-assessment as a routine in your lessons. • Create a safe and powerful learning environment by giving learners choices, challenging tasks, and paying attention to social class processes.	Practical techniques: • Traffic Lights • Red or Green Disks • Coloured Cups • Learning Portfolios • Learning Logs • Self-marking, based on provided templates, protocols • …

Example 5

In the next lesson, Leah starts by discussing the results of the exit tickets. Then she tasks the different groups to make a shortlist and to finalise their advertisements in order to submit it to the next lesson. In a classroom discussion, she evaluates with the students what kind of strategies marketers use to seduce people to buy their products. She also asks the students to reflect on working in groups: what helps and what to avoid?

At the end of the lesson, Leah wanted her students to individually reflect on their learning

by writing a reading log, but some struggled with how to do this. She consulted Wiliam's work (2018, p. 184) and found prompts she would like to use:

- In these lessons, I learned…
- I was surprised by…
- What I liked most about this unit of work was…
- The most useful thing I will take from this unit of work is…
- One thing I am not sure about is…
- I would like to learn more about …
- I might have gotten more from this unit of work if…

HOW CAN YOU GET STARTED WITH FORMATIVE ASSESSMENT IN YOUR CLASS?

What we know from research (Wiliam, 2018) is that formative assessment in itself is not decisive for students' success, but that the quality of the teacher makes the difference. But what makes a good teacher? Looking at the five key formative assessment strategies, they are all intertwined, which emphasises the holistic character of teaching. Good classroom management and creating a safe learning environment are prerequisites for embedding formative assessment and increasing student learning. On the other hand, this could be seen as a circular process, where using meaningful learning goals, engaging questioning techniques that involve all students, feedback activities that guide students on what to do next, and helping students become aware of how they organise their work and approach learning, will all contribute to supporting classroom management and learning culture.

With more experience and having your own classes it might be easier to work with formative assessment, but one of the benefits of student-teachers is that they are open to trying new techniques and have the time to experiment during micro-teaching activities and their internship. In this way, they might inspire their mentor-teachers and most of all their students.

In addition to this, here are some tips to get started with formative assessment, based primarily on Shirley Clarke's work (2005):

1. Take your time

Formative assessment is not just about using one tool, it is a way of teaching. Think about where to begin and what steps to take next. Start by sharing learning intentions in a meaningful way, and consider comparing and contrasting different work samples to discuss quality and set success criteria.

2. Do not rush
   It will take time for both you and your students to get used to new routines. Be patient.
3. Share your insights

Talk with colleagues, lecturers, and peers. Sharing ideas helps everyone grow.

4. Learn from the experts

    Consult the work of formative assessment experts like Shirley Clarke and Dylan Wiliam. Dive into more readings on the topic, and do not forget to check the references at the end of the chapter for further suggestions.

5. Keep a journal

    Jot down notes about what worked well in lessons, what could be improved, and ideas for making things even better next time.

6. And most importantly, involve your students!

    Ask students for feedback on the formative assessment strategies you're using. Get their opinions and listen to how they feel about it.

When formative assessment is not part of the routine at your school and everyone is focused on grades and summative tests, it is common for students to say they prefer grades over comments, dislike random questioning, or would rather get feedback from teachers instead of doing detective work or receiving peer feedback. Do not be discouraged. This shows you're on the right track, encouraging your students to think and engage more deeply. It also highlights the importance of having a school-wide formative assessment policy. Embedding formative assessment into regular practice across classes will support you in making it a part of your teaching. Keep communicating the why, what, and how of formative assessment with your colleagues, school leadership, students, and their families.

CONCLUSION

The purpose of this chapter is to emphasise the value of formative assessment in inclusive classrooms and to provide alternative paths to put it into practice. Literature review indicates that formative assessment, when employed consistently and continuously, may involve all students and instructors in a safe inclusive classroom environment that fosters equality and equity among its members.

Formative assessment is conceptualised as a dynamic evaluative process that serves two main roles in the ongoing instructional process: it informs students about their understanding of the content and engages them in the learning process, while also acting as a catalyst for teachers' reflection on their practice and the selection of instructional strategies.

When formative assessment is put into practice, the following elements should be included for its success: clearly laid out learning goals, a variety of formative assessment techniques to elicit students' learning, and feedback in a range of formats at appropriate levels. The diversity exhibited in the collection of formative assessment techniques reminds us that there can be no one-size-fits-all package (Tomlinson & Moon, 2013). Getting to

know the students, the way they learn better, their academic readiness level, their needs, interests, and background assist in adopting multiple means of formative assessment that offer several evaluation paths to show their understanding. By ensuring the engagement of all students in the assessment and learning process, teachers create fruitful conditions for a safe inclusive environment where none is excluded or feels marginalised. In such a welcoming and safe learning environment, students may be comfortable clearly communicating their mastery of the content, thus providing useful information to teachers about their knowledge level, and any potential gaps or misconceptions.

The chapter highlights a wide range of formative assessment techniques from the conventional to more contemporary, providing teachers with a variety of options to select those they consider appropriate to help students demonstrate what they know. In several of these, technology plays an important and facilitating role.

Continuous training of pre-service or in-service teachers in a variety of assessment strategies and techniques will equip them with the knowledge and the flexibility to create or choose formative assessment techniques that are best suited to their classroom. It is crucial to emphasise at this point that even if a teacher is unfamiliar with all of the approaches presented in this chapter or other works, the process of assessing the current situation starts the moment the teacher enters the classroom, even in a more informal way. As a result, it is critical for teachers to enhance their knowledge of the value of formative assessment in guiding all students' learning and growth. Typically, practising formative assessment in the classroom leads to a more fun learning experience for your students, and students tend to learn more, remember more, and see the connections to what they are learning more holistically. And who does not want to be a fun teacher doing fun things in their classroom?

Local contexts

An interactive H5P element has been excluded from this version of the text. You can view it online here:
https://book.all-means-all.education/ama-2025-en/?p=427#h5p-1

Closing questions to discuss or tasks

1. How can students' involvement in formative assessment be improved?
2. How can specific learning targets relate to students' future achievement goals?
3. How favourable should an educational context be for formative assessment?
4. What can be done to enhance the feasibility of assessment for learning?
5. What is the importance of clarifying, sharing, and understanding learning intentions and success criteria? How can we do this in a meaningful way engaging all students?
6. What makes an effective classroom discussion, eliciting evidence for learning?
7. What is the importance of student agency and self-regulated learning?
8. How do peer- and self-assessment contribute to student agency and self-regulated learning?
9. If independent learning is so important, why does it happen so little?
10. How do we balance formative and summative assessment?

Tasks

Activity 1: How to share learning intentions

Think about a topic to teach and how to introduce it, including big ideas, learning intentions and success criteria. Prepare a teaching activity in which you share your learning intentions in an engaging way and work with success criteria, related to a task for students. Teaching time depends on your activity, so do not rush yourself. Include ideas about what to take into account regarding how to manage the classroom.

Success criteria to consider:

- At least 3 learning intentions are formulated by making use of Bloom's taxonomy (Bloom verbs).
- Learning intentions are connected to a big idea, related to a task, and by keeping the context of learning out of the learning intention.
- At least 4 success criteria are provided, giving clear steps or ingredients indicating how to successfully finalise the task.
- Learning intentions and success criteria are shared with students in a creative way, stimulating all students' learning.
- Ideas about classroom management are included.

Activity 2: How to engineer a classroom discussion

A classroom discussion is meant to inspire all students to deepen their knowledge and develop their thinking skills about a specific topic. It is often used to introduce new materials but has to be built on expected prior knowledge, which explains its use as a formative assessment technique eliciting students' prior knowledge. The teacher guides the discussion but is not involved in answering the questions themselves. Students need to be active,

which emphasises the teacher's use of effective questioning skills and efficient all-response systems. Think about a topic to discuss and how to organise your classroom discussion.

Success criteria to consider:

- The discussion lasts 10 -15 minutes .
- Prior knowledge of the students, related to learning objective(s), is elicited
- Questioning strategies are used in order to make all students think, i.e. wait time, no hands up, no opt out, etc.
- A range of different questions are used. They are at the right level, not only checking understanding, but to make visible what to teach next.
- Students are encouraged to develop their own questions and to ask them to the teacher as well as to peer students.
- At least one all-response system is used.
- Classroom lay-out is in line with the activity and motivated with reference to relevant theory.
- Classroom discussion procedure is announced to the students.

Activity 3: Providing feedback and feed-forward

Dylan Wiliam (2015) states: 'Feedback should be more work for the recipient than the donor'. Explain the meaning of this statement and provide three concrete examples, related to your serial lessons, of how to organise feedback that is "more work for the recipient than the donor" and offers clear guidance on what to do next.

Activity 4: Peer assessment

Working on their task (accompanied by success criteria), organise a peer assessment activity, in groups of 3-4 students.

Consider the following:

- Describe the peer assessment activity you plan to organise and explain your rationale for choosing it.
- How do you prepare your students for this activity and what do you tell them before starting?
- Explain how you will create groups: homogeneous groups or mixed-ability groups. Give reasons for your answer with reference to relevant theory.
- Explain the importance of 'individual accountability' and how to safeguard it within your activity.

Activity 5: Self Assessment

Watch the video (5.46 minutes) about Self-Assessment and provide ideas about this strategy in this chapter.

Link to the video: Self-Assessment: Reflections from Students and Teachers – YouTube

Answer the questions below and share your ideas with a peer:

- What connections do you draw between the video and the text and your own life or other learning?
- What ideas, positions or assumptions do you want to challenge or argue within the video and the text?
- What key concepts or ideas do you think are important and worth holding on to from the video and text?
- What changes in attitudes, thinking, or action are suggested by the video and text, either for you or others?

(Based on The 4 C's Thinking Routine (The 4 Cs_1.pdf (harvard.edu))

About the authors

Vana Chiou

Vana Chiou loves teaching and training future teachers on contemporary teaching methods and techniques. Her research interests include contemporary methods of teaching and assessment, teacher training, inclusion and education. Her published work includes editing books, chapters in books and articles in Greek and international journals.

Janneke Eising

Janneke Eising is an enthusiastic teacher trainer with a passion for learning and developing; and languages and literature. To foster inclusive education, she works on topics such as formative assessment, differentiation, classroom management, teaching adolescents and mentoring. Using practitioner research, for instance the Lesson Study approach, she works with (student-) teachers on how to enhance all students' learning in the classroom.

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

Melike Özüdoğru

Melike Özüdoğru completed her doctorate in the Curriculum and Instruction Department at Middle East Technical University (METU) in Turkey. She is interested in flipped learning, integrating technology into the teaching and learning process, differentiated instruction, teacher training, curriculum design, learning environments, teacher identity, situated learning, reflective thinking using videos in the teaching practicum,

and curriculum evaluation. She obtained her associate professorship from the higher education institution in Turkey.

LANGUAGE LEARNING FOR ALL

Example Case

Tracy is a language teacher who works with newly arrived immigrants in Sweden. Here she describes some of the strategies and techniques she uses to ensure that her classroom is inclusive for all.

"I've been teaching in Sweden for the past 12 years and I work with newly arrived immigrant students who come to Sweden from a variety of backgrounds. They come and they are put together in a preparation class for a maximum of two years. So we have a group with different ages, abilities, ethnicities and backgrounds, all together in one class. It's quite a challenge. In general, we are seeing a rise in multilingual classrooms. So it's something that teachers everywhere really need to be aware of— how we recognize the diversity of our students, what they're bringing to the classroom in terms of background and cultural experiences, and how this experience of being together with many different people is enriching and that we should celebrate it. It's also important to think about how this experience might affect their learning identity and mark them for the rest of their school career. Therefore, we have to be positive and encouraging about their own home languages. In Sweden, we support them by using techniques such as translanguaging. We use that as a method for recognizing where they're from, but also for integrating them into a new system."

Tracy Fletcher-Tjernberg, High School Teacher and Researcher, Sweden

Introduction to Topic

Schools today are increasingly multilingual with learners bringing different home languages and ethnolinguistic identities to the classroom. The language of instruction may be the learners' first language (L1), their second language (L2), an additional language or a foreign language (for example, in contexts where English is a foreign language and is being used as the language of instruction) (Cenoz & Gorter, 2022). In order for the learning space to be fully inclusive, care must be taken to make the language of instruction accessible to all learners.

Many factors are at play when we take into consideration how learners understand the language being used in the classroom. A helpful initial starting point is a framework developed by the Council of Europe entitled the Common European Framework of Reference for Languages (CEFR). This provides a framework around which curricular and educational initiatives can be developed which prompt and support multilingualism and multiculturalism. The CEFR was designed to "protect linguistic and cultural diversity, promote plurilingual and intercultural education, reinforce the right to quality education for all, and enhance intercultural dialogue, social inclusion and democracy" (Council of Europe, 2022). The CEFR outlines clear standards and performance indicators for each level of language learning and includes descriptor scales which run from A1 to C2. The first level, A1, is a beginning language learner and user and C2 is someone who can use a language in all facets of their life – personal, public, professional/occupational and educational. These spheres are significant because they emphasise authentic, real-life ways in which learners use language to function and communicate.

Figure 1: CEFR Scale and short descriptors of spoken production

Basic User   **Independent User**   **Proficient User**

| A1 | A2 | B1 | B2 | C1 | C2 |

Can read a very short, rehearsed statement - e.g. to introduce speaker, propose a toast.

Can give a short, rehearsed, basic presentation on a familiar subject.

Can give a prepared straightforward presentation on a familiar topic within his/her field.

Can give a clear, prepared presentation.

Can give a clear, well-structured pre- sentation of a complex subject.

Can present a complex topic confidently and articulately to an audience unfamiliar with it

Based on https://badges4languages.files.wordpress.com/2015/08/cefr-hours.jpg

Another important component of the CEFR framework is the distinction between receptive language skills—what a language user can hear and understand or read and understand and productive language skills—what a user can say or write. When we focus on checking for understanding and making sure the language of instruction is accessible to all learners, this is an important distinction to bear in mind. As with language learning in early childhood, learners may be in different stages in their language acquisition. They may be able to access content and understand the subject matter in the classroom but they may not yet feel comfortable "producing" responses—for example participating in a classroom discussion (Lightbown & Spada, 2021).

It is also critical to provide learners with different modes and modalities for showing their knowledge and understanding. Termed multimodality, this practice emphasises the integration of not only written texts but also images, aural resources, video resources, movement and technology (Choi & Yi, 2016). Some learners might prefer a more "traditional" approach such as reading a text and answering questions while other learners might prefer listening to a reading text and then making a video about what they have heard. Both approaches enable learners to demonstrate their knowledge and understanding.(Sousa, 2017; Tomlinson, 2017).

Additional dimensions of the CEFR expand on receptive and productive language skills and include interaction and mediation. Both of these dimensions highlight the social component of language learning. Language usage is a social act that enables participation and interaction within a society. Particularly in multilingual classrooms, learners need to be given time to practise interacting and mediating meanings in the target language. This is especially critical for students who do not share the language of instruction and the often implicit, sociopragmatic expectations. As previously discussed, these opportunities for

practice provide scaffolding for subsequent, real-life, day-to-day situations when learners will need to use the language to communicate.

A final aspect of the CEFR that is important to highlight is its framing as a "competence-based approach" to language learning (Council of Europe, 2020). In the CEFR, language learning primarily focuses on activities and interactions that are related to real world tasks. Language learners are assessed on what they can do with the language around specific communicative tasks (and not what they cannot do or do not yet know). This additive approach ensures a focus on real-life communicative competences learners are developing. It is a motivating approach that highlights the ongoing nature of language acquisition. There is always more about language to be learned but everybody, including, for example, non-verbal communication, knows and can do something with language.

With the CEFR framing our thinking, in this chapter, teachers will be introduced to three dimensions for making language more accessible to learners: mindsets, models and methods. The first, mindsets, are the epistemological frameworks—in other words the belief systems— teachers bring to the classroom which inform their teaching and learning. The second, models, are the structures teachers use to think about and organise their classrooms. Finally, methods are the actual tools and techniques teachers use in the classroom to make language more accessible to learners.

Due in part to migration, globalisation, technologization and mobility (The Douglas Fir Group, 2016) classrooms are increasingly diverse and plurilingual. Teachers may have four, five, six or more different home languages present in their classrooms. Mindsets, models and methods have a major impact on how inclusive and accessible these classrooms can be and how well learners can use the language of instruction to access the content being learned.

In this chapter, we provide resources that can be used for different kinds of language users including for example, learners studying in their first language, learners studying in their second language, bilingual learners and learners who are speakers of other languages and are studying, for example, in an English as a Medium of Instruction (EMI) classroom. Irrespective of the linguistic circumstances in the particular school or classroom, in this chapter teachers will find general resources for increasing their students' access to language. It is important to bear in mind that the provided resources are designed to be used in multilingual classrooms. Another chapter will be devoted to language learners with special educational needs (SEN). That said, the provided resources must be adapted to the local, sociocultural context. Teachers need to take into consideration aspects within their specific contexts such as local identities, ideologies, values and priorities which may impact the ways in which the provided resources can be implemented in their classrooms. Some learning contexts, for example, may readily encourage multilingual mindsets while others may prioritise majority language usage and therefore would need greater guidance in adopting a mindset shift. Ultimately, teachers need to consider the language being used

and the linguistic makeup of their classrooms—which are increasingly multilingual (Ortega, 2019).

Description of a structural disadvantage and how to address or prevent it

Content in the classroom is mostly delivered through language. In multilingual, bilingual and monolingual classrooms, learners have different levels of accessibility to the language of instruction. In order to make the subject matter accessible to all and to ensure that the classroom is fully inclusive, teachers need to relate explicitly to language. They can do this by (1) scaffolding language and by (2) defining content learning objectives while remaining aware of the role language(s) play in the learning process in general.

Scaffolding covers the systematic support for learners to carry out tasks successfully. The aim is to assist learners in moving, step-by-step, towards acquiring new skills. Scaffolding "is a special kind of help that assists learners in moving toward new skills, concepts, or levels of understanding. Scaffolding is thus the temporary assistance by which a teacher helps a learner know how to do something so that the learner will later be able to complete a similar task alone. It is future oriented and aimed at increasing a learner's autonomy" (Gibbons 2015, p.16). In the terms of language education, scaffolding refers to breaking up language learning into manageable chunks. Scaffolding relates not only to vocabulary, syntax and grammar but also to semantic and pragmatic meanings as well as the prerequisite knowledge needed to access particular content. For example, learners reading about a snowy day in Finnish, might need to understand the difference between "*tykky*" (large chunks of snow) and "*viti*" (fresh powdery snow), a difference that in other languages might be marked by adding adjectives to describe snow. Similarly, learners listening to a cooking show about a common Middle Eastern food, "*kubba*" or "*kibbeh*" will need background knowledge about the more than twenty varieties of these meat-filled dumplings in order to understand the program. Scaffolding is important not only for language teachers but for all teachers who are guiding learners who are using language to access subject areas.

Defining both content learning objectives and language learning objectives is also an important part of language awareness pedagogy. Along with this, the teacher has to ensure that all learners have access to the language of instruction. A component of this is encouraging teachers to reflect on the prior knowledge needed within the realm of language and within the realm of content. Therefore, it is important to guide teachers towards asking and reflecting on how they are scaffolding language, the medium of instruction, to access content and also to consider how they are defining their content learning objectives to include language. These steps help ensure that all learners can access the subject areas being learned.

Key aspects

This chapter proposes three M dimensions (3m's) for thinking around language and accessibility within multilingual classrooms:

1. Mindsets, the epistemological or belief systems for grounding teaching and learning;
2. Models, the structures and frameworks used for organising instruction;
3. Methods, the concrete practices and techniques for making language more accessible for all.

Dimension 1: Mindsets

The first dimension discussed is Mindsets. This relates to the epistemological or belief systems teachers bring to the classroom. In our case, these mindsets specifically relate to multilingualism and language accessibility. Teachers need to be aware of the kind of language of instruction their students are familiar with and which other languages are present in their classrooms. They need to know which linguistic resources their learners bring to the classroom. Only then, is it possible to make sure that all learners also have access to the lesson's contents. In general, classroom linguistic awareness means that teachers are conscious of the role languages play in teaching and learning. They pay attention to language use in different situations and support learners' development by focusing on language and content skills interchangeably. As will be addressed in the subsequent section on methods, teachers who promote accessibility to language pay attention to language and content-learning objectives even if they do not explicitly adopt a content and language integrated approach (CLIL) to learning. They maintain a *mindset* that continuously bears in mind the role languages play in learning. According to previous research, language awareness significantly influences teachers' beliefs related to multilingualism and teaching multilingual learners. Teachers who consider home languages as a resource and maintain positive beliefs about multilingualism are more likely to promote multilingual ideologies and inclusive practices such as translanguaging (Alisaari, Heikkola, Cummins & Acquah, 2019).

Multilingualism can be defined as "the use of more than one language by a community of speakers; a society in which different languages coexist side by side" (p.13). In contrast, pluralingualism refers to "an individual's ability to communicate in a number of languages and switch among them to suit given circumstances, taking into account the trajectories and dynamic nature of language acquisition and use" (Council of Europe, 2001). In language education, the notion of plurilingualism "particularly highlights the relevance of learners' language repertoires and the necessity to take these into account in teaching and assessment" (p.14) https://meyda.education.gov.il/files/Mazkirut_Pedagogit/English/framework2020.pdf

Students' who are multilingual demonstrate language varieties, which have been developed through prior instruction and also at home, through hobbies and during their free time. Students' extracurricular and personal resources, especially their media environments, have a lot of learning potential irrespective of their subject or content. For example, students who follow football league fan sites or play online games in multilingual communities acquire particular words and phrases that can also be useful in formal learning settings (see Pitkänen-Huhta, 2019). As the above examples demonstrate, multilingualism and multisemioticity are key resources in multilingual classrooms in order to promote students' thinking and expressing of their ideas (for further information see Duarte and van der Meij, 2018; Leppänen & Kytölä, 2017).

The above describes a mindset that recognizes the cultural and linguistic background of the learners. It can be meaningful when planning and implementing instructional choices. When teachers are aware of the learning potential found in, for example, students' text worlds and media environments, they can better facilitate learners' agency, and sometimes give learners tools for connecting the learning transpiring in formal classroom settings to the learning transpiring in non-formal settings. Teachers who, for example, acknowledge the linguistic competences present in their classrooms and design activities that build on their learners' linguistic strengths can ensure that students are a part of the linguistic and cultural learning environment.

Another important aspect of mindsets is the relationship between students and teachers, which is fundamental and influences the pupils' attitudes towards learning and knowledge (Rudduck, Chaplain & Wallace, 1996). Students will have difficulty learning from those they do not love (D'Amore & Fandiño Pinilla, 2015). Only when teachers obtain admiration from their students, can they promote enthusiasm and interest in the school subject (Petracchi, 1993). This is especially true for language learning where the content and the language are intertwined. Students generally do not decide the content being studied but can only build their knowledge based on their relationships with teachers and to the materials the teachers have chosen (D'Amore & Fandiño Pinilla, 2009). Therefore, students' engagement depends on their personal relationship with the teacher and the ways in which the teacher mediates the content.

This is particularly relevant in multilingual classrooms where learners are accessing the language of instruction in different ways and from different starting points. The feelings and emotions they bring to the classroom, what the linguist Krashen (1986) referred to as "the Affective Filter" impact language acquisition. When learners feel anxious, embarrassed or afraid and exhibit a "high affective filter," it becomes difficult for language acquisition to occur. In contrast, teachers who are invested in promoting wellbeing, including building connections with their learners and creating positive learning environments, will ultimately nurture more successful language learners (Mercer & Gregersen, 2020). Language teachers should be encouraged to promote positive emotions around knowledge as well as strong human relationships.

A final aspect of mindsets worth mentioning relates to beliefs, stereotypes and errors. Empirical studies such as those carried out by Donaghue (2003) and Borg (2019) have shown that teachers' beliefs about language learning and teaching inform the mindsets they bring to the classroom. Therefore, it is worthwhile spending time reflecting on beliefs about teaching and learning in general and specifically as they relate to language.

One area where this is particularly important is around stereotypes and errors and specifically attitudes towards language "errors." How can teachers approach errors in order to encourage and motivate learners? First, errors should be framed as "appropriate" and "inappropriate" rather than "correct" or "incorrect." For example, if learners were writing a letter to the prime minister of their country, they would need to learn and practise formal letter writing including official and formal registers. However, these forms and structures would be quite "inappropriate" (albeit "correct"), if learners were writing an informal email to their new friend. Errors are very context dependent, and, in most situations, it does not matter if the grammar or syntax is "perfect." The goal is usually to communicate something which the CEFR refers to as communicative language (Council of Europe, 2020). Therefore, the focus should be on whether the point the learner is trying to convey is being successfully communicated. Another important mindset shift is seeing "errors" in a positive light and as a source of information. Often, errors can provide insights into what the learner knows and can do with the language. For example, a language user who adds an "ed" ending to an irregular verb in the past simple (such as 'fighted'), is showing awareness of the regular "ed" ending.

When considering errors, it is always important to think about the linguistic and cultural background of the learners, their prior knowledge and the home languages present in the classroom. These all have an impact on how learners grapple with and access language.

The way that teachers relate to language "errors" also connects to the perpetuation of stereotypes and the erroneous assumption that learners who do not use the language of instruction "correctly" or "perfectly" are less capable or knowledgeable. The distinction between receptive comprehension and linguistic production can again be useful here. All language users, and particularly plurilingual language users, have receptive linguistic knowledge, meaning they can understand many things being said to them before they can actively produce the same words and constructions. Moreover, they may be able to actively produce these same items in their home language but cannot yet do so in the language of instruction (for further discussion see Stubbs, 2002). As will be discussed in the section on methods, varying instruction and techniques and making use of multimodalities such as visual, non-linguistic representations can facilitate access to the content being addressed and provide opportunities for learners to successfully demonstrate their knowledge. Equally important is adopting a mindset that challenges assumptions around ability and "correct" language usage. Appropriate language usage depends on the social context and situation at hand. Teachers can openly discuss such constructions and differences while dismantling evaluation and judgements. Stereotypes sometimes used to describe variations of

language (or those that are considered "nonstandard") include "uneducated, improper, impolite and bad" (Crovitz & Devereaux, 2017). Such presuppositions can have detrimental effects on students' evolving identities both as learners and language users. Encouraging teachers to reflect on their attitudes and biases towards language differences is a critical part of the process of debunking stereotypes and validating all learners.

Dimension 2: Models

"UDL is about thinking about our learners in terms of variability instead of ability and disability. It is about the different ways that our brain learns. UDL breaks up how our brain learns into three strategic networks – UDL principles – which we can use to engage students in their learning. These principles are engagement, representation and action and expression. If you think about these principles in terms of the learning in your classroom, I can give you some really nice examples. In terms of engagement, you can think about bringing in the students' first language where they can see themselves in the classroom. If you ask them what their primary word is for a word you are teaching or for a word you taught yesterday, that is engaging them in the lesson and is bringing in that contextual aspect to the learning as well. If you think about representation, this is about the content you are delivering to the students and how they are able to access that content. If you are teaching new words and you just give the words on a worksheet with some sentences for the students to fill in, they are not necessarily going to be able to do that if they are not able to access the new words in different ways. So another way could be through audio where the words are phonetically spelled out for them. Or another way could be through visual signs. I was walking through the corridor today and the classrooms here have subjects written in Italian and German. I do not speak Italian or German. So in most rooms I don't know what subjects are being taught. But in one door, they had Italian, they had German, and then they had a music note. I know music is happening in that classroom. So that is an example of representation in terms of action and expression. It is about understanding the goal. It is focusing on that accessibility, knowing your goal and making sure that there are no barriers to the students demonstrating that they have achieved the goal. […] That is UDL in a very short nutshell and I hope some good examples of how it can be used to foster language accessibility."

Margaret Flood, Assistant Professor, University of Maynooth (Ireland)

The variety of linguistic and cultural backgrounds of students describes nowadays best the fact that every teacher is actually also a language teacher. The diverse needs of learners have to be taken into account despite the school subject. For ensuring language accessibility for all learners, the universal design for learning (UDL) framework works as a pedagogical tool in order to assess classroom activities (Connell et al., 1997). Instead of the speaking abilities and disabilities of learners, the different ways that our brain learns can be observed and used as resources of learning. Our brain learns into three strategic networks: engagement, representation and action and expression. These are UDL principles, which

we can use to engage students in their learning. We present in the following section four models that are based on the UDL principles. The PID model, thinking skills relating to the linguistic competences, languaging in mathematics, and arts-based meaning making represent the models that facilitate the learners to use their various linguistic capacity also for content learning.

The core of student-centred language pedagogy is acquaintance of students including their hobbies, reference groups, reading histories, and studying techniques. Systematic classroom observing in language settings is a part of teachers' competences and a part of teacher professionalism, it is something that can be learnt (Stürmer & Seidel, 2015). When the planning process of instruction begins, we can encourage teachers to explicitly reflect on the prior knowledge needed with respect to language and content issues and, after that, to define the learning objectives. In their reflection process, teachers can use a framework entitled the **PID model** (perception – interpretation – decision-making).

The PID model encourages teachers to pay attention to both language and content issues affecting students in their classrooms. In the first phase, the perception phase, teachers' attention should focus on a specific component of language and interaction or other content present in the classroom. Then teachers interpret their perceptions based on their experience, knowledge, and familiarity of the group. In the last phase, the decision-making phase, teachers come to conclusions about the activities being implemented in the classroom. The activities arise organically based on students' situational interests which, ideally, harnesses motivational aspects of learning (Swarat, Ortony & Revelle, 2012).

Even for experienced teachers, the PID model gives tips to get in students' engagement (Stürmer & Seidel, 2015). For example, students may not appear to be involved in the lesson, although they are actually doing intensive thinking work. Therefore, practising observation is needed to notice students' engagement. Further, co-teaching is a great opportunity to maintain and to develop observation skills. When co-teaching, both teachers' observations can be compared. It is critical to notice that students are unique with respect to their linguistic and learning resources. The observation process needs to be carried out by teachers at both the group and individual levels in order to enable teachers to recognize learners' strengths and to develop learning objectives related to linguistic competences.

Students' **thinking work** is closely connected to linguistic competences. For example, the ways in which learners work with text sources is intimately related to thinking skills. According to Lipman (1988), good thinking means critical reasoning, which includes the thinking skills of estimating, evaluating, classifying, assuming, inferring logically, grasping principles, noting relationships among other relationships, hypothesising, offering opinions with reasons, and investigating and making judgements with criteria. All of these skills contain linguistic elements which some learners grapple with. Further, multimodal text interpretation and production requires transferring from one textual mode to another (from audio to visual etc.), which can be challenging to students, while the meaning-making systems use different semiotic resources. What teachers need to do is to clarify the

connections between actual thinking and learning processes and their connection to linguistic choices. Scaffolding is critical so that the linguistic elements can support students' thinking processes.

Teachers can combine language with content in several ways (see Bunch, 2013). For example, in mathematics teachers can use languaging when there are expressions of mathematical thinking through language in the classroom. In this case, drawings, diagrams, body language and other multimedia forms of expression can be a part of the instruction. For example, learning geometry in investigating tessellations gives learners many multimodal resources for content learning despite their linguistic background (Hähkiöniemi et al., 2016). In this way, teachers can combine the content learning and language learning objectives through careful planning of the components of the learning environment (see Hähkiöniemi et al., 2016).

Arts-based meaning-making provides ways to activate multimodal expression and thus promote multilingualism as a resource of learning. It is based on the *StoRE® − Stories make readers* programme, which Aerila and Kauppinen (2017) developed together with Finnish teachers. The arts-based meaning making lies on the ASM model for literacy learning. There are 3 cornerstones of the ASM model for reading and writing literacy as follows:

- A refers to the **amount** of reading and also enough time for reading. Any kind of text can be the material of reading.
- S refers to the **suitability** of text material for the reader. Suitability includes reader's interest in topics, popular genres, language choice etc. as well as adequacy to the level of reading skills.
- M refers to **meaningfulness** to the reader so that the action around the texts makes sense to them, and the reading environments and activities are meaningful to them rather than repeating and rote reading without meaning. Especially arts-based activities have inspired the students to literacy learning.

The ASM model as part of the StoRE®-programme can be applied to various linguistic and age groups of the learners with diverse reading and writing skills (Pathways-training | Polku-täydennyskoulutus). The programme develops academic literacy skills as well as aesthetic and emphatic stances towards reading, where readers focus on the experiences and emotions they have with a text. The ASM model lies in the reading setting consisting of physical, psychological, cultural and social factors (Brooks, 2011; Figure 2). The arts-based meaning-making activities can be the part of all these reading environments so that all capacity of expression by students is largely promoted.

Figure 2: The elements of reading environment in the ASM model for literacy learning

Includes interactions prior, during and after reading in pairs as well as with adults; shared reading history

Fosters reading models, shared experiences, dialogue-initiated communication

Includes individual skills, book choices, immersing into literature, attitudes, reader-images

Fosters positive emotions, self-confidence & agency

Psychological reading environment

Social reading environment

Physical reading environment

Reading spaces, materials, reading history, simulated environments, libraries, homes etc.

Fosters auditory, visual and kinesthetic epxepriences

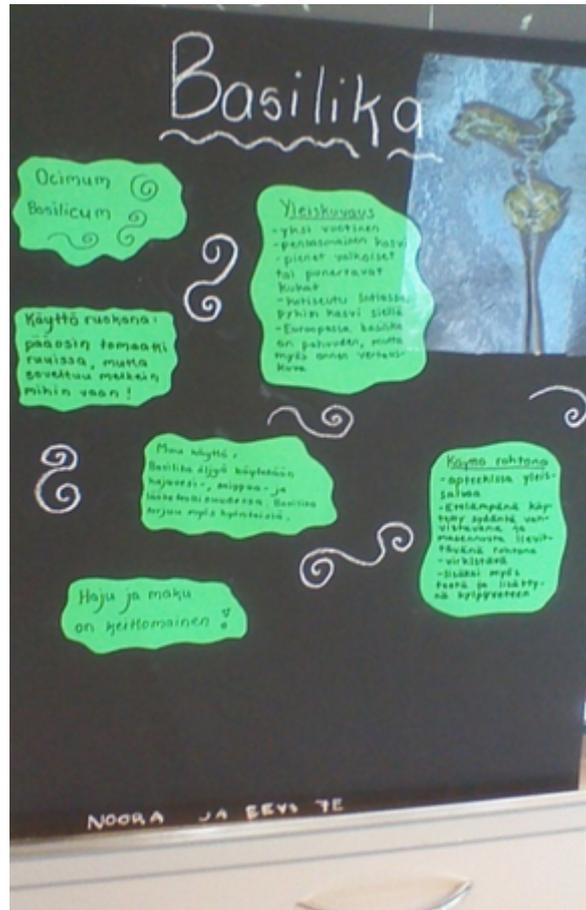
The following example concerns the Finnish school applying language awareness pedagogy in science. It concretely shows how the ASM model is used in transversal learning combining biology and domestic science in language learning settings. In one school, there was a greenhouse in the school yard, where students could grow plants and also different types of herbs. They learned what various herbs need in order to grow properly; namely oregano needs different soil than basil. As the herbs grew, the students made notes about the plants' properties and collected them on a table. The notes consisted of pupils' observations via senses, for example how the herbs smell, what they look like, etc. Vocabulary in the field of biology related to observations and phenomena concerning the plants' growth was learnt at the same time. Furthermore, the students searched for information about the medical purposes of the herbs as well as the herbs' history and prevalence globally. After that, they created posters that related to all of the content and

material learned. At the end, the students made a menu in which dishes were spiced with herbs.

Picture 1: Students' poster representation of Basil.


In this task, the linguistic as well as other multimedial meaning-making resources were diversely used in the classroom, while content information was collected and defined via various modalities. In addition, students learned Latin words when they searched for information about how herbs can be used for medical purposes. They also became familiar with meaning making through the visual mode of posters and other visual and graphic forms. Students reported that the learning task was meaningful and also useful for them. The choices of layout like the position of each element were an authentic learning experience for them. The teachers noticed how important it was to give multimodal meaning-making tools for learning in the multilingual classroom. In that way, each student could choose the tools which they found to be suitable for their situation and purposes.

Afterwards, the students who have studied herbs in the greenhouse organised a Herb Path for younger students with special needs. The older students planned and prepared activities that consisted of several stations where their classmates learned about different herbs. The older students guided the younger ones to smell, taste and recognize each herb and put their notices on the table. At each station, they searched for words and information

about herbs together. At the end, there was common discussion about herbs and the learning experiences.

Dimension 3: Methods

Employing innovative techniques, methods and approaches can help ensure learners have access to the language used for learning in the classroom. There are many methods in terms of tools teachers use in the classroom to make language more accessible to learners, for example, cooperative learning, peer tutoring, laboratories, and open-space learning. Methods and techniques abound. However, it is critical to bear in mind a fundamental principle: no one method is superior or best for meeting the needs of all learners. Rather, teachers should make use of and alternate different teaching methods, thus increasing the possibility that students with different personalities, characteristics and learning preferences are involved in the learning process. Even if it constitutes the most recommended method at the time or is based on "traditional" teaching, focusing the teaching-learning process on a single teaching method is almost always a source of error (D'Amore & Fandiño Pinilla, 2015). Instead, what is important is to consider the difference between teacher-centred methods and pupil-centred methods. In the first case, the focus is on the teacher, who can implement a range of teaching methods. One example is a frontal lesson. When it is the main method used and it assumes the structure of a purely transmissive lecture where the teacher explains and students listen and take notes, without moments of elaboration and feedback, the students mainly play a passive role (Trinchero, 2013), even if they could learn something. In the second case, in pupil-centred methods, students are the protagonists of the learning process. They actively experiment and act, constructing their own learning under the guidance and supervision of the teacher. This approach can include, for example, active workshops, cooperative or group learning and learning technologies. In particular, methods based on technology can help learners to use language to access content, using different modes and modalities for scaffolding language. Learning technologies can support students' learning in different ways and reinforce their motivation. Educational technology increases learner agency and helps further motivate searching for information, knowledge and for developing texts for different purposes.

Another method for fostering access to the language embedded in specific subject areas is Content-Based Instruction (CBI) or Content and Language Integrated Learning (CLIL) (Wiseman, 2018). Such approaches involve teaching certain school subjects in a language other than the learners' main language of school instruction. In these types of lessons, the focus is on the topic or school subject, and the students access the content using the language they are learning. In particular when adopting CBI, it is important to define both content learning objectives and language learning objectives so that all learners can access the language being used (Wiseman, 2018). CBI is a helpful method and an important example for ensuring language learning for all, but before planning and simply

applying this strategy, it is necessary to consider the relationship between learners and their school subjects, in terms of pleasure and displeasure to learning a particular school subject (Ghaith & Shaaban, 2005). If students like the subject but they do not like the language used in CBI, they might end up not liking the subject as well. By contrast, using this method might be helpful for learners who love languages, helping them to approach the school subject positively. It is always better to consider students' relationships and feelings towards the topic being taught in the classroom. Teachers can take into account the affective aspects that can be interposed, positively or negatively, between the students and the subject. These aspects have repercussions on students' attitudes towards the language used and the school subjects, in terms of success or failure in a language acquisition process (Balboni, 2012; Freddi, 2012).

Another useful method is "Task-Based Language Learning" (Larsen-Freeman & Anderson, 2011) which is an approach to language learning where learners are given an authentic and interactive task to complete. In order to complete the task, learners need to communicate with each other. Every student has a part in completing the task. A nice example is the creation of a weekly activities chart where each student writes down the activities they do in a weekly calendar. For example, in the column for Monday, a student named Jack might write "every Monday Jack plays basketball." The task is complete only when every student in the group has written their activities. This ensures that all students are taking part, but they can help and support each other in filling out the weekly activities chart (for further information see Larsen-Freeman and Anderson, 2011).

A final method for fostering language learning for all is encouraging translanguaging in the classroom. Translanguaging can be defined as an approach or method that considers multilingualism at its core and uses learners' full linguistic repertoire – the home language and the language of instruction. Methods based on translanguaging relate to language and content competences and include planning activities in two or more languages. This approach is learner-centred and endorses the support and development of all the languages used by learners. Pedagogical translanguaging can be applied in language and content classes and it can be valuable for the protection and promotion of the non-majority languages present in the classroom (for further discussion see Cenoz and Gorter, 2022). In this way, it is possible to include all students in a respectful and authentic manner.

This chapter addresses three dimensions for making language accessible for all: mindsets, models and methods. A final point of consideration is that the provided resources for content learning must be adapted to specific contexts. Classrooms as well as curricular expectations vary, and it is up to teachers to modify and apply their practices to local contextual needs.

Closing questions

- How do you take into consideration pupils' different starting points in the language of instruction? What tools or strategies do you use?
- How do you build on pupils' prior content knowledge when introducing new subjects and topics?
- How can you preserve the cultural and linguistic background of your students?

About the authors

Silver Cappello

Silver Cappello has accomplished a PhD in General Education, General and Social Pedagogy at the Free University of Bolzano-Bozen (Italy). He is qualified as primary school teacher with a specialisation as support teacher and he has worked as primary school teacher (mainly teaching second language), as assistant for people with disabilities, and as research assistant on different research projects at the Competence Centre for School Inclusion of the Free University of Bolzano-Bozen.

Julia Schlam Salman

Julia Schlam Salman, Ph.D., is a lecturer and teacher educator at the David Yellin Academic College of Education in Jerusalem. She also teaches in the MA TESOL program and the Division of Languages at Tel-Aviv University. Her research interests include language education, language learning and teaching, and English language learning in areas of intractable conflict. She lives near Jerusalem with her spouse and four children.

Merja Kauppinen

Merja Kauppinen is adjunct professor (language didactics and literature education) and senior lecturer of the pedagogy of L1, L2 (Finnish) and literature in the Department of Teacher Education at the University of Jyväskylä in Finland. In addition to this, she works as a poetry therapist. Her main work and research areas are multiliteracy, arts-based learning, creative methods in language learning, (reading and writing) literacy pedagogy, holistic literature education (Store® – Stories Make Readers -model) and poetry therapy in educational context. She works in both pre- and in-service teacher education in the levels from elementary to secondary education.

COMPREHENSIVE SEXUALITY EDUCATION (CSE) AND THE POTENTIAL TO TRANSFORM YOUNG LIVES

Zeynep Karaosman; Sevcan Karataş; Cynthy K. Haihambo; and Suzanne O'Keeffe

Example Case

When I was a student at a STEM-focused school, comprehensive sexuality education was noticeably absent. In grade 8, our female biology teacher, faced with a classroom of mostly boys, chose to skip the topic altogether. The discomfort surrounding the subject meant that we never received any structured information on sexuality.

By grade 10, the gap became even more apparent. Our new biology teacher, realizing that the subject had been entirely overlooked, decided to address the issue in an unconventional way—by screening Woody Allen's film Everything You Always Wanted to Know About Sex (But Were Afraid to Ask). Although this film provided some information, it was more of a brief and superficial foray into the topic. Consequently, much of our understanding of sexuality came from external sources such as the youth magazine Bravo, with its Dr. Sommer-Team answering questions, and a few neglected pages in our biology textbook.

Years later, reflecting on these experiences as I began my own journey in teaching, I was determined to do things differently. I recognized the importance of not only providing factual information but also teaching students how to navigate discussions about sex in various contexts. In my classes, I made it a point to include sessions on "how to speak about sex" appropriately. I engaged students by collecting vocabulary related to sexuality and

collaboratively deciding which terms were suitable for different settings and which should remain within more private discussions (and what words maybe better stay in the DIY section).

This personal journey from receiving incomplete and piecemeal information to developing a classroom that embraced open, contextual, and inclusive conversations about sexuality has shaped my approach to teaching comprehensive sexuality education today.

Frank J. Müller, University of Bremen, Germany

Initial questions

In this chapter you will find the answers to the following questions:

1. What is Comprehensive Sexuality Education (CSE) and how does it differ from traditional or faith-based approaches to sexuality education?
2. What are the key components of CSE, and how do they address the cognitive, emotional, physical, and social aspects of sexuality?
3. How does a rights-based approach underpin CSE and contribute to empowering young people to make informed decisions?
4. In what ways does CSE cater to diverse learners, including those with different cultural backgrounds, gender identities, and special educational needs?
5. What common myths about sexuality education does CSE challenge, and how does it foster a safe and inclusive learning environment?

Introduction to Topic

Teaching sexuality education can take different approaches. These approaches include faith- and culture-based, public health, and rights-based approaches. Faith- and culture-based approaches to sexuality education take "moralistic" views on sexuality. Public health approaches are concerned with health-related matters such as sexually transmitted illnesses (STIs), using contraception, communication skills and unintended pregnancies. The rights-based approach emphasises the principles of sexual and reproductive health and rights (SRHR) with content taught beyond pregnancy and disease prevention (for

more, see Wangamati, 2020). Comprehensive Sexuality Education (CSE) takes a rights-based approach to teaching sexuality education. CSE is understood as a curriculum-based process of teaching and learning about aspects of sexuality. It is concerned with learning about the cognitive, emotional, physical, and social aspects of sexuality (WHO, 2010). CSE was first introduced in Europe by the International Planned Parenthood Federation (IPPF) in 2006. It became more widely used when adopted by the United Nations Population Fund (UNFPA, 2014, 2015) and the United Nations Educational, Scientific and Cultural Organisation (UNESCO, 2015, 2018). Good quality sexuality education is grounded in internationally accepted human rights, including the right to appropriate health-related information (European Expert Group on Sexuality Education, 2016). International agencies such as the Organisation for Economic Co-operation and Development (OECD, 2020) and the United Nations Educational, Scientific, and Cultural Organisation (UNESCO, 2009) are consistent in the belief that sexuality education reduces sexual risk-taking behaviour, protects against sexual abuse and that a child's access to sexuality education is crucial for building competency, as well as understanding one's own sexual subjectivity (Robinson, 2012). CSE is an approach that offers breath and depth across knowledge, skills and attitudes to sexuality education. This will be explored more in the following section.

What do you mean by comprehensive sexuality education?

Comprehensive sexuality education (CSE) is a curriculum-based process of teaching and learning about the cognitive, emotional, physical and social aspects of sexuality (WHO, 2010). Depending on the country or region, CSE may go by other names. It may be referred to as 'life skills', family life', or 'HIV' education (UNESCO. 2017). It is sometimes called 'holistic sexuality education'. CSE seeks to empower children and young people by equipping them with knowledge, skills, attitudes and values that will inspire them to realize their health, well-being and dignity; develop respectful social and sexual relationships; consider how their choices affect their own well-being and that of others; and understand and ensure the protection of their rights throughout their lives (UNESCO 2017). Traditional models of sexuality education, as described above, took a risk-based approach focusing on biology and reproduction and are often informed by religious values and standards. Comprehensive sexuality education extends beyond those areas to include eight key concepts: relationships; values; rights; culture and sexuality; understanding gender; violence and staying safe; skills for health and well-being; the human body and development; sexuality and sexual behaviour; sexual and reproductive health (UNESCO, 2017). These key concepts aim to equip children and young people with age-appropriate and accurate information about sexuality such as information that dispels myths; about sexual and reproductive rights/health; references to useful resources and services, and information about sexually transmitted infections-STIs. They also develop skills such as decision-making and theability to take responsibility and create positive attitudes and values. This

results in a broader set of outcomes, which include caution against of homophobic bullying, intimate partner violence, and child abuse; understanding of sexual orientation and gender diversity; and promotion of healthy relationships, social emotional learning, and media literacy (for more, see Goldfarb and Lieberman, 2021).

Why do we need comprehensive sexuality education in our classroom?

Comprehensive sexuality education is needed in our classrooms for numerous key reasons. First, it is a central consideration of global education agendas. CSE is directly aligned with the Sustainable Development Goals (SDG), in particular the SDG 3: Health; SDG 4: Education, and SDG 5: Gender Equality. It is also a key recommendation in HIV and health agendas. In a 2010 report on sexuality education, the UN Special Rapporteur on the Right to Education stressed that sexual education should be considered a right in itself and should be linked with other rights. The need for comprehensive sexuality education is also acknowledged in the 2030 Agenda for Sustainable Development of the United Nations and in the International Technical Guidance on Sexuality Education (UNESCO 2017), which states that CSE is needed so that children and young people can access reliable and scientific information appropriate to their age, become individually stronger, and ensure social peace. However, many sexuality education programs delivered in schools are from a risk-based perspective that are underpinned by biology and the traditional view of sex for reproduction. Large-scale international reports suggest that the emotional, social and health needs of young people are not being fully met from this vantage point (IPPF, 2010; UNESCO, 2021; WHO, 2021). Youth mental health is a growing concern across Europe with the World Health Organization (WHO, 2021) reporting that depression, anxiety and behavioural disorders are among the leading causes of illness and disability among adolescents and suicide is the fourth leading cause of death among 15-19 year-olds. UNESCO (2021) details important gender differences in youth mental health such as girls reporting a higher prevalence of sexual violence and eating disorders. Restrictive gender norms increase psychosocial vulnerability amongst all adolescents involved in the study across the globe. CSE plays a critical role in school-based sexuality and gender education and is essential to build a safer society for everyone. It can combat and help prevent sexual violence and exploitation, gender-based violence and discrimination by providing factual, non-stigmatizing information on sexuality and gender identity, promoting non-stereotyped gender roles, and educating children and young people about mutual respect, consent and non-violent conflict resolution in interpersonal relationships.

What should we teach in CSE?

Knowledge, skills, attitudes and values underpin CSE teaching. The content in this section represents what we should teach in CSE. This section draws from the UNESCO International Technical Guidance on Sexuality Education (2018) and is also informed by

literature review of several other resources that are significant in delivering CSE content to the referred ages globally. This section outlines the first three key concepts, topics and learning objectives: relationships; values, rights, culture and sexuality, and understanding gender.

Key Concept 1: Relationships

We understand ourselves better through our families It allows us to locate our own family within a broader context of personal experiences, cultural values and societal trends. When combined, these factors promote greater personal understanding. Teaching young people about families brings many educational benefits. It introduces young people to difference, which challenges assumptions and beliefs, and promotes greater respect and inclusion.

Friendship, Love and Romantic Relationships

Friendships and relationships are fundamental to a young person's growth and development. While it may appear that friendships and love evolve naturally, teaching young people about friendship, love, and romantic relationships is an important opportunity for young people to learn   social skills. It facilitates young people in developing good communication skills and boundary setting and   helps children understand what healthy and unhealthy relationships look like and how to report concerns.

Tolerance, Inclusion and Respect

Introducing young people to issues of tolerance, inclusion and respect has been shown to increase creativity, open-mindedness and encourages a life-long appreciation of respect for difference. This topic promotes a better understanding for young people of   self-knowledge and encourages prosocial attitudes and practices crucial for accepting and respecting others for who they are.

Long-term Commitments and Parenting

Introducing young people to positive parenting practices promotes safety, well-being, and a sense of permanency. UNESCO (2018) provides comprehensive guidance on the themes as well as the knowledge, skills and attitudes that are important under the categories of long-term commitment and parenting. The themes relevant to long-term commitments and parenting include:

- There are many different families that exist around the world.
- Different family members have different needs and roles.
- Gender inequalities are often reflected in the roles and responsibilities of family

members.

- Love, cooperation, gender equality, mutual caring and mutual respect are important for healthy family functioning and relationships.
- Conflict and misunderstandings between parents/guardians and children are common, especially during adolescence, and are usually resolvable.

Key Concept 2: Values, Rights, Culture and Sexuality

Values and Sexuality

Values are strong beliefs that are learned in society/family and that are effective in shaping emotions and behaviours (UNFPA 2018). Different individuals, families and cultures have different values. Values can be influenced by many things such as religion, tradition, mass media, political and social situations. Children can learn their values by sharing with their parents/primary caregivers or other family members, religious teachings, teachers and friends. Values play an important role in children's attitudes/behaviours that they will develop throughout their lives, their reactions to events/persons, and social relationships (UNFPA 2018). Sharing similar values within the family or in social environments is effective in developing stronger relationships; therefore, values can sometimes be accepted as they are and without reflection. Values are also effective in children's development of positive or negative attitudes about sexuality. Positive values taught at an early age will help young people think about their own sexuality, respect others' sexuality, and make positive decisions. They may change over time, but it is necessary to have access to accurate and accessible resources and materials.

Human Rights and Sexuality

Sexuality is a central aspect of being human throughout life and encompasses gender, gender identities, sexual orientations, relationships and reproduction (WAS 2014). Sexuality is an integral part of every person's personality. The full development of sexuality depends on meeting basic human needs such as privacy, emotional expression, and compassion. The healthy continuation of sexuality is affected by the quality of the interaction between the individual and the social structures. Sexual rights are universal human rights based on fundamental rights such as freedom, human dignity and equality for all people. Sexual rights should also be one of the basic human rights such as health, education and housing. To develop the sexual health of individuals and communities, sexual rights must be recognised, encouraged, respected and defended by all societies.

Culture, Society and Sexuality

Every culture has norms about sexuality. In some societies, sexuality continues to be

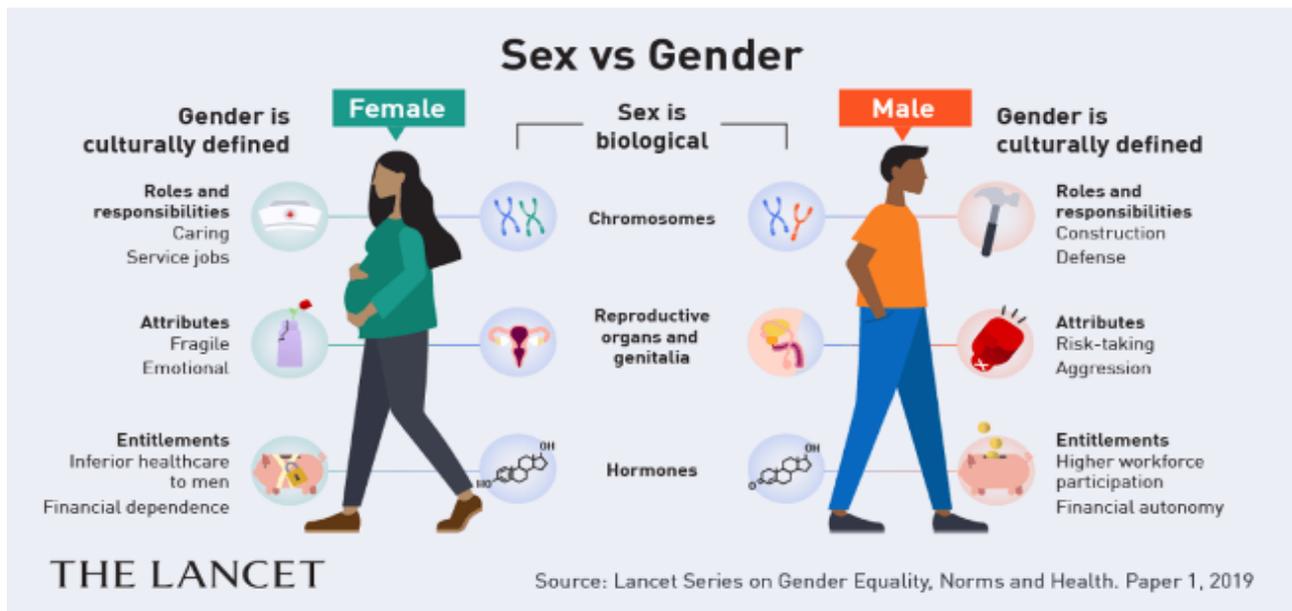
perceived as complex, mysterious and a source of fear. Sexuality has mental and behavioural aspects as well as biological and physical characteristics (UNFPA 2018). The most important factor in the development and change of young people about sexuality is the perspective of the culture in which they grew up. Cultural and societal perspectives on sexuality may differ from each other, and even regional differences within the same culture affect the view on sexuality.

Children receive messages from family, friends, the media and the environment about how to behave, which encourage children to conform to existing patterns and practices of sexuality. Young people ought to be encouraged to discuss sexuality in schools, social areas, with their partners and families because of different sexual values and beliefs. Many young people do not consciously choose their gender-related social roles. They have already gained their roles in the socialisation process that begins in childhood.

Key Concept 3: Understanding Gender

The Social Construction of Gender and Gender Norms

The social construction of gender comes from the theory of social constructionism which states that meaning and knowledge are socially created. According to the social constructionism theory, the things that are acknowledged as natural or normal in society, such as understanding of gender, race, class, and disability, are the result of social interaction and the rules imposed by the dominant groups in society. Until the last couple of decades, the word gender was used interchangeably with sex and therefore, gender roles are the roles that are assigned to people based on their sex. For example, men were – in some societies, still are- viewed as breadwinners and women as housewives and homemakers. This meant the public sphere of life, which includes involvement in political matters, paid labour and civil society, was/is associated with men. The private sphere, on the other hand, including family issues, household and unpaid labour was associated with women. These socially created gender roles not only put people in the category of man and woman but also decide how one must behave, present and perform publicly and privately.

Figure 1: Sex vs Gender


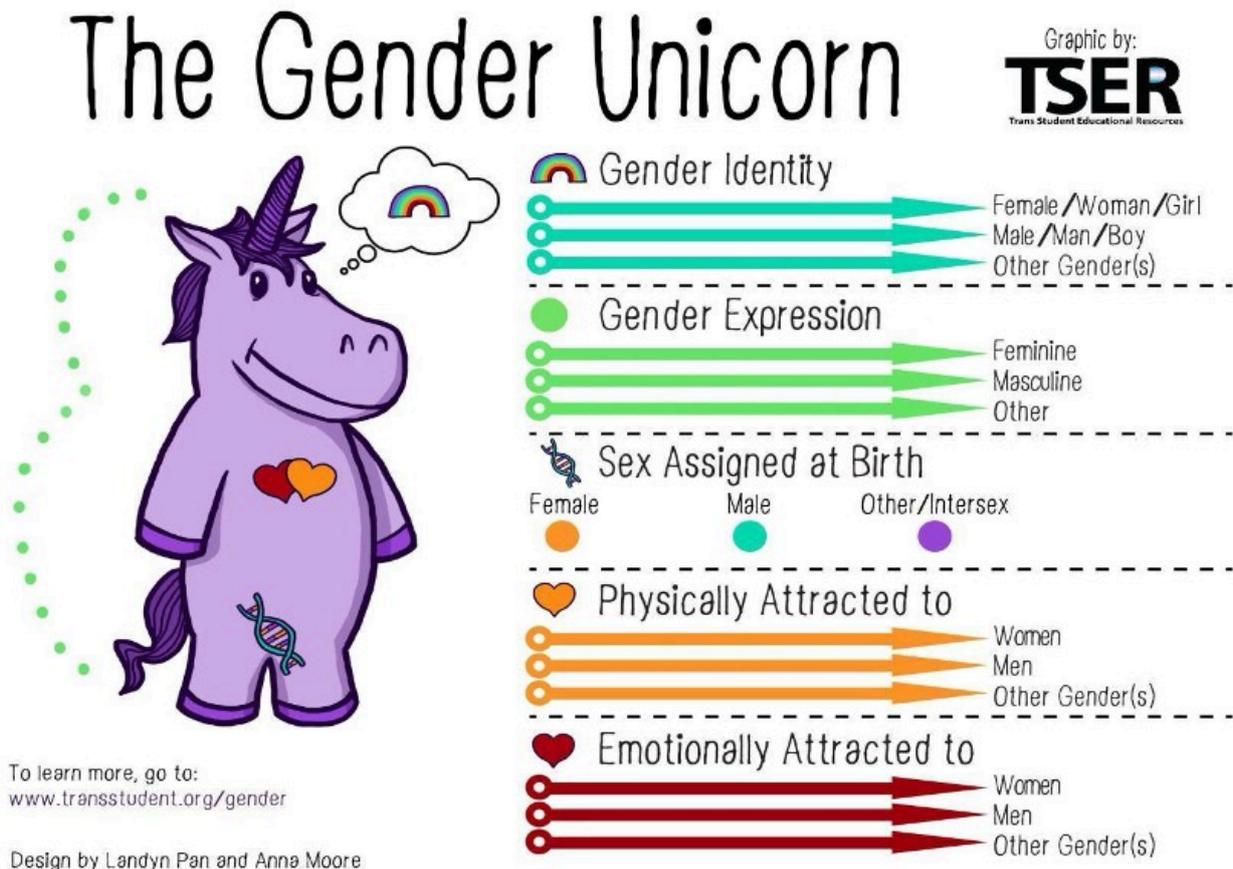
Source: Lancet Series on Gender Equality, Norms and Health, Paper 1, 2019

Unlike the traditional definition, sex is a label assigned at birth based on the genitalia, chromosomes, and hormones one is born with (e.g., male, female, intersex), while gender is about the perception, understanding, and experience of a person about what they are meant to be and how they want to interact with the world (e.g., cisgender, transgender, non-binary, gender non-conforming, genderqueer, woman, man). Therefore, assuming someone's gender identity or sexual orientation based on how they look and thinking that people are only attracted to the "opposite" gender, teaching that people are either men or women based on their body parts (cisnormativity) and ignoring non-binary and gender non-conforming people are all part of socially constructed gender norms.

Gender Equality, Stereotypes and Bias

Gender stereotypes are over-generalised assumptions and beliefs about individuals, and they reflect the perceptions and expectations about people that are solely based on their gender. The content of stereotypes and biases generally includes behaviours, physical and characteristic features, roles, preferences, attitudes, interests, and skills among others. They serve as a lens through which people view their social world and are constructed in minds as early as childhood. They influence the toys children play, the way they dress, the way they speak, the relationships they build, the school subjects they study, their entire experience of education, and their future careers and lives. These ideas come from all sorts of sources – families, schools, media, workplaces and so on. In order to ensure that every child is given the opportunity to reach their full potential, it is critical to challenge gender stereotypes and biases and teach kids about gender equality starting from a very young age. Children need to understand what gender bias is and how it shapes the society they live in. This can be achieved through non-gendered play activities, gender-neutral toys, books

and stories that challenge stereotypes, and positive role models. Our role as educators is to challenge these gender norms, deconstruct gender stereotypes and promote gender equality in and out of the school. Children should unlearn and question these false and limiting beliefs about themselves and others and for that, we should prepare them to think outside of the "gender box".

Figure 2: The Gender Unicorn


For more information about Gender Unicorn, definitions and how to use it in classroom: Gender Unicorn – (transstudent.org)

Gender-based Violence

Gender-based violence is defined as acts or threats of physical, sexual or psychological violence directed against a person based on their gender or sex and enforced by unequal power dynamics. Gender-based violence is among the most common violence that exist in all societies and all cultures because of gender norms and stereotypes. Such violence can appear in many different forms:

Table 1: Types of gender-based violence

Types of gender-based violence
Sexual violence: Includes actual, attempted, or threatened rape, including marital rape; sexual abuse and exploitation; forced prostitution; transactional/survival sex; and sexual harassment, intimidation, and humiliation.
Physical violence: Includes actual, attempted, or threatened physical assault or battery; slavery and slave-like practices; and trafficking.
Emotional and psychological violence: Includes abuse and humiliation, such as insults; cruel and degrading treatment; compelling a person to engage in humiliating acts; and placing restrictions on liberty and freedom of movement.
Harmful traditional practices: Include female genital mutilation/cutting (FGM/C); forced marriage; child marriage; honour or dowry killings or maiming; infanticide, sex-selective abortion practices; sex-selective neglect and abuse; and denial of education and economic opportunities for women and girls.
Socio-economic violence: Includes discrimination and denial of opportunities or services on the basis of sex, gender, or sexual orientation; social exclusion; obstructive legal practices, such as denial of the exercise and enjoyment of civil, social, economic, cultural and political rights, mainly to women and girls. For more, please refer to: **https://www.unhcr.org/**

What should we keep in mind when preparing CSE materials?

While teaching CSE, it is important to consider the needs of target groups/learners within the social and cultural contexts of their lives and to use variety of methods:

- **Storytelling**
  Storytelling can be a very powerful tool when they are relevant and the learners can relate to them.
- **Brainstorming and making Flip charts**
  Brainstorming is a great method when introducing a new topic or solving a specific problem. The topic to brainstorm should be formulated into a question that has many answers. Write the question on a flip chart and ask learners to contribute with their ideas. The answers should be written as words or short phrases. At the end of brainstorming, the group can discuss the ideas.
- **Role-play**
  Role-play can be a key method especially when we want to encourage learners to empathise with others. Through imagining themselves in an unfamiliar situation, learners can realize how social stereotypes can be reproduced even when they are theoretically against them. Before asking learners to act out in a role play, it is useful to explain the objects and outcomes of the activity. It is also important to make sure no one feels excluded or marginalized.
- **Discussions**
  Discussions in small or large groups are vital to stimulate critical thinking and

understanding important points of the topics. This method can be combined with the others by asking open questions such as; "What do you see here? Why do you think it happens? What can we do in order to prevent it?". It is necessary to summarize the major ideas and to write them down at the end of the discussion. Otherwise, it can be hard for the learners to grasp the most important points and to understand their significance.

• **Using Media**

Sources such as film clips, videos, songs or articles can be used as effective active learning materials. They can help especially young children learn complex subjects better. Learners can also be asked to create their own media like videos, writing and recording songs or articles about the topics they have learned.

In order to fulfill this comprehensive mandate of comprehensive sexuality education, the developers of Comprehensive Sexuality Education (CSE) material should consider these principles:

• CSE starts from birth and progresses in a way that is developmentally appropriate through childhood and adolescence into adulthood.
• It covers a comprehensive range of topics beyond biological aspects of reproduction and sexual behaviour, including (but not limited to) sexuality, gender, different forms of sexual expression and orientation; gender-based violence (GBV); feelings, intimacy and pleasure; contraception, pregnancy and childbirth; and sexually transmitted infections (STIs), including the human immunodeficiency virus (HIV) and Human Papillomavirus.
• CSE is an evidence- and curriculum-based process of teaching about the cognitive, emotional, social, interactive and physical aspects of sexuality.
• CSE provide current, accurate information on sexual and reproductive health and rights (SRHR) that is publicly available and accessible to all, and incorporated into educational curricula, and in all spaces used by children and young people.
• It strengthens children's and young people's ability to exercise their sexual and reproductive rights to make conscious, satisfying and healthy choices regarding relationships, sexuality and their physical and emotional health while considering their lives at the current moment and for the future.
• It is based on respect for universal human rights, gender equality and diversity that underpins individual and community well-being.
• It helps young people to reflect on, understand and challenge harmful social and gender-based norms and the impact these have on relationships with peers, parents, teachers, other adults and their communities.

CSE is an integral part of the human right to health and support services; in particular, the right to access appropriate, adolescent-friendly sexual reproductive health and rights

information and support-services. In addition, the content of and design of CSE material should be:

- Age- and developmentally-appropriate
- responsive to the changing needs

What role does diversity play in CSE?

For a long time, comprehensive sexuality education materials have targeted the "average" child or young person, irrespective of the diversity of humanity. We are referring here to diversity in terms of physical, cognitive, socio-cultural, emotional, socio-economic, political and any other characteristics. In the past, comprehensive sexuality education programmes have excluded, although unintentionally, children and young people with non-normative sexual and gender identities, disabilities and other special educational needs; from remote, rural and underserved communities, wreligious and traditional beliefs and other forms of diversities. In this chapter, we want to undo this form of exclusion by using the phrase: *"All Means All"* and arguing for inclusive, comprehensive sexuality education.

Why does LGBTQI+ inclusion in CSE matter?

Adolescence is a period when friends and social circle become very important. Many LGBTQI+ students hide themselves for fear of being ostracized and ridiculed by their friends and teachers. While invisibility and being ignored alleviates a severe aspect of violence and oppression, feeling restricted and unable to be authentic paves the way for discrimination to take place. In such cases, it is possible to talk about the existence of traumatic events, especially during adolescence, when sexuality is at the forefront. Adding LGBTIQ+ to CSE is essential important as it removes the veil of silence surrounding issues of inclusivity and diversity and gives students and teachers the confidence and competence in this area. This will help shine a spotlight on LGBTQI+ issues and concerns, promote an inclusive school and address homophobic and biphobic bullying.

How can we as educators create a safer space for everyone?

CSE programmes should be designed to ensure a safe and enabling environment for students, one that engenders a sense of comfort, openness, and safety. In the classroom, a facilitator can create a protective and enabling environment, also known as 'climate setting', by establishing ground rules, such as keeping confidentiality and avoiding making generalizations about any groups of individuals; demonstrating active listening by paraphrasing questions and contributions from learners; building trust, as demonstrated by a willingness to respond to all questions without shame or minimization; reducing showing your own bias by expressions of shock or judgment to what the young people share;

encouraging contributions from learners in participatory ways, which communicates the value of the students and enables them to personalize and integrate the information and skills being taught. (UNESCO. 2015: 24).

How can we use language to open communication to open communication?

For effective and successful CSE classes it is important to set a number of agreed expectations beforehand to ensure that a safe learning space is created. The participants should be involved in generating these rules. This will make them feel more comfortable and safer. Some expectations might include:

- The personal stories shared and discussed here will not be shared with someone outside of this group.
- Everyone has the right to share and not to share their personal stories.
- We have no right to share stories or experiences of others.
- No question is stupid or not worth asking.
- We will take responsibility for challenging harmful prejudice and oppression and reflecting our own prejudice.

What are the challenges we might face during CSE?

UNESCO (2019) acknowledge resistance to CSE in some communities. The barriers to CSE implementation include social opposition, which may negatively affect other areas such as policy-makers; the availability of and teacher access to appropriate curricula and training resources covering a comprehensive range of key CSE topics; teachers' attitudes and readiness to deliver a curriculum and create the right classroom conditions for effective teaching and learning; students' motivation; and parental concerns and lack of cooperation. High teacher attrition rates, or high-turnover, is also noted as a barrier to CSE as are changes in educational administration such as a change in minister impacts on CSE implementation strategies and their momentum.

Exploring common myths and facts is an effective strategy in addressing underlying assumptions and biases that might prevent effective CSE implementation.

Table 2: Myths and Facts

MYTHS ❌	FACTS ✅
Comprehensive sexuality education encourages children and young people to engage in sexual contact and desensitizes them to sexuality	Comprehensive sexuality education program helps young people to fully understand sexuality, delays sex, and use condoms or other contraception effectively
Comprehensive sexuality education programs teach young people to consent at all times about sexuality and undermine parent/ family authority	Comprehensive sexuality education is much higher quality and inclusive than the sexuality education that families will give to their children. These education programs define the role of parents in sexuality education and create a supportive environment
Comprehensive sexuality education disregards values and promotes homosexual/ bisexual behaviour.	Comprehensive sexuality education supports a rights-based approach that includes values. It gives young people the opportunity to discover and define themselves. Moreover, it includes respect, acceptance, tolerance, equality and empathy for other individuals, cultures and societies
Comprehensive sexuality education teaches teens the mechanics of sex	Comprehensive sexuality education is planned according to the needs of age groups. Information such as family structure, body parts/structure/ names, consent, changes in puberty, infectious diseases, making decisions about relationships, contraception methods and pregnancy are included in the education content according to age groups. How to have sex is not included in comprehensive sexuality education
Comprehensive sexuality education highlights inappropriate condom use and provides inaccurate information about condom effectiveness.	Condom use is very effective in preventing HIV, other sexually transmitted diseases and unwanted pregnancies. Comprehensive sexuality education programs are not used as a tool to control population growth. Comprehensive sexuality education emphasizes the importance of using condoms, but not by using sexually explicit and/or sexually entertaining methods.

How can we be more inclusive of children from different cultural backgrounds?

In order for teachers to effectively deliver barrier-free, inclusive CSE to all children and young people in their care, they need to develop attitudes, skills and materials that speak to the wide range of diversity of their learners. It is advisable to conduct an index of the students to get an understanding of their backgrounds, belief systems and traditional practices in their communities. This sounds like a mammoth task which no one should attempt to do in one week and tick off. It is a long-term process that requires an open mind and introspection of one's own value system and biases. A value -audit will help teachers to determine their own opportunities and irritations to teach CSE and seek support. This process should prepare teachers to develop material that is bias-free, barrier-free and non-judgmental. In different parts of the world, Comprehensive Sexuality Education is delivered in different ways as deemed appropriate to that particular setting. The following includes guidance and questions to ask when considering diversity and inclusivity in teaching: does the programme represent the cultural backgrounds of those you are teaching? Is the programme respectful of different languages, cultures and social structures represented in those you are teaching? Are there materials suitable for children with neuro-diverse, sensory and cognitive conditions? Do the textbooks and worksheets include representations of race, gender, religions or other forms of diversity? Does the material refer learners to a counseling support group or adolescent-friendly reproductive health clinic, yet it does not exist in the school or community? If some of the answers to the questions above are NO, what adaptations will need to be made?

Conclusion

Sexuality education is an important part of human development and starts from, through all developmental stages such as early childhood, late childhood, puberty, adolescence, adulthood and old age. It is intended to support and protect children and young children sexual development. It aims at providing tools to empower children and young people with factual knowledge, skills and positive values to understand and enjoy their sexuality, while maintaining safe and fulfilling relationships. Furthermore, comprehensive sexuality education capacitates children and young people to take meaningful decisions for their lives and take responsibility for their own and other people's sexual health and well-being. It provides them with tools to negotiate their rights and values amidst cultural and structural barriers.

Comprehensive Sexuality Education was traditionally approached from a medical, disease prevention perspective, the international trend is to prescribe to a more holistic approach including areas of positive relationships and individual as well as group wellbeing. The move from the medical perspective is also accompanied by a balance between the focus on the anatomy and the socio-cultural aspects of wellbeing.

Closing questions to discuss or tasks

- Reflect on your own journey as a young person in their puberty and early adolescence years. How did you access information related to your changing body, emotions, and feelings? Who/ What helped you cope with these changes? What do you wish you were told before you experienced it? Now ask your students to do the same and discuss the issues that come from this exercise with your learners.
- Ask learners to place questions they want to ask about the topic of comprehensive sexuality education or worries they have in a box. Also ask them how they prefer you to respond to those questions. Consult with your colleagues (be selective of whom you include) and develop a strategy for responding to those issues. Where you need to refer learners for further help beyond your scope, please do so while following the relevant referral steps.

About the authors

Zeynep Karaosman

Zeynep Karaosman is a Palestinian-Syrian queer, feminist and peace activist and a teacher. She was born and grew up in Turkey. She studied English Language Teaching(BA) at Anadolu University and English Language&Literature at Istanbul Aydin University. After 8 years of teaching English in Turkey, she moved to Germany in 2020. She is currently a student in the Turkish language teaching department at the University of Essen and has been working as an Inclusion Assistant at a secondary school for 3 years. Apart from her teaching profession, she has been doing queer, feminist activism. She is also one of the founders of *Palestinian and Jews for Peace* activist group. Considering teaching as a political act, she advocates for anti-bias education for everyone.

Sevcan Karataş

Sevcan Karataş is a Assistant Professor in First and Emergency Aid Program, Istanbul Yeni Yuzyil University (Turkey). She completed her doctorate in Florence Nightingale Nursing Faculty Mental Health and Psychiatric Nursing Department, Istanbul University-Cerrahpaşa. Her research focuses on different topics in the field of mental health, especially sexual identity and sexual orientations.

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Suzanne O'Keeffe

Suzanne O'Keeffe is Assistant Professor of Education in the Froebel Department of Primary and Early Childhood Education, Maynooth University, Ireland. Her work focuses on sociological questions in education, with a particular interest in questions of gender and masculinities. Areas of interest include children and childhood, feminist research designs, and gender and sexualities. Recent publications include *Masculinities and Teaching in Primary Schools* (2022, Palgrave MacMillan).

PART VI

SECTION 6: BUILDING INCLUSIVE SCHOOL CULTURES AND POLICIES

INCLUSIVE SCHOOL CULTURE

Example Case

Don't judge a book by its cover

ORGANISING A HUMAN LIBRARY TO FOSTER A CHANGE IN ATTITUDES TOWARDS DIVERSITY IN SCHOOLS

The town in which Westfield primary school is located has experienced a changing demographic in recent years due to increased global migration. Across the country and indeed across Europe, the rise of right wing politics has led to increasing incidents of discrimination, and Westfield has not been immune to this trend. Following some disturbing incidents of bullying based on gender, class, disability and ethnicity, the staff team of the school decided that something proactive needed to be done to address the changing school climate, rather than simply responding to incidents as they arose. After conducting research on various approaches to developing an inclusive school culture, they decided to organise a Human Library (see below for details on how to organise one yourself!). In the Westfield Human Library, members of the school community had the opportunity to meet people who they normally do not have access to. These included refugees, persons with disabilities, ex-prisoners, ex-drug users, victims of domestic violence, members of the LGBTQIA+ community, people who have gender atypical jobs, people of different skin colour, parents representing different family structures such as same sex or lone parents and people from religious and ethnic minorities. The human books available in the library were chosen depending on the school context and the demographics of the school population, especially the students. Similarly, the conversations,

use of language, the stories told depended on the demographics of the readers. The Human Library was a safe space where members of the school community were able to ask difficult questions and to be provided with honest answers about different realities and human experiences. Readers of these human books learned not to judge books by their cover; that there is a human being inside every cover; they learned to reflect upon their prejudices and attitudes towards the social categories represented by each book. Visitors to the Human Library who came themselves from a minority, disadvantaged or stigmatised background appreciated being represented by human books with whom they could identify, from whom they could learn about challenges and how they may be overcome. The aim of the human library was to challenge attitudes, assumptions and taken-for-granted stereotypes about a social category of people. While it didn't solve every problem of society, the feedback to the principal from the school community of Westfield was very positive, and teachers noted a reduction in incidents of bullying afterwards. In reflecting on the activity afterwards, the general consensus of staff, children and families was that the Human Library was a hugely successful and effective way to allow people to reflect on their attitudes towards diversity and work to create a school culture where everyone feels welcome, safe and represented.

Initial questions

In this chapter you will find the answers to the following questions:

- What is an inclusive school culture?
- Why is an inclusive school culture important?
- How is an inclusive school culture implemented?

Introduction to Topic

What is an inclusive school culture?

Nowadays societies are increasingly socially and culturally diverse, and school communities are often a reflection of this diversity (Killen & Rutland, 2022; Mallia Borg,

2007). Social exclusion, discrimination, bullying, and expressions of hate are also widespread (Killen & Rutland 2022). Therefore, the need to create an inclusive school environment and to address prejudice and discrimination has become more urgent. Building and fostering an inclusive school culture within the school community in order to respond to these trends has been recognised by the international educational community and by local learning communities and educational leaders as well as by policy makers who legislate in favour of inclusivity, diversity and equality. The foreword to A guide for ensuring inclusion and equity in education (UNESCO, 2017) refers to the 2030 Sustainable Development Agenda and to Sustainable Development Goal 4 whose aim is inclusive and equitable quality education for all. The goal is for educational institutions and learning environments to be sensitive to the needs of all learners, to be inclusive, safe, non-violent, child-friendly, gender-sensitive and to cater for all abilities.

Inclusion policies have become more common within educational systems and are increasingly becoming incorporated within teacher education curricula in different countries, as educational institutions and educators are expected to be skilled in 'inclusion' even if there is no universally accepted definition of inclusion, or how best it can be promoted and implemented (Essex, Alexiadou & Zwozdiak-Myers, 2021). Consequently, student teachers may have to deal with different approaches to inclusion and diversity which may at times also be conflicting or contradictory (Essex, Alexiadou & Zwozdiak-Myers, 2021).

Within the social sciences, there is also no universally accepted definition of culture. It may be considered a contested concept since different scholars have provided different definitions and approaches to defining the concept (Spencer-Oatey, 2012). Jahoda (2012) claims that culture is difficult to define as it is a social construct created from a wide range of complex phenomena. However, others are more explicit in terms of phenomena and state that culture flows from standards, values, beliefs, habits, and practices developed gradually over a period of time (Peterson & Deal, 1998).

On the basis of Spencer-Oatey's (2012) discussion on the various attempts at defining culture, we may broadly define culture as a set of norms and values, attitudes, beliefs, rituals, ways of doing things, assumptions and expectations that are shared by a social group. Culture is learned from one's social environment through the various agents of socialisation such as the family, the school, religion, peer groups and so on. Similarly, defining a school culture is not straightforward but it has been described (Deal & Peterson, 2016) as having a powerful effect on school life. According to the authors, it is something which is not easy to pinpoint but rather affects how things are done at school, how people interact, norms, forms of dress, and various other elements within an educational institution. Therefore, we may define it as the set of norms, informal rules, values, rituals, traditions, goals and practices that is developed, shared, promoted, learned and reproduced within an educational setting and learning community but which, at the same time, remains slightly "elusive" and hidden, as Deal and Peterson (2016, p. 7) describe it. Cultures include

both material and non-material elements, that is those aspects of a culture which are tangible or visible and those aspects which are abstract such as values and attitudes (Hahn, 2018).

For a school culture to be inclusive, it needs to create an atmosphere which is embracing of diversity and which ensures that every member of the school community is treated with respect and dignity and embraced as a unique person regardless of gender, race, ethnicity, religion, belief, sexual orientation, parental or family status, geographic origin, political views, socioeconomic background, age and ability. Material aspects of an inclusive school culture would include physical structures such as accessible buildings, universal bathrooms, religious symbols representing different belief systems, teaching resources and materials such as images representing diversity or dolls of different skin colour and body shape used with early learners. Non-material aspects would include non-tangible elements such as the values, norms, philosophies, beliefs and attitudes which are often the drivers behind the realisation of such a culture. Values of social justice, equality and inclusion, feelings of belonging, ideas about schools being safe spaces for all, an appreciation of diversity in all its forms are all examples of non-material elements of inclusive culture.

An inclusive school also strives to go beyond the idea and practice of integration, where, for example, students with disabilities learn alongside students without disabilities. An inclusive school is not only concerned with social categories that are more likely to be stigmatised or marginalised such as gender non-conformers, persons with disabilities or those coming from minority ethnic groups, but emphasises the inclusion of all members of the school community. It strives to put into practice the concepts of universality and equality in education and considers diversity, regardless of how it is manifested, as a positive source of enrichment, within a broader scheme based on the value of social justice (Moliner Miravet & Moliner García, 2013). Inclusive schools embrace and celebrate diversity to ensure that all students have the same rights and opportunities to fulfil their potential in all areas (Hannigan, Grima-Farrell & Wardman, 2019; Villa & Thousand, 2005).

An inclusive school culture aims to foster a sense of community and belonging within the educational community (Osterman, 2000) and to ensure that all members of the community consider their school as a safe space where they can be themselves, and where they can flourish academically and find care and support. For a school culture to be really inclusive, it needs to be shared by the whole school community, as its values and principles guide everyday interaction, decisions, policies and attitudes, both on a macro and micro level within an educational institution and learning community.

An inclusive school culture is not static. In order to adequately respond to changing trends in social and cultural diversity, inclusive school cultures are developed, reproduced and reconstructed through everyday interaction, activities, initiatives, reflection, decisions, procedures, objectives of the institutions and the communities within them. It becomes an essential element of the institution in the sense that it underlies the whole structure and

day to day operations and is reflected throughout, both in its formal and informal practices (Moliner Miravet & Moliner García, 2013). In other words, it is a way of thinking.

Why is an inclusive school culture important?

Educational institutions, educational leaders and educators play a crucial role in the creation of inclusive learning spaces. When schools take proactive action to bring about change, they are more likely to succeed in reducing social and cultural exclusion as well as bias and discrimination and to create and maintain a safe and inclusive environment for all. An inclusive school culture creates a more conducive learning environment, even if it does not necessarily guarantee academic success. These include students who; do not feel accepted or who lack friends, experience rejection, discrimination or bullying, are less likely to engage or perform well academically, who lack motivation, whose attendance is poor or are likely to drop out of school, and their social development suffers (Juvonen et al., 2019; Killen & Rutland, 2022).

In recent decades, the educational community has become more sensitised to the varying needs of students. While all students have needs, some students may have more needs and may require more support and attention. Mallia Borg (2007) notes a paradigm shift in education where instead of perceiving students as failures, the onus is placed on the educational system for failing to cater for their needs. In literature, considerable attention has been given to the benefits of including learners with special needs. However, research shows that the benefits of inclusivity extend beyond students with special needs. Utomo and Thaibah (2021) describes how inclusive education is particularly beneficial for character building among all students, as experiences of inclusionary practices teach life skills and promote positive attitudes towards others who have different needs. An inclusive school culture also encourages students to take the side of those who are willing to offer support and assistance to those who need it (Killen & Rutland, 2022).

A review of initiatives in various countries, aimed at promoting an inclusive educational environment particularly for transgender young people (Domínguez-Martínez & Robles, 2019), suggests that educational institutions which have in place policies protecting gender minorities are beneficial in a number of ways. Educational spaces where binary notions of gender are challenged, where students can express their gender without fearing the consequences and which embrace diversity, tend to create a more positive and safe school climate, enhance overall wellbeing, decrease instances of victimisation and harassment and reduce absenteeism. A positive practice implemented in several countries is the formation of gay-straight alliances, which has proved to have a number of positive effects, particularly for young transgender people. School curricula which are representative of minorities also tend to have a positive impact on enhancing wellbeing and reducing victimisation and harassment of students who are considered different (Domínguez-Martínez & Robles, 2019).

A qualitative study conducted with five school principals who adopted an inclusive approach in their schools found that inclusive cultures, based on a philosophy of inclusion as "a way of thinking and acting", ensures that all members of the community become meaningfully involved and gain equally from it (Osiname, 2018). An inclusive school culture strives to eliminate social exclusion and barriers that hinder students from enjoying their rights and from feeling valued, respected, protected, and safe. This, in turn, motivates members of the school community to express themselves freely, openly, and honestly, knowing that they will be listened to and have their views respected. Staff and students have the opportunity to approach the principal and express their feelings and concerns without the fear of being punished or chastised. Adopting an open-door policy can be an effective way of encouraging openness as it conveys a message that everyone can contribute to building an inclusive school environment (Osiname, 2018).

The rapid advances and dependence on technology since the Covid-19 pandemic has highlighted the importance of digital inclusion and investment in digital technology. Research by Kim, Yi & Hong (2021) describes the inequalities of access to digital technology at home or school and noted that disparities were greater when other factors such as socio-economic background are taken into account. School cultures should be digitally inclusive as unequal access to digital technology is likely to have long term implications.

Inclusive school cultures are important as they respond to students' need for belonging (Osterman, 2000). In a context where mental health concerns are becoming increasingly critical, inclusive school cultures may prove vital for enhancing psychological well-being, and for highlighting how exclusion, disengagement from school, education-related stress, marginalisation, lack of friends or popularity may all have a significant detrimental impact on the mental health of students (Hannigan, Grima-Farrell & Wardman, 2019).

How is an inclusive school culture implemented?

Diversity within a school setting does not automatically ensure inclusion. Inclusion is a goal that needs to be developed and promoted proactively (Juvonen, 2019). The Council of the European Union reiterates the importance of implementing inclusivity in schools in its 2018 Recommendation on promoting common values, inclusive education, and the European dimension of teaching:

"Ensuring effective equal access to quality inclusive education for all learners, including those of migrant origins, those from disadvantaged socioeconomic backgrounds, those with special needs and those with disabilities — in line with the Convention on the Rights of Persons with Disabilities — is indispensable for achieving more cohesive societies" (Council of the European Union, 2018, point no. 16).

Responding to social and cultural diversity in our educational systems is no easy task. It is a challenge that many schools, colleges and universities are now implementing.

Educational institutions striving to foster a culture of inclusion often need to implement radical changes which require commitment and hard work involving both deconstruction and reconstruction. Fostering a culture of inclusion often requires the dismantling of all that hinders its development such as attitudes towards diversity and may necessitate the transformation of the whole educational institution. It also requires the motivation of the whole school community in order to ensure the contribution of all involved (Moliner Miravet & Moliner García, 2013).

In his foreword to A guide for ensuring inclusion and equity in education, Dr Qian Tang (Unesco, 2017) writes that:

"To achieve this ambitious goal, countries should ensure inclusion and equity in and through education systems and programs. This includes taking steps to prevent and address all forms of exclusion and marginalisation, disparity, vulnerability and inequality in educational access, participation, and completion as well as in learning processes and outcomes. It also requires understanding learners' diversities as opportunities in order to enhance and democratise learning for all students" (Foreword).

Research by Fine-Davis & Faas (2014) into how schools in six European countries address cultural diversity revealed that European societies approach diversity in education based on different models. In countries such as Germany, Greece and Ireland, the concepts of interculturalism and intercultural education were preferred while in Britain, the Netherlands, Canada, the United States and Malaysia, the term multiculturalism is used. The authors also cite research which shows that national historical and political legacies as well as the topics taught also influenced educational policies and practices in different European countries (Fine-Davis & Faas, 2014).

The authors of this chapter have identified four major components that play a crucial role in the implementation of an inclusive school culture. These include attitudes, collaboration, knowledge, and leadership.

Attitudes – A multi-layered approach aims to bring about attitudinal and behavioural changes among students as well as administrators, educators, and other members of the school community (Juvonen et al., 2019; Killen & Rutland 2022; Mallia Borg, 2007; Moliner Miravet & Moliner García, 2013).

Collaboration – Different stakeholders, entities and communities working together, supporting and learning from each other. It involves educators working together, facilitating a leadership and educational authority structure and a supportive legal framework, involving parents and students, collaborating with other school communities, and sharing a determination to reach common goals (Lave and Wenger, 1998).

Knowledge – Knowledge, more specifically research-based evidence, that guides the realisation of school inclusion in terms of different beliefs, needs and cultures, family situations and socio-economic backgrounds of everyone in the school community. Acknowledging the importance of knowledge and recognising different sources of knowledge, e.g., through interaction with students and their parents, the provision of training

or learning from the good or bad practices of other schools (Razer, Friedman & Warshofsky, 2013).

Leadership – The role of educators and administrators as role models whose behaviour may be reflected in the attitudes and behaviour of their students (Juvonen, 2019) and the whole school community. Educational leaders may take on the roles of facilitators, innovators, visionaries and strategists, as well as enablers of an inclusive school culture and must be open to change.

All of these above combine to create 'safe spaces' in educational settings where all staff, students, and members of the wider educational community feel welcome, respected, safe and visible.

Key aspects

Attitudes

Attitudes refer to how societies, communities and individuals learn to perceive issues, people, things, objects, and events in a particular way which could be positive or negative but which could also be ambivalent at times (Cherry, 2024). According to the same author, psychologists tend to consider attitudes as having three components. These include; an affective component referring to how one may feel about a social group of people such as Muslim students; a cognitive component relating to the beliefs and ideas that one may have about an issue such as the inclusion of trans students; and a behavioural dimension where attitudes about someone or something may influence how people act, even in an unconscious manner, such as addressing the assistant of a learner with disability rather than the learner.

Moliner Miravet and Moliner García (2013) consider two factors as being crucial for the promotion of a culture of inclusion: "(a) a set of objectives agreed on by the educational community, and (b) shared values" (p. 1376). They identify a number of factors as contributing to the achievement of consensus among the teaching community such as the degree of teaching experience, the position one occupies within the school as well as the gender of the educator and the subject one teaches. Although there are convergent views about the issue of how to establish "a common language" throughout an institution, they argue that a shared culture of inclusivity reinforces the sense of community and belonging within an educational setting (Moliner Miravet & Moliner García 2013). The question remains on how to achieve this.

How does a school community come to embrace a common set of objectives and values? This is a long-term goal which can only be achieved through a passionate, committed, joint and continuous effort and involves challenging taken for granted assumptions, transgressing boundaries, orthodox views and methods. Attitudes are shaped through socialisation and learning at home and at school, through media influence, social

experiences, and observation, and while they may become ingrained, it does not mean that they are incapable of change (Cherry, 2024).

The Recommendation on promoting common values, inclusive education, and the European dimension of teaching (Council of the European Union, 2018) suggests that educational staff should be able " to promote common values and deliver inclusive education, through:

(a)	measures to empower educational staff helping them convey common values, and promote active citizenship while transmitting a sense of belonging and responding to the diverse needs of learners; and
(b)	promoting initial and continued education, exchanges and peer learning and peer counselling activities as well as guidance and mentoring for educational staff".

Heads of school play an important role here as they are often the drivers behind a change in attitudes. Acting as both role models and facilitators, heads of schools who facilitate openness, accessibility, critical feedback, democratic participation and involve all members of the school community are more likely to bring about an attitude change towards inclusion (Osiname, 2018). Embarking on a project which strives to bring about a change in attitudes towards diversity within a school setting may necessitate both direct and indirect interventions as well as strategies targeting different processes and practices. These include; developing an inclusion policy and multicultural curriculum as well as indirect ways through which messages about inclusion, acceptance, equality and social justice are conveyed, e.g., through the use of images in class or, if working with small children, through the use of dolls, soft toys or puppets having different body shapes or skin colour and hair textures (Juvonen et al., 2019). The hidden curriculum is a primary tool through which inclusivity may become a way of thinking within an educational institution.

Changing attitudes towards diversity could be encouraged by facilitating communication among members of diverse groups. This helps to reduce negative stereotypes and biases about those who are different. Within their classrooms, teachers may find ways of encouraging inter-group interaction, e.g., through seating arrangements or group work. Interaction across groups may also be encouraged through extracurricular activities or themed clubs which attract students from different backgrounds. It may also be encouraged through a peer mentoring system (Juvonen, 2019, Killen & Rutland, 2022). Creating a school and classroom context where students interact with those who are different from themselves is an excellent opportunity to promote openness to diversity. Intergroup interaction enables young people to see both the differences and the similarities that exist between them and their peers, and to appreciate differences as alternative realities rather than as threats (Bayram, Özdemir & Boersma, 2021).

Research suggests that how educators respond to diversity in schools and in their classrooms is of utmost importance since their attitudes are reflected in their classroom practices and will have an effect on student social wellbeing and educational performance (Wang et al., 2022). Garmon (2004) suggested six factors that seem to carry central

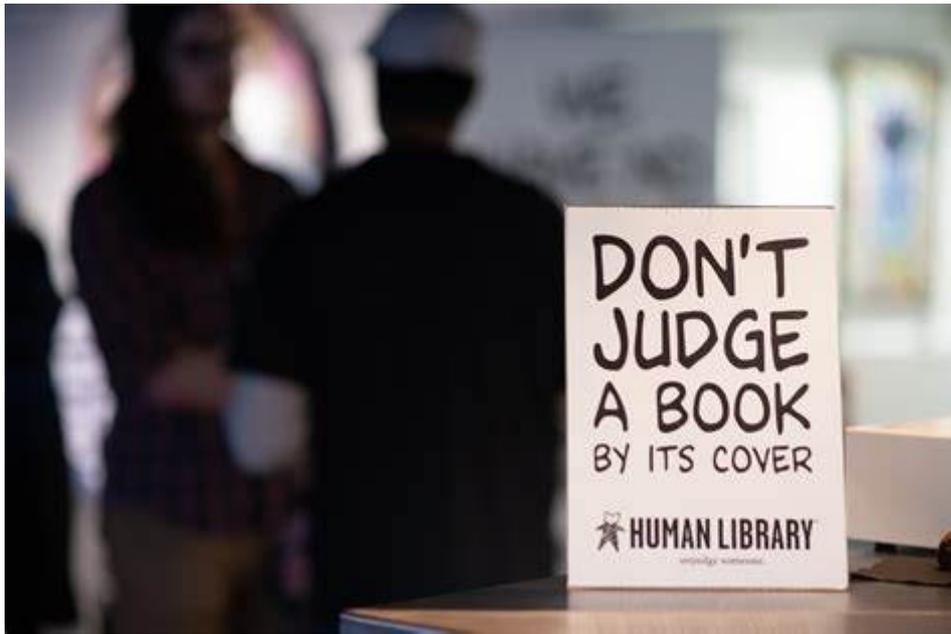
significance in bringing about effective transformation in the attitudes of teachers towards diversity. These factors include openness, self-awareness/self-reflection and commitment in terms of disposition and intercultural, educational, and support group experiences. As societies and classrooms continuously change and become more diverse, teachers need to be equipped with the necessary skills, knowledge and attitudes to address these realities in an effective way. They need constant training and preparation to address the needs of all learners and to promote inclusivity in their everyday practices and interactions with students and colleagues (Fine-Davis & Faas, 2014; Mallia Borg, 2007). The importance of revisiting teacher education has also been recognised. In light changing demographics of our education systems, many Europeans countries are reforming teacher education policies to ensure that teachers will be equipped to face the challenges of inclusive education (Florian & Camedda, 2020)

Initiatives aimed at attitudinal changes towards diversity strive to eliminate biases, negative stereotypes and other exclusionary practices that have negative consequences on both victims and perpetrators. During the transition from childhood to adolescence, students become increasingly aware of social inequalities and of the possible links between social stereotypes and of being unjustly treated by peers or other members of the school community (Killen & Rutland, 2022). Adolescence is an age where youngsters are trying to better understand the world around them and to form opinions and attitudes about it. Research suggests that as they become more independent of their parents, they tend to be more open to ideas about diversity and that schools have an important role to play in fostering positive attitudes about diversity (Bayram, Özdemir & Boersma, 2021). At such a sensitive stage in their development, school experiences can have a significant impact on attitudes of adolescents towards classmates, according to Eckstein, Miklikowska & Noack (2021). They also note that school climates which promote democratic participation and supportive attitudes towards classmates tend to minimise prejudice among young adolescents. The authors also suggest that schools should take into consideration differences in students and across the school context. For example, student age when implementing initiatives which may facilitate the development of positive intergroup attitudes (Eckstein, Miklikowska & Noack, 2021).

Students in preschool and primary school are actively developing their attitudes and understanding about their culture and society. They learn from both their own direct experiences as well as from their exposure to their environment, media, and other people around them. Additionally, experiences that young students have in their primary social groups, like school, have a great impact on their attitudes (Triandis, Adamopoulos & Brinberg, 1984).

For example, a range of research has shown that gender stereotyping becomes embedded in young children's experiences in education and in life more generally from their earliest days. This video shows examples of how adults subtly and not-so-subtly direct children's attention towards gender stereotyped toys, often unconsciously: Girl toys

vs boy toys: The experiment – BBC Stories – YouTube. Children may internalise these messages about what is 'right' for them based on their gender, and so begin to choose gender stereotyped activities, perpetuating behaviours and limiting their opportunities for learning, development and play. For example, Coyne's research has explored how exposure to stereotyped super-hero content (Coyne et al., 2014) or Disney Princess content (Coyne et al., 2016) influences children's play and gender stereotypical behaviour. Perhaps even more worrying is evidence that children's attitudes towards children who play in gender atypical ways (as traditionally defined) tend to be negative, and children may police each other's gender conforming behaviour, even to the extent of bullying (O'Toole and Hayes, 2020). Kuvlanka and colleagues (2014) also showed that gender non-conforming and trans children can be at risk of difficult peer interactions. This emphasises the importance of educators reflecting on their practice to ensure that they are not consciously or unconsciously communicating discriminatory messages to children. Practice that helps to counter such narratives in education includes ensuring to offer equal experiences to students regardless of gender, choosing resources mindfully (for example books in which characters challenge gender stereotypes) and ensuring opportunities for all genders to mix together so that stereotypes can be challenged through direct experience (see Sex/Gender Education chapter of this book).

These examples apply to multiple dimensions of diversity. Studies have found, for example, that direct contact experiences with students with disabilities in primary school positively influenced non disabled students' attitudes about inclusion (Allport, 1954; Diamond et al., 1997; Okagkai et al., 1998; Pettigrew, 1998). Students who had contact with a peer with a disability or had a family member with a disability had more positive attitudes towards students with disabilities compared to students who were simply attending an inclusive class who did not have any direct contact with peers with disabilities or had a family member with a disability (Goncalves, 2014; Schwab, 2017). The Human Library approach described in the example case is one strategy to support this.


Source: Unjudge someone – The Human Library Organization

A Human Library may be simply described as a library where instead of books, there are people who are willing to share their stories with readers. These human books are volunteers and would typically represent social categories of people that tend to be the target of stigma, discrimination, prejudice, hate, bullying and marginalisation due to factors including colour of skin, religion, body shape, disability, gender nonconformity, sexual orientation, health status, beliefs and so on. The aim of a human library is to challenge stereotypical ideas, attitudes, feelings and beliefs about these social groups through contact and dialogue.

Visitors to a Human Library, such as members of the school community, teachers, students and parents should be informed beforehand of the significance and scope of the activity. Apart from the practical dimensions of this, the school has the opportunity to put the organisation of the library within its broader agenda of promoting positive attitudes towards diversity as part of a holistic, inclusive school culture.

'Books' sit around small tables or on an armchair where visitors can join to listen to the stories. Some 'books' might also sit on carpets and visitors could sit in front of them on cushions on the floor. Each book should have a sign, representing the book title indicating the social category that is being represented. At the entrance to the library, there could be a colourful visual displayed with the list of books available on the day.

Example of Human Library with children and teenagers: Kids Meet A Deaf Person | HiHo Kids – YouTube

Evidence exists of the effectiveness of such approaches to contact and dialogue for reducing stigma and prejudice. For example, early exposure to information about peers with disabilities can increase children's acceptance of peers with varying abilities (Okagaki et al., 1998). Loeber and colleagues (2022) also found that "learning new information about peers with non-compliant classroom behaviour by students can correct their negative views and existing misconceptions and ultimately lead to positive attitudes" (Loeber et al., 2022, p. 4). These findings were reflected in a study by Ostrosky et al., (2013) where preschool students spent time reading and discussing books with characters with disabilities in their classroom as well as at home with their families. The study found that preschool students had an increase in their positive attitude from the combined effect of contact with peers with disabilities and from information shared through books (Ostrosky et al., 2013).

This type of intervention on inclusion can be extrapolated to other dimensions of diversity and is likely to result in desired outcomes such as developing positive attitudes towards inclusion. As young students are exposed through direct contact experiences in addition to literature and multimedia, they are also developing their sense of the world and their understanding of how things work together.

CHALLENGES TO ATTITUDE CHANGE

The benefits of having a shared set of values and attitudes which are positive and open to inclusion are widely recognised. Yet, bringing about an attitude change is not an easy task. Despite the importance of implementing, and sustaining, an inclusive school culture, schools face a number of challenges. While School leadership and the teaching staff are

major drivers of change, some may not be open to change or be unwilling to embrace inclusion themselves, or act as role models in the process. Existing literature highlights where teachers may be less receptive to the idea of inclusive education (Revelian Steven & Tibategeza Eustard, 2022). School leaders, or any agents of change within the school, are likely to face resistance (Zimmerman, 2006) and lack of resources or legal frameworks may also pose difficulties. Teachers may resist change for various reasons such as an unwillingness to change their habits, or because they lack the knowledge and resources or necessary skills to implement change (Yılmaz & Kılıçoğlu, 2013). Changing cultural attitudes is demanding in any context. Nevertheless, it is a key driver to facilitating change and in light of the social and cultural realities of our schools.

Collaboration

Inclusive school culture can be supported and developed through a collaborative approach with school staff, children, families and the wider school community. Collaboration in schools is rooted in, and depends on, the relationships that are made up from repeated interactions across time (Pianta et al., 2003). It could be argued that relationships underpin all learning, and that a focus on creating positive relationships (or in German 'Beziehungsarbeit') is a crucial element of an inclusive school (see Relationships chapter of this book). In terms of collaboration, each participant in an inclusive school brings different orientations, knowledge, expectations, priorities, and interests (Foong et al., 2018). In the context of supportive relationships, such diversity can be leveraged so that these become more than the sum of their parts, but within hostile, defensive or disrespectful relationships these differences can become a source of tension. Recognising this and working towards the creation of inclusive school collaboration, does not suggest that we all have to agree with each other or be homogenous in our thinking. In fact the opposite may be true: for example in an inclusive setting the needs and wishes of individual parents may not always align with the needs and wishes of the community as a whole or of individuals within the school. However, the negotiation, rather than avoidance, of these tensions is part of a democratic society (O'Toole, Dowling & McElheron, 2023) and an inclusive school climate allows for them to be deconstructed in respectful ways. This is just one of many ways in which relationships impact on the inclusivity of a school culture. Some examples of collaborative approaches for the establishment of inclusive school cultures include communities of practice and co-teaching.

Communities of Practice

A Community of Practice (CoP) is just one way to support and foster collaboration within a school environment. A CoP consists of a network of people who frequently come together to share, learn, and work to achieve agreed targets or goals. A CoP is important as it also allows educators and other educational professionals to assemble and share insights

from their previous experiences (Ostrowski et al., 2017). The development of a CoP can be a complex undertaking as it tends to have a multitude of moving parts and requires buy-in and time investment from other stakeholders. From a leadership perspective, CoP provide a safe space for school leaders to learn, gain new perspectives, test new ideas and engage in meaningful, authentic feedback and reflection (Bickmore et al., 2021). This type of safe space can foster deep conversations and build educator confidence (Patton & Parker, 2017).

CoP can also play a monument role in igniting and driving teacher professional development (Schlager & Fusco, 2003). Evidence has shown that the adoption of a teacher CoP can result in more positive views of teacher professional development and enhanced leadership behaviours (Bickmore et al., 2021). Moreover, for some teachers, a CoP provides teachers with the opportunity to engage in dialogue with others on topics including research, teaching practice, and student learning (Patton & Parker, 2017). As a CoP gradually matures, it may also begin to produce its own cultural artefacts, norms, and values (Schlager & Fusco, 2003). Schlager & Fusco (2003) contend that an effective CoP can enact policies, spread innovation and foster change. They further argue that a significant characteristic of a successful CoP is its ability to flourish, evolve, and reproduce its membership where new members can begin a journey towards mastery and leadership. However, some concerns have been highlighted around the use of CoP. For example, a dysfunctional CoP can have a detrimental effect on a school environment. Rather than driving collaboration, they are hijacked and employed to resist progress, impede innovation or subvert policies (Schlager & Fusco, 2003). In this instance, leadership is essential to ensuring communities of practice are not co-opted in this way.

Co-teaching

Another means to foster collaboration within a school community is by facilitating and empowering teachers to co-teach (see Teamwork in the classroom chapter of this book). Firstly, it is important to recognise that there are many models of co-teaching including; whole class team teaching, parallel teaching (with either heterogenous or homogenous groups), one teach and one assist, station teaching, or whole class and small group instruction (Brendle et al.,, 2017; Solis et al., 2012). As co-teaching is an intimate relationship, it requires the teachers to first agree on the model that they will be using. Agreement on the roles and responsibilities before beginning to teach results in better outcomes for both students and teachers who have co-taught (Trent et al., 2003).

Figure 1: Models of co-teaching

Models of Co-Teaching

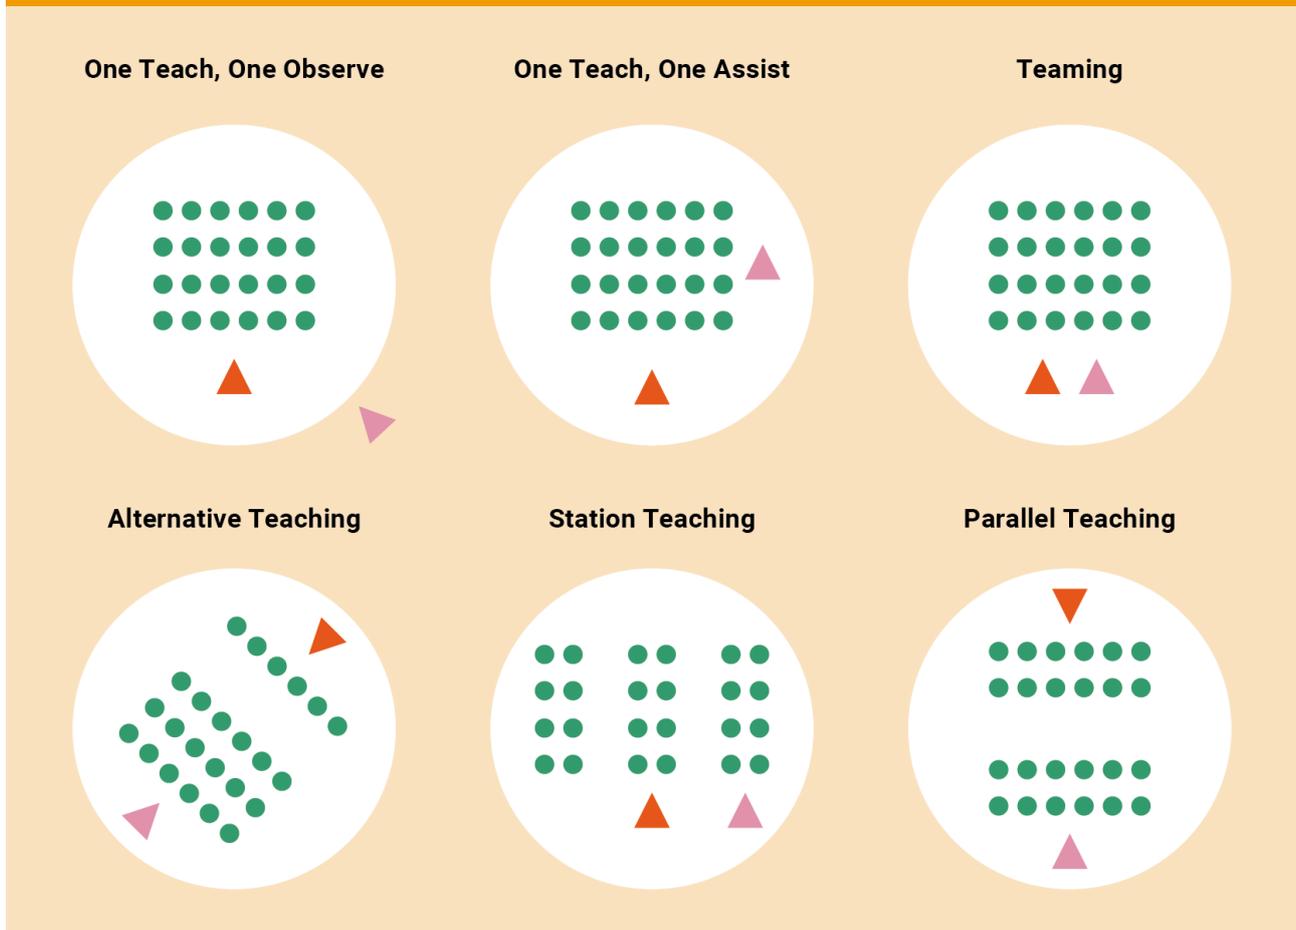
One Teach, One Observe

One Teach, One Assist

Teaming

Alternative Teaching

Station Teaching

Parallel Teaching


Source: Friend & Bursuck, 2009, p. 88.

After the model is determined, teachers can then collaborate on how to meet the outlined curriculum objectives and execute their plan. The highly collaborative nature of co-teaching draws on the strengths of both the teachers and has been shown to provide positive outcomes for students, specifically those with disabilities (Brendle et al.,, 2017). Co-teaching has also been proven to increase positive attitudes of teachers towards the inclusion of students with disabilities (Solis et al., 2012).

There are many challenges to effective co-teaching such as time and expertise. The role of administrators in advocating and allowing for collaborative planning time is critical to ensure that co-teachers have sufficient time to plan together. It also has been well documented that teachers lack that knowledge of how to effectively co-teach (Brendle et al.,, 2017; Solis et al., 2012, Trent et al., 2003). Further practice and coaching on how to co-plan, co-teach, and co-assess is necessary for the success and positive outcomes to be measured.

Juvonen and colleagues (2019) make similar arguments. They consider challenging the norm and adopting a proactive approach in promoting a culture of social inclusion. Like

Killen and Rutland (2022), they also call for the facilitation of interaction among members of diverse groups which helps to reduce negative stereotypes and biases concerning those who are different. Within their classrooms, teachers may also find ways of encouraging inter-group interaction, e.g., through seating arrangements or group work. Interaction across groups may also be encouraged through extracurricular activities or themed clubs which attract students from different backgrounds. It may also be useful to have a peer mentoring system (Juvonen, 2019).

Knowledge

In order for a school to develop an inclusive culture, the educators, administrators, and the school staff must first know about their community and the community that they serve. To know a community requires knowledge about all the dimensions of diversity that affect the unique makeup of that population such as race/ethnicity, socioeconomic status, language, nationality, sex, gender identity, sexual orientation, religion, geography, disability, and age.

Multi dimensional

The interplay of the different dimensions of diversity is complex and requires an awareness of the implications of certain elements of diversity. For example, as seen in Figure 2, there are elements of someone's profile (as seen in the inner portion of the wheel) that are more or less fixed and potentially visible to the wider community. There is a recognition here that gender and gender identity may not be fixed, but fluid for some people. The outer portion of the wheel indicates pieces that evolve over time or are not necessarily visible to the outside observer.

Figure 2: John Hopkins University Diversity Wheel

Source: See for example Hawkins et al., 2017

Knowledge of school and wider community demographics is just the first step in this process. It is also necessary to analyse that knowledge to understand how power dynamics affect one's experience in that community. Fostering and promoting inclusion in a school setting requires knowledge about social exclusion and how to prevent it and address it on different levels (Razer, Friedman & Warshofsky, 2013). As deeper learning is acquired regarding the dynamics of a community, the resulting implications become more clear. For example, if there is a large community of non-religious families in an otherwise predominantly Muslim area, what implications does that have on the inclusion of these families into the school culture?

Fostering and promoting a culture of inclusion may necessitate both direct and indirect interventions and strategies targeting different processes and practices. Educators need

constant training and preparation to enable them to acquire the necessary knowledge and skills to be able to cater for the needs of all learners as well as to promote values of inclusivity in their everyday practices and interactions at school both with students and colleagues (Mallia Borg, 2007).

In-depth knowledge of the multiple dimensions of inclusion must begin with pre-service teacher training (Bishop & Jones, 2022). As Yuan (2017) states, "It is central to educate pre-service teachers and students in teacher education programs in a culturally responsive way, as well as to facilitate teacher candidates construct effective teaching pedagogies which draw on experiences and knowledge developed in their professional training processes" (2017, p. 3). This knowledge comes from the composition of the community as well as from examination of one's own background. Whether as an educator, staff member, or administrator, each person brings their own experiences and beliefs with them to the school community.

Learning and developing culturally responsive or inclusive practices does not conclude with pre-service teacher training. While it is important that teachers are exposed early on, it is equally important that it continues throughout a teacher's career. Continuing professional development is critical for teachers in order to grow their understanding of how to be as inclusive as possible (Carrington and Elkins, 2002; Uçan, 2016). The act of being inclusive is an ongoing process. As the community evolves, so too do their needs, and inclusive school cultures must reflect that. Furthermore, the need for constant evolution does not rest only on teachers, it is necessary that the administrators of the school, as well as school staff and parents, continue to develop their multi-dimensional understandings of their community.

For example, when a community welcomes an increasing number of refugee families over the course of a year, what can be done to understand their cultural or linguistic needs? More recently, there has been an increase in students identifying as LGBTQIA+ and we must question how we can adapt to support their needs. We want to be more inclusive of students with disabilities, therefore what needs to be done to promote more teacher training? What types of programmes do working parents, for example, need to have in order to feel supported?

Members of the community can also be encouraged to explore areas of need within the community. Recognising shifting demographics or evolving concepts in the wider society are essential to having an open attitude towards inclusion, but further research is necessary to fully understand how that change affects a specific school community (Hawkins et al., 2017; Raffo & Gunter, 2008).

Juvonen and colleagues (2019) cite research which shows that when members of minority groups are in larger numbers, the negative effects, such as lower achievement or mental health issues, are reduced. Although this is not possible in many educational settings, it points to the importance of relative student representation (and ethnic characteristics) which may lead to stigma and discrimination (Juvonen et al., 2019). When

members of a school community understand this important point, policies can be enacted that reflect the school population and include minority students in the community.

Intentional

An inclusive school culture does not happen spontaneously. There is a great deal of intentionality behind gathering knowledge and using the information to create policies, programs, and practices that foster inclusion and continue to reflect the community that they serve (Carrington & Elkins, 2002). For example, as administrators are intentional about setting up spaces for teachers to collaborate, teachers are proactively seeking to understand the cultural make-up of their new class community or in the instance of the parent community reaching out to new members of the community, we see the thread of intentionality playing an integral role in creating an inclusive school culture.

When an inclusive curriculum is implemented, intentional choices are made including having an understanding of the school's community characteristics and being committed to including everyone. For example, schools that use Universal Design for Learning (UDL) are one means of ensuring all students, and not just those with disabilities or learning differences, are included and highly engaged (see UDL chapter of this book).

Intentionality is implicit in the use of language and vocabulary to explicitly include those otherwise marginalised. In the classroom, teachers' use of inclusive language sends a strong message to students such as respect for students' preferred pronouns. Gender-neutral language is important in terms of challenging gender inequalities and including students who are non-binary or gender non-conforming (Bastian & Rohlik, 2022). In order for teachers to be able to implement this level of inclusivity in their classrooms, they first must understand their community's needs and how it works.

We can examine the intentionality of our inclusion by understanding accessibility and what barriers to access may exist for some students. Barriers to access include attitudinal barriers (whether intentional or unintentional), environmental or structural barriers, technological barriers, policy and communication barriers (Pivik, McComas & Laflamme, 2002). When we use this lens to examine what students with a disabilities experience in school, teachers perceptions concerning issues such as lack of access to the classroom or a belief that coursework is too demanding and therefore inaccessible for the student, or that the technology (i.e., screen reader or a assistive device) required by the student is not available, can all prevent inclusion. Viewing barriers to access and participation through an individual's lens can further promote inclusion.

Another facet of intentional inclusiveness comes from who, and what, is visible and represented in the school environment. This shows a newcomer what is valued in the school community (Ryan, Jerome & Lynch, 1994). Examples of this can be seen by who is represented on the school's marketing or external communication materials – for instance, is there a variety of races, ethnicities and genders? Are individuals with disabilities visible?

What else does the school's physical environment show us about who is included? Does the physical space demonstrate who is valued here? For instance, accessible bathrooms, parking spaces, classrooms, and offices show that there has been an intentional thought into who makes up this school community. Books and resources that depict multicultural values including different cultures and languages and other visible signs of inclusion. Using culturally responsive teaching practices increases student participation, and has a positive outcome on student achievement as well as the student's understanding of their own identity (Byrd, 2016; Larson et al., 2018; Piazza et al., 2015). The use of flags – such as pride flags or indigenous flags – can also be an outward sign of the inclusivity of the school culture, provided that they are not used as tokenism, but rather have come from the community (Wolowic, 2017).

Challenges

The greatest challenge is the need to maintain an inclusive school culture. There is a constant need to build knowledge around the evolving nature of a school population. While there are elements of an inclusive school culture that persist over the years, e.g., the policy on inclusion or the ramps and elevators that allow physical access, however, the language used and representations of who makes up a school community will evolve.

The knowledge of legal frameworks and the resulting implications on inclusion within regional or national settings can be challenging. If, for example, there is explicit policy which does not acknowledge one group, religion, or language, it can pose possible legal challenges to how to actively include the entire school population effectively. The policies surrounding education are political by nature and are at risk for change, either to the benefit or detriment of the people, according to changes in political power.

Lastly, maintaining adequate resources is always a challenge. In the case of knowledge building, affording teachers the time, and accompanying financial compensation for their time, to continually increase their knowledge is not always a primary goal for schools given limited budgets. There may not be the financial resources available to purchase materials, equipment, and resources that represent and support the current population of the school.

So, what can a teacher do with these challenges?

Start where you are. Use what you have. Do what you can. Inclusion may not be big sweeping initiatives supported by a whole school community. Inclusion might be small acts within a classroom of a teacher that welcomes all children in with an open mind and actively builds their own knowledge. Schools play a critical role in reducing vulnerability to exclusion by developing pupils' sense of self-efficacy, self-worth, and sense of belonging (Raffo & Gunter, 2008) and that can happen on a small scale if necessary until the movement of inclusion grows into a greater school culture.

Leadership

Leadership plays a crucial role in the development of an inclusive school culture (see Leadership chapter of this book). Zollers and colleagues (1999) contend that an inclusive school culture is born through three key characteristics: a broad vision of the school community, a shared language and values, and inclusive school leadership. They further argue that a thriving school culture may be needed to ensure inclusion flourishes within a school (Zollers et al., 1999). However, creating an inclusive school campus is complex and so often requires a fearless leader (Ainscow, 2001). Strong inclusive leaders explore ways to ensure a collaborative and engaging school environment where everyone is valued, and where staff and students feel safe and have a true sense of belonging. Inclusive leadership's primary focus is on achieving inclusion and ensuring the necessary processes and goals are in place to achieve that inclusion (Ryan, 2006). Despite what one might think, leadership and inclusion tend not to be mutually inclusive, but instead focuses on a number of factors to create a synergy between them (Ryan, 2006). These include how leadership is understood and planned, and how roles and activities for fostering inclusion are allocated (Ryan, 2006). Promoting and fostering inclusive school culture is a leadership choice, with schools choosing to move in a clear philosophical direction. However, it is often school principals, or the school heads, who are involved in making this decision.

Principals are often viewed as leaders in driving school culture (Francis et al., 2016). Principals are seen as having the most knowledge, access to resources and are in the best position to drive change (Leithwood & Jantzi, 1990). As a result, principals play a key role in the development of inclusiveness ethos within that school culture. An inclusive principal must be morally strong and advocate for inclusion for both staff and students. Evidence suggests that these types of principals are also more likely to support creativity and allow extended levels of risk to be taken (Black & Simon, 2014). Being a leader often requires making difficult decisions. Moreover, promoting an authentic inclusion environment means making daily decisions that include or exclude students and staff (Banks, 2023).

To foster inclusive practices and attitudes, principals should mirror the inclusive practices in their everyday practice. Principals also need to understand, recognise, and value the individuality and diversity of the student population (Ainscow, 2001). They also need to understand that the path to an inclusive school culture is a continuous journey and not a predefined destination. Inclusion is never complete; schools can always learn more ways to be more inclusive. Causton-Theoharis and Theoharis (2008) echo this by arguing that inclusion should be viewed more as a way of thinking than a set school target to be achieved. Moliner Miravet and Moliner García (2013) also contend that two essential components are necessary to foster an inclusive and intercultural culture in schools. These components are a set of objectives agreed on by the educational community and a set of shared values.

However, Ryan (2006) reasons that inclusive leadership is underpinned by a specific

set of practices. He purports that these practices include advocating for inclusion, the education of all stakeholders, encouraging debate and discourse, developing critical consciousness, and implementing inclusive decision and policymaking strategies. They also state that inclusive leadership should promote the adoption of whole-school approaches with a particular focus on student learning and classroom practice. Others such as Ainscow (2020) have championed this whole-school approach. The practices mentioned above highlight how inclusive school leadership is very much an intentional process. However, inclusive leadership is only one part of the inclusive culture. For inclusive leadership to have an optimal impact, all stakeholders must promote and support inclusive ideals that foster an inclusive school culture (Ryan, 2006). From a cultural perspective, it is important that leadership examines the cultural needs of not just the students but also parents and teachers alike (Khalifa et al., 2016).

Staff values and attitudes also play an integral role in the creation of an inclusive school culture. Schools need to be staffed by teachers who believe all students can learn and have a responsibility to teach and support every learner (Rose, 2023). These values should include openness and celebration of diversity if teachers are to include and support the participation of every student (Kugelmass, 2003). Sometimes, it is about understanding the climate that is already present within your school. Principals have noted that inclusive leadership can be about knowing what the school's current baseline is and working from there (DeMatthews, 2021). Moreover, Black and Simon (2014) argue that teachers need to critically reflect on their assumptions and behaviours, inclusive practice and build partnerships with parents and others in the community. They further note how principals are responsible for leading these processes of reflection and collaboration that shape teacher values.

Inclusive practice and the development of an inclusive culture is a shared enterprise. From a sustainability perspective, leadership needs to plan and develop a sustainable approach that commits to the inclusive agenda that is everyone's responsibility (Black & Simon, 2014). To achieve this goal, a certain level of cooperation and collaborative work is required. This collaboration is at the core of inclusive school cultures and leaders play a critical role in supporting and developing a collaborative culture within a school.

Ryan (2006) states that "for leadership to be genuinely inclusive, it must foster equitable and horizontal relationships that also transcend wider gender, race and class divisions" (p. 8). However, for openness and more fluid collaboration and relationship building, leadership needs to facilitate relationships across both the horizontal and the vertical. These relationships, partnerships and collaborations should not be limited and include, for example, parents, caregivers, teachers, educational professionals, community partners, students and researchers. Collaboration is not a new phenomenon as we can see from examples of co-teaching and communities of practice earlier in this chapter. Many teachers are enthusiastic about working in teams and already collaborate in teams to solve problems, but often they require a strong leader to initiate and support these types of

collaborations (Clark et al., 1995). Strong leaders also recognise the need for teamwork, collaboration, and discourse. In addition to collaboration, Banks (2023) notes the influence of dialogue between stakeholders in shaping and reforming inclusive education and practice. Furthermore, collaboration need not be confined within the school. Evidence shows that a school's capacity to support learner diversity can be better achieved through school-to-school collaboration diversity (Muijs et al., 2011). Likewise, Carrington and Robinson (2006) maintain that a principle of development of a more inclusive school community lies in collaborating and valuing external partners such as parents and the wider community.

School policies have a significant impact on how a school culture and inclusion are created within a school. Inclusive culture requires policymakers and senior staff across educational structures to share similar visions for inclusive education in terms of differences, collaboration and supporting every student. After all, promoting and fostering inclusive practices is everyone's business, and so all stakeholders, including the students themselves, should be included when developing policy (Ainscow, 2020). However, while the development of policies is one goal, the implementation of these policies is another. There are often inconsistencies about how policies are implemented, so leadership plays a key role in ensuring implementation is successful across the school (Black & Simon, 2014). Ainscow (2020) agrees and notes that policy changes related to inclusion require an effective strategy for implementation to ensure barriers affecting marginalised cohorts are removed. Moreover, all leadership processes should be designed and planned to advocate and support inclusion (Ryan, 2006). Inclusive leaders need to be consistent and clear when it comes to policy. Policies should clearly state what is meant by terms such as inclusion and equity (Ainscow, 2020). However, inclusive school policies that promote inclusive culture may mean little without the resources required to embed a school's inclusive agenda.

School leadership plays a pivotal role in the acquisition of resources for schools. These include resources that are pivotal to inclusive education, such as aides, technologies and additional staff, including those with specific expertise (Black & Simon, 2014). Shevlin (2023) argues that in an inclusive utopia, schools would have the appropriate resources and accessible spaces so schools could ensure everyone experiences a sense of belonging. However, many inclusive-centric accommodations and supports often require schools to have the financial resources to achieve inclusion, resources schools may not have. Time is another resource often required to accommodate or support a student or colleague in promoting or facilitating inclusive practice. With competing priorities, inclusive leaders need to be proactive and deliberate in acquiring the resources they need. They also need to be cognisant of the additional time often required to facilitate more inclusive agendas and to recognise the value of supporting staff initiatives that focus on creating a more inclusive culture.

From a curriculum standpoint, school leaders must understand that the adoption of

inclusive pedagogical frameworks such as Universal Design for Learning (UDL) or Culturally Responsive Pedagogy (CRP) may require the allocation of resources – human, physical and otherwise. These resources include time and formal acknowledgement within performance reviews (Fovet, 2023). It may also have additional financial requirements, such as the acquisition of tools and technologies. However, teachers have identified systematic support from leaders and senior management as essential in obtaining the resources to address barriers to inclusion (Woodcock & Marks Wolfsen, 2019). They also noted the role leadership plays in terms of attitudinal barriers and managing competing demands such as time. Adopting new frameworks requires an understanding of the intricacies of these new approaches. Therefore, knowledge is important when changing inclusive practices and promoting new ways of engagement.

This chapter has already discussed the importance of knowledge in terms of developing an inclusive school culture. However, it is crucial that leaders and senior staff are knowledgeable about inclusive practice and creating an inclusive climate within schools. Worryingly, despite the high level of university-based leadership preparation programs, concerns have been raised about their lack of focus on special education and inclusion (DeMatthews et al., 2020). If leaders are not being trained to understand and mirror the values of inclusive leadership, it may never take hold across educational organisations – a key practice of inclusive leadership. Inclusive leadership needs to be educational as the leader must educate stakeholders across campus on all issues pertaining to inclusive and exclusive practices (Ryan, 2003).

'Safe space'

Another element that leadership plays a critical role is the nurturing of a 'safe space'. As noted from the beginning of this chapter, an inclusive school culture can often be an intangible aspect of educational settings, and may be something that is subjectively felt rather than objectively articulated. Inclusive attitudes within collaborative relationships and possession of appropriate knowledge and awareness, guided and resourced by inclusive leaders, can combine to create a school culture that feels safe for all. There is a rich literature dating back to the 1960s on this concept of the intangible 'felt' elements of cultures in workplaces using the term 'psychological safety' (Schein & Bennis, 1965). This is increasingly being applied to educational settings (e.g. Xie et al., 2022). Equally, there is a range of literature using the term 'safe space' that originated in the 1970s in women's and LGBT movements and which referred to safe physical meeting places. This has more recently been applied to learning environments characterised by respect and safety (Flesner & Von der Lippe, 2019). In this chapter, in recognition of the fact that a truly inclusive school culture needs not just a psychological sense of safety, but also a physical one, we mostly use the term 'safe space'. However, in defining this intangible element of inclusive school culture we draw on literature that uses either term.

Edmondson, Higgins, Singer and Weiner (2016) state that a sense of safety is particularly crucial in settings characterised by high stakes, complexity, and essential human interactions, and name educational settings as one such type of environment. They indicate that school climate is a key predictor of how people within schools will act, respond, adapt and learn. In schools characterised as safe spaces, individuals feel able to take a risk to try something new or to be themselves. People are able to contribute without fear of being embarrassed or rejected and so within such spaces there is trust, mutual respect and people are comfortable being themselves (Duhigg, 2016). This participation builds a sense of belonging within a community leading to inclusion.

A well-known study on the effects of mutual respect and team dynamics was conducted by the company Google, who explored why some teams were more successful than others. This study, called 'Project Aristotle', funnelled millions of dollars into gathering a dizzying array of data measuring almost every aspect of their employees' lives in an attempt to quantify what constituted the 'perfect team' (Duhigg, 2016). They investigated aspects such as how often colleagues ate together, characteristics of effective leaders, gender balance across teams, personality characteristics like introversion and extroversion, and found no common points of data across successful teams or across unsuccessful teams. It was only when they began to investigate the more intangible elements of team culture that they discovered what distinguished successful teams from unsuccessful ones – the way people treated each other. 'Psychological safety', broadly defined as people being comfortable expressing and being themselves without fear of embarrassment or retribution, and 'social sensitivity' whereby people showed empathy for each other's perspectives and needs, combined to create inclusive cultures conducive to learning, creativity and success (Edmonson, 2018).

This has implications for inclusive school culture, and it may be the reason that the four elements we identify (attitudes, collaboration, knowledge, and leadership) are so effective in developing inclusive school culture and creating safe spaces for the whole school community. For example, Zhou and Pan (2015) linked psychological safety to transformational leadership and highlighted the necessity of cultures of communication to enhance employee creativity and participation.

There are many problems and difficulties that face inclusive leadership, particularly when it comes to changing cultural norms. The attitude section of this chapter highlighted the attitudinal barriers that must be faced when promoting a more inclusive culture. This leadership section also discussed how policies and financial restrictions might impede the inclusive process. Ainscow (2020) notes how these competing pressures add to the difficulty of developing a more inclusive culture within a school. He further claims that problems around promoting inclusive and equitable school culture stem from three key areas, which focus on issues with schools, issues between schools and issues external to schools (such as family issues and policy-related problems).

Inclusive leadership is paramount in the implementation of an inclusive school culture as

it impacts so many facets of the school environment, and models the values of the school or schools it represents. Ryan (2006) contends in order to make the world a better place, schools need to practise inclusive leadership. However, difficulties with inclusive-friendly leadership have been documented and have resulted in a move towards more distributed leadership approaches rather than the traditional hierarchy approach (Ryan, 2006). Ainscow notes that schools must acknowledge that leadership is often the responsibility of a multitude of staff and not just a small number of individuals. For true inclusion, school leaders must foster an inclusive school culture where responsibility for inclusion is everyone's business, and where an approach based on multiple leaders is encouraged.

Ultimately, moving towards more inclusive ways of operating and thinking takes time and affects an entire school system. However, Ainscow (2020) argues that this can lead to significant changes within schools and classrooms. Additionally, Rose (2023) also notes that to sustain this inclusive change, schools must be respectful of those who are required to implement the change and acknowledge the current climate and culture that exists. After all, inclusive educational change involves dialogue and compassion towards others, but more importantly, a changing of attitudes, actions, beliefs and behaviours, which school leaders are in the optimal position to achieve this inclusive change.

Conclusion

The idea of creating, adapting, or changing a school culture may seem like a daunting task. To make the shift from exclusive to inclusive is not a quick process. It cannot happen in isolation, nor can it be forced on an unwilling participant. There are many interlocking pieces that fit together over time and amongst many members of the community to create a whole school with a commitment to an inclusive culture. Yet each of those cultures starts with one step.

It has been established in this chapter that the attitudes, collaboration, knowledge, and leadership in a school interact to create an inclusive school culture. But the question remains where do you begin? How then does an educator contribute towards the ever evolving concept of an inclusive school culture?

Importantly, teacher training is a key part of this process, yet many teachers feel unprepared or lack confidence on how to effectively include the wide range of students in their classrooms (Florian & Camedda, 2020). This is where the journey of 1,000 steps starts. These are the steps that you begin with today. We can be motivated by the big picture of inclusion, but it can be easy to get discouraged by the enormity of the task and choose not to act at all. Choose to act.

Closing questions to discuss or tasks

- Consider the role that you currently play, or hope to play, in your school culture. What is one thing that you can do to increase the level of inclusion in the school? Where is one area that you can make a change to build a greater sense of inclusion? What is one area that you need to know more about? What are practices that ensure sustainability of inclusive school culture?
- How could you evaluate the effectiveness of inclusive measures in your school?
- What is the most effective way for you to address resistance to building an inclusive school culture?
- How could you foster collaboration with all the stakeholders of your school – the immediate local community, families and caretakers, educators, administrators, staff, specialists, and students?
- What can you, as a student teacher or a pre-service teacher, do now to make your school culture more inclusive?

About the authors

Angele Deguara

Angele Deguara is a resident academic and subject co-ordinator of Sociology at the Junior College of the University of Malta. She also lectures in gender and sexuality within the Department of Gender and Sexualities, Faculty for Social Wellbeing. She conducted her PhD research in the anthropology of religion and sexuality with LGBT Catholics in Malta and Palermo, Sicily. She is the author of *Life on the Line: A Sociological Investigation of Women working in a Clothing Factory in Malta* as well as a number of other published works. Her main research interests are gender, homosexuality and religion. She co-founded and chaired the Diversity Committee at the Junior College for a number of years. She is an activist for social justice and civil rights with Moviment Graffitti and has previously volunteered with other organisations such as the Malta LGBTIQ Rights Movement and within the Fair Trade movement.

Jessica Lament

Jessica Lament is a specialist in inclusive practice, especially for students with disabilities. She has worked in schools in the US, Singapore, and France supporting teachers – from pre-k to secondary school to teachers in higher education training programs – always with the same goal, to increase the implementation of research-based inclusion.

Thomas Joseph O Shaughnessy

Thomas is a graduate of the University of Limerick at both undergraduate (BSc. in Computer Systems) and postgraduate level (MSc. in Software Engineering). With a background in accessibility, teaching and assistive technology, Thomas has extensive experience promoting and facilitating inclusive practice in primary, post-primary and post-

secondary education. Thomas has experience guest lecturing at undergraduate and postgraduate levels in assistive technology, accessibility, and Universal Design for Learning (UDL). Thomas's interests include wider institutional approaches to inclusive practice, the role of third space professionals in higher education and the use of communities of practice in fostering and promoting more inclusive practice.

Leah O'Toole

Dr Leah O'Toole is Associate Professor of Early Childhood Education in the Froebel Department of Primary and Early Childhood Education in Maynooth University, Ireland. With an academic background in Psychology, her research interests include early childhood education, particularly accessing the voices of the youngest children from birth, relational pedagogy, bioecological theory and working with parents and communities. Inclusion across multiple dimensions is central to all elements of this work.

RESTORATIVE PRACTICE IN SCHOOLS: IMPLEMENTING RESTORATIVE APPROACHES TO RESOLVE CONFLICTS AND BUILD POSITIVE RELATIONSHIPS WITHIN THE SCHOOL COMMUNITY

Example Case

Food for thought before we begin:

Traditional school example

Three children rush up to the teacher at the end of free-play time. All three are shouting and pushing each other aside, clearly wanting to say something urgently. The teacher holds up her hand and says, 'All of you have broken the rule of no running in the corridor and no shouting. For all of you that will mean no token earned for the next part of the day.' With that, one child bursts out crying, pushes another one over and says, 'Now look what you did. I'm going to make you pay!' That child falls awkwardly and starts screaming. The third child runs off in the confusion.

Now the teacher has one violent, furious child, one injured, furious child and one missing, furious child on her hands, not to mention the other 23 children waiting for her in the classroom.

Does this sound familiar to you as a teacher? If so, you may be interested in this chapter.

Restorative school example

Three children rush up to the teacher at the end of free-play time. All three are shouting and pushing each other aside, clearly wanting to say something urgently. The teacher holds up her hand and says, 'Ok, we all might just need to stop for a second. I can see you all want to talk to me, I can see it's urgent. It looks like you are all pretty upset. You know by now that my brain can only hear one voice at a time. Do you think you could help me out? Could you all sit with a friend while the class eats lunch? If we can all agree with this, I will chat to you all one by one and then maybe we can work this out.'

Now the teacher still has three upset children on her hands, but the process of de-escalation has started. The three children have something new to think about (lunch with a friend!) and there is a clear path ahead. Any harm that has been done to relationships can now be repaired, starting with the teacher's conversations with each child.

Does this sound like a ridiculous dream? If so, you may be interested in this chapter.

In the examples above we see the contrast between a traditional, rules-based, reward-and-punishment approach to solving a typical everyday problem in a school context and a restorative approach to the same problem. The teacher in the traditional example did nothing wrong, she followed the school's policy: the children had broken the rules; she administered the punishment equally and clearly. Crucially however, the children also did not do anything wrong. They just reacted as children to a situation of asking for help, albeit in a way that adults tend not to like or to recognise. They were met with a punishment, because they asked in a way the teacher did not like. Thus everyone, the children and the teacher, found themselves in a much worse situation pretty quickly. If you have worked in a school, this type of situation is probably not new to you. Approaching the problem restoratively asks that we, as teachers, are aware of and communicate our own needs and feelings clearly, recognise or try to recognise the feelings and needs of students, and focus the energy of all parties on the restoration of relationships, rather than the allocation of blame, consequences, and punishments (Hopkins, 2011). We invite you to read on if you would like to learn more.

Initial questions

1. What do we mean by Restorative Practice as a way of being in schools?
2. Who are you and how do you understand yourself as a restorative teacher?
3. What does Restorative Practice look like in practice and what are the benefits for all members of the learning community?
4. What are the common critiques of Restorative Practice? What are the common myths?
5. How can Restorative Practice foster inclusion and challenge inequalities?

Introduction to Topic

In this chapter, we will consider restorative practice (RP) in schools and think about how to implement restorative approaches in order to build positive relationships and resolve conflicts when they arise within the school community. In the collaborative writing process for this chapter, we started with five foundational questions above.

These questions formed the basis of our discussions, which we then mapped onto the chapter structure for this handbook of inclusive education. The first question will be answered in this Introduction, the other questions will be woven through the subsequent sections. We understand RP as a return to practices of being together in a community that can be traced back to at least 2000 BCE (Thorsborne, 2014) – or, indeed, as old as human history, as suggested by Zehr (2014). Much research situated in the North American context cites First Nations people as the originators of a restorative approach, but similar practices have been ongoing in many different cultures, which will be discussed further on in this chapter. Within public discourse around schools, there is often a quest for something new that will solve all the problems which arise in the classroom. While many new interventions have been tried, research shows that groups work best at all levels in society when value is placed on intentional relationship building (Ganotice et al., 2022; New York Times, 2016). Classrooms are first and foremost groups, but they are also groups which must come together day after day after day. Therefore, finding a way of building connection and repairing the almost inevitable interpersonal hurt or harm that arises between group members is essential.

In the broadest sense, RP represents "a broad term that encompasses an array of non-punitive, relationship-centred approaches for addressing and avoiding harm" (Darling-Hammond et al., 2020: 295). Fronius et al. (2019: 1) describes RP as "a growing social movement to institutionalise non-punitive, relationship-centred approaches for avoiding and addressing harm, responding to violations of legal and human rights, and collaboratively solving problems." Anfara and colleagues (2013) clarify the relationship between values and practice with respect to RP, highlighting that restorative values serve to guide the delivery of RP. Within schools, practising restoratively takes on a particular nuance. It is more

than something that is done only in a specific instance of harm, it represents a way of being throughout the whole day. Traditional punitive systems of behaviour management and discipline in schools have borrowed heavily from the criminal justice system (Hopkins, 2011; Zehr, 2014) – perhaps, with a kinder hand. It is important to note that the context of school requires that individual actors can continue to share each other's space in the aftermath of harm caused and experienced. Therefore the response to harm must address the issue of how to repair the damaged relationship.

Structural disadvantages in traditional behaviour systems and how RP can address them

Traditional punitive or retributive models (Burnett et al, 2015) of dealing with discipline in schools reinforce dominant societal power structures, replicate hierarchies and structural disadvantage, and normalise violence as just and fair (Gregory et al., 2013; Nolan & MacRuairc, 2022). As a result, children internalise their place in the social order as one of compliance to avoid harm, learn to repress their feelings and needs, and begin an endless quest for approval from a significant adult irrespective of how that adult treats them. Schools have favoured punitive, behaviourist approaches borrowing heavily from criminal justice systems with the justification of managing behaviour and maintaining order and discipline (Hopkins, 2011; Nolan & MacRuairc, 2022; Rogers, 2000). Within this, the language of criminal justice prevailed (Zehr, 2014), with terms such as 'rules,' 'consequences,' 'victim,' 'perpetrator,' 'blame,' and 'guilt' being prominent. As part of this, conflict between children in schools has traditionally been resolved through the teacher's mediation in administering some form of consequence for a behaviour deemed to be undesirable or problematic – with little emphasis on repairing the damage that has occurred to the relationships between members of the community. Such disciplinary and exclusionary approaches have been demonstrated to be ineffective and harmful, while also being associated with racial disparities which exacerbate structural inequalities and contribute to challenges across the lifespan. In one report citing the connections between prisoners' childhood and family background, on discussing school experiences, noted that 63% had been suspended or temporarily excluded, and 42% stated that they had been permanently excluded or expelled (Williams, Papadopoulou, and Booth, 2012). In another report, the Chief Inspector of Prisons for England and Wales found in its annual report for 2017-2018 that 89% of detained (or 'imprisoned') children and young people aged 12-18 have reported being excluded from school (Perera, 2020). By contrast, research has established that restorative schools demonstrate reductions in disciplinary disparities with respect to racial and ethnic groups discussed above (Darling-Hammond et al., 2020; Gregory et al., 2013; Zakszeski & Rutherford, 2021). Traditional approaches have also been characterised as creating power imbalances between children and educators which is detrimental to their voice and empowerment (Tyler, 2006; Zehr, 2014). As educators we must be knowledgeable and mindful of the historical racial disparities and the impact of

institutional racism and how it shows up in our classrooms, especially in the areas of suspension and expulsion.

Reflection

It is important to consider whether teacher disposition could be a reinforcer of structural disadvantage. We all have our own commitments and values that guide us. It takes some honest reflection on the self as a teacher to answer the question of whether RP is something that we are going to be able to engage in.   This is a very important question for all of us as educators to reflect on and be intentional about. Who we are impacts how we lead. Without this honest reflection and self-examination, often our work in inclusion and equity becomes performative and a checked-box approach. We believe that when you can answer those questions honestly, then you are a more authentic and valuable member of that learning community. Oftentimes, as we engage in classroom practices and engagement philosophies, that real knowing of self is lacking. We all come to situations and events with our identities, lens, vantage points, cultures, values, biases and beliefs. These all play a role in how we not only interpret incidents, but how we solve them.

By contrast to traditional approaches rooted in a mindset of 'behaviour management,' a restorative approach actively seeks to intentionally resolve structural inequalities and harm that occurs in the classroom. In our writing of this chapter, we drew on the analogy of a whirlwind to represent the nature of this process, reflecting the multidirectional manner in which interactions occur between members of the learning community, and the tensions and complexities which are involved. By recognising that damage to relationships can be intentional or unintentional, it instead focuses on the needs and feelings being communicated in a given situation. Being restorative encourages empathy, connection and belonging at all levels of practice. RP in schools seek to disrupt the replication of harm in the following key ways (Thorsborne and Blood, 2013):

- Establishing shared values.
- Fostering empathy, belonging, and connection.
- Using restorative language.
- Focusing on feelings and needs rather than behaviour.
- Using restorative conversations, circles and meetings to respond to harm and repair relationships.

Furthermore, RP can challenge inequalities and foster inclusion by creating brave spaces with a strong sense of belonging (Campbell and Eizadirad, 2022). A brave space is one with opportunities for students to speak up, to express their feelings, to be heard, to listen to each other, to understand and respect differences, to make mistakes, and to correct those mistakes. A brave space must be cultivated and sustained, and the onus is on us as educators to do so. RP supports the creation of brave spaces by laying the groundwork for and relentlessly practising inclusive and non-violent communication in all interactions.

Key aspects

Situating RP as a cross-cultural ancient practice

As noted previously, the roots of RP can be traced to ancient times. It has been highlighted that indigenous South Pacific and American cultures took an approach to conflict centred on taking accountability for one's responsibility in causing harm and the subsequent reparation of the ruptured relationship (Darling-Hammond et al., 2020; Zakszeski & Rutherford, 2021). Indigenous cultures from First Nations to Maori, from many African and Aboriginal to Celtic cultures practised the fine art of sitting together peaceably to resolve harm and repair the group so that it could continue (Grinnell College, 2022). As survival outside of the group was not possible, banishment meant certain death. In order to survive, one had to be prepared to make amends for harm caused and not shy away from hearing the stories of those who were harmed. There is a curious symmetry between this and the modern-day classroom. Expulsions from school are incredibly harmful acts that have often lifelong impacts (Darling-Hammond et al., 2020; Gregory et al., 2022), and many, who are harmed by peers or adults in school, feel that the traditional, punitive system directs its attention to those that cause harm, and little or no attention to those who have been harmed – their stories are less heard. RP is not an adaptation of the carceral justice system for schools, rather it is a practice that attends to all members of the community in order to foster belonging and strengthen community bonds.

RP as a relational, inclusive problem-solving continuum

RP in schools involves a relational approach to problem solving using a robust continuum of processes and models (Thorsborne & Blood, 2013). Below we identify some of the elements of this continuum which are essential to the approach. While a pattern exists across the RP literature whereby the approach is ill-defined (Darling-Hammond et al., 2020; Zakszeski & Rutherford, 2021), several fundamental elements consistently arise, as will be explored:

- Each group or community ideally shares a set of core values (Hopkins, 2011) that need to be established together. This gives the group clear direction and makes the intention of the group visible to all. If, for example, a class group of young children values respect, tearing up another's work does not honour that value. The values become the terms of reference for all interactions in the group. They are also very useful for teachers for self-reflection (i.e., Am I showing respect? Does my action display empathy?). These values can be established by the whole school community, or by an individual class group, depending on the implementation plan for RP in the school. Either way, it is imperative that all members of the group are aware of the shared values and ideally have been given the opportunity to contribute meaningfully

to the agreement on values.

- Restorative language, or the language of non-violence (Rosenberg, 2013), is the gold standard for interactions. Shaming and blaming words are replaced with factual observations and an honest request for a solution that would work for all. This language work requires pre-teaching and practice. Ideally the teacher would be modelling the use of restorative language throughout the day. Here are some examples to illustrate the difference:

Blaming and shaming	Restorative
Why did you kick your classmate?	What happened?
I hate it when you shout. You are a bad, angry person.	You are shouting. I feel scared because I don't feel safe.
Why are you always late?	I see you have trouble getting to class on time. Is there something we can do about that?

- Restorative circles invite members of the learning community to share information about themselves and build a sense of community and belonging (Darling-Hammond et al., 2020). For example, they may share their energy levels at the start of the day to foster an awareness in the group of how everyone is that day and express something about their interests or preferences which can forge bonds in the group. This forging of empathy and connection is the backbone of RP.
- Restorative conversations or meetings occur when conflicts or tensions arise in relationships between members of the learning community, as they inevitably do in all human relationships (Darling-Hammond et al., 2020; Zakszeski & Rutherford, 2021). Depending on the extent or severity of the situation a two-way conversation or a more formal meeting are both scaffolded by the following six essential questions, which seek to repair the damage which has occurred:

1. What happened?
2. What were you thinking at the time?
3. What have you thought about it since?
4. Who has been affected and in what way?
5. How could things have been done differently?
6. What do you think needs to happen next?

These six questions (or localised versions of them) are common to all iterations of RP in schools. There can be variation in the order of the middle four questions, but all approaches start and end with the same two questions. It is recommended that all six questions are asked in this order for the practitioner starting out. As experience builds the practitioner

listens out for answers to these questions being given without prompting. In this case, the particular question that has been addressed is skipped. The key message is to shift the opening question from *why* to *what* happened when harm occurs, to give all actors the chance to tell their story via the middle four questions, and to move forward with the final question (Restorative Practice Ireland, 2018).

Dispelling myths about RP

Letting people off the hook

The most common critique of RP is that it lets people off the hook (Anfara et al., 2013; Darling-Hammond et al., 2020). In practice, however, when a person truly accepts and understands that they have caused harm, intentionally or unintentionally, they usually want to make amends and restore the relationship. If the person does not do so, the practice of a restorative conversation or meeting can be offered to prompt them to do so, not because they have to, but because they see the value in it. It is key that the participants are willing to partake. Forcing someone to partake in RP totally undermines the whole process and tears away its integrity. There is high accountability in RP. People without exception are called to answer for their actions and to be accountable to themselves and to their community. Accountability, responsibility, and healing are the core values of RP (Burnett et al., 2024).

Quick-fix circles

Circle work in RP can suffer from being considered an early childhood practice that has no place as individuals progress through education. Firstly, we can learn a lot from early childhood practice. Secondly, circles form just one part of RP. The role of the facilitator in the circle is key. The circle needs a clear intention and willing participation, or it will be inauthentic and it will not work. This can be a common stumbling block. A teacher may try a circle, decide it did not work because the children did not listen, and then give up on all aspects of RP. Circle work can only be done by invitation, and with willing participants, otherwise it is coercion, not connection. Circle work also takes practice. The aim of circles is to establish and live the values of community, strengthen connections, build empathy and offer a space for true belonging. They are also a space wherein we get to practice restorative language or nonviolent communication (Rosenberg, 2013). This is not the language that surrounds us on the whole, certainly in Western society. We are so inured to the harm caused by the shaming and accusatory language we use, that the restorative language of honest feelings and needs can feel uncomfortable and unnatural at first. This is why it is a practice and not a quick fix intervention. When we become more fluent in this language and can communicate with each other without causing harm, we begin to talk meaningfully about making amends and repairing relationships where harm has been done.

A waste of time?

All practice takes time. RP takes time, but what is more important and powerful in education than creating and cultivating an inclusive respectful classroom culture and climate built on a sense of belonging and community? These are fundamental skills that will impact everyday learning inside and outside of the classroom. RP is not something to distract from the curriculum or the teaching and learning equation, but something that will build and strengthen the teaching and learning process (Hopkins, 2011; Zakszeski & Rutherford, 2021). Consider how much time is spent by the teacher on a daily basis 'correcting' and 'referring' behaviour issues under the punitive model, wherein only the teacher can decide what needs to be done. Consider how much time may be freed up for the teacher to teach by enabling children to have the confidence and skills to navigate their own conflicts in a non-harmful way. The reality is that it will take some time for this practice to become embedded. RP is not just fixing something, but rather building those foundational skills needed for our students to engage effectively in their learning community and beyond. RP brings an attitude and aptitude to the individual and to the larger society as a whole when these aspects can be generalised beyond the classroom.

Discussion of the key aspects of RP

Despite the proliferation of RP in schools in recent years, research in the area remains limited – albeit growing, especially in the US context (Acosta et al., 2019; Darling-Hammond et al., 2020). As Zakszeski and Rutherford (2021: 382) note, "the 'cart' appears to be before the 'horse' when it comes to research on school-based restorative practices," whereby limited research exists evidencing the effectiveness of the approach despite its growing prominence. In spite of this practice-to-research gap, however, the extant literature demonstrates a range of benefits associated with RP, including improved school climate, gains in children's social/emotional skills, improvements in children's behaviour, reductions in punitive disciplinary practices, and greater levels of academic engagement (Darling-Hammond et al., 2020; Gregory et al., 2013; Zakszeski & Rutherford, 2021). Some evidence also exists of reductions in bullying incidents, improved child attendance, and gains in children's academic performance in schools which take a restorative approach (Darling-Hammond et al., 2020; Gregory et al., 2022). Notably, research has also established that restorative schools demonstrate slight reductions in disciplinary disparities with respect to racial and ethnic groups discussed above (Darling-Hammond et al., 2020; Gregory et al., 2013; Zakszeski & Rutherford, 2021). Importantly, as well as building a strong sense of community and belonging which lessens the likelihood of conflict, the restorative approach supports all members of the learning community to demonstrate accountability for their actions, for their role in conflict in relationships, and for their responsibility to take measures to repair any damage that has occurred.

While one teacher alone can make a difference by using RP, another teacher may realise

that something interesting is happening in a particular class and the practice can grow from there. Ideally, however, a whole-school approach with strong support from the school management team is preferable. An individual teacher who is working in a school that does not support RP still retains the choice of how to interact with students. As a sole practitioner in an unsupportive structure, it is important not to become despondent. If you are aware that a system is harmful, consider to what extent you are going to replicate that harm for the sake of keeping your job. Choosing the words that you speak and the nature of interactions for the day-to-day operation of the classroom remains in the gift of the teacher. The individual teacher may not be able to change a punitive system, but they do get to choose what words are spoken by them as a teacher. The act of showing another way of being to students is nonetheless powerful.

It has been argued however, that RP is most effective when it constitutes a comprehensive change in the overall philosophy and culture of a school, altering the shared assumptions, values, and beliefs among stakeholders (Gregory & Evans, 2020; Zakszeski & Rutherford, 2021). Such an approach typically involves the training of all children and school personnel, thereby supporting intentionality and whole-school commitment (Darling-Hammond et al., 2020). However, Zakszeski and Rutherford (2021) caution against such a 'train-and-hope' approach to professional development with respect to RP, questioning the fidelity of all educators in a school to the principles of the approach. In this regard, it is also important to note that the integration of RP into the philosophy and practices of a given school will vary in correspondence with the size of the institution (Sumner et al., 2010), with research highlighting that it may take up to five years to become embedded (Darling-Hammond et al., 2020; Gregory et al., 2022).

In summary, a restorative approach is best represented not as an optional menu of practices for teachers and schools, but as a philosophy embedded within the culture of a school and members of the school community, consisting of a number of key ingredients based on shared values and restorative language. The restorative circles are an essential element in building community, respect, and belonging. Importantly, they serve to lessen the likelihood of conflict between members of the learning community and damage to the relationships which they share. Restorative conversations and meetings – depending on the extent of circumstances or situation – crucially avoid the language of judgement, criminal justice, and violence. Instead, they scaffold the repair of any damage that has occurred between members of the learning community. This is not something that can be implemented tokenistically or without clear intentionality – it flourishes with meaningful commitment and buy-in from all members of the learning community. It represents a profound shift and invaluable opportunity in how we understand relationships in schools.

Closing questions to discuss or tasks

To conclude this chapter, we share a series of questions for teachers who may be considering implementing a restorative approach in their work, or who are already doing so. These questions are a prompt and a provocation that will hopefully foster curiosity about the benefits to RP in schools.

1. What training and support do you need to effectively implement restorative approaches to resolving conflicts within the school setting?
2. What resources and infrastructure will you need to support the implementation of restorative approaches, including space for restorative circles or meetings, dedicated staff time, and ongoing professional development?
3. How can you educate your school community on the principles and benefits of RP to ensure buy-in and support for the implementation process?
4. What criteria will be used to determine when restorative approaches are appropriate? Is there a time when they would not be appropriate?
5. How can the effectiveness of RP be measured and evaluated? What strategies will be put in place to continually improve and refine the process?
6. How will you encourage collaboration and teamwork among students to build a sense of community and belonging?
7. How will you work intentionally to cultivate and create a braver and safer environment where individuals feel comfortable expressing themselves and share their thoughts and feelings?
8. How will you work at recognising and celebrating diversity within your school community, honouring the unique backgrounds, and experiences of all individuals?

About the authors

Andrew Campbell

Andrew B. Campbell (DR.ABC) is an Assistant Professor, Teaching Stream, in Leadership for Racial Justice in Teacher Education in the Master of Teaching Program at the Ontario Institute for Studies in Education (OISE), University of Toronto OISE. He is the Coordinator for the Black Future Educators' Program (BFEP) and the Director of the Centre for Black Studies in Education (CBSE). DR. ABC is known to the OISE

and broader community for his leadership on advancing equity, leadership, 2SLGBTQIA+ community, and teacher education. He presently teaches courses in anti-discrimination education, leadership, educational change, urban education, and Black Educators' Identity and Pedagogy. He has presented at numerous conferences and has delivered many presentations as a keynote speaker, motivational speaker, and workshop facilitator. He loves people, food, fashion, travelling and bringing his community together for a good meal.

Emer Byrden

Emer Byrden is the Deputy Principal of a primary school in south-east of Ireland, and is doing a PhD in the School of Education in Maynooth University, Ireland. Her interests are relational pedagogy, inclusive education and restorative practice, particularly where these areas intersect. Her current research is on the relational soundscape of the primary school classroom. Emer is contributing a chapter on relational research to the upcoming Routledge Handbook of Relational Pedagogy.

Seán Gleasure

Seán Gleasure is an educational researcher in the field of sociology of education. With a background as a primary school teacher, his research focuses nurture and care in schools, particularly those serving working-class communities, as well as pedagogy in schools more broadly, with an emphasis on children's rights, voice, and participation. He lectures on issues related to in/equalities in children's learning and children's rights, voice, and participation.

Leah O'Toole

Dr Leah O'Toole is Associate Professor of Early Childhood Education in the Froebel Department of Primary and Early Childhood Education in Maynooth University, Ireland. With an academic background in Psychology, her research interests include early childhood education, particularly accessing the voices of the youngest children from birth, relational pedagogy, bioecological theory and working with parents and communities. Inclusion across multiple dimensions is central to all elements of this work.

INCLUSIVE CURRICULUM DEVELOPMENT

Example Case

"Countries around the globe have different ways of curriculum-making for their school and higher education. In some countries, school curricula are a responsibility of committees, mostly composed of staff in the departments responsible for education. Although there could be some form of consultation with teachers, parents, and communities, the final curriculum is often centralised, and the power lies in the hands of the departments of education.

In Namibia, the prescribed or planned curriculum is mainly the responsibility of the ministry which is responsible for basic education. Basic education in Namibia is from Grade zero/ pre-primary education which is normally at the age of 6 to Grade 10, which is normally when the child is 16 years of age. This Ministry would appoint various working groups consisting of the Ministry of Education, Arts and Culture officials, subject experts and teachers serving on subject panel committees hosted by the National Institute of Education Development. These working groups hold regional consultations with community members, which often assume the form of meetings held at specified venues in the communities. Often, members of communities do not view themselves as stakeholders in curriculum making and thus do not attend. A classic example is that of the latest basic education curriculum in Namibia which was implemented in 2014. Many parents and community members started to complain about the curriculum when it reached Grade 10 and Grade 11 level, and according to the new curriculum, not all students can proceed to Grade 12 Advanced Subsidiary Level. Many parents and community members were

taken by surprise because they never attended those meetings, and neither could the majority remember having been invited to these meetings. This demonstrated a gap in the process of curriculum-making as well as in communities' agency to participate and inform the curriculum rather than taking the position of receivers of the curriculum.

The Higher Education planned curriculum-making in Namibia involves a more clearly defined process, guided by the Namibia Qualification Authority's framework. At the beginning of the process, the higher education institutes establish curriculum review committees, which evaluate the current programmes and propose curricula transformation or review. Once these committees have drafted the proposed programmes, they share them with their stakeholders, who include but are not limited to other higher education organisations, government offices, civil society organisations, current and former students and communities. This process rarely includes students and parents. Their voices become secondary as they are represented by teachers and other adults who use an authoritarian lens (Freire, 1968) which deprives them of their democratic role to influence curriculum making through a process of co-production (Reed et al, 2023).

In addition to the planned curriculum from pre-primary to higher education, the lived curriculum plays out in the day-to-day interactions in schools, classrooms, playgrounds, cafeteria, and in communities. These are the lenses through which we see whether the curriculum is inclusive to the needs of a wide array of learners or not, and what role the stakeholders could play in making the curriculum suit their context while forging acceptance, belongingness, participation and achievement (Ainscow, 2016) across a diverse group of learners, teachers and communities."

Initial questions

In this chapter you will find the answers to the following questions:

1. What is the curriculum and how does it come about?
2. What is curriculum-making?
3. What does 'inclusive' mean in inclusive curriculum-making?
4. What is inclusive curriculum-making? And what is not?
5. What does inclusive curriculum-making mean in relation to the assessed curriculum?
6. What are the constraints educators are experiencing in relation to the enactment of

inclusive curriculum-making?

7. How might educators/ teachers/ learning communities respond to these constraints?

Introduction to Topic

This Chapter discusses the meaning of the concepts: curriculum, curriculum-making and inclusive curriculum making.

What is the curriculum, and why do we need it?

The term curriculum *is many things to many people (Aoki, 1984: 94)*

As the quote above by the prominent curriculum scholar Ted Aoki suggests, the term "curriculum" holds diverse meanings, and a universal definition remains elusive – nor would such a definition be desirable given the complex nature of educational practice. Tracing the etymological roots of "curriculum" reveals its Latin origins in the word *currere*, meaning "to run the course" or "the running of the course" (Oxford English Dictionary). This etymological foundation offers an important conceptual starting point for understanding the curriculum's fluid nature. While the traditional notion of curriculum in English and Anglo-American contexts acquired mainly organisational attributes, concerned with objectives/outcomes, vertical and horizontal integration, scope and sequence, subject content, and units (Clandinin and Connelly, 1992; Westbury, 2000;), the concept of *currere* reintroduces the importance of personal and subjective experience in education. We believe that this approach is crucial for inclusive curriculum making, as it recognises the diverse experiences of students and teachers alike and emphasises reflection and dialogue, key to creating a curriculum that is responsive to all. This helps us understand that curriculum is not just about what we plan to teach, it is about how students and teachers experience learning together (Pinar, 2019).

Before examining inclusive curriculum-making in detail, this chapter first explores the diverse conceptualisations of curriculum and the critical distinction between curriculum development and curriculum-making—a shift that positions teachers as active agents rather than passive 'implementers.' Through analysing various curriculum types and reconceptualising inclusivity beyond mere integration, we examine the potentialities and constraints of curriculum-making in addressing educational inequities. The chapter progresses from theoretical frameworks through practical implementations, culminating in strategies for organising collective action towards more democratic educational practices.

Building upon this understanding of curriculum as lived experience, curriculum scholar Ted Aoki suggests the curriculum takes on various dimensions that reflect the complexity

of the educational process. We shall briefly cover these dimensions, with a focus on the enacted curriculum, which is central to inclusive curriculum-making.

Curriculum conceptualisations can be categorised under two broader categories: narrow and expansive. Narrow definitions, aligned with strict constructionist views, see the curriculum as a structured course of study with a specific scope and sequence. Expansive definitions, aligned with life experientialist views, consider the curriculum as a subjective and all-encompassing experience, shaped by the feelings, perceptions, and attitudes of individuals and groups (Ellis, 2014). This expansive view aligns closely with the concept of *currere*, emphasising the curriculum as a lived experience, continuously reconstructed through individual reflection and dialogue.

Under narrow definitions, we can group the planned curriculum (Porter, 2012), which encompasses the outcomes and understandings that teachers aim to achieve with their students. The taught curriculum (Glatthorn et al., 2019) refers to the way content is taught by teachers, often at the discretion of the individual teacher and regardless of its alignment with the planned curriculum. The assessed curriculum (Porter, 2012) captures the aspects of learning evaluated through diagnostic, formative, and summative assessment strategies, while the learned curriculum (ibid.) denotes what students genuinely absorb from their educational experiences.

Under expansive definitions, we can group the lived curriculum (Aoki et al., 2005), which reveals the unpredictable and complex manner in which the planned curriculum emerges within the classroom environment. The hidden curriculum (Jackson, 1990; Willis, 1997) consists of the implicit lessons imparted through the routines of school life, such as unacknowledged assumptions, tracking systems, and community discourse about schools. The null curriculum (Flinders et al., 1986) highlights the implications of omitting significant topics from the school curriculum. The experienced curriculum (Connelly and Clandinin, 1988; Dewey, 1928) represents holistic learning derived from a student's interactions with people, materials, and the social and emotional climate they encounter throughout their education. Finally, the enacted curriculum (Snyder et al., 1992; Zumwalt, 1988) refers to the educational experiences co-constructed by students and teachers, drawing on externally mandated materials and strategies but adapted to fit the teachers' backgrounds and the specific cultural and structural contexts of the classroom. As Popkewitz, Tabachnick, and Wehlage (1982) note, curriculum enactment isn't just about transmitting knowledge but about understanding how "schooling modifies unanticipated and unintended consequences" shaped by ideology and context. This view highlights the teacher's active role in continuously building educational experiences with students in a dynamic, interactive way. It has to be noted that while expansive definitions aim to include diverse student experiences, they can still perpetuate exclusion. As Nind (2005) argues, inclusive education requires more than adopting an inclusive mindset – it demands a dynamic, co-constructed curriculum that challenges entrenched power structures (more on this below).

As we can see, there are a multitude of definitions and conceptions around the

curriculum, making it difficult to find a universal definition. However, Glatthorn et al. (2012) provide a framework that can be argued to be encompassing. This framework serves as a blueprint for educational experiences, articulated in documents that guide teaching practices and influence the dynamics of learning experiences. They emphasise the complex nature of education, which includes both the intended plans and the diverse ways in which these plans are experienced and interpreted by students within various educational settings.

Inclusive curriculum making happens across various sites, not just in schools or ministries, but also through the work of organisations such as the Organisation for Economic Co-operation and Development (OECD), United National Educational, Scientific and Cultural Organisation (UNESCO), and the World Bank at the supra level, where transnational policies are shaped. Some of these bodies, like UNESCO, United Nations Children's Fund (UNICEF), Global Partnership for Education (GPE) have a stronger focus on inclusive education, and actively promote it through international guidelines, frameworks, programmes and projects. At the meso-level, NGOs or government semi-autonomous agencies often work directly with schools and governments to ensure marginalised groups are included in educational policy. This broad range of actors reflects how inclusive curriculum making is a complex social practice, involving distinct roles, and priorities across different sites of curriculum making (Priestley et al., 2021).

Overall, the curriculum can be said to consist of three aspects. First, curriculum as a social practice, as it is something participated in and enacted by practitioners and other actors working collaboratively; second, it is something that happens across and within multiple sites of education systems, for instance, schools, local municipalities, NGOs, and policymakers. The third dimension concerns the structuring, sequencing, and selecting teaching content and approaches, integrating curricula, resources, and pedagogical methods to create a cohesive and inclusive learning experience for all students (ibid.).

1. For more comprehensive overviews of curriculum conceptualisations, the reader is advised to refer to Ellis (2014), Jung and Pinar (2016) and Short (2023).

2. However, it has to be added that different cultures have conceptualised curriculum in diverse ways, shaped by varying educational philosophies, societal values, and historical contexts. For more, refer to Paraskeva (2021), and Eppert & Wang, (2008).

Key aspects

The Centrality of the Teacher in Inclusive Curriculum Making

Our approach deliberately steers away from a static conception of curriculum that envisions teachers as 'passive conduits implementing…somebody else's curriculum product' (Priestley et al., 2021: 2). Instead, we recognise the central role of teachers as agentic actors in the complex process of inclusive curriculum making. This perspective aligns with Clandinin and Connelly's (1992: 323) view of the 'teacher as the integral part of the curriculum constructed and enacted in classrooms,' acknowledging that every school is 'unique and that curricular needs are…largely idiosyncratic' (Kelly, 2009: 9). However, it is crucial to understand that teacher agency in inclusive settings is not merely about individualautonomy. As Pantić (2017) argues, teacher agency is deeply embedded in socio-cultural and institutional contexts. Teachers navigate complex networks of power relations, policy mandates, and diverse student needs, which both enable and constrain their agency (Biesta et al., 2015). In the context of inclusive education, this agency becomes even more intricate, requiring teachers to move beyond thinking about 'most' and 'some' students to considering 'all' students (Florian & Spratt, 2013).

The professional knowledge informing teachers' judgments in inclusive curriculum making extends beyond traditional pedagogical content knowledge (Shulman, 1987). It encompasses what Florian and Black-Hawkins (2011) term "inclusive pedagogical knowledge," which includes not only subject matter expertise but also an understanding of how to create learning opportunities accessible to all students, regardless of their perceived differences. Moreover, the concept of "funds of knowledge" (Moll et al., 1992) highlights how teachers in inclusive settings need to recognise and leverage the diverse cultural and linguistic resources that students bring to the classroom.

Collaborative curriculum making is central to inclusive practice. This involves not just collaboration among teachers but also with students, families, and community members (Artiles & Kozleski, 2016). Such collaboration challenges traditional power dynamics and aligns with the principles of democratic education (Apple & Beane, 2007).

By implication, we're steering away from a conception of curriculum that views education as guiding learners towards specific, predefined goals or outcomes. Traditional education, often seen as socialising and normalising individuals to fit into an existing framework of values and norms, can be problematic for inclusion. This ends-oriented model promotes certain interests and values at the expense of others, potentially marginalising those who do not conform to these predefined outcomes (Biesta, 2009; Osberg & Biesta, 2010; Slee & Allan, 2001).

Instead, we embrace a complex definition of education that rejects the notion of predefined educational ends. In this chapter, we outline a conception of an inclusive curriculum that is fundamentally open-ended and focuses on creating openings rather

than reaching closures. Judgments about what emerges from the educational process are made collaboratively and continuously, supporting a democratic space where diverse possibilities are critically assessed (Osberg & Biesta, 2010). This approach has significant implications for teacher education and professional development. Preparing teachers for inclusive curriculum making requires a shift from transmissive models of teacher education to more reflexivity (Cochran-Smith & Lytle, 2009). This includes developing critical consciousness about the issues of power, privilege, and oppression in education (Gorski, 2009).

Recognising the centrality of teachers in inclusive curriculum making means acknowledging their role not just as implementers, but as key agents in a complex, collaborative, and continuously evolving process. This perspective allows for the continuous renewal of ways of being-in-the-world-with-others, making education an adaptive and inclusive practice rather than a rigid, goal-oriented process. It challenges us to rethink not only how we conceptualise curriculum but also how we prepare and support teachers in their critical role of fostering inclusive educational environments.

> **Reflection activity**
>
> Think about what you learn in school, college or university. What or who determines what you learn? Do you think that what you learn and how you learn it is important to you and your peers? How different would you like to see it? For example, do you think teachers, parents, learners and community members should participate in the curriculum-making process? If yes, why and how? Discuss the answers with your peers. You can also get the opinion of any of your lecturers.

What does 'inclusive' mean in inclusive curriculum-making?

As highlighted above, in this chapter, we are attempting to move away from a narrow and deterministic conception of curriculum making where teachers are seen as mere conduits of the mandated curriculum that has to be 'delivered' or 'implemented' in the classroom. We think that this kind of conception of curriculum making would also have implications as to what we mean by 'inclusive'. Osberg and Biesta (2010) argue that curriculum and curriculum making are crucial to inclusive education because the curriculum guides the educational process. Traditional, deterministic views impose predefined norms, and this can limit inclusivity by excluding those who do not or cannot conform to these expectations. Such an understanding implies that people can only be included in a set of norms defined in advance by those who are already 'on the inside' who have decided what it is that is 'normal.'

This critique of normative inclusion finds theoretical resonance in Rancière's (1995) conceptualisation of democracy as inherently sporadic and disruptive. He argues that true democracy occurs in specific moments of disruption that challenge the established order, and these disruptions often come from outside the existing structures. Rancière helps us to see that we should understand democratic inclusion not in terms of adding more people to the existing order, but rather as a process that necessarily involves the transformation of *that* order itself. As long as we restrict our inclusive efforts to those who are known to be excluded, we only operate within the existing order (ibid.). This perspective suggests that achieving inclusivity in education requires similar external disruptions to challenge and transform entrenched norms and practices from the outside in. Through this reconceptualisation, we move beyond approaches to democratic inclusion that remain embedded within colonial frameworks of thought. Such frameworks perpetuate the imposition of predefined norms and hierarchies that systematically exclude diverse perspectives and lived experiences from educational spaces. The criticisms highlighted by Slee and Allan (2001) further emphasise that inclusive education has often been misappropriated by traditional special education paradigms, leading to further exclusion rather than genuine inclusivity. The current policy context, characterised by neoliberalism, marketisation, and standardised testing, often reinforces exclusionary practices. To genuinely achieve inclusive education, it is necessary to move beyond these traditional models to ensure that the curriculum is open to (or indeed inclusive of) transformations and disruptions that challenge existing power structures and knowledge hierarchies.

Defining *inclusive* curriculum-making is not straightforward given the various interpretations of the concept of curriculum-making, and the broad remit of the principle of inclusion both itself and in relation to curriculum-making specifically. Inclusive education can be defined as an education system and process whereby "all children in the same classrooms in the same schools" (UNICEF, 2024) learn, and where real opportunities for learners who have been previously excluded are provided (UNICEF, 2024). All learners include not only children with additional needs, but also speakers of minority languages and learners from diverse cultural backgrounds (UNICEF, 2024). Inclusive systems respect and value the contributions that learners from all backgrounds bring to the classroom and enable diverse groups "side by side to the benefit of all" (ibid).

An inclusive school, for example, may be defined as "a place where everyone belongs, is accepted, supports, and is supported by his/her peers and other members of the school community in the course of having his/her educational needs met" (Johnson, 2020: 115). At school level, a central challenge is how to build and maintain a bridge between the principle of inclusion and practices related to individual pupils as partners in a joint class or group.

UNESCO identify curricula as the "central means for enacting the principles of inclusion and equity" (2017: 19) which underlines the importance of both mandated curricula, and the process of enacting curricula by educators in terms of an avenue, process and means of prioritising inclusive practice on many levels. Johnson (2020) explores the concept a

curricular approach to inclusive practice at institutional level, and identifies seven key areas of a *curricular approach*: (i) **the pupil/s, (ii) educational intentions, (iii) educational content, (iv) methods and organisation, (v) assessment, (vi) communication and (vii) care**, all of which are framed by the school's own context (Johnson, 2020: 123) These seven aspects are concerned with the school's inner activities; and represent the teaching-learning context and processes on a micro level, and are representative of a 'bottom-up' approach whereby students and their curricula are the central focus of the educators serving the school community (Johnsen, 2020). In terms of making the curriculum accessible to all, adaptation of curricula to meet the needs of individual learners which represents an established school-level approach internationally. It is argued that the cornerstone of inclusive practices at school level is based on "making, implementing and continuously revising individual educational curricula" (Johnsen, 2020: 119).

What is inclusive curriculum-making? And what is not?

Teaching is a political act. What is included in and excluded from what is taught in the classroom? And who gets to make the decisions around this?

The exclusion of Black History, the history of Africa, the Caribbean, and their diasporas, from the mainstream curriculum of the Global North is a clear example of a systematically exclusionary curriculum. This exclusionary practice in curriculum settings has been documented in several countries. For example, in 2020, in Wales, a curriculum working group set up by the government found…

"no clear evidence on the extent to which existing school curricula address issues of race and diversity (or indeed any other specific issue or theme) within history or any other subject."

And additionally,…

"There are major gaps in the available resources which support the teaching of Black, Asian and Minority Ethnic themes across the curriculum. A review of Hwb identified only eleven resources with a black history focus, and the majority of these are considered by the Group to be outdated, lacking in supporting material for teachers, and of little relevance to Wales."

(Welsh Government, 2020)

Similar to the History curriculum, the lack of inclusivity has also been demonstrated in other subjects. Research into the English Literature curriculum at UK secondary schools by Lit in Colour (a collaboration between the publisher Penguin Random House and the think tank Runnymede Trust) found that an overwhelming 82% of children surveyed did not recall ever studying a text by a Black, Asian or minority ethnic author (Elliot et al., 2021). Runnymede's research into the secondary level curricula of art-based subjects at UK schools found a similar pattern:

- − "[…] Work by white artists represents 89.2 percent of mentions whereas work by minority ethnic artists represents only 10.8 per cent.
- − […] Named white artists make up 91.6 percent (1,371 mentions) of all exam board mentions but minority ethnic artists only 8.4 percent (125 mentions).
- − Only 2.3 percent of references to named, stand-alone artists are from Black or South Asian backgrounds, this is made up of 0.74 percent South Asian (11 mentions) and 1.54 percent Black (23 mentions) artists" (Begum, 2024).

These examples of the exclusion of topics within history, and the lack of diverse authors and artists taught at schools in the UK have led to urgent calls for the decolonisation of the curriculum. In its "Framework for developing an anti-racist approach" (2022), the National Education Union (UK) defines decolonisation as follows:

What does 'decolonising education' mean?

Decolonising is a way of thinking that interrogates how colonisation shapes the way we think, our education system and the curriculum. The legacy and ongoing impact of the ideas that shaped colonisation and the actions of the British Empire contribute to contemporary racial inequalities. Discussions about decolonising education is one essential step to developing anti-racist educational spaces. Understanding the context for today's immigration debates is impossible without understanding that large numbers of people who came to the UK did not actually come as migrants; they came from colonies and former colonies as citizens. A representative and relevant education system should reflect Black children's histories, achievements, culture and politics. All children deserve to see themselves reflected in their books, schools and communities and to achieve this we must rethink both curriculum and assessment. (NEU, 2022)

Writing in the Higher Education context, Leon Moosavi argues that "decolonising" the curriculum or creating a more inclusive curriculum is often understood as "trying to address the Western Centrism of teaching content by incorporating perspectives that have often been excluded because of coloniality" (Moosavi, 2023).

However, is this act of "diversifying" the curriculum with marginalised perspectives adequate in creating a truly inclusive curriculum? What happens when we simply add one or two lessons about Africa to the syllabus, leaving the entire syllabus unchanged? What if a school introduces a Black History Month where students learn and celebrate the history of Africa and its diasporas, with the rest of the year's lesson plans remaining unchanged? Moosavi (2023) further argues, "While a mere diversification does not necessitate a

decolonial shift, introducing students to scholars, theories, topics, solutions, case studies, or concepts that have been relegated to the periphery due to coloniality is a common approach to decolonising the curriculum."

Indeed, while initiatives such as Black History Month can be helpful, tokenistic additions to an otherwise exclusionary curriculum does not make the curriculum inclusive. An inclusive curriculum is where the inclusion of marginalised knowledge and people are integral to the curriculum as day-to-day practice. If the history of Africa, Asia, and elsewhere beyond Europe is included in the curriculum as normal practice, if historical figures of Black, Asian, and Indigenous heritages are frequently introduced to learners all year round, tokenistic initiatives such as Black History Month would become redundant. These initiatives would not be needed without the systemic exclusion of marginalised voices and knowledge from the mainstream curriculum.

A truly inclusive curriculum also goes beyond diversification of topics and historical figures introduced to learners. Writing about the under coverage of race and racial diversity in the secondary school curriculum in England, Remi Joseph-Salsbury argues:

"Under a reorientation of values, schools would begin to move beyond the (important) racial diversification of school curricula, towards the implementation of an anti-racist curriculum. […]

An anti-racist curriculum would involve showing how the history of modernity is shaped by racism, coloniality and white supremacy. So, while diversity might stop at the inclusion of BME people, anti-racism would urge learners to look at the socio-political context of BME people in relation to white people…" (Joseph-Salisbury, 2020)

The same argument can be made for the discussion of other marginalised identities, and other systems of oppression in the curriculum. For example, in addition to introducing female scientists to learners, a truly inclusive science curriculum would also invite learners to critique why women are often excluded from science in the first place and explore consequences of the exclusion of women in scientific and medical research.

Making an inclusive curriculum requires the teacher to critically challenge and debunk dominant narratives in the curriculum, which cannot be done through adding marginalised voices to the curriculum alone. Writing about state-making propaganda in education in the Australian contexts, Arathi Sriprakash and colleagues argue:

"[The pedagogy of the state] brings certain histories into the present in order to secure particular futures. This pedagogical work can take multiple forms, […] in the messages relayed through public holidays and memorialisation, in public images and narratives, and in commemorations of national 'leaders' and dates of the past. These enter into education curricula and systems."

In a truly inclusive curriculum, the teacher or educator would not just present propagandic narratives that glorify empires alongside a handful of marginalised voices. They would go further by recognising and critiquing the problematic nature of the dominant narrative in the curriculum.

Black Feminists such as Patricia Hill Collins have attributed exclusionary biases in the knowledge that is produced, legitimised, and taught in the curriculum, to the exclusion of marginalised and minoritised people in academic institutions. Writing in the US contexts, Hill Collins argues,

"Because elite White men control Western structures of knowledge validation, their interests pervade the themes, paradigms, and epistemologies of traditional scholarship. As a result, U.S. Black women's experiences as well as those of women of African descent transnationally have been routinely distorted within or excluded from what counts as knowledge."

(Hill Collins, 2014: 251)

Inclusive curriculum-making requires the teacher or educator to have an awareness of historical, social, and political contexts that produces and reproduces suppression of marginalised knowledge. Thus, one strategy for inclusive curriculum making is the involvement of and consultation with a broad range of stakeholders, including learners and their wider community. An inclusive curriculum recognises the credibility and importance of learners and their wider community in shaping knowledge, in deciding what's important enough to be taught in the classroom.

What does inclusive curriculum-making mean in relation to the assessed curriculum?

The implementation of "child-, disability-, and gender-sensitive" and for "providing safe, non-violent, inclusive and effective learning environments" (UNESCO 2017: foreword) has been defined as the 4th Sustainable Development Goal (SDG) and taken up in national, local and institutional policies. This is just one example of how the goal of inclusion is promoted through educational policies worldwide. On the one hand, the planned curriculum defined in national policy frameworks is only a single element that shapes the students' experiences – teacher skills and attitudes, infrastructure, pedagogical strategies and many more factors are also relevant in forming the co-constructive classroom experience (cf. UNESCO 2017: 13, see above). At the same time, both the way in which a curriculum is constructed and its interactive implementation in the classroom are powerful processes that can have a serious impact on the culture of learning and learners' opportunities.

Bearing in mind the knowledge-forming dimension of curricula (see above), it makes sense to explore the differences between the assessed curriculum (examination (results)), grades and other documents that are supposed to quantify and document learning' progress) and the inclusive curriculum (encompassing the dimension of in- and exclusion unfolds in relation to the lived experiences, which emerge from within, between and beyond school institutions (see above, Ainscow 2016: 148ff.)) a little further.

From a theoretical point of view, a key dimension of the inclusive variant of the curriculum

may be defined as an achieved reflection of the written curriculum with regard to the diversity within the student body as well as contextual factors (ibid.).

Regarding curriculum *making*, as the example of decolonisation (see above) shows, inclusivity can only be triggered if the dominant discourse inscribed in curricula and teaching and learning patterns is exposed. Hence, there is a need to overcome existing hierarchies in collaborative practices. According to Baron (2018: 340), a circular and recursive mutual exchange may allow for ongoing self-critical and bias-sensitive examination of in- and exclusion dynamics at all (micro-, meso-, macro-) levels, based on trust and understanding:

"Since a conversation is not one-sided, there should not be a dominant discourse. Variety and mutual learning are valued as the curriculum and understandings surrounding the curriculum are embraced and adjusted by other worldviews" (Baron 2018: 334).

To build anti-hierarchic, "heterarchical" relations (Baron, 2018), teachers may look for significant others in their professional environments on policy, practice and relevant intermediate levels to share, exchange, discuss and adjust ideas on how to make the curriculum inclusive as communities of practice (or professional learning communities).

These professional or learning communities can seek to exchange their ideas with other groups and stakeholders in feedback-loops and, in a best-case scenario, establish a dialogical exchange between students, teachers, management and policy makers. In the sense of co-construction of agency as a highly, "situated achievement" (Priestley, Biesta & Robinson, 2014: 151), curriculum making can be carried out as an iterative, co-constructive process between teachers and pupils that can unfold and adapt in a continuous and circular way. In addition, a relational exchange can be installed at the institutional level (ibid.: 157) to promote professionalisation and further training.

With regard to curriculum *enactment*, the objective of critical agency, would avoid seeking a universal formula for the design or implementation of an inclusive curriculum. Regarding the objective of avoiding tokenistic addictions to a curriculum (but seek for a reorientation of values instead). As an alternative, a critical agency can be built by accounting for the high dependency on contextual conditions from which grades and learning outputs emerge. A democratic and participatory process of co-construction and reflection on forms of in- and exclusion that are caused or reinforced by the existing curriculum in the medium to long term can enable teachers to take the experiences of diverse learners and their learning needs into account. Hence, general teaching tools and standardised approaches should be reflected regarding their in- and exclusionary potential within a particular setting based on engagement with the students' experiences. To do so, it is also necessary that teachers are given the opportunity to learn about their own potentials and limits regarding their experiences and knowledge about structural barriers and their ability to problematise existing forms of exclusion in the individual setting.

In addition, inclusive enactment of curricula may require the adjustment of standardised assessment tools or even working with alternative approaches, such as interviews and

conversations, self-evaluation, logbook or diary, portfolios, etc. (Johnsen 2020: 131-2). Such individualised assessment techniques can support continuous adaptation of curriculum enactment to changing requirements in the classroom. Also, this might allow schools to start moving beyond the (important) racial diversification of school curricula, as criticised above, and thus feed back into the process of curriculum making as a form of participatory knowledge.

Regarding limits and potentials, it should be noted that many schools include the requirement to realise inclusion in their mission statements without providing support structures for teachers to put this claim into practice. Hence, the distinction between the assessed and inclusive curriculum may be diluted and developing inclusive and participatory routines may be left to the individual teachers. Responsibilitisation, however, is not the same as critical teacher agency. In responsibilisation, teachers are given sole responsibility for implementing the curriculum, thereby ignoring the institutional setting as a basic condition and the exclusionary structures that exist within it. This may lead to the fact that implementing a given curriculum in a non-exclusive way can be particularly challenging for teachers, while at the same time being put under high pressure to "perform" as in present good examination outcomes.

"Agency ,[…] is not to be understood as something that people can have; it is something that people do. It denotes 'quality' of the engagement of actors with temporal-relational contexts-for-action, not a quality of the actors themselves" (Priestley, Biesta & Robinson 2014: 150).

It is thus crucial to account for the difference between the inclusive and assessed curriculum to analyse inner and contextual constraints and opportunities to adjust pedagogical routines to make them more inclusive. Critical teacher agency would account for the inclusive curriculum dimension in a way that respects aspects of participation, which "relates to the quality of their experiences whilst they are there and, therefore, must incorporate the views of the learners themselves" (Ainscow 2016: 147). From a critical teacher agency point of view, "'achievement' is about the outcomes of learning across the curriculum, not merely test or examination results" (ibid.). It is useful for teachers to develop strategies and techniques to review the assessed curriculum for the potential of exclusion and make adjustments where necessary to move closer to an inclusive curriculum. The aim of such an approach would be to engage in a critical and practical agency, based on both the learners' needs and contextual requirements.

What are the constraints educators experience in relation to the enactment of inclusive curriculum-making?

It is recommended to readily identify barriers to inclusion (Ainscow, 2020) as a proactive strategy to inform how educators and education systems can seek to address such constraints.

- The growth of neoliberalism at government level globally which in turn influences (inclusive) education policy.
- Curriculum overload- the weight of content and business of teaching schedule detracts from creating space to discuss and critically analyse mandated curricula at school level and explore philosophical stances such as the development of inclusive practices. In most cases, school and higher education curricula are subjected to examination-oriented assessment systems that overlook actual skills and competencies. The unfortunate outcomes of this are that educators are pushed to tick off these academic targets and, in the process, miss out on the actual humanity goals. In the delivery of the curriculum, a lot of time is spent on "learning to pass" rather than "learning to be." Learners' needs might not be identified or there is limited time to develop support strategies that could serve as support for a variety of learning needs. The learning experiences of these learners could be marked with loss of identity, bullying and marginalisation. These are the opposite of an ideal inclusive curriculum in which every role-player should thrive (Ainscow, 2016).
- Lack of access to and provision of continued professional development in relation to inclusive curriculum-making.
- Lack of clarity, trust and support between education partners regarding the enactment of policy at school/ institution level.

Organising for inclusive curriculum-making

This chapter has provided some suggestions for teachers to implement inclusive curriculum-making at the classroom level while also acknowledging the challenges and constraints of implementing an inclusive curriculum. One way to overcome some of these challenges is through organising and campaigning with other teachers and educators, as well as the wider community outside of educational establishments.

Writing in the context of HE, Moosavi (2023) reflected on his experience of implementing a decolonial curriculum for his module and expressed regrets over the missed opportunities in encouraging colleagues in the broader programme to examine their curriculum and pedagogy. He writes, "[I]f students only experience a decolonised curriculum in a small part of their overall studies, we may still be complicit in being part of an educational programme that is Western-centric and that we have not done enough to subvert."

Additionally, Abu Moghli and Kadiwal (2021) have argued for the importance of institutional changes in the power structure of educational institutions, that individual inclusive curriculum practices alone cannot take place in a vacuum, detached from other symptoms of an exclusionary education system. Similarly argued by Moosavi (2023), "even better than recruiting one's colleagues to engage in academic decolonisation, it may be better to lobby one's university for institutional changes in implementing academic decolonisation at a more strategic level."

Historically, teachers and educators have also worked with the wider community to campaign for inclusive curriculum practices. The establishment of Black Studies at US colleges in the Civil Rights Movement, bringing "previously excluded knowledges" (Andrews, 2018) to the HE curriculum, was a clear example of where this has happened. Chronicling the movement for Black Studies in the US, Kehinde Andrews (2018), the first professor of Black Studies in Europe writes: "Establishing Black Studies was a political act, supported by communities because it was seen as a progressive step that could improve the lives of African Americans."

In fact, Andrews believes that community support was integral to this academic movement and that African American scholars alone could not have established Black Studies in the US.

"Black Studies spoke to so many because it set out to transform the accepted knowledge base. The movement was far more substantial than simply asking for more Black people to be hired, it insisted on recognising previously excluded knowledges."

(Andrews, 2018)

Case study: The National Education Union and its campaigns for inclusive curriculum in the UK.

The National Education Union (NEU) is the largest trade union of workers in the education sector in the UK. The NEU represents not only qualified teachers but also those in training as well as other professions, such as teaching assistants and school support staff.

In addition to representing members in the workplace, the NEU also campaigns for issues within the sector, such as poverty, anti-racism, as well as teachers' pay and workload. The union has consistently called for inclusive curriculum reforms in their campaigns. For example, in their manifesto leading up to the 2024 general election in the UK, the NEU demanded that the next UK government must

"Ensure the changes to the curriculum are engaging and inclusive, and that teachers have access to professional learning to embed antiracism and guarantee all pupils access to a broad range of subjects, including the arts and PE"

(NEU, 2024).

Additionally, as previously cited, the NEU has also created an anti-racism framework (2022) to support and empower members in advocating for this agenda at school, especially in creating an inclusive curriculum at school level. The framework covers anti-racism in five core themes, posing a series of questions to help guide NEU members in examining anti-racism in their practice and local school context. Under "teaching and learning", readers of the guide were invited to reflect on the following:

"Is the curriculum being used to:

- Challenge race inequality
- Achieve cultural inclusion

- Respond to the differences in children's lives caused by racism, poverty and discrimination?" (NEU, 2022).

In addition to the written guidance, the NEU also provides training sessions to facilitate the implementation of the framework to members' workplaces.

Joining trade unions such as the NEU is a fantastic way for teachers and educators to advocate for inclusive curriculum making beyond the class-room – at their school and even at a national level. One single teacher cannot campaign for inclusive curricula on their own. However, when the mass collective of teachers organise for progressive curriculum reform, this objective is a lot less difficult to achieve.

Local contexts

About the authors

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Penny H. C. Dinh

Penny H. C. Dinh is first and foremost a social justice activist – an active campaigner for decolonial and antiracist education within her trade and students' unions. She is currently researching teacher activism and anti-racist education in Wales as part of her PhD at Cardiff University.

Jane O'Toole

Jane O'Toole is a primary school teacher who specialises in language education. Jane's doctoral research explored student and parent engagement with the Irish language utilising a participatory action research methodology. Jane has also served as a school principal and has a special interest in inclusive education and curriculum. Jane has been a coordinating member of the Collaborative Action Research Network (CARN) since 2016.

Lisa Marie Rosen

Lisa M. Rosen is a University researcher and teacher at PhD level, working on the topic of various forms of (policy-based) concepts of diversity and

inclusion and their contextualized enactments in educational settings from comparative and intersectional perspectives.

Nika Maglaperidze

Nika Maglaperidze is an English teacher and a beginning educational researcher from Georgia. A first-year PhD student from the Department of Education, Maynooth University. His research focus centres on teacher education, social justice in education, curriculum making and philosophy of education.

ADVANCING INCLUSIVE EDUCATION: POLICY, PRACTICE AND STRUCTURAL CHANGES'

Example Case

"We would first like to bring in the case study of Malala Yousafzai from Pakistan a 17-year-old education activist who won a Nobel Peace Prize in 2014 for her work in female education which makes her the world's youngest Nobel Prize Laureate. She is credited with highlighting the importance of an inclusive education policy. However, we would like to refocus the attention towards her father Ziauddin Yousafzai who was an education activist himself and worked vehemently towards bringing about equal basic education for all, including women. It was and still is considered quite a radical perspective in a Taliban-dominated country like Pakistan that justifies violence against anyone who dares to defy their radical Islamic policies. However, her father's bravery and zeal for inclusive education motivated Malala to bravely face all kinds of discrimination and violence-including getting shot by a Taliban gunman (UN, 2017).

If we consider Malala and her father to be conscious educators then, it is crucial that we chart out what makes them relevant educators and how can those characteristics be inculcated among young researchers and intending educators. It would then help us in understanding the significance and impact that our roles as educators can have on policy in education."

In this chapter, you will find answers to the following questions:

1. What are policies and how should we read them?
2. What is the contemporary significance of an inclusive teacher education policy and what impact do we expect from such an inclusive policy?
3. In what ways do structural disadvantages manifest within educational institutions, and how do existing educational policies both contribute to and fail to address these inequalities, thereby impacting the realisation of inclusive education?

Introduction to Topic

There are an estimated 240 million children with disabilities worldwide. Yet children with disabilities or any other 'different kinds' of children are often overlooked in policymaking, thereby, limiting their access to education and their ability to participate in social economic and political life. Worldwide, these children are among the most likely to be out of school and/or face discrimination, stigmatisation and violence. Robbed of their right to receive a proper education, such children are also often denied the chance to take part in their community activities, the workforce and the policy decisions that mostly affect them. Inclusive education is thus considered as the most effective way to give all children a fair chance to go to school, learn and develop the skills they need to thrive. By maintaining a focus on transforming teachers/educators into active agents while formulating policy and implementing the curriculum-inclusive education very simply means that children from different backgrounds can grow and learn in the same classroom. The concept is popularised widely by UNICEF, and it has requested all the member states to implement it in ways that would address their distinct needs (UNICEF, 2001).

The most crucial, however, is the outcomes of the 48th Session of the International Conference on Education (ICE) held in Geneva in November 2008. It presented a broadened concept of inclusive education as a holistic reform strategy for education systems aiming to achieve quality education for all. They are of the view that "a broadened concept of inclusive education can be viewed as a general guiding principle to strengthen education for sustainable development, lifelong learning for all and equal access of all levels of society to learning opportunities" (UNESCO, 2008). Within the context of this broadened concept of inclusive education, a key role for inclusive teachers has been recognised and developed

around the need to meet diverse learner's needs and promote inclusion. This consensus is built on a rights-based perspective of education and considers the startling numbers of learners excluded from education around the world (Opertti and Brady, 2011).

This has led to the right to basic and equal education irrespective of age, class, geographical location, culture, politics, religion and other factors to be lacking in many countries even in the contemporary times. It might be quite difficult to chart out the core reason behind this due to the complex intersectionality shared by the three major institutions of society, i.e law, politics (both domestic and international) and religion. However, key issues include the widening gap in learning outcomes, that is closely related to social and economic conditions; the increasing diversity of classrooms with respect to cultural and linguistic origins; the shortage of experienced teachers working where they are needed and how their services are required; the difficulties in recruiting teachers from diverse social backgrounds; and the low pay and status of the teaching profession (Opertti and Brady, 2011). Thus, through this proposed policy, we are trying to articulate and justify this approach and create an inclusive teaching policy that can address the contemporary distinct needs of its students and break the power imbalance between the educator and the students.

Key aspects

Structural Disadvantages

Having explored the broader concept of inclusive education and the role of policy in addressing structural disadvantages, this chapter now focuses on the specific forms these disadvantages can take. In this next section, the concept of 'Structural Disadvantages' in education is explored in more depth. This exposes common mistakes in policy, where surface-level goals don't match the realities students often face.

Structural disadvantage in education describes the circumstances where specific groups of children and young people experience marginalisation or disadvantage within educational institutions like schools, universities, kindergartens, etc. This is often a result of social divisions that create and perpetuate inequalities (Unterhalter, 2021). These are students who often have limited access to educational opportunities or are subjected to low-quality education (Matsumoto, 2013). These disadvantages are entrenched in societal structures and exacerbated by ineffective education policies, permeating the very classrooms where we teach, and as a result inhibiting the implementation of inclusive education. As a teacher, you will likely observe that these structural disadvantages originate due to various factors, including your students' socioeconomic status, race and ethnicity, gender, disability, and geographical location, among others. It is also important to draw our attention to how inequalities can also be embedded into our teaching practice (Unterhalter, 2021). Even within deeply unequal systems, individuals strive to combat structural

disadvantages in education on a daily basis. A powerful example of this is Malala Yousafzai and her father Ziauddin, who defied entrenched gender restrictions on education in Pakistan. Despite immense barriers, they championed equal basic education for all, including women. This case exposes how the transformative power of education depends on policy shifts; even the bravest individuals struggle alone against systemic barriers.

Intersectionality offers a lens to examine the complex interplay of these different factors and illustrates the multi-faceted nature of inequalities and how they can play out in your classroom and the school (Crenshaw, 1990). This intersectional lens reveals limitations in policy responses that treat each disadvantage in isolation (ethnicity-focused programmes that ignore poverty, etc.). Further, it underscores how socioeconomic status, race, ethnicity, gender, and geography can intersect and interact in ways that exacerbate educational disparities. For instance, a student from a low-income, ethnic minority background might face compounded challenges due to both economic constraints and systemic racial biases. Similarly, gender disparities in education can be influenced by a combination of societal norms, educational policies, and socioeconomic factors, which can vary significantly across different geographical contexts. Furthermore, these policy-exacerbated disparities are not isolated but can reinforce each other, creating a complex web of inequality that is deeply embedded in our educational systems (Matsumoto, 2013; Unterhalter, 2021).

A wealth of research evidence now suggests that socioeconomic disparities have a broad range of impacts on children's learning, with the effects of socioeconomic disadvantage being felt both within and outside of school (Hirsch, 2007). One of the most conspicuous manifestations of these disadvantages in schools and classrooms is through educational outcomes. In fact, it's striking that 60% of the variance in assessment outcomes can be attributed to out-of-school factors, such as those previously mentioned (Haertel, 2013). For instance, children from impoverished and disadvantaged backgrounds typically perform significantly worse than their peers from more advantaged backgrounds. A primary contributor to child poverty in many instances is the lack of opportunities available to parents with limited skills and qualifications. Such parents are less likely to be employed and have the necessary income and resources to meet the financial demands of raising a family.

Consequently, children from disadvantaged households are less likely to acquire the necessary qualifications that could help them escape the cycle of poverty and achieve social mobility. This highlights the failure of our system to address the root causes of underachievement. Current policies often focus on individual achievement within the school system, neglecting the broader societal factors that contribute to disadvantage. This narrow approach fails to address the root causes and perpetuates existing inequalities. If societal support to overcome economic disadvantage is absent, even motivated students suffer, revealing the need for holistic policies beyond the classroom. These systemic inequities manifest in varied ways across contexts: In wealthy nations, parental lack of opportunity might prevent buying school supplies and resources. Additionally, in low-

income countries, such as Kenya, parents with low literacy levels may not fully understand the long-term benefits education offers their child. This lack of understanding can sometimes lead to children not attending school consistently or at all, perpetuating the cycle of poverty across generations (Unterhalter et al., 2012). These varied socioeconomic barriers illustrate how disadvantage in education has different roots depending on context, yet with sadly similar consequences. In response to these socioeconomic disadvantages, certain policies have been enacted to address these and other educational inequalities. For instance, the Right of Children to Free and Compulsory Education enacted in India can serve as a good example as was mentioned earlier in this chapter.

Building on the idea that educational outcomes vary among different social groups, particularly those from diverse ethnic and racial backgrounds (Hirsch, 2007), it is important to delve deeper, albeit briefly, into the mechanisms behind these disparities. One of the most prominent factors is represented in the concept of racialisation, which is when people's relationships with each other are influenced by their racial identities, which has a big impact on education (Bajaj & Scott, 2022). Racialisation leads to systemic biases and prejudices that are deeply embedded in educational systems, biases often left unaddressed by current policies due to a focus on individual teacher 'bad apples' rather than institutional failings. This bias affects teacher responses, grading, limiting student belief in their own ability regardless of true effort, affecting the quality of education received by students of different racial and ethnic backgrounds. This can manifest in various ways, such as differential access to resources, biased curriculum content, and discriminatory practices within the school environment (ibid.). Further, in some instances, some ethnic groups tend to be positioned far from the centre of power, which will affect their access to both the quality of schooling they receive and the curriculum that alienates them and omits material of cultural significance for them.

Gender differences in education persist even in high-income nations. For example, in Germany, Luxembourg, and Switzerland, boys are more likely to leave school prematurely compared to girls, and girls typically achieve higher school grades than boys. However, interestingly, in these same countries, girls are less likely than boys to pursue higher education several years later (Hadjar & Buchmann, 2016(a); 2016(b)). This trend coincides with a lack of robust government support systems, such as affordable childcare or flexible work arrangements, which disproportionately hinder a mothers' pursuit of higher education. This pattern can be attributed to a combination of intersectional factors. Socialisation and cultural norms, educational systems and policies, and socioeconomic factors play significant roles in these gender disparities. Societal expectations and stereotypes about gender roles can influence students' educational choices and performance. The structure of educational systems, particularly those that sort students into different tracks early (as in Germany, Austria and Switzerland), can exacerbate these inequalities. Lastly, socioeconomic factors, such as increased educational motivation among girls and women due to expanding opportunities in the labour market, also contribute to these trends.

This focus on enrolment reveals a common limitation in education policy: despite good intentions, strategies focused on surface-level equality often bypass deeper structural causes (Unterhalter, 2008). For instance, the 'get girls in' mindset overlooks how gender bias impacts student experience itself and persists well after graduation due to limited career opportunities and discriminatory hiring practices. This mismatch between stated equality goals and the barriers girls actually face underscores how structural change isn't achieved through simplistic initiatives, making deeper reform strategies vital.

Another significant area of structural disadvantage in education pertains to students with disabilities, who often face multiple challenges that can limit their access to quality education even after multiple charters on the right to quality education in a number of human rights conventions such as the Convention on the Rights of the Child (UN, 1989) and the Declaration on the Rights of Disabled Persons (UN, 1975). For example, the development of mass education systems throughout the 20th century where grand proclamations of education for all in truth meant education for some (De Bruin, 2021), reflecting deeply unequal policy implementation. While international commitments exist, insufficient funding and flawed inclusion programmes reveal low policy priority for true empowerment. According to the UNESCO Institute for Statistics (2017), in Cambodia, the out-of-school rate for children with a disability is 57%, which stands in a stark contrast to the 7% rate for neuro-typical children. Similarly, in the Maldives and Uganda, children with a disability are more than twice as likely to be out of school. Furthermore, only 44% of Cambodian adolescents with disabilities complete primary education, compared to 72% of their neuor-typical counterparts. Even in Western nations, the situation is far from ideal, for instance, in England, students with special needs were more than nine times likely to face permanent exclusion (UNESCO, 2020). These disparities underscore the structural disadvantages that children with disabilities encounter in accessing education.

Moreover, the challenges do not just end with access to education. Once in school, students with disabilities often face additional obstacles. For instance, teachers may lack the necessary training to effectively teach these students, which leads to unclear responsibilities and limited collaboration with support personnel. Discrimination and segregation can further exacerbate feelings of exclusion. Inadequate resources, inconsistent policies and practices, and dismissive and indifferent attitudes towards inclusion can also impact the quality of education received by students with disabilities and their overall school experience (UNESCO, 2020). These factors create a complex web of challenges that can significantly impact the educational experiences and outcomes of students with disabilities.

This is also evident when looking into the experiences of LGBTIQ+ students in schools and the likelihood of increased absenteeism and thus the limited access to education this has for such individuals. This is likely attributed to varying factors mainly to do with safety in schools and visibility within schools. As Goldstein, Russell & Daley (2007) explain, safety refers here to the ability for all students including LGBTIQ+ students to feel safe being

themselves and understanding their identity in school. On the other hand, visibility refers to schools clearly being inclusive and welcoming to their LGBTIQ+ communities through teaching and social practices which are visible in the school. While safety for LGBTIQ+ students is on the rise (ILGA, 2022), policy and pedagogical practices, which ensure the visibility just described and inclusive sex education on gender, sex and sexuality, remain a big challenge in schools. This is often a result of a gradual politicisation of the subject which leads to either policymakers remaining silent on the matter or otherwise enacting specific policies to regulate and exclude the visibility of the LGBTIQ+ community in schools in order to gain political popularity.

Building on the understanding that structural flaws hinder educational access and equality, we must examine how these injustices materialise within the seemingly inert walls of the classroom. Curriculum, far from a neutral tool, acts as a vessel for deeply embedded policy priorities. Indeed, Basil Bernstein (2003:77) argued that 'how a society selects, classifies, distributes, transmits and evaluates the educational knowledge it considers to be public, reflects both the distribution of power and the principles of social control.' Through textbook omissions of some histories, to rigid curriculum pacing mandates struggling students are left with no recourse, however policy creates the illusion of equal opportunity (Bertram, 2012). Teachers are then scapegoated as the problem, when it's precisely a lack of anti-racist resources or flexibility in policy that perpetuates inequity. Decisions regarding which historical figures, scientific disciplines, and literary voices matter are not made in a vacuum. They are enshrined in policy under the guise of objective knowledge, potentially perpetuating systemic exclusion.

The Role of Teachers and Policymakers

As an educator, it is crucial to recognise that teachers, while critical agents in fostering inclusive learning environments, often navigate complex limitations imposed by these very structures. While recognising and understanding the specific challenges their students face is crucial, their ability to make significant curricular changes can be constrained by factors like limited resources, mandated standardised testing regimes, and a lack of professional development opportunities focused on culturally responsive pedagogy. Adding to the challenges faced by teachers is the common practice of policymakers and reformers to exclude teachers and students from key decision-making processes directly related to their profession. This is often accompanied by undervaluing teachers' expertise and professionalism, leading to their opinions being dismissed out of hand.

Around the world, there is a rising trend of distrust towards teachers, with policies increasingly designed to scapegoat them, subject them to surveillance, and compel them to adhere strictly to teacher-proof lesson plans and curricula (Niesz, 2018). In this context, teacher agency becomes a nuanced concept (see below), requiring not just individual initiative but also systemic support and policy shifts that set educators free to challenge the status quo and create truly equitable learning experiences. Despite the daunting nature of these structural disadvantages, teaching remains our most promising activity in addressing

them so far as education policy is concerned (Jones, 2019; Wiliam, 2018). For example, developing pre-service teachers who are socially just in their beliefs and practices has been emphasised and to this end, numerous relevant and potentially impactful policy strategies have been suggested to equip teachers with the necessary tools to navigate and mitigate the challenges presented by the structural disadvantages and inequalities prevalent in our schools (Mills & Ballantyne, 2016). For example, Berliner (2019:187) proposes that in addition to teachers acquiring in-depth curricular content knowledge, instructional skills and classroom management skills, teachers must also be trained 'to promote the success of their students by understanding, responding to, and influencing the larger political, social, economic, legal, and cultural context in which they lived and work.'

In response to all of these challenges, we think that the teachers themselves should feel empowered to achieve agency to affect change on multiple levels starting from the classroom and school level and extending their impact to the structural and systemic levels. We believe that teacher education policy could be a way for achieving this. For example, Berliner (2019) advocates for teacher education policy to emphasise the social activist element for teachers to become better representatives of students and their families and indeed themselves. Teacher education institutions need to stress the politics of education as much as more technical aspects of teaching and learning (Jones, 2019). Given the significant influence of curriculum in educational settings, it is crucial for teachers to achieve agency and become advocates for liberatory curriculum (Le Fevre et al., 2016). This involves challenging narrowly defined, standardised, and teacher-proof curricula. By doing so, teachers can take on essential roles as curriculum activists, confronting problematic policies and crafting a curriculum that addresses the needs of their students and communities.

Education, with its multifaceted nature, necessitates the formulation of policies to reduce its complexities and make it more manageable. However, an over-simplification and reduction of these complexities can lead to an education system that is overly focused on outcomes, thereby risking the neglect of inclusive teaching practices. Therefore, a balanced approach is essential in the development and implementation of education policies. Moreover, policymaking is not a value-neutral process. It is deeply influenced by the values, intentions, and perspectives of those who craft them. Hence, it is crucial to critically examine who is involved in policymaking, how these policies are formulated, and the purposes they are intended to serve. This nuanced understanding can help ensure that policies are not only effective but also equitable, promoting an education system that truly caters to the diverse needs of all students.

As we delve deeper into the complexities of structural disadvantages in education, it becomes increasingly clear that these issues are not confined to the classroom but are deeply intertwined with broader societal structures and policies. The role of policy in shaping educational practices and outcomes cannot be overstated. Policies determine not only what is taught in schools but also how it is taught, and by whom. They are the invisible

hands that guide the actions of teachers and the experiences of students in the classroom. However, the process of policymaking is not a straightforward one. It involves a multitude of stakeholders, each with their own interests, perspectives, and power dynamics. The following section will explore the intricate world of educational policies, shedding light on who gets to decide what is included in them and how they impact the everyday realities of teachers and students. This chapter will also delve into the role of various stakeholders, from local institutions to supra-entities, in shaping educational policies and practices. By understanding these dynamics, educators can better navigate the policy landscape and advocate for more equitable and inclusive educational practices.

The Role of Teachers and Policymakers

As an educator, it is critical to be aware of the causes and effects of these systemic disadvantages. Being cognisant of these allows you to better understand the specific challenges your students may be facing and use your discretion as a teacher to make appropriate curricular changes that address each of your student's needs. It also equips you with critical insights to advocate for crucial changes within your school and the wider education system that could help alleviate some of the disadvantages faced by students and the challenges you will face as an educator. Despite the daunting nature of these structural disadvantages, teaching remains our most promising activity in addressing them so far as education policy is concerned (Jones, 2019; Haertel, 2013). For example, developing preservice teachers who are socially just in their beliefs and practices has been emphasised and to this end, numerous relevant and potentially impactful policy strategies have been suggested to equip teachers with the necessary tools to navigate and mitigate the challenges presented by the structural disadvantages and inequalities prevalent in our schools (Mills & Ballantyne, 2016). For example, Berliner (2019:187) proposes that in addition to teachers acquiring in-depth curricular content knowledge, instructional skills and classroom management skills, teachers must also be trained 'to promote the success of their students by understanding, responding to, and influencing the larger political, social, economic, legal, and cultural context in which they lived and work.'

Adding to the challenges faced by teachers is the common practice of policymakers and reformers to exclude teachers from key decision-making processes directly related to their profession. This is often accompanied by undervaluing teachers' expertise and professionalism, leading to their opinions being dismissed out of hand. Around the world, there is a rising trend of distrust towards teachers, with policies increasingly designed to scapegoat them, subject them to surveillance, and compel them to adhere strictly to teacher-proof lesson plans and curricula (Niesz, 2018).

In response to all of this, we think that the teachers themselves should feel empowered to exercise agency to affect change on multiple levels starting from the classroom and school level and extending their impact to the structural and systemic levels. We believe

that teacher education policy could be a way to achieving this. For example, Berliner (2019) advocates for teacher education policy to emphasise the social activist element for teachers to become better representatives of students and their families and indeed themselves. Teacher education institutions need to stress the politics of education as much as more technical aspects of teaching and learning (Jones, 2019). Given the significant influence of curriculum in educational settings, it is crucial for teachers to exercise their agency and become advocates for liberatory curriculum (Le Fevre et al., 2016). This involves challenging narrowly defined, standardised, and teacher-proof curricula. By doing so, teachers can take on essential roles as curriculum activists, confronting problematic policies and crafting curricula that cater for the needs of their students, and which are created together with the students.

Education, with its multifaceted nature, necessitates the formulation of policies to reduce its complexities and make it more manageable. However, an over-simplification and reduction of these complexities can lead to an education system that is overly focused on outcomes, thereby risking the neglect of inclusive teaching practices. Therefore, a balanced approach is essential in the development and implementation of education policies. Moreover, policymaking is not a value-neutral process. It is deeply influenced by the values, intentions, and perspectives of those who craft them. Hence, it is crucial to critically examine who is involved in policymaking, how these policies are formulated, and the purposes they are intended to serve. This nuanced understanding can help ensure that policies are not only effective but also equitable, promoting an education system that truly caters to the diverse needs of all students.

As we delve deeper into the complexities of structural disadvantages in education, it becomes increasingly clear that these issues are not confined to the classroom but are deeply intertwined with broader societal structures and policies. The role of policy in shaping educational practices and outcomes cannot be overstated. Policies determine not only what is taught in schools but also how it is taught, and by whom. They are the invisible hands that guide the actions of teachers and the experiences of students in the classroom. However, the process of policymaking is not a straightforward one. It involves a multitude of stakeholders, each with their own interests, perspectives, and power dynamics. In the following section, we will explore the intricate world of educational policies, shedding light on who gets to decide what is included in them and how they impact the everyday realities of teachers and students. We will delve into the role of various stakeholders, from local institutions to supra-entities, in shaping educational policies and practices. By understanding these dynamics, educators can better navigate the policy landscape and advocate for more equitable and inclusive educational practices.

What are policies and who gets to decide what is included in them?

Although policies shape a lot of the subjects and styles of teaching that teachers adopt

in schools, teachers might not know much about the powerful role these documents play in institutions of education around the world. This is especially the case if policy development and policy implementation are not respectively discussed and reflected on as topics during one's initial teacher training education. However, educators need to recognise that '[education] does not exist in a vacuum – it is exercised in a policy context, shaped decisively by its historical and cultural location' (Bell & Stevenson, 2006:7). Thus, as a profession, teaching is not an act which relies only on the students and the teacher in a classroom but is a product of different forces acting on it to achieve their desired outcomes. The forces or entities which shape what takes place in schools are referred to as, stakeholders, meaning that they have a share, interest, or involvement in deciding what is taught in schools, how it is taught and to whom. Some examples of stakeholders include ministries, local or international organisations, and other private entities.

The example mentioned above is only a small sample of how stakeholders impact the learning that takes place in formal schooling through curricula. Generally, this applies to all areas of schooling which are largely organised and maintained by a government or another institution, including inclusion and addressing structural disadvantages such as the ones described in the previous section. As schools directly engage with their policies, they must also fulfil those established by external forces. External forces do not only refer to local institutions such as the government but include different entities which also extend outside of national borders. Priestley et al (2021) refers to these entities as sites of activity and classifies them into five main levels. At the heart of this model lies the educator and the students in the classroom, but by looking outwards, one may note how the events taking place at the nano level are part of a web of established policies by different entities. Who are these entities?

The role of supra-entities in policymaking is usually to do with influencing and flowing ideas across different nations. A clear example of these entities is UNESCO which we have mentioned in the example case above. By establishing competency frameworks, country reviews and standardised objectives for national policies to absorb, supra-entities are active key players in various education systems around the world. This is evident through popular country reviews which compare countries participating in international studies such as the Program for International Student Assessment (PISA), conducted by the OECD. Since the year 2000 PISA has conducted seven rounds of assessments which focus on literacy, mathematics, and science with the aim of testing the knowledge and skills of the students from participating countries with a metric that is collectively agreed upon (Schleicher, 2019:3). Consequently, the results obtained by low-performing countries have over the years pushed national policies to adopt strategies and targets which are believed to be effectively working in other countries topping the charts of PISA and other similar studies. This process is usually known as policy borrowing and has over the years been increasingly used in education as countries adopt strategies and programs which were proven successful elsewhere (Mundy & Verger, 2016: 375-6).

Therefore, the OECD, through PISA, is policy-oriented because it provides scores and analyses to guide decisions taken by education entities in the participating countries. Despite not having direct legislative and financial power on the other levels, the OECD has contributed to many changes in policies and curricula around the world. The same cannot be said for entities such as the World Bank which is, 'the largest single international provider of development finance to governments … and source of education finance' (Mundy & Verger, 2016: 335). The World Bank has since the 1970's obtained direct financial power as it establishes policy requirements as part of financial packages dealing with different countries (Mundy & Verger, 2016:339). This influence on different states around the world stems from the belief that such institutions are assessing and ensuring co-operation and increasing efficiency in a globalised world driven by large economic forces. This is visible in some of the policies that the World Bank has pushed which include ensuring equal

education for all, improving learning outcomes and quality of education, developing early childhood programmes, and focusing on skill-based vocational education. These are said to ensure the needs of the future labour market are met. Having said this, bearing such institutional power over curricula in schools requires extensive critique. This is explored in the upcoming parts of this paper.

On a macro level the policies implemented by the ministries do not only consider the directives and results published by the supranational entities mentioned above. Ministries must also consider the input of different stakeholders involved on a national level. These include the government and its ministries, local universities, teachers' organisations, unions, and other local entities. It is through this level that, 'state-mandated programs of study present authoritative statements about the social distribution of knowledge, attitudes, and competencies seen as appropriate to populations of students' (Priestly et al, 2021:17). Once a policy is designed and agreed upon by the stakeholders, Education Departments, or broadly the mesosystem, ensure that these policies are implemented by directly supporting schools and their staff members. Usually, departments organise teacher training, post-implementation assessments and observations to monitor the effectiveness of a particular policy. In sum, 'meso-curriculum making sits between the production of policy … and the curriculum making arenas in practice settings such as schools' (Priestly et al, 2021:19).

Although these levels have been explained here in succession it is important to bear in mind that they collectively operate with one another and influence each other. In fact, these levels can be defined as sites of activity, metaphorically presented by a spider's web. 'Policy making may be informed in a particular context by both supra discourses and by diverse local imperatives [and] a variety of mediating factors' (Priestly, 2021:12-14). This captures the complexity behind the transactions that happen between each of the levels described. Moreover, it is important for the reader to grasp how such contentious, interconnected, and multidimensional arenas, do not necessarily produce and implement policies successfully all the time (Honig, 2006:2). In fact, as identified in the previous section, policies can have a devastating impact on students, teachers and/or even a state's education system.

Where does the teacher fit into all this?

However, if formulated and implemented inclusively, policy also has the capacity to bring about great positive changes with a focus on a more wholesome welfare for the targeted population. For example, when we bring back the discussion about Malala and how she was influenced by her father to brave against all odds and fight for a change in the education policy of Pakistan we witness the importance of the educator as an active agent, and the range of possibilities that opens because of it. Her story also proves the urgent need for an inclusive education in government education policies of all countries. This we believe will not only be able to challenge the established, often discriminatory status quo during policy

formation, but if implemented properly, would also be able to address the various social evils of the respective countries-exactly like Malala (UN, 2017).

So, what is required here is focus on four key areas that has been promoted by UNICEF:

- Advocacy: that promotes inclusive education in discussions, high level events, and other forms of outreach geared towards policymakers and the general public.
- Awareness-raising: that shines a spotlight on the needs of children with special needs by conducting research and hosting roundtable workshops and other events for government partners.
- Capacity-building: that builds the capacity of education systems in participating countries by training teachers, administrators, and communities while also providing technical assistance to governments.
- Implementation support: to monitor and evaluate partner countries to close the implementation gap between policy and practise (UNICEF, 2005).

In addition to that, UNICEF has also published a checklist of actions that all participating governments must comply with to make inclusive education a reality. Known as 'progressive realisation' it includes: committing all government departments to work towards active inclusion, introducing laws and policies to end discrimination and guarantee the right to inclusive education, deciding the course of action, timetable and a curriculum for introducing inclusive education, ensuring that enough resources are available to enable the transition to inclusion, collecting data and measuring progress and growth, providing early childhood care and education, providing adequate teacher training for inclusive education, introducing inclusive testing and assessment and introducing complaint procedures (UNICEF, 2017). Now, although not everything might be possible straight away, there are certain things that States could act on immediately. It primarily includes compulsory, free primary education for all-much like the RTE Act in India, proper sensitisation programs for all so that children from all kinds of backgrounds feel welcomed, and transforming teachers/educators to be an active agent in both policy formulation and implementation (UNICEF, 2017).

It is the third point that our proposed policy is focussing more on. Taking inspiration from Foucault's very famous argument of 'knowledge being power, wherein power is based on knowledge and makes use of it to create and recreate its own field of exercise' (Hewett 2004:10). We argue that all educators need, can and should, play a powerful active role in promoting societal inclusion and equity for all kinds of learners (Li and Ruppar, 2021). The common responsibilities/expectations would include being included during policy formulation, possessing the power and recognition in amending existing education policy, being provided the space and autonomy to implement said policies in ways that fits the demography and needs of their children, and having a safe space and/or creating opportunities to familiarise themselves with the backgrounds and distinct needs of the

children in their class. However, as teacher agency is considered under-theorised and variously constructed in the education reform literature, conceptual models of agency have been developed by drawing on broader theories of human and professional agencies. Drawing from Li and Ruppar's (2021) work on attempting to map out the empirical significance of theorising teacher agency, we would like to chart out the factors that have a strong influence on how teacher agency is understood and practised:

Table 1: *Teacher Agency for Inclusive Education*

Teacher Agency for Inclusive Education

Interaction

Personal histories:

- Biographical histories

Professional histories:

- Teacher education experience
- Professional development experience
- Years of teaching experience
- Years of teaching dealing with the diverse needs of students.

Practical-Evaluate

Structural (rules and policies implicated in the production of systems)

- School's organizational set-up or education system structures
- Partnership beyond schools
- Relationships within schools
- Parallel operation of special education, general education and second language education.

Cultural (ideational contexts and traditions)

- School cultures or broader societal views of what is ability.
- Heavy-duty accountability mechanisms.
- Culture of performativity based on high-stakes testing results.
- Societal and institutional views of inclusion.
- School and socially perceived professional roles.

Material:

- Resources (books, curricula), physical spaces, teaching assistants, and assistive/ augmentative technology

Projective

- Visions of their students in mainstream higher education institutions, inclusive job fields and independent living communities.
- Visions of their professional work around inclusive education

The above figure provides an empirical framework that could be used to establish the practicality and relevance of the theory of teacher agency in inclusive education. Moreover,

the adapted conceptual framework follows socio-cultural theory, which treats teacher agency as a result of the interplay among individual teacher's capacity and environmental conditions, along with the interaction of the teacher's past experiences, current practise and future orientations. We believe that an explicit way of theorising teacher agency for inclusive education can help future empirical studies treat teacher agency as 'an analytical category in its own right' and hence, crucial while discussing education policy. It would also assist in cementing the proposal of including teachers/educator's opinions during policy formulation while providing flexible spaces in the curriculum for the policies to be implemented in what ever unique and creative ways the teachers/educators deem to be fit for its students (Li and Ruppar, 2021). Such an approach will be able to contribute towards a more sensitive and inclusive social education policy that is global (popularised by British sociologist Roland Robertson in the 1990s and later developed by Zygmunt Bauman) in its approach (Mambrol, 2017).

Why should a teacher want to know about and be involved in policymaking?

Before proceeding with this section, let's take some time to revisit what has been established thus far in this paper. The example case mentioned in the first section refers to a policy for inclusion in education as established by UNESCO. We later learned that the latter is one of the many supra-national entities which, as established in part three, has the capacity to influence goals for education on a global scale. We saw this in practice through India's Education Act of 2009, which was introduced to absorb some of these principles established by UNESCO. The second section sheds light on different types of structural disadvantages that students in our schools are still experiencing because of varying factors which policies have either failed to recognise or address in their implementation. We then took a closer look into the different stakeholders that exist and influence policy in education. These ranged from international entities with direct or indirect financial power over education, to also local ministries, institutions, and organisations. This large and complex web of different sites influencing education can often feel daunting and exclusive of the teachers' experiences and needs in schools. It often feels that decisions and new directives come and go and teachers bearing the change and challenges in the classroom are not considered in the process of designing new policies and strategies. This is best summed by Robinson in saying that, historically, 'the most consistent overarching theme which has dominated teacher education has been its relationship to the state. It has been externally controlled and shaped by governments and their agencies – and not by the teaching profession itself' (UNESCO, 2017:16).

Therefore, educators should know about policy because, despite their potentially good intentions, such institutional documents, may not necessarily be as effective as intended.

This could be a result of different factors ranging from inadequate funding, potential clashes between stakeholders involved, or expediently misguided strategies. The latter is

alarming since it is more likely to be less effective for the institutionally disadvantaged groups mentioned above. Therefore, policies are in themselves, powerful and political tools which may not necessarily be used to ensure equal access to education. On the contrary, as Malala's story very well portrays, policies and laws can be used to further solidify levels of structural disadvantages to ensure an individual or group's dominance over another. This becomes ever more likely when the complex web of sites influencing policies becomes increasingly inundated with different forces acting on it, most of which coming from outside of the classroom.

On the other hand, despite their often-felt sense of external and authoritative force, policies can be instrumental in addressing these difficulties especially when teachers are not just implementors of their goals but also writers and thus, active agents in the decision making. In Malala and her father's actions, we can witness the impact that praxis and active involvement can have in addressing structural disadvantages through education. This is why the previous section gradually shifted our focus to teachers as active agents and not just deliverers of content. Teaching, in its nature, gives educators the opportunity to interact with the structural disadvantages described above and understand the impact and challenges that students face. Freire (1970) sees both the students and the teachers as constructors of knowledge together through interaction. If it were not for human interactions, teaching would be lifeless and thus policies should reflect that same interaction.

Therefore, similar to the previous section, we have gradually shifted our perspective on policy to a critical one whereby the educator is encouraged to not only read and be aware of policy but to reflect on its point of being. We aspire to have the readers appreciate their potential not only as educators with students simply following established forms of knowledge and pedagogical practices, but as powerful professionals striving to improve the lives of others because they have lived and learned about others. 'For the critic, the important thing is the continuing transformation of reality, in the continuing humaniaation of men' (Freire, 1970:65). This is why the educator is here encouraged to question who is benefiting the most from the currently established systems designed over the years through curricula and policies as we know them and how these can be changed to benefit all through education. Thus, as we proceed to the coming sections, we aim for the reader to further equip themselves with strategies and tools they may use to become active agents in policymaking, to become critical readers of policies and frameworks, and consequently key contributors in this process.

How can a teacher become a reflective and critical agent in the decision-making process?

Understanding the complex web of the different stakeholders involved in writing up and implementing policies can be a daunting task. To critically do this may feel even more

challenging for an educator who aspires to address the needs of their students but is too perplexed by a system which feels bigger and stronger than them. However, this does not need to be the case, because teachers can and have become active agentic individuals in changing the system and not just implementing it. Critically reading policy is far from an untapped field in academia and has over the last thirty years greatly expanded to investigate the 'opaque as well as transparent structural relationships of dominance, discrimination, power and control as manifested in [the] language' contained within policy documents (Blommaert & Bulcaen, 2000:448).

The field is denoted by the term Critical Discourse Analysis (CDA) and it is particularly appropriate for critical analysis of policies because it allows a detailed investigation of the relationship of language to other social processes, and of how language works within power relations' (Taylor, 2004: 436). In practice, this means that words contained in policies are no longer just read but examined for their implications and the powers they establish. Through a CDA framework for a systematic analysis, [one] can go beyond speculation and demonstrate how policy texts work' (Taylor, 2004: 437). Critical discourse is mainly two types: The first sees the analysis take place at a textual level where the words, pictures, and language used are analysed. For example, one may investigate the number of times words such as "inclusion" and "needs" are used in a document and reflect on how much importance is being given to these words. Otherwise, one may investigate the style of language being used in a policy; is it authoritative in its style of writing by using declarations such as, "teachers must" or is it emancipatory by including words such as, "we need" or "we should" (Simons, Olssen & Peters, 2009).

The second, broader critical analysis examines the social and historical context of the space in which the policy was implemented. In sum, this does not analyse the words themselves but the power that lies within them, those who wrote them, and the context in which they were made. Policies are here seen as 'instruments and effects' of discourse' and therefore power. This approach takes a Foucauldian understanding of 'language and concomitantly power relations which assumes that these are manifest[ed] in material and anthropological forms, that is, in policy objects (artefacts as we call them in the book), architectures, subjectivities and practices' (Ball, 2015: 307). These two branches of CDA do not need to be mutually exclusive but have over the years been used together. Taylor (2004) encapsulates these two aspects of critical discourse analysis as tools to 'explore the relationships between discursive practices (language), events, and texts, and wider social and cultural structures, relations, and processes' (Taylor, 2004: 435). Hence, the use of CDA in policy is also instrumental when one is analysing policies and institutional structures pertaining to inclusion and inclusive strategies designed for schools. For example, it is not uncommon for such policies to fail at incorporating the voice of whom they are intended to cater for, thus retaining the discourse and the decision making in the hands of dominant groups. This is often observed through the use of CDA. Our first example case in the next

section provides an example of this and proceeds to explain how it was mediated by a group of students and teachers together.

Although CDA is assumed to analyse what is written (visible discourse), it can also exert its critical nature by looking into potential silences which may be present in a policy. As established earlier, writing, and implementing policy are both in themselves political moves. Therefore, policymakers often try to choose the right words, while leaving out others, to achieve a desired goal, while simultaneously making sure that the language used does not disappoint or anger one or many stakeholders involved. This is often done using instances of silence which leave the policy open to interpretation by those implementing it. Moreover, such instances of silences can be indicative of policymakers failing to consider the experience of marginalised groups and the impact such policy could have on them.

Critical discourse analysis has been of great use when it comes to analysing policies which are established by supranational entities and ministries. Over the years such entities have become increasingly involved in determining the social role and purpose that education plays across different countries. With increasing power over education, the decisions taken by these entities have consolidated an 'articulation and re-articulation of orders of discourse [which] is correspondingly one stake in a hegemonic struggle' (Fairclough, 1992: 93). The latter implies that as education policy has over the years become increasingly guided by these entities, the latter have consolidated their power in determining the purpose of education. Simply put, such entities now have a great say in establishing what we, as educators, are teaching and why we need to teach it.

The latter may be briefly demonstrated through the impact that international studies such as PISA and PIRLS have had on teaching. As more countries participate in these studies, governments from countries performing below average became concerned and have borrowed policies from countries faring well with the hope of getting better scores in the next round of tests. This can certainly be said for Malta, which after its "worrying results" in such studies, saw a rapid change in its education policies to shift towards those present in Scandinavian countries such as Finland. Caruana (2020: 81) used CDA on policies to focus on this shift and noted that 'there is no clear indication as to how the policies will affect teacher recruitment, and whether it will be necessary to have Continuing Development Programmes or re-training of teachers already in employment.' A few years down the line, the implementation of these policies saw numerous challenges, especially for students, educators, and parents. This included increased paperwork and workload for teachers, teachers' unions taking legal action by issuing directives to school staff, and parents not grasping the new system to help their children. Through this example, we can see how the silences pointed out by Caruana and left unaddressed by policymakers, led to a turbulent process of implementation which has greatly impacted school life in Malta (Caruana, 2020).

As Zaalouk (2011: 139) explains, through such entities, there has been a gradual shift towards managing education and defining its purpose to primarily 'fit the capitalistic

demands of the labour market.' Policies often end up being hyper focused on fulfilling this need by devoting their attention to the production of a high-skilled future workforce. Having such a high skilled workforce is not something inherently problematic and can help individuals to flourish. However, in the process of establishing what is needed from education, such entities have had the power to narrow down what is to be considered as useful knowledge and the point of being in school. Over the years, this has continuously homogenised the purpose, and strategies for teaching this same knowledge whilst failing to recognise education as an act of liberation, humanisation, and emancipation. As the example of Malta suggests, educators have become hyper-focused on delivering the content established and limiting their space to understand and use the stories of the students in front of them as a form of education. Students are prepared to become small parts of a larger whole rather than holistically whole beings in themselves. This mostly impacts the students experiencing structural disadvantages. As Freire aptly puts it, 'to glorify democracy and to silence the people is a farce; to discourse on humanism and then negate it is a lie' (1970: 64).

Now that CDA has been established as a useful strategy which can be used by educators as they read policies and established curricula, we can look into how this together with other strategies can be used by educators so that they can become active contributors to the formulation of education policy. As authors of this paper, we believe that this can be exemplified through three individual case studies in which we ourselves have critically analysed policy to show how, through its practices or lack thereof, education was failing to address the needs of different structural disadvantages.

Case Studies

(i) Pedagogy of Coming Out, A Queer-Positive Policy

This pedagogy was recently designed to address the shortcoming of policies focusing on the safety and visibility of the LGBTIQ+ community in schools across the Maltese islands. Malta has in the last ten years recognised many rights pertaining to marriage equality, adoption, and also gender identity. Consequently, this has seen the country topping the International Lesbian, Gay, Bisexual, Trans, and Intersex Association (ILGA) European index for several years. However, over the same decade, studies focusing on the experiences of the same community in school continued showing concerning results in terms of safety and visibility in Maltese schools. 61.9% of students still experienced derogatory language pertaining to the LGBTIQ+ community and 49.6% felt unsafe attending schools (Pizmony-Levy, 2019). The experiences of rainbow families have also shown instances of stigmatisation by different members of the school community (Schembri, 2020). So, what went wrong?

As many of these rights were being recognised, a framework containing several policies under the name *Respect for All*, was implemented in Maltese schools to mitigate various

challenges experienced in schools by various disadvantaged groups (Ministry of Education and Employment, 2014). These also promised to address the *learning to be* and *learning to live* pillars of education as explained by UNESCO (2023) through the promotion of values of inclusion and respect for diversity. Applying a critical analysis of the discourse of the text, suggested that often these policies did not properly address the diverse needs of different disadvantaged groups. For example, while the first to locally recognise the LGBTIQ+ community as a group likely to experience bullying, it failed to elaborate on how this is to be proactively addressed by schools. Moreover, this silence on the matter was further exacerbated when the Minister for Education refused to include books containing LGBTIQ+ narratives in schools and ensuring the public that these will be kept at the ministry (Times of Malta, 2015). Therefore, these policies, as also shown by the data in the following years, failed to address the needs of specific disadvantaged groups such as the LGBTIQ+ community. To not cause too much of a stir over the inclusion of such topics in schools, the ministry's policy left instances of silence which failed to properly address such instances of structural disadvantage.

Figure 2: Front Page of Pedagogy of Coming Out

Source: A pedagogy of Coming Out (Grech, 2022)

A Pedagogy of Comin Out, was therefore designed together with local LGBTIQ+ students and teachers. The latter were recruited as participants to not only talk about their experiences in schools but to apply these to the design of a practical policy which can be easily implemented by schools (Grech, 2022). This was also presented to heads of schools to gather their insight on the challenges which can be met in implementing such a policy. The final document includes clear strategies for teachers and other stakeholders involved to ensure that these structural disadvantages are addressed. Moreover, the document leaves its implementation open to adaptation in order to allow schools to adopt practices which best work for their community, and to ensure continuous reflection and assessment of the policies' implementation. This work was also then presented to various governmental and non-governmental organisations in Malta at a symposium.

Therefore, from this first example mentioned here, we can note how educators and students have become active agents in policy development and implementation to address structural disadvantages pertaining to the LGBTIQ+ community in schools. Using CDA, gathering insight and other experiences of educators and students, organising oneself and presenting the work to local entities, educators have designed a practical document which addresses these needs locally. However, analysis and critique of policymaking and implementation do not only need to take place in an academic arena. As educators and implementors of policies in schools, we must ensure that there is clear, bilateral, and continuous communication between those establishing policies and teachers delivering them.

(ii) Inclusion of Migrant Children through Curricula.

In response to the ongoing conflict in Ukraine, numerous European nations have initiated policies aimed at integrating migrant children into their school curricula. Among these, the approach adopted by Ireland offers a noteworthy example.

The Irish Department of Education has issued guidelines to schools, advocating for the needs of the child to be central in decisions related to curriculum provision, programme access, and support. These decisions are also intended to incorporate students' current and future needs, including their readiness for key transition stages in the Irish education system (DoE, 2022).

To facilitate this, the department has provided schools with information about the Ukrainian education system, aiming to help them recognise and validate the prior learning and educational experiences of these children. However, the practical implementation of this recognition and its impact on the students' integration and progression in learning are yet to be determined.

For primary schools, the aims of this policy effort are to place the student in a class that best suits their age, with staff using observations and insights from the students and their families to determine the best way to meet the student's immediate and emerging needs. For instance, in post-primary schools, the student should ideally be placed in a year group that aligns with their age, with engagement from the students and their parents to ascertain the student's educational experience to date.

The role of teachers in this process is crucial. They are on the front lines of implementing these policies and are responsible for creating an inclusive and supportive learning environment for these migrant children. However, the effectiveness of these policies largely depends on the resources, training, and support provided to these teachers, which is an area that needs further exploration and evaluation.

(iii) Intersectionality at play: Is it possible for policy to be fully inclusive?

Absolutely not. It will be an extremely utopian expectation for one policy to be completely inclusive and address the complexity of intersectionality and marginalisation that any given individual might be facing at a given time. However, what we are trying to do here is attempt to include as many as possible and create a respectful methodology that is flexible

enough to address the multiple identities, difficulties, and discussions, as they come. I would like to bring in the example of a 22-year-old social media influencer Gabe who was born in Brazil and has a severe form of Hanhart syndrome, a rare condition that caused her to be born without legs or arms, and was put up for adoption at 9 months old. She recently came out as transgender and was adopted by a family in Utah. She now has over 180,000 followers on Instagram and about 4 million followers on TikTok where she shares makeup tutorials, beauty challenges and 'Get Ready With Me' videos, along with offering her followers glimpses of her day-to-day life without limbs with a big smile on her face. She claims that her life changed when she came out as gay at 19 years of age to her parents. She also told her parents that she wasn't going to change and if they wanted to be in her life, they would have to accept her as she is-and they did. This really motivated her to continue being herself with confidence and pursue her career as a beauty blogger (Hopkins, 2023).

She credits her adoptive family's unconditional love and support for helping shape her into a confident, independent and capable person. She also thanks her school and her teachers for helping her shape her personality and pushing her towards achieving her dreams. This gave her the confidence to work as a motivational speaker, after finishing school and then touring schools and businesses to try and make a difference in her community (Hopkins, 2023). Her successful business, confident personality, and zeal to help others like herself is based on the support she received from both her adoptive parents and her educational institution. Moreover, she also would not have been able to develop a healthy emotional and mental personality if she was not motivated by her teachers and her peers. This is exactly what an inclusive education policy should do. By providing a safe flexible space for teacher agency and identifying the distinct needs of its students, it should have the capacity to nurture the true talents and persona of its students.

Conclusion

This chapter has provided an exploration of inclusive education, its significance and the unabating challenges it faces. It has underscored the role of teachers as active agents in implementing inclusive policies and the need for their involvement in the policymaking process. The chapter has also highlighted the structural disadvantages that certain groups of students face within the educational system, emphasising the need for a more equitable approach to education.

The chapter, through the case study of Malala Yousafzai and her father, underscores the transformative power of inclusive education and its potential to overcome societal barriers and promote equality, while also acknowledging the complexities and challenges that arise, particularly in contexts where social divisions and inequalities are deeply entrenched. It highlights the need for a nuanced understanding of educational policies and their impact on the everyday realities of teachers and students, advocating for a balanced approach in

the development and implementation of these policies to ensure they are not only effective but also equitable.

Local contexts

Closing questions to discuss or tasks

Finally, we would like to conclude the chapter by leaving the reader with questions for reflection as the issues discussed in this chapter certainly do not provide comprehensive answers to all the related questions. Furthermore, it's important to note that the issues highlighted will present themselves differently in each teacher's unique context:

- Reflecting on your current teacher training and knowledge base, in what ways do you feel prepared to enact inclusive teaching strategies in your classroom?
- Considering the structural disadvantages that your students in your classroom might face, what policies and services in your local context can help you to address these challenges?
- How do you plan to address the effects of structural disadvantages in your classroom to ensure an equitable learning environment for all students?

About the authors

Jean Karl Grech

Jean Karl Grech is from Malta. A gay primary teacher with a particular passion for inclusion and cultural integration. A recent graduate with a Master's in Euro-Comparative Education. In his studies at the University of Malta, he focused on the inclusion and visibility of the LGBTIQ+ community in schools through subjects and daily school practices.

Nika Maglaperidze

Nika Maglaperidze is an English teacher and a beginning educational researcher from Georgia. A first-year PhD student from the Department of Education, Maynooth University. His research focus centres on teacher education, social justice in education, curriculum making and philosophy of education.

Akangshya Bordoloi

Akangshya Bordoloi is an Assamese Indian social researcher from Department of Sociology, Maynooth University, Ireland. Her research interest lies in gender, sexuality, deviancy studies and social movement. She is also interested in classical sociological theory and considers herself a Foucauldian. She has been awarded the John and Pat Hume Doctoral Awards, the Department of Sociology Teaching Studentship, and the National University of Ireland Travelling Scholarship for my doctorate research.

LEADERSHIP FOR INCLUSION

Example Case

"Kezia is a 12-year-old girl from the Roma community, who recently started Year 7 at her local secondary school. Kezia is the eldest in her family with two younger siblings and she lives with her extended family. Kezia has an aptitude for mental Maths calculations and is a critical and creative thinker.

Despite a successful first half of the academic year, since the beginning of semester 2, Kezia has been increasingly absent from school and when she was at school she appeared withdrawn. She also struggled with her end of term exams, and her peers have started to exclude her from classroom activities and social interactions during recess times.

Ms Lee, a new social studies teacher in their second year at the school, is concerned about Kezia's declining connection with school and academic struggles. She suspects that Kezia may have an undiagnosed literacy need and brings these concerns to a Year 7 grade level meeting. Instead of addressing the issue, other teachers resort to harmful stereotypes about the Traveller community, undermining Kezia's academic abilities and associating her difficulties with assumed, unconfirmed family challenges. The Year 7 leader, facilitating the meeting, fails to challenge these views, frustrating Ms Lee, who feels helpless.

During a check-in meeting with Mr Schmidt the school principal, Ms Lee raises her concerns about Kezia and the lack of an inclusive school culture. Ms Lee also shares that she has looked at the school's policies and found them unhelpful and difficult to navigate, and is unsure about

the support structures that Kezia can access, if any. She was reluctant to share her struggles with the head of school, however her desire to serve all students under her care superseded her desire to fit in with her colleagues that she was starting to lose trust in. Ms Lee was hoping to find an ally in Mr Schmidt as the school's mission states that "we value diversity and create inclusive learning environments where all learners thrive".

Mr Schmidt and Ms Lee are considering their next steps. They want to take decisive action to foster an inclusive learning culture that respects intersectional identities to serve all learners (youth and adults), including marginalised community members like Kezia. They recognise that the school's policies need strengthening, and that providing training to staff on inclusion related topics, cultural competence and the harmful effects of stereotypes would strengthen the school's capabilities to be more inclusive. Ms Lee leaves their meeting with some immediate steps she can take, such as reaching out to Kezia's family to learn more about her difficulties and engaging the school counsellor. Mr Schmidt is contemplating his next steps and has placed strengthening inclusion as a priority on the agenda for the next leadership team's meeting."

Initial questions

This chapter explores the following questions:

- What is leadership in school?
- Who are leaders in school?
- What are guiding principles that underpin inclusive leadership?
- What do schools need a shared understanding about?
- How can inclusive leaders best manage and accelerate change?
- What makes a policy inclusive?
- How can we move from an inclusive policy to inclusive practices?
- How can leaders nurture inclusive cultures for diverse identities to feel safe and grow?
- How can leaders support partnerships for inclusion?

Introduction to Topic

Central to this chapter is the belief that leadership is a skill that everyone can develop. From this standpoint, all members of a school community have influence as leaders. Both adults and students can become leaders for inclusion, by understanding they have the power to influence their environment. To do so, school community members need to see themselves as learners about inclusion, facilitators of inclusion and leaders for inclusion.

Building on this belief about leadership and the positions community members hold, this chapter outlines four possible pathways to make leadership for inclusion happen. The first pathway addresses the importance of co-constructing shared meaning about foundational concepts related to inclusion. With a shared understanding of inclusion, the second pathway explores how policies can be developed and operationalised to shape expectations, accountability and inclusive cultures. Thirdly, a culture of care that is underpinned with safeguarding diverse identities is described as essential for cultivating inclusion. Finally, the fourth pathway shows how shaping partnerships within and outside the school can strengthen inclusive practices.

Key aspects

Leadership in Inclusive Schools

Leadership in an educational setting serves the purpose of shaping the mission, vision, and values and how these aspirations will be achieved. When a clear and compelling vision of what inclusion looks like within a school is articulated, this can align efforts and guide initiatives toward a common goal. Inclusive leaders inspire and empower others to achieve shared goals by leveraging their influence to foster an inclusive learning culture. Leaders who are committed to cultivating an inclusive school take risks and are willing to challenge the inequitable status quo (Morrison, 2018). They are ethically driven to bring about change that shapes existing cultural norms towards more inclusive ones that serve all learners.

It is important to be clear that leadership is not limited to formal titles and roles; it is a set of capabilities and behaviours that all members of a school community can develop. Leadership in inclusive schools fosters an environment where everyone sees themselves as potential leaders, capable of developing the necessary skills and attributes to drive inclusion and contribute to collective growth and development (Dimmock, 2011). Therefore, leaders in a school need to see themselves as lifelong learners, as facilitators of learning, and as leaders of learning. For example, a school principal who values what they learn from the start, teachers will be able to make better decisions by gaining new perspectives. At times, a coordinator in a school may be facilitating meetings where educational practitioners are learning together about a strategic initiative and how they can contextualise theory into practice. Teachers are leaders when they reflect on the way they

teach, listening to colleagues' observations and students' feedback. Children who articulate their learning preferences and interests to inform learning and teaching decisions are leaders who determine their own learning experiences. Everyone in a school contributes to building inclusive cultures by modelling key values and behaviours as learners, facilitators and leaders of learning.

Inclusive leaders play a crucial role in cultivating school culture and ensuring the safety of all community members. They nurture environments where individuals feel safe to express their authentic selves, thus creating the psychological safety that is necessary for fostering an inclusive school culture. Leaders can build trust through integrity, transparency, and consistency in their actions. These actions set the tone for inclusion through modelling behaviours that demonstrate genuine care, empathy, active listening, and respect for diverse people and perspectives. Open communication, where feedback is encouraged and valued, helps identify and address issues related to inclusion promptly. By promoting a collective growth mindset and demonstrating that intelligence and leadership capabilities can be developed through hard work and dedication, leaders set expectations and norms that inspire others. This holistic approach ensures that a school community thrives within an inclusive, supportive, and growth-oriented environment.

Students and Educational Practitioners as Leaders

When leadership is defined as a person's role in shaping an inclusive learning environment, by default, all members of a school community are leaders as everyone has the potential to positively impact school transformation. In this section, we explain how both teachers and students can make important contributions in strengthening inclusion in educational settings.

First and foremost, educational practitioners serve the needs of students and as such, practitioners need to refocus students' needs as leaders by elevating learner agency and involving students in decisions that affect them (Rodriguez and Villarreal, 2003). The concept of students as leaders should not be a performative and superficial notion. The same can be said about teacher agency, because there is no learner agency without teacher agency. When decisions have already been made without the input of student or educational practitioners, this can lead to trust being lost and demotivation. Rather, schools need to intentionally develop all community members' leadership capabilities and strive to create meaningful ways for all to contribute to school decision-making (Quaglia and Corso, 2014).

A common misconception is when a school considers students as leaders resulting in students assuming executive decision-making power and responsibility. However, how students are viewed by teachers, and other members of the school community, is essential for the decision-making process. As highlighted above, by encouraging students to articulate their own learning interests and preferences and then incorporating this in

pedagogy and curriculum, teachers are providing students with opportunities for shaping and leading their learning. While inclusive practices are about empowering all students, this does not mean that students have complete executive decision-making responsibilities. Students as leaders involves meaningful integration of student voices into decision-making around a broad range of experiences that they encounter at school. It is a co-constructive process that values diversity of perspectives and contributions from those who are experiencing the schooling system that educational practitioners create to serve them (Rudduck, 2007).

An example of meaningful student leadership comes from a German secondary school where a student-driven "Schule Ohne Rassismus" (School Without Racism) project was initiated and implemented by student activists. Student leaders interviewed peers and found that acts of racism were prevalent across the community. This highlighted the need to shift cultural norms, hence teachers collaborated with students to successfully lead the secondary school towards gaining a Schule Ohne Rassismus status. As a part of this initiative, students led staff training sessions, were invited to contribute to strengthening the school's safeguarding policy, and the secondary students also shared their initiative with the primary school's student council and primary teachers.

By valuing students as leaders, educational practitioners hear their needs, maintain relevance and are able to evolve their practices to serve the children and youth under their care (Diamond and Spillane, 2016). Schools that are responsive to student input, are underpinned by democratic values that respect student voice and can lead to academic performance benefits and reduced rates of absenteeism (Kahne, Bowyer, Marshall and Hodgin, 2022). An example of how this can be systematically established is by adopting a 'reverse mentoring' concept. This is when the traditional mentor-mentee role is flipped, for example, when students become the mentor to an educational practitioner or when a newly qualified teacher or teacher new to a school is a mentor to a principal or head of school. Reverse mentoring can offer fresh perspectives and fill in understanding gaps to help leaders enhance how they serve those under their care (Israni, 2022).

Table 1 provides an overview of who may be referred to when using the term educational practitioners. These are all roles and responsibilities in a school that influence inclusion practices and that impact student learning. All of the roles mentioned may have alternate names in various school contexts. It is not an exhaustive list, and should be used as a guide to exemplify the concept of how all roles can be embodied with a leadership perspective.

Table 1: List of Educational Practitioners

Educational Practitioners

Principles Underpinning Inclusive Leadership

Extensive research and literature have been written about leadership styles and the characteristics or dispositions leaders should possess. When considering leadership for inclusion, a combination of these capabilities is put into action by leaders who are hoping for maximum impact. A flexible and responsive approach to leadership is essential as success is grounded in, and responsive to, the unique contexts that leaders are operating in. Schools are shaped and driven by specific policies or initiatives that leaders operationalise and put into practice. For example, implementing safeguarding policies may involve directive leadership, while developing policies for engaging with community service providers and leaders requires dialogue and responsiveness. Meanwhile, when striving to transform learning and teaching with a school-wide adoption of universal design for learning, a leader would achieve more sustainable practices if adopting a relational and transformational leadership approach.

It is crucial that leaders have, at the heart of their adaptable leadership approaches, key principles that positively promote inclusion. Leadership for inclusion is not merely about enacting policy and practice; it is about embodying inclusive values. Guiding principles support leaders with 'living' inclusion, as they serve as foundational factors that underpin the inclusive behaviours that are modelled. Without a majority of these key principles, a leader may stray away from values that drive inclusion. For example, a leader can be democratic and take on a distributive leadership approach to implement segregating learners from one ethnic background, or who are perceived to have deficits with literacy or numeracy that results in greater othering and marginalisation . On the other hand, a leader with ethical principles driven by inclusive leadership would design for greater equity with initiatives that break down barriers for learning as opposed to creating more division.

The following guiding principles are organised around two components: inclusive leader characteristics and inclusive leadership styles. The principles chosen are based on leaders' experiences and leadership in schools' research.

Inclusive Leader Characteristics

Caring

Care is a specific activity that includes everything that we do to maintain, continue, and repair our world so that we can live in it as well as possible. That world includes our bodies, ourselves, and our environment, all of which we seek to interweave in a complex, life-sustaining web. (Fisher & Tronto, 1990, p. 40).

Inclusive leaders care deeply about their work and interactions with others. 'Leadership' in educational settings is not regularly associated with 'care', but 'ethics of care' are increasingly recognised as critical for leaders who seek to strengthen inclusive practice (Myende, 2023). The social change that is needed for genuine inclusion requires leaders who care about equity and social justice and how they interact with and influence people. For example, a school leader that is given space to care deeply about their work will be able to prioritise building relationships with the people they interact with.

Genuine care that leads to positive social transformation is an important aspect of how we operate in the world more broadly (Cook-Sather, 2020). A leader that embodies ethics of care holds themselves and others to account to move inclusion forward. To successfully care about ourselves, students, colleagues and our environment, leaders also need characteristics such as passion and self-awareness.

Passion

I get this feeling of passion, almost like a passion for the school.

I sense a feeling that she feels something that when the school achieves

that she has achieved in order for the school to be achieving

… she has always had a strong desire to maintain or improve standards and to better the school

… to see that people are able to achieve (Parent). (Day, 2005, p. 579)

The following excerpts are direct quotes taken from interviews that illustrate how parents, as well as children and school staff, appreciate leaders who are personally invested in, or connected, to their schools. When leaders convey their passion for cultivating inclusion, for their school community, for each individual under their care and for every learner to achieve their goals – this passion can embolden and encourage others to be active participants that contribute to furthering the school's inclusive mission.

The ability to care and lead with passion, has been identified as a characteristic that can sustain success in challenging learning contexts (Day, 2005). It plays an important role in shaping inclusive learning and teaching because passion includes and conveys: moral responsibility, optimistic enthusiasm, constant perseverance, urgency for action, genuine valuing of others and more (Caldwell and Okpala, 2022). Understanding the role of passion in building strong relationships has practical benefits for inclusive, caring and self-aware leaders.

Self-awareness

…teachers must spend time recognizing who they are, bring that authentic self into the class-room, and invite their students to do the same. In this process, it is important to note that the goal is not to be like our students. Instead, we must be as unapologetic, raw, and honest as we can be about who we are, while creating space for our students to express their authenticity and vulnerability in ways that have never been allowed before and that support their freedom to learn and become academically successful. (Sealey-Ruiz, 2022)

Self-awareness and the capacity to 'tune into' the range of lived experiences and perspectives of children, colleagues, and community members are essential. This begins with tuning into oneself as leadership for genuine inclusion requires openness and humility. Inclusive leaders are able to reflect on their own biases and comprehend diverse experiences through in-depth engagement and active listening. Being self-aware supports inclusive leaders in terms of leaning into their own identity and discomfort, particularly as this can often be a barrier for having conversations about race, gender, sexuality, religion, socio-economic status, etc (Talusan, 2023). The process of understanding one's own and others' lived experiences has been described as 'tuning', or becoming 'attuned'.

With self-awareness, leaders can recognise one's own socialisation that informs conscious and unconscious ways of knowing, doing and understanding the world. This includes recognising one's unconscious biases that can lead to having affinity with certain people and groups and that can also lead to polarising judgements and exclusionary behaviour. Being cognisant of the limitations of one's own lenses helps us move beyond our own perspectives to develop informed understandings from multiple perspectives (Cook-Sather, 2020). For example, a head of school who is aware of one's power and positionality can use it to prioritise inclusive hiring for greater representation of teachers from underrepresented groups. This does not suggest that power related to the position is used in a coercive and controlling way (power over), but rather the sharing of power (power with) is necessary in order to maximise every persons' unique potential (power within) and achieve shared goals (power to). A newly qualified teacher also has power and positionality to make a difference in their context and spheres of influence, for example a teacher has great power in the classroom and can intentionally form the content they choose to include or omit from their unit and lesson designs.

By understanding ourselves and others deeply, an inclusive leader will be able to bridge differences in order to develop shared ways forward that honours all intersectional identities in one's learning community.

Inclusive leadership styles

Leadership for inclusion encompasses various styles and approaches. The most effective style depends on the individual leader, the school, the wider community, and the leadership task at hand. Some key leadership styles discussed in literature around leadership for inclusion include transformative leadership, distributive leadership and ethical leadership.

For example transformational leadership nurtures the characteristics listed above as it focuses on educational practitioners' professional identity evolvement. Distributive leadership fosters collaboration among and between educational practitioners, students, families, governors, school evaluators and more. Ethical leadership ensures that decisions are driven by socially responsible motives that transform society for good. These three styles represent research-informed approaches that drive inclusion and foster a thriving school environment. To support further learning about each of these leadership styles Table 2 shares resources that serve as a starting point for your ongoing professional inquiry.

Table 2. Leadership Style Resources

Resource	Short summary
Transformative leadership	
Carolyn M. Shields & Kristina A. Hesbol (2020). Transformative Leadership Approaches to Inclusion, Equity, and Social Justice. Journal of School Leadership, 30(1), 3-22. https://doi.org/10.1177/1052684619873343	This article discusses how transformative leadership approaches can be utilised to promote inclusion, equity, and social justice within educational settings.
Carolyn M. Shields (2016). Transformative leadership in education: Equitable and socially just change in an uncertain and complex world (2nd ed.). New York, NY: Routledge.	This book explores how transformative leadership in education can bring about equitable and socially just changes in complex and uncertain environments.
Distributed leadership	
European Agency for Special Needs and Inclusive Education (2020). Inclusive School Leadership: A practical guide to developing and reviewing policy frameworks. (M. Turner-Cmuchal and E. Óskarsdóttir, eds.). Odense, Denmark. https://www.european-agency.org/sites/default/files/SISL_Policy_Framework.pdf	This guide offers practical advice for developing and reviewing policy frameworks to support inclusive school leadership through distributed leadership models.
Alma Harris (2012). "Distributed leadership: implications for the role of the principal", Journal of Management Development, Vol. 31 No. 1, pp. 7-17. https://doi.org/10.1108/02621711211190961	This article examines the implications of distributed leadership for the role of school principals, highlighting its potential to improve educational outcomes through shared leadership practices.
Ethical leadership	
Nina Sharma (January 2021). Paving the way for Ethical Leadership in Education. National Governance Association, UK. https://www.nga.org.uk/media/ylteeeuz/ethical-leadership-report-final.pdf	This report advocates for the integration of ethical leadership in education, emphasizing the importance of values-based decision-making in school governance.
Jorge Berges-Puyó (2022). Ethical Leadership in Education: A Uniting View Through Ethics of Care, Justice, Critique, and Heartful Education. Journal of Culture and Values in Education. 5. 140-151. https://doi.org/10.46303/jcve.2022.24	This article presents a comprehensive view of ethical leadership in education, incorporating ethics of care, justice, critique, and heartfelt education to unify various ethical perspectives.

In summary, inclusive leadership involves articulating contextually appropriate principles that emphasise care, passion, self-awareness and adaptable leadership styles. These principles help leaders create an inclusive school culture where everyone feels valued and supported, ensuring the safety and well-being of all. With these foundational principles, specific strategic priorities can be actioned in accelerated ways. The following pathways outline steps schools can take to cultivate sustainable inclusion.

Four pathways to inclusion

A shared understanding about leadership and inclusive leader characteristics as well as leadership styles helps to create clarity across the school community and that all members have a role to play in this process. Given these principles which underpin leadership for inclusion, a school also needs to co-construct aspects of the school to strategically move forward in order that inclusive cultures can be nurtured. To promote success among educators and in the school more generally, four pathways to inclusion are presented for leaders to address in contextually relevant ways in their learning communities, these are:

1. Developing shared understandings of key concepts related to inclusion.
2. Designing inclusive policies and implementation processes.
3. Nurture inclusive cultures for diverse identities to grow.
4. Cultivate partnerships to strengthen inclusion.

Each of these pathways has the potential to move a school forward if leaders provide support and opportunities for positive interactions. If any of these pathways are neglected, leaders will find that progress is likely to be hindered. In any school, multiple pathways can be developed simultaneously. Together, these pathways complement and support each other by providing multiple ways to achieve a goal when specific paths may be a barrier to reaching an inclusion-related goal. For example, let's take the example case of Ms. Lee's desire to support Kezia and the Roma community. It is clear that a shared understanding about how best to serve students with Kezia's background or policies, practices or partnerships is lacking and fostering respect and understanding is necessary to support Ms. Lee with achieving her goals. Consider how each of these pathways, if addressed with Kezia and Ms. Lee in mind, would promote leadership for inclusion.

   Each pathway's purpose and importance is explained and examples of practice are provided. These examples should be considered as starting points for strategic planning and development for a school. Through strategic planning and development these pathways can lay foundations so that steps can be taken towards embedding more inclusion in educators' daily practice.

Pathway 1: Developing shared understandings of key concepts related to inclusion

'Shared understanding' happens when the vision and core values in an educational setting are clearly articulated, regularly discussed, widely disseminated and well understood. When staff and students share an understanding about the importance, and key aspects of inclusion, they are able to take communal action in achieving an inclusive and caring environment.

   A shared understanding and commitment to inclusion is essentialas it enables communities to move beyond rhetoric in promoting meaningful participation of all

members, irrespective of their age, gender, race, colour, caste and religion. A shared understanding about inclusion is supported when there is space and opportunity for all perspectives in a school community to be noticed, heard and valued. By harnessing diverse perspectives and ideas, shared commitment to inclusion also leads to greater creativity and innovation.

It is important for schools and school policies to reflect a clear sense of how 'inclusion' is understood and enacted within their own contexts. Inclusion is a multifaceted concept and understandings of inclusion are constantly evolving to reflect broader changes in society and the world. One concept that has played a key role in shaping ideas about inclusion is the idea that education is a 'political act'. As Paulo Friere stated in his 1968 book Pedagogy of the Oppressed, "All education is political, teaching is never a neutral act" (Freire, 1968, p. 19). Decisions about what is taught in the curriculum reflect particular values and ideologies that do not always mirror the lived experiences of all children and their communities. For instance, emphasis on particular historical figures, the framing of historical events, the choice of language of instruction, are all political decisions. Teachers themselves might also make choices about topics that they teach, and how these topics are delivered, that reflect their own values, beliefs and understanding about how societies function. Politics are therefore intertwined with children's learning, and it is important that teachers are encouraged to reflect on their own teaching and learning choices, to ensure that they do not unintentionally marginalise or exclude.

Developing cultural competence among community members and leaders is also important for developing a shared understanding around inclusion, as this promotes awareness of how diverse cultures and values systems can be better incorporated, or at least considered, in planning and delivery. This could be achieved via continuous learning and by providing development opportunities for teachers, including open, constructive discussion of potential bias across all school policies and practices. Empowering community members to participate in development of inclusion policies promotes ownership of inclusion initiatives and ensures sustainability and relevance.

As part of developing a shared understanding about inclusion, it is important to have open dialogue across schools around the importance of justice. This includes differentiating between equality and equity. Traditionally, equality means treating everyone the same. However, recent educational literature emphasises the importance of equity (Hammond, 2014), in other words, a school environment provides resources and support tailored to address individual unique needs, thereby ensuring everyone has an equal opportunity to succeed. For example, providing extra language support for students who might face difficulties with accessing curriculum content taught in the language of instruction is an example of equity in action. This approach, supported by scholars like Ainsworth & Ladson-Billings (2018), promotes a more just and inclusive school community where all students can reach their full potential. According to Cobb and Krownapple (2019),

successful educational equity initiatives require a shared understanding that moves beyond diversity to fostering a culture of dignity and belonging.

Examples of how shared understandings can be disseminated and implemented

A shared understanding of, and commitment to inclusion facilitates action by ensuring that inclusive practices are integrated into the full range of school policies and practices. One example could be around creating a shared understanding of terminology related to gender. When leaders, educators, and community members are well-informed about and sensitive to diverse expressions of gender, this reduces stigma, promotes acceptance, and ensures that everyone feels valued and understood. Practical actions to demonstrate this shared understanding could include the possibility of Alias Careers that legitimate sexual identity in terms of subjective choice.

This second illustration draws on the concept of restorative practice, which is elaborated on in the chapter Restorative Justice in Schools: Implementing restorative approaches to resolve conflicts and build positive relationships within the school community. Shared understandings of inclusion that are widely discussed and practised across a school community can support heightened awareness among teachers, which is critical for acknowledging and addressing instances of exclusion and 'othering' that might not be overtly visible. For example, students from ethnic backgrounds that differ from the mainstream can be subjected to instances of microaggression or feeling disregarded. These experiences are not always immediately identifiable, but they can lead to behaviours that result in traditional disciplinary measures such as reprimanding both groups or the detention of some students from the majority group, which can further isolate the excluded student and might not resolve the issue. A more inclusive approach would be for the teacher to facilitate a restorative circle involving the excluded student and the dominant group. In the circle, an inclusive space can be facilitated for students to feel safe to discuss key values underpinning inclusion and share their perspectives. The excluded student can express their feelings of isolation, while the dominant group might become more aware of the harmful consequences of their behaviour. This open dialogue allows for empathy building and an opportunity to find solutions together.

By establishing core values, creating inclusive decision-making processes, prioritising well-being, embedding inclusivity in organisational practices, and continuously monitoring and evaluating outcomes, leaders can ensure their decisions foster a supportive, equitable, and thriving community. This comprehensive approach enhances individual well-being and promotes a culture of respect, engagement, and collective success.

Pathway 2: Designing inclusive policies and implementation processes

To foster sustainable growth, it is essential to outline a strategic direction that articulates the school's key purposes. A school's mission, vision and values are operationalised

through its organisational policies (Eredics, 2018). Policies provide clarity of shared beliefs, values and approaches which the school adopts to achieve its stated mission. Without this clarity, it can be difficult to achieve one's promise to students and their families and to hold each other accountable. As policies play such an important role in shaping a school's culture and learning ecosystem, it is vital that all policies are underpinned by inclusive values. A well-articulated policy has the power to promote development, change and to sustain an inclusive organisation.

In this section, we highlight two very important considerations in developing inclusive policies: the first focuses on the 'human aspect' of policy: the importance of tuning into, representing and engaging with, diverse perspectives in policy development and review. The second focuses on policy content and external influences.

The human aspect of policies

The first consideration centres around the importance of connections between policies and the communities that they are designed to serve. Successful policies 'speak to' people. They are highly valued, well understood and grounded in shared understanding about why they matter. As outlined earlier, some policies, such as safeguarding policies, may require a higher degree of top-down implementation that may be less open to democratic processes of development. However, effective implementation of such policies still requires a process of engagement with the school community, to ensure that they are widely understood and valued. In the case of policies that seek to promote genuine inclusion, these aspects are particularly important. Policies drive practice, so in the case of inclusion, policies need to incorporate diverse 'voices', carry meaning for diverse groups, and clearly articulate key values (including care, respect and dignity) outlined earlier.

In a school setting, leadership for inclusion requires that the diverse needs and capabilities of all students and staff across the school community are incorporated into policy development and review. Where possible, students should be given opportunities to participate in policy-related decision making. At the very least, the best interests and well-being of all children should drive policy making and review. Democratic structures like student councils or children's parliament can contribute to fostering student leadership and space for learners' voices to be heard.

As well as representing children, inclusive policies should consider and reflect the interests of all members of a school community, including staff, parents and caregivers, and key stakeholders who share responsibility for supporting children and their well-being. Teachers need to understand and 'tune into' the importance of engaging with and embracing children's diverse lived experiences in classroom settings. Support staff need to engage with and understand the importance of inclusive language and a caring environment. Parents and caregivers need to be encouraged to participate in policy development at the school level, so that they understand the values that underpin regulations, pedagogical approaches and other key aspects of school life.

Policy contents and external influences

With regard to the second key consideration, developing inclusive policies in schools involves recognising the interconnectedness of various policy areas, such as gender, safeguarding, and human resources. Rather than viewing these policies as mere compliance checklists, schools should adopt a commitment-driven approach that emphasises growth and development (Wutschka and Lossen, 2022). This shift fosters a culture where policies are living documents that actively support inclusivity and equity. By integrating policies that address multiple dimensions of inclusion, schools can create a more cohesive and supportive environment for all members of the community.

Inclusive policies must also consider external parameters that may be exclusionary, including legal and cultural factors. For instance, Germany ranks highly on the legal index for LGBTQ+ rights according to Equaldex, but public opinion is less supportive (Equaldex, n.d.). This discrepancy highlights the need for school policies to bridge the gap between legal protections and societal attitudes. Schools must be proactive in creating an environment that upholds legal standards while also promoting a culture of acceptance and respect. Understanding these dynamics helps schools to tailor their policies to both reflect legal requirements and address cultural mindsets, ensuring that all individuals feel safe and valued (European Agency for Special Needs and Inclusive Education, 2021).

Policies within a school can significantly promote or inhibit progress towards inclusion. For instance, a Language Policy that encourages multilingualism and honours home languages fosters an inclusive environment where all students feel valued and respected. Conversely, a policy mandating the use of English only (or another dominant language only) sends a message that one language is more valuable and powerful than other languages, potentially diminishing the cultural and linguistic identity of students (Blume, Gerlach, Roters and Schmidt, 2021). This can result in marginalisation and potential loss of a multilingual identity as students conform to a monolingual standard. On the other hand, when a school adopts a specific language for instruction, but also explicitly supports multilingualism and welcomes all languages, it aligns with research showing that students learn additional languages more effectively when they can connect new knowledge with their existing linguistic repertoire (Cummins, 2021). This approach will also ensure that students with limited proficiency in their school's language of instruction are fully able to comprehend their rights and responsibilities.

To be effective, policies must be accessible, realistic, and their implementation carefully monitored. Accessibility ensures that all members of the school community can understand and engage with the policies. Realistic policies are those that can be practically applied within the school's context (Cairney, 2023). Monitoring implementation is crucial to ensure that policies are not only put into practice but are also adapted as needed in order to remain effective. By focusing on these aspects, schools can develop inclusive policies that

truly support the diverse needs of their students and staff, fostering an environment where everyone has the opportunity to thrive.

Managing and accelerating change

Managing and accelerating change to achieve inclusion requires leaders to strike a balance between driving transformation at a pace that challenges and inspires, while also ensuring that the community feels supported and capable of keeping up with changes (Abrams, 2019). Distributive and transformative leadership are universally acknowledged approaches that will inclusively involve all community members in enacting change in non-hierarchical ways (Gómez-Hurtado, Valdés, González-Falcón, Jiménez Vargas, 2021).

Successfully managing change in democratic ways means providing opportunities for everyone to have a say in decisions that affect them. When community members understand reasons for decision-making, they are more likely to accept the legitimacy of decisions and feel more ownership to act. Transparent sharing of decision-making processes brings more visibility and builds trust. Additionally, when community members have a role in decision-making, they can clearly see future opportunities for participation to act on change initiatives (Santana, Rothstein and Agnes, 2016). In order to ensure that policies are transparent and visible, they may need to be translated into multiple languages and formats, to reach diverse communities. Careful dissemination of policies can enable parents and students to understand the importance and nature of school regulations, academic requirements, and available resources.

Fullan (2000) highlights the need for ongoing monitoring and support for successful policy implementation. It is very important to gather feedback from teachers, staff, students, and families to identify challenges and areas for improvement. On-going collection of key data should inform policy review and development. For example, if school data indicates low scores for students who come from lower socio-economic backgrounds, then immediate actions should be undertaken to understand the needs of those students and to provide appropriate support. Another example could be that a school policy could mandate bi-annual anonymous surveys and quarterly feedback sessions for all teachers to assess school climate and operational effectiveness. For instance, a monthly "Feedback Friday" could be established, where teachers and students provide input through easily accessible online forms and in-person meetings, ensuring continuous and inclusive improvement. For the students, a feedback wall could be established in the school enabling students to provide feedback on important questions that might guide policy development. Once this data is collected and analysed, a summary report highlighting key findings and action steps should be shared with all stakeholders, and follow-up meetings should be scheduled to address any urgent issues and track the progress of implemented solutions. If the findings show inequity, then further analysis should be undertaken to understand what caused it. A thorough action plan responding to the analysis should be made and

implemented. The plan could consist of communicating and then allocating resources equally to ensure that everyone's needs are met.

On-going reflection on how policies are working across the school, and how they are viewed by staff and students, is important to regularly assess policies' effectiveness in achieving an inclusive environment for all students. Furthermore, it is important to review and update the policies so as to ensure that it is aligned with the goals and the vision of the community. More information can be found in the chapter on Policy Development and Implementation.

Pathway 3: Nurture inclusive cultures for diverse identities to grow

Nurturing diverse identities within school communities is at the heart of leadership for inclusion. We use the term 'nurturing' here intentionally, as it reflects the importance of on-going development and growth in valuing and embracing human diversity as a core component of inclusive cultures and thriving classrooms. Genuine inclusion is an on-going process that requires all members of the school community to take responsibility for recognising, supporting and responding to diverse ways of knowing, being and belonging. Schools are places where student and teachers' identities evolve, and addressing the following aspects helps to provide preventative measures that foster inclusive mindsets and behaviours so that curative steps are less needed.

For example, if students are exposed to diverse role models in their curriculum, such as black women as presidents, Roma girls as heroine characters in books and trans-activists as role-models, students will then see possibilities for themselves which can positively inform their future identities and decision-making. These steps contribute to mental health and well-being and reduce biased, harmful behaviour from students and adults in schools. As you engage with the following aspects, consider how these preventative aspects can be cultivated to support the curative work that arises in schools.

Designing an inclusive curriculum

Even schools with little autonomy for developing inclusive curricula, can determine how curriculum is implemented in their own context. Collaborative approaches that incorporate insights from children, teachers and parents in planning, implementing, monitoring and revising the curriculum can lead to curriculum content that reflects diverse perspectives and life experiences, and that all children can connect with.

As teachers plan lessons, they play a key role in determining the extent to which curricula are delivered to reflect and present diverse groups. In many schools, time for teachers to reflect on the extent to which their lessons represent diverse knowledge and learning interests is often limited. Allocating time for teachers to engage in shared planning on a regular basis creates space and autonomy for teachers to work collaboratively in generating culturally-responsive ideas for learning that draw on diverse interests and lived experiences

of students in their own context. On the other hand, teachers who are regularly presented with pre-determined lesson plans that prescribe overly standardised lesson outcomes, can become disempowered. Teaching becomes a process of technical delivery that provides limited opportunity for connecting with and responding to diverse interests and needs.

A range of frameworks are available for providing guidance on the inclusive implementation of curriculum. Some frameworks, such as Universal Design for Learning focus on cognitive aspects of inclusive curriculum. The Index for Inclusion (Booth and Ainscow, 2011) advocates for a spiral curriculum where both locally and globally relevant topics (like food security, mobility and the arts) are regularly addressed through interdisciplinary learning. Other, more philosophical frameworks, provide insights into indigenous world views on education. For example, the African philosophy of Ubuntu, applied to education, emphasises inter-connectedness and 'humanism' in education. Four key principles of Ubuntu can support implementation of inclusive practices in implementing curricula: solidarity and interdependence; coexistence and harmony; compassion and concern, and respect and dignity (Ngubane and Makua, 2021). There are many other educational philosophies from different parts of the world that engage seamlessly with key concepts of inclusion and we would encourage readers to explore these.

Identifying and addressing barriers to learning

While it is important to recognise that schools cannot be held accountable for meeting all children's needs, where there are needs that are impacting on a child's right to safe, secure and positive learning experiences, schools and educational settings must meet this challenge. As Adelman and Taylor (2018) have highlighted, barriers to learning must be understood as stemming from a combination of environmental factors, or deficits, as well as the 'needs' of an individual child and their family.

An interactional view of 'need' that acknowledges potential exclusionary factors is important as it enables leaders to identify where school policies and / or practices might be exacerbating, or creating, barriers. For example, if communication channels with parents and caregivers are only available via a single, majority language, this could exclude parents from linguistically diverse backgrounds and affect their child's access to various resources and / or activities. If children are not able to see representations of themselves in the curriculum, or in everyday practices at school, they are less likely to develop a sense of belonging, safety and / or trust in school policies and procedures.

In earlier sections, we referred to the importance of the leader's ability to 'tune into' the experiences of students, colleagues and community members in order to achieve inclusion. This ability to genuinely listen to, understand and connect, with a diverse range of experiences and perspectives, is key to achieving success in the inclusive implementation of curriculum, and in identifying and addressing barriers to learning. One example is how a school, during the COVID-19 pandemic, addressed a structural barrier for one kindergarten child which subsequently benefited all the children. Multiple entrances were activated and

coloured lines on the floor were introduced to guide children to their class and prevent a feeling of disorientation. The strategy was developed to support the needs of a child diagnosed on autistic spectrum disorder and proved useful in allowing all children to gain autonomy.

Valuing open and shared decision-making

An inclusive, participatory approach to decision-making that is grounded in democratic student leadership practices, serves as a preventative measure for nurturing inclusive spaces where diverse identities can thrive. By involving students in decision-making processes, schools foster a sense of belonging and empowerment among students, which is crucial for their social and emotional well-being. This approach also encourages students to take an active role in shaping their educational environment, ensuring that their voices are heard and their needs are addressed. Research by DeMatthews and Mueller (2022) highlights how inclusive leadership, that promotes student participation and collaboration, can significantly enhance the inclusivity of school environments and support positive identity development among students with diverse backgrounds. These practices are effective in preventing identity-based harm, as they cultivate a culturally responsive school culture where all students feel safe, respected, and valued, ultimately contributing to their academic and personal growth.

Nurture a sense of belonging

Members of a school community experience a sense of belonging when they feel valued, cared for and represented in policy and practice. Fostering a sense of belonging for all intersectional identities is a complex process, as it requires leaders to engage authentically with a range of possible factors that might cause some children to feel 'othered' or excluded. These might include gender, ethnicity, race, language and disability. Children may also experience a sense of detachment if they lack confidence, are made to feel that they are not meeting academic expectations (or 'underperforming'), or do not feel connected to the school community.

Educational leaders and practitioners can support a sense of belonging for all children and colleagues, by building relationships based on dignity, respect, trust and intercultural understanding that nurture inclusive spaces for diverse identities to grow. This involves creating a school culture that values every student's unique background and experiences, ensuring not only that diverse voices are heard and respected, but that this diversity is made visible.

For instance, schools can adopt culturally responsive and sustaining teaching methods, provide professional development for staff on issues of diversity and inclusion, and establish support groups for various identity groups within the student body (Paris and Alim, 2017).

Caring about human resources

Creating a school environment where identities can evolve, learn, and thrive involves inclusive human resource practices. Schools need to prioritise hiring, retaining, and supporting teachers with a diverse range of intersectional backgrounds that reflect both one's learning community and society at large (The Leadership Academy, 2021). Some schools have autonomy over who to hire, forming teaching teams and selecting school leaders. There are also schools that have external bodies, such as local or state authorities, that determine staffing in their institution. Whether a school has the authority to seek individuals who possess both inclusive mindsets and skillsets or not, it is important to intentionally further develop educational practitioners' inclusive mindsets, understandings and skills.

By intentionally cultivating practitioners who value inclusion, schools can build a community where every individual feels represented, respected and valued. Leaders that foster a culture of care need to also intentionally foster well-being among their colleagues and across their learning community. Leaders need to understand that burnout is often caused by environmental factors and is not a problem of the individual themselves, and they can therefore act accordingly to ensure support is available for themselves and their colleagues. The key to avoiding burnout is just better self-care but also having an understanding of the impact of school-based factors on their working practices and taking steps to create a working environment where all colleagues can flourish (Kelly, 2023).

While the effectiveness of self-care is limited unless an imbalanced work environment is addressed, leaders and practitioners can also take steps to maintain their wellbeing. Leaders and practitioners would benefit from regularly engaging in four types of recovery activities during their rest periods: psychological detachment from work, relaxing, choosing how to spend their free time, and doing non-work activities that give a sense of achievement.

It is very essential to nurture an understanding of the importance of emotional, physical and mental health. Some examples of healthy habits are shown in Table 3.

Table 3: Building Resilience for Leaders

Physical Health	Emotional Health	Mental Health
Good Sleep	Self-awareness: Reflection through journaling	Psychological Detachment from Work
Exercise and balanced nutritious diet	Regulate emotions by managing work life balance	Practising mindfulness

Self-care plays a vital role in nurturing well-being. By enhancing emotional resilience, improving decision-making and empathy, ensuring sustainable leadership, and creating a culture of care, self-care enables leaders and practitioners to support and promote an inclusive and respectful environment effectively. When leaders and practitioners prioritise

their well-being, they set a powerful example and create the conditions necessary for a thriving, diverse community.

Engage in professional learning that values diversity

Professional learning and development are also critical in nurturing inclusive spaces for identities to flourish. Leadership training should focus on developing inclusive mindsets, and encouraging leaders to understand and empathise with the diverse experiences of their community members, particularly those from minority groups (Talusan, 2023). Leaders must also be equipped with the skills to manage difficult conversations on race and other sensitive topics, as addressing these issues is crucial for fostering an inclusive environment (Singleton, 2015). Additionally, managing social change involves more than implementing new curricula or management systems; it also requires a fundamental shift in values that impacts both personal and professional identities.

Creating a continuous professional development culture within schools is essential for fostering an environment where ongoing critical reflection, questioning, and mistake-making are embraced as key components of growth and learning. Leaders in schools can support this culture by implementing practices and strategies that encourage continuous professional development, collaboration, and a mindset that views mistakes as opportunities for learning. These spaces provide a safe forum where everyone can creatively express their thoughts and ideas and where diversity is celebrated.

Faculty development plays a vital role in supporting identity-conscious practitioners. Educators should be trained to affirm learners through identity-centered learning and culturally responsive and sustaining pedagogies. Recognising that practitioners continue to evolve their professional identity development is also essential for leaders. These approaches humanise all identities and honour's each learner's background (both students and practitioners) by valuing diverse ways of knowing, doing and understanding in the learning process.

Identify and address exclusionary practices

To nurture safety for diverse identities to evolve, learn, and thrive, schools must cultivate a critical awareness and affirmation of learners' identities among educational practitioners (Wickner, 2020). This involves recognising and addressing exclusionary practices that cause identity-based harm, such as bullying, violence, and other forms of discrimination. By actively identifying these harmful practices within the school community, educators can take proactive steps to ensure a more inclusive and supportive environment for all students.

Strengthening safeguarding practices is an essential part of this process. Schools need to develop comprehensive safeguarding policies that specifically address identity-based harm. This includes creating inclusive spaces and trusted systems where students feel secure and supported. Additionally, educators should be skilled in equity-centered, trauma-

informed practices, which are crucial for effectively supporting students who have experienced identity-based trauma (Venet, 2021). Restorative practices is an inclusive approach to improving and repairing relationships and social connections among people who are victims or perpetrators of harm. These approaches ensure that the unique needs of each student are met with sensitivity and understanding, promoting inclusive and nurturing learning environments.

Implementing these measures requires a commitment to continuous professional development for educators. Training in recognising exclusionary practices, developing robust safeguarding policies, and practising equity-centered, trauma-informed care are all vital components. By equipping educators with the necessary skills and knowledge, schools can create an environment where diverse identities are not only protected but also celebrated, allowing all students to fully engage in their learning and personal development.

Pathway 4: Cultivate partnerships to strengthen inclusion

Educational settings do not operate in a vacuum. Any agency that has an impact on a student's life experience and well-being, directly or indirectly shapes how a school operates. If students live in safe, thriving communities and have access to resources that support their learning, they are in a better position to fully benefit from, and contribute to, their experiences at school. Successful leadership for genuine inclusion therefore requires efforts on the part of schools to establish strong partnerships with community-based and other external agencies. In this section, we provide three diverse examples of how school communities can benefit from well-established partnerships and networks that connect schools with external bodies.

Schools as community resource hubs

Schools can play a very important leadership role in supporting parents to navigate systems of support that may not be available within the school itself, but are critical for children's learning and well-being. One example of where educational settings could provide important support for children and their families is in facilitating connections with service for children with disabilities and social support needs. For many parents and caregivers, navigating the complex network of government and non-government agencies involved in provision of services for children can be overwhelming. This can be especially so for families with linguistically diverse backgrounds, or families who have little experience of interacting with government agencies or administrative departments. This can result in children missing out on important interventions. In a similar vein, information about government subsidies and provisions for families on low incomes is not always readily available.

Schools that have active and on-going links to local government and non-government agencies that provide such services can play a crucial role in ensuring that equitable

access to learning (through the provision of targeted supports) is available to all children. In Ireland, the role of Family and Community Partnership Coordinator has been recently addressed across schools to enact these important home-school-community networks and partnerships, as part of the newly introduced New Start initiative (Department of Children, Equality, Disability, Integration and Youth, 2024). A chapter on Collaboration with Parents outlines more ways to strengthen partnerships with parents.

Identifying and addressing diverse needs

Leaders can also support partnerships by tuning into family's needs and understanding the circumstances of families. This can be achieved by having an open dialogue with families in need and then implementing support services. Needs should be co-constructed so that actions implemented actually address specific needs – those which are not based on stereotypical assumptions about what families may or may not need. Sensitively managing access to services to avoid stigmatisation is a consideration leaders need to be aware of.

For example, a school where the majority of the student population come from lower socio-economic backgrounds has seen attendance rates drop as students feel stigmatised due to the lack of access to clean clothing.To address this challenge, schools could provide a laundry service, free of charge, and equipped with washing machines and dryers providing access to clean clothing and improving attendance.

Another example of meeting the needs of a diverse school demographic relates to affinity groups and organisations for practitioners with marginalised identities where the school demographic may not reflect them. In this instance, developing external partnerships for learning can significantly enhance a school's capacity to support and empower its staff, particularly in addressing gender and racial disparities within educational leadership. While women constitute approximately 70% of the teaching profession, they remain underrepresented in senior leadership positions. To address this gender gap, schools can partner with grassroots organisations like WomenEd, which aims to support aspiring and existing women leaders in education (About Us, n.d.). By providing mentorship, networking opportunities, and professional development resources. Such partnerships can help women educators advance into leadership roles, promoting greater gender equity within the profession.

Schools must also recognise and address the unique challenges faced by educators of colour, who often find themselves underrepresented among colleagues and across leadership positions. Navigating professional environments where one's background is not reflected in the broader community requires specialised support. Affinity groups, such as the Association for International Educators and Leaders of Color (AIELOC), offer vital spaces for educators of colour to connect, share experiences, and receive the support necessary to thrive (About Us, n.d.). Partnering with such organisations can provide educators of color with a trusted space, resources and community they need to navigate and succeed in predominantly white institutions.

By leveraging external partnerships with organisations like WomenEd and AIELOC, schools can create more inclusive and supportive environments for all educators. These partnerships not only help to narrow gender and racial gaps in educational leadership but also foster a culture of equity and inclusion within the school community. Through these partnerships for learning, schools can support all educators, with access to identity-affirming communities needed for them to advance and excel in their profession.

Local contexts

Closing questions to discuss or tasks

Whether you are studying to be a teacher, a newly qualified teacher or a seasoned practitioner, how you embrace and lean into your leadership capabilities will determine the impact you will have on students, colleagues, families and your whole school community. How will you nurture your leadership capabilities? How will you leverage your power and positionality in a school to make a positive, inclusive difference?

> The most common way people give up their power is by thinking they don't have any
>
> (Walker, n.d.)

How will you proactively guide yourself and others to act ethically and with care to cultivate inclusive school cultures, policies, and practices?

Our sample case presented Kezia, a marginalised student in a school community that needed leadership to support a change process to enhance inclusion. Consider Kezia's needs and

the support Ms Lee needed to successfully meet these needs. Reflect on key understandings presented in this chapter and consider:

- How can Mr Schmidt and Ms Lee move forward with their next steps?
- What are some immediate steps that can be taken to support Kezia?
- What are some medium- or long- term goals that are needed to address policies and school systems and structures?
- Which pathways for inclusion should they advocate for as priorities to put into a school's strategic action plan and why?
- Which professional learning and development topics should be prioritised and budgeted for in this case?
- Which partnerships within and outside the school community can be leveraged to support Kezia?
- How can data and systems of accountability support Mr Schmidt and Ms Lee to meet their enhancement of inclusion goals?
- What leadership capabilities and styles do Mr Schmidt and Ms Lee need to activate to address the current needs of the school?

Now, consider the most marginalised student in a school community that you know well. Consider how you can lead others, from your position, to best support this student to access learning and be supported to succeed in an inclusive school.

Reflect on these questions to consider the actions you could take:

- What are practical ways you can foster a shared understanding of inclusion among all members of your school community?
- How best can you develop pathways towards inclusion that meets the most pressing needs of your school community?
- How best can all learners be safeguarded to learn in inclusive spaces that foster belonging and well-being?
- How can data inform the development of strategic priorities, decision-making and action taking?
- How can partnerships be leveraged, developed and/or sustained to support learners who have barriers to learning?

Elevating inclusion in schools is a complex process. It involves the development of mindsets and behaviours as well as systems and structures. Aspects of this complexity have been outlined in this chapter and topics related to inclusive schooling are given more texture in all of the chapters accessible through All Means All's materials.

Each child under our care deserves a leader who advocates for and promotes inclusion. **Will that leader be you?**

About the authors

Angeline Aow

Angeline is an international educator, author, consultant and pedagogical leader. She has undertaken multiple roles within schools, as a teacher, curriculum coordinator, accreditation coordinator and professional learning and development coordinator. Angeline is an advocate of inclusion, coaching, concept-driven learning and teaching and contributes as an active citizen on social justice issues through her role as a country network leader of WomenEdDE, facilitator of the Humanising Pedagogy Committee of the International Schools Anti-discrimination Task Force and work with the Council of International Schools. Her book, Becoming a Totally Inclusive School: a Guide for Teachers and School Leaders was published by Routledge in November, 2022.

Bhuvan Israni

Bhuvan works as an Assistant Lecturer at Technological University Dublin. Before joining Technological University Dublin, she worked at DBS, ECBM, and IBAT colleges in Ireland. She holds a Bachelor's (Hons) and a Master's degree in Psychology, both with first-class honours, and is currently completing her doctorate.

With over five years of experience as a Special Educational Needs (SEN) teacher in India and Ireland, Bhuvan is deeply passionate about Equality, Diversity, and Inclusion (EDI). Her research in this field has been featured at both national and international conferences. A strong advocate for continuous professional development (CPD), she is actively engaged in advancing her academic and professional journey.

Bhuvan has contributed multiple publications to RTE Brainstorm and maintains an active ResearchGate profile, where her work continues to make a meaningful impact.

Emma Pearson

Emma Pearson works in the Froebel Department of Primary and Early Childhood Education at Maynooth University in Dublin. Her research and outreach work centres around understanding and documenting the perspectives and experiences of children and families from under-represented communities. During the past

15 years, she has worked with a range of international, regional and national government and non-government early childhood agencies (including UNICEF, UNESCO, Plan International and the UK Department for International Development / FCDO) to advocate for policies that promote community-centred, equitable access to early childhood education and development supports.

Heidrun Demo

Her work centers on equity in education, with a particular focus on supporting diverse learners, fostering inclusive teaching practices, and driving inclusive school development. She is deeply involved in research and teacher training, dedicated to creating and sustaining inclusive learning environments.

SCHOOL ASSESSMENT IN AN INCLUSIVE EDUCATION SYSTEM - DO WE MEASURE WHAT WE VALUE OR DO WE VALUE WHAT WE CAN MEASURE?

Vana Chiou; Catherine Reid; Leslie-Ann Webster; and Merve Ayvalli Karagoz

Example Case

A school in a neighbourhood wants to build an inclusive educational environment. The school wants to promote inclusive education through recognising and celebrating the diversity of young people and staff. For example, it has made significant steps to organise its physical environment for facilitating access for all. Teachers use a variety of teaching and assessment strategies, depending on students' unique needs and preferences.Through a variety of activities it aims to support the socio-emotional needs of the students and to enhance its connections and collaborations with families and communities. The national education authority has issued a policy requirement for schools to engage in internal assessment. The school is in front of a big challenge. How to organise an assessment process that will be aligned with its priorities? Which are the important voices that should be heard in the context of its assessment? How to collect the data? How to analyse them? In which ways should these results help the school to reflect on its practices?

In this chapter you will find the answers to the following questions:

1. What are the core principles of inclusive education, and how do they relate to system/school assessment?
2. Which steps are necessary to assess inclusive education?
3. How can system/school assessment be designed to promote inclusive education?
4. How can school assessment promote social justice and equity in education?
5. What is the role of stakeholders (teachers, students, parents, policymakers) in system/school assessment for inclusive education?
6. How can technology be leveraged to support system/school assessment in inclusive education settings?

Introduction to Topic

This section will explain why we have focused on school-level assessment of inclusion. We will discuss different approaches to school assessment and how they can support inclusive practice in the light of diverse understandings of inclusion across schools and countries. We will show why assessments designed and conducted by individual school communities can be particularly effective in supporting inclusive practice.

This chapter will support schools to reflect on why evaluation might support their inclusive practice, what key areas they might wish to explore, what indicators of inclusive practice might be used within particular key areas, and how effective school system assessment might be explored through an action research model. We believe teachers are "'meaning makers'; they bring creativity and commitment" (Ball et al., 2012) to the work of envisioning, enacting and assessing inclusive practice. Our chapter will support school communities in developing forms of assessment that reflect their values of inclusion, in planning assessment that help school communities to answer questions that are important and meaningful for them (drawing on resources like the Index for Inclusion (Ainscow & Booth, 2002), the Framework for Inclusion (Scottish Universities Inclusion Group, 2022) and the many resources available through the UN and the EU in collecting and analysing useful data and – most importantly – in putting this new information to work in improving inclusive practice in schools.

Types of assessment

There are many types of assessment associated with schools, some of which are very familiar to teachers and learners, and others which can seem more distant and – perhaps – less relevant to the everyday work of teaching and learning.

Many teachers are familiar with individual level assessment. This can be assessing pupils' attainment through formative and summative assessment, or identifying various learning differences such as dyslexia. Individual level assessment is a hugely important part of inclusive practice – how can assessment be made more accessible for individual pupils? How can identification be used equitably and fairly to support pupils' learning? There are also some important questions about whether identification practices can reproduce existing social inequalities. For example, Holmqvist (2020) describes how identification of dyslexia was used to support the attainment of pupils in an elite school in Sweden. Likewise, some groups (particularly affluent young people) may be more likely to be identified as gifted than other equally gifted young people (Ambrose, 2013). Schools do not always find it easy to recognise high ability in all. Looking beyond the individual level of assessment could help us to recognise – and perhaps change – patterns of educational injustice.

Another form of assessment familiar in many education systems is top-down assessment, from local educational authorities or national governments. This kind of assessment can allow for schools to be compared to each other within a particular education authority or country. This kind of comparison can be very valuable when engaged in international comparisons and when considering national policies in relation to international frameworks produced by bodies such as UNESCO, but it can also have some drawbacks. There are some particular methodological challenges when attempting to assess inclusion internationally, including varying approaches to identification, assessment and support, alongside definitional differences (D'Alessio and Watkins, 2009). Even within one particular country, schools could be assessed on national measures which do not necessarily match their own local concerns or challenges. This kind of assessment can also often be quite time consuming. For example, in Scotland the "How Good Is Our School" (HGIOS) document is 69 pages long and includes 15 sections, each of which is further broken down into multiple themes, illustrations and lists of features of effective practice and challenge questions (Education Scotland, 2015). This exhaustive approach to school assessment can make quite high demands on teacher time, and consume resources which might otherwise have been used in teaching and learning. But there are also other concerns. There is a danger that top down assessment such as HGIOS can also change school community practices and even values – schools can end up focusing on meeting the demands of the external assessment and national policy rather than focusing on the enactment of their own values (Ball et al., 2012).

International assessments are one of the most prestigious forms of educational

assessment, and PISA results will often make national news (Picken, 2023). For example, PISA 2018 Results (Vol. V) (2020) examines, school polices and practices in a relations to performing materials and school staff and different types of assessment. However, there are some questions around PISA and inclusive education. PISA has historically extremely low rates of participation for young people identified as having special educational needs (SEN). LeRoy et al. (2019) report historical rates of inclusion for young people with SEN as being below 3%. The PISA rules also allow for (and even require) the exclusion of some young people (Guez et al., 2024), permitting exclusions of up to 5% of the population. These levels of exclusion are not a good match with how SEN is understood in many countries, which can lead to much higher numbers of pupils identified as having additional support needs. For example, in 2022 40.1% of Scottish secondary pupils (aged 11-18) were identified as having additional needs (Scottish Parliament Education, Children and Young People Committee, 2024).

It is also possible that some nations may inappropriately exclude large numbers of young people. PISA has many rules about how many young people can be excluded from testing, how many must be included and how many schools must respond to tests. These can be misunderstood and misapplied by testers, and results can differ from requirements without questions necessarily being raised by the OECD (Andersson & Sandgren Massih, 2023). There are also more fundamental questions which can be raised about the validity of international comparisons. Given the unique history and context, resource availability and cultural attitudes to education in different systems, is it meaningful to use the same metrics to assess them? Kamens (2013) criticises the idea that 'a school is a school is a school', that all schools are fundamentally the same and that the same metrics may be used to evaluate them, no matter their context.

In any case, external evaluation provides valuable data and feedback to educational institutions, which can contribute to enhancing inclusion in schools through reflective and improvement practices.

Finally, teacher evaluation is another type of evaluation taking place within school. Although models of teacher evaluation are significantly differentiated across different education systems due to diverse educational philosophies and legislation frameworks, teacher evaluation generally refers to the process of assessing the teaching effectiveness of educators that was found to be improved after evaluation procedures (Taylor & Tyler, 2012). One main objective of teacher performance evaluations is to enhance the learning experience for students, and on these premises, teachers evaluation can be used as a valuable source for identifying factors that may affect inclusion-related issues in schools such as challenges faced, need identification, and so on.

School communities and assessment

While we acknowledge that all these approaches to assessment can be very useful, we are going to focus on how school communities assess themselves and their systems in terms of inclusion. In particular, we will show how teachers can use this kind of meaningful and specific assessment to improve their inclusive practice using teacher enquiry (Alves et al., 2024). However, we are not going to dictate one form of assessment that should be used in every school as what counts as meaningful assessment – and how we understand inclusion – can vary from practitioner to practitioner, and from school to school.

We define school assessment as an enquiry undertaken by a school community to understand and improve some aspect of their practice – in this case, inclusion. School community members such as learners, teachers, families and communities will work together towards a shared understanding of an educational value, creating an environment which supports agency (Biesta et al, 2015). They will plan and conduct an enquiry into how their practice reflects their values. The resulting information will then be used to improve inclusive practices.

The Evolving Concept of Inclusion

Although inclusion has been part of the work of schools for a long time, busy educators may not always have had time or resources to consider what inclusive practice is, and what it can look like in their school. We consider one of the most important benefits of school assessment to lie in the opportunity for school communities to consider and to discuss what inclusion is, and what it looks like in their context.

Inclusion is an evolving concept and has taken many forms in different times and in different contexts (McCulloch & Sutherland, 2018). International definitions of inclusion have exerted tremendous influence, such as the UNESCO Salamanca statement, which had its 30th birthday recently (UNESCO, 1994). The Salamanca statement proposed that all children should be educated in the same schools – schools for all – as part of a movement towards Education for All. This was in contrast to previous approaches to education for children with SEN, which had often focused on special teaching, special classes and special schools (Lewis & Norwich, 2005). Salamanca offered an educational, a social and an economic justification for inclusive schools and, along with other legislation such as the UN Convention on the Rights of Persons with Disabilities (United Nations, 2006), has had a meaningful impact on how young people are educated (Ainscow et al., 2019). Another significant UN initiative is the Sustainable Development Goals 2030 (UNDP, 2024), whose 17 ambitious goals underline a commitment that everyone is included, and no one is left behind. Understanding this international context can be tremendously useful for schools as they interpret their own national and local policy.

The European Union has also shown a long term commitment to inclusive education, including both policy commitments and support and guidance. For example, the European

Agency for Special Needs and Inclusive Education (European Agency for Special Needs and Inclusive Education, 2024) offers support for members on how to implement and assess inclusive education. The European Commission also offers detailed support for policy makers and governments who are interested in using school self-evaluation alongside top-down school assessment to support inclusive practices (European Commission & Directorate-General for Education, 2020).

As well as looking at definitions and guidance from international organisations, school communities may explore other resources to help establish their understanding of inclusion. One important tool is the Index for Inclusion (Ainscow & Booth, 2002), which is a resource designed to help school communities develop their inclusive practice. The Index for Inclusion for schools is available online in many different languages (Index for Inclusion, n.d). Other guidance may be found at a national level. For example, in Scotland, the National Framework for Inclusion (Scottish Universities Inclusion Group, 2022) offers challenge questions for student teachers, teachers, and experienced teachers to reflect on their practice.

Constructing school community understandings of inclusion

While grappling with all these, many definitions can seem intimidating or even overwhelming, it is important to see all of the above as resources for schools to put to work in ways that are meaningful for them. Using resources such as the frameworks, indices, supports and policies above can help school communities shape their shared understanding of inclusive practice. It is our belief that through thoughtful, critical engagement (rather than compliance) with national and international ideas of inclusion, school communities can build a shared understanding of inclusion. Teachers, learners, families and communities can come together to build a strong foundation of shared values to their assessment of their practice.

A strong shared understanding of inclusion can also support schools to determine which aspects of their inclusive practice they wish to explore, and what kinds of assessment would be appropriate and proportionate for the time and resources available. We think it is important for schools to determine their own assessments because inclusion can look very different in different contexts. This can mean national contexts, but we suggest that inclusion can even look different in different parts of the same schools – teachers may understand and practice inclusion in different ways due to resources, teacher education, disciplinary requirements, personal and professional ethics and external pressures such as accountability (Ball et al., 2012). School communities, including learners, teachers and adults in schools, families and communities should be empowered to explore their own values and to understand and assess their own practices, and to plan for improvement.

Key aspects

Inclusive education aims to create an education system that can meet the unique needs of

each student. To achieve this goal, a multifaceted school evaluation is essential to ensure the effective implementation of inclusive practices. This evaluation process can include many areas, but in this book chapter we will address the following five key areas that form the cornerstones of an inclusive educational environment and possible indicators for their assessment:

a. School environment
b. Staff
c. Curriculum
d. Learners
e. Family and community.

A comprehensive assessment of these five key areas allows schools to identify their strengths, identify areas for improvement and ensure that they are on track to create a fair and equitable education system for all students.

School Environment

Assessment of the school environment focuses on providing a safe, accessible and supportive atmosphere for all students. Some possible indicators for school environment assessment are mentioned below.

Safety

Physical safety requires that school buildings and facilities are safe and accessible, as well as the establishment of emergency plans and procedures (Florian, 2019). Emotional and psychological safety requires that students feel safe, respected and accepted, and that the school provides psychological counselling and support services (Sharma & Salend, 2016). One of the important criteria to have in the school environment is a sense of both physical and socio-emotional safety felt by students, teachers, parents and other school members. It is important that all school members feel safe and believe that the school is physically and socio-emotionally safe for everyone. Indicators of the sense of safety can be physical violence, verbal abuse, harassment, bullying, and others. Practices that provide students and adults with a sense of safety from physical abuse, verbal abuse, bullying and exclusion (Darling-Hammond, L., & Cook-Harvey, 2018; Dary & Pickeral, 2013; Hoffmann et al., 2021) are supportive practices that contribute to a safe school environment and promote inclusion within the school (McCarthy, 2019; Shareefa, 2016).

Accessibility

The accessibility of inclusive educational environments is critical to meeting the educational needs of all learners. The physical environment of the school should provide a safe and accessible learning environment for all. The physical environment of the school can be defined as buildings, spaces and equipment (St Leger et al., 2014, Wilson, 2017). The physical environment and infrastructure of schools should be made accessible to all students. It can be said that accessibility refers to the extent to which something is available to everyone. When something is accessible, everyone has the opportunity to use it or participate in it. Accessibility happens when we discover and break down barriers and create opportunities for everyone to participate fully in their schools and communities. For example, something that can be used by everyone, such as an automatic door, ramp or wide corridor, is considered accessible. In addition to that, physical access to facilitate inclusive school physical environments should be enabling and enriching for optimal learning and social experiences.When these elements are not present, all students, especially disadvantaged students, are deprived of full participation and an equitable educational experience. According to St Leger et al. (2014) social accessibility is also essential. The social environment of a school is also a composite of the quality of relationships between staff and students. It is about building quality connections between and among all key stakeholders in a school community. Consequently, when the physical and social environment is accessible to all students, they can make the most of and participate in all aspects of school life.

Resources

Resources in the school environment can be listed as human resources, physical resources, technology materials, educational materials resources, and curriculum. While physical resources ensure physical access and safety of school members, educational resources support the learning process and provide education that is appropriate for different needs. Effective use of resources is critical to the success of inclusive education. The issue of resources for inclusive education is theoretically intertwined, taking place at different levels and within different academic disciplines, such as policy making, district, school, classroom, students, parents and teachers (Goldan et. al., 2022). When assessing their resources, schools can take the opportunity to identify opportunities and barriers to resource provision, and to think about how best to maximise the resources available to them within their particular policy and funding context. Educational spaces used in inclusive education should be designed in accordance with the needs of all students. These spaces should support students' learning processes while also meeting their physical and emotional needs. However, schools may struggle to access the resources required to create such spaces, and may be required to make choices about what aspects of inclusive

educational space to prioritise. Educational resources are teaching, learning and research materials in digital or non-digital media and provide students with an additional platform for learning (UNESCO, 2017). Areas such as individualised education programmes, assistive technologies, libraries, computer labs, sensory rooms, art and music rooms, sports halls, science labs, multi-purpose halls, and guidance and counselling rooms are critical to the success of inclusive education. However, learning management systems (LMSs) allow students to choose their own learning paths through a course in a non-classroom environment and share information through tools such as forums, e-mails, chat rooms and discussion groups (García et. al., 2009). Consequently, the accessibility of educational resources is crucial for students to have equal opportunities by creating an inclusive teaching environment.

School Assessment Key Areas and Examples of Questions		
Key evaluation areas	Possible indicators	Examples of questions
School environment	Safety	Does the school provide a safe learning environment?
		Does the school have security policies and how are they implemented?
		Does the school have programmes or services to ensure the psychological safety of learners at school?
	Accessibility	Is the physical structure of the school (stairs, corridors, classrooms) suitable for everyone?
		Does the school have arrangements in place in the school to facilitate inclusive education?
	Resources	Does the school have tools and technologies that take into account the diversity of students and are they suitable for everyone?
		Does the school have educational materials suitable for use by all students?
		Does the school have sufficient staff to support disadvantaged students?
		Does the school have library resources (e.g. Braille books, audio books, e-books, digital resources, research centres) available to all school members?
		Does the school have mentoring and guidance programmes to support the education of all students?

Staff

In the establishment of an inclusive school system, staff resources are recognised as a key factor. All staff (teachers, administrators, psychological counsellors, administrative staff, etc.) should be adequately trained and equipped about inclusive education. All staff should recognise the diversity of learners (cultural, linguistic, physical, etc.) and know how to take

advantage of diversity positively in the educational process. Teachers should be able to develop teaching strategies appropriate to different learning needs and use technology and other educational materials to make the classroom environment more inclusive. They should be able to create a positive learning environment and prepare a flexible learning environment according to student needs and should be able to communicate effectively, be collaborative, open and sensitive to innovations. Schools should also consider how they work with outside agencies or school staff, such as social workers, educational psychologists and community paediatricians, to meet the psychological, social and emotional needs of learners. In addition, having crisis management skills is another important qualification. Administrative staff, as school members, are also an important part of inclusive education. Staff need good communication and organisational skills. In inclusive education, managers should have good leadership qualities. They should be leaders who set a vision that embraces all students, encourage collaboration, support teachers and other staff, create a fair and equitable environment, empathise and advocate continuous improvement (Hitt and Tucker, 2016; McCarthy, 2019).

Professional development of staff on inclusive education practices is very important. Staff should be able to benefit from professional development opportunities in a fair manner without any discrimination. Instructional leadership is one of the important variables that contribute to the professional development process (Cooc, 2019), therefore the school management should offer these development opportunities to staff.

System/school Assessment Key Areas and Examples of Questions		
Key evaluation areas	Possible indicators	Examples of questions
Staff	Teachers	Do teachers have adequate training in inclusive education?
		Do teachers provide education taking into account the different learning styles (e.g. visual, auditory, kinesthetic) of students?
	Managers	Are the values of diversity and inclusion embraced by the manager?
		Do managers have leadership skills to support inclusive education policies and practices?
		What strategies and resources do administrators use to improve the school's inclusive education practices?
	Psychological Consultants	Do psychological counsellors have the necessary knowledge and skills to meet the emotional and social needs of students?
		Do they have crisis management skills?
		Do psychological consultants have knowledge about bullying prevention programmes and methods?
	Administrative Staff	Do the administrative staff have effective communication and organisational skills?
		Are administrative staff informed about inclusive education practices?
	Professional development	Do staff have opportunities for continuous professional development to enhance inclusive education practices?
		Are the resources for professional development of staff for inclusive education professional development sufficient?

Curriculum

Curriculum is a foundational part of school education, but it can often pass unquestioned by teachers. As working professionals, we can tend to accept curriculum as a natural

part of our working lives rather than critically engaging with it as a document produced by a particular society in order to achieve a particular educational purpose. And yet the work of the curriculum is tremendously complex and interactive. For Priestley et al. (2021), curriculum involves "interpretation, mediation, negotiation and translation, across multiple layers or sites of education systems." This includes both the developers of the curriculum, schools, teachers and learners. Kelly (2009) asserts the importance of the need for teachers to have the tools to engage critically with curriculum "as a defence against the imposition on them of policies framed by amateurs". This is perhaps particularly important when assessing inclusion, where curriculum can be used as a tool to include or exclude groups in society (Kelly, 2009). This section will invite you to explore to what extent your curriculum includes and excludes all learners.

Indicators – Curriculum Content

The following questions, and their accompanying notes, may be helpful when engaging critically with the curriculum in your school.

Question One – What educational purposes shaped this curriculum? Does the curriculum match the stated or implicit educational purposes of the curriculum?

- Schiro (2013) emphasises the connection between educational purpose and curriculum. What are the purposes of education in your context? Are they explicitly stated, or implicit in the curriculum itself?
- Biesta (2009) suggests three purposes for education – qualification (earning examination results, valued knowledge and skills – including vocational skills), socialisation (learning to live in your society) and subjectification (becoming a unique, independent person). Do you think that the curriculum in your context helps school communities achieve these educational purposes?

Question Two – Is inclusion fundamental to your curriculum?

- Does your curriculum address inclusion explicitly? Does it include inclusive principles implicitly?
- To what extent does your curriculum teach learners about inclusion?
- The Index for Inclusion (Ainscow & Booth, 2002) offers some suggestions into how the curriculum can support inclusion – or can exclude young people.

Question Three – Is the curriculum informed by educational research? How often is this reviewed to reflect changes in the research literature?

- In the Scottish National Framework for Inclusion, section 2 (Scottish Universities Inclusion Group, 2022) you can find questions to help teachers reflect on their use of research to support inclusive practice. Consider whether these questions make sense for your context, and whether your curriculum draws on recent, relevant research.
- How do teachers access educational research in your context? Do they have time and resources set aside to support this? Is research engagement supported with practitioner enquiry ?

Question Four – Does the curriculum focus on the histories and stories of one particular group in society to the exclusion of others?

- Does the curriculum include education about historical and ongoing social injustices and inequities such as the history of colonialism or the oppression of marginalised groups due to race, gender, and sexuality?

- In their blog, Johnson and Mouthaan (2021) identify the role of teacher education and professional development in decolonising the curriculum and working towards anti-racist curricula. Does their approach fit with your context? Or would your school require a different approach?
- When thinking about histories and stories, consider whether the teacher collaboration approach outlined by Olsson Rost (2022) reflects your current practice, or whether this could be a model that might fit your school community.

Question Five – Which voices are included in determining the curriculum?

- Is this curriculum: pupil centred, teacher determined, subject discipline centred, assessment focused? Whose voice is included and whose voice is excluded in determining what is taught to whom?

- Messiou and Ainscow (2021) suggest the Inclusive Enquiry technique as a method for making classroom lessons more inclusive, and as a way forward to promote equity. The Inclusive Enquiry technique joins the lesson study approach with a reflective centring of young people's voices. To what extent does your school community view curriculum as a negotiation between learners and teachers?
- If your curriculum is centrally determined, how much flexibility do learners and

teachers in your community have about how it is enacted?

Question Six – How does the curriculum navigate individual differences?

- Must all young people learn the same material at the same time in the same way? How much flexibility is available within the curriculum? What measures are in place to ensure that learners are able to access the curriculum equitably?

- Does your school community insist that all learners learn with peers of the same age, or do you offer opportunities for young people to learn with cognitive peers? How much flexibility does your curriculum have to support learners who are different to their peers? The World Giftedness Council proposed some principles for learners who are more able (World Giftedness Council, 2021) – how would your school community navigate these learners' learning needs?

- To what extent does the curriculum include sufficient breadth and depth to allow young people to make meaningful choices about what they learn?

System/school Assessment Key Areas and Examples of Questions		
Key evaluation areas	Possible indicators	Examples of questions
Curriculum	Content	What educational purposes shaped this curriculum? Does the curriculum match the stated or implicit educational purposes of the curriculum?
		Is inclusion fundamental to your curriculum?
		Is the curriculum informed by educational research? How often is this reviewed to reflect changes in the research literature?
		Does the curriculum focus on the histories and stories of one particular group in society to the exclusion of others?
		Which voices are included in determining the curriculum?
		How does the curriculum navigate individual differences?

Learners

Assessment, as it is known, captures the learners' progress throughout their educational journeys by identifying their ever-growing knowledge and understanding. Additionally, it supports the educators to reflect on and enhance their pedagogical practices. It is considered one of the most powerful pedagogical processes. However, due to external pressures at times, from policy makers, families and educators in some contexts, the social skills and attributes of learners are often overlooked (European Union, 2024). Experiences throughout education teaches us many interpersonal, intrapersonal and life skills. There is a responsibility on educational settings to promote these skills among the learners, so that they have an understanding of the everyday experiences of 'life' (McMullen & McMullen, 2018). However, Zaman et al. (2023) state that both life and social skills are the least focused within educational settings where a strong focus is aimed at the development of deep critical thinking and problem-solving skills. A key component of nurturing and supporting social development skills of learners is the educator.

Within an inclusive school environment, learner assessment remains a critical component that ensures all learners, regardless of their backgrounds, circumstance or differing abilities, are provided with equitable opportunities to thrive and succeed in the learning environment. An inclusive approach to learner assessment recognises the many diverse needs of all learners and places a strong emphasis on the importance of tailored, individual assessments that capture their ongoing achievements, skills, participation and engagements. This type of inclusive assessment not only identifies the progression of academic abilities, but also takes into consideration the social and emotional development of the learners (Nieminen, 2019). Educators can create and utilise a variety of assessment tools and strategies that creates an environment in which every learner can have the opportunities to demonstrate their strengths and receive the support they need to succeed.

Incorporating holistic perspectives towards these areas of evaluation and indicators within school assessment, foster a supportive and collaborative environment that promotes the full potential of all learners. The following indicators, while not exhaustive, may be useful to consider within your practice.

Achievements

A variety of methods and tools can be used to capture the diversity of learners' achievement. (Andersen, 2023; O'Neill & Padden, 2021). Some of them are presented as follows.

- Individual Educational Plans (IEP) to support all learners with diverse learning needs to co-create specific, personalised learning goals to meet.
- Portfolios that have compiled collections of the learners' work over the learning period. This can be showcased throughout the year to support the learner to reflect on

their growth, new and extended learning, skills and abilities.

- Reflections and self-assessments where all learners are encouraged to engage in their own form of self-reflection and given opportunities to foster their personal growth.
- Collaborative assessment between learners where they assess each other's work. This builds a collaborative environment where learners are exposed to diverse feedback.
- Parent/guardian and learner feedback that is taken into consideration and incorporated into the curriculum.
- Reflections and self-assessments where all learners are encouraged to engage in their own form of self-reflection and given opportunities to foster their personal growth
- Formative assessments including observations to see and document learners' progression through group work, quizzes, and class discussions.
- Summative assessment methods to include various paths for students to allow them a fair chance to show what they could achieve.

Life skills and social skills

- Observations play a key component in assessing learners' life and social skills. Educators can observe learners in various environments and scenarios. There are opportunities to document interactions, communication styles, behaviour towards self and others.
- Reflective journals through various written, digital or creative formats that encourage thinking, feeling, awareness and creativity.
- Role-play, when carefully planned and sympathetically handled to strengthen collaboration, knowledge and understanding of learner's responses to various scenarios.
- Group projects that require teamwork, collaboration and communication skills.

Engagements

- Learner voice and choice in the assessment process, having a say in their learning and choosing the methods in which they participate i.e. assignments, routines, creative projects.
- Mentoring supports where learners work in pairs with other faculty, older learners and members of the community to attain guidance, support and encouragement.
- Interactive learning through technology with fun, engaging learning platforms and to extend on the learners existing knowledge.
- Positive reinforcement through recognising and celebrating the learners' progressions and achievements that enhances engagement and motivation.
- Regular check in with learners to discuss progress, social-emotional well-being and

any issues that they may be facing.

- Signposting services for learners who may be or feel at risk of disengagement such as counselling and mental health support (Thompson & Carello, 2022).

School Assessment Key Areas and Examples of Questions		
Key evaluation areas	Possible indicators	Examples of questions
Learners	Achievement	How do we measure all learners' progress?
		Are there alternative assessments in place to capture diverse learning outcomes?
	Skills	How do we assess the development of learners' life skills and social skills?
	Participation	What strategies are used to ensure that all learners participate in classroom activities?
		Are there opportunities for learners to provide feedback on their own participation and engagement?
	Engagement	How do we involve all learners in setting their own learning goals and reflecting on their own learning progress?
		What initiatives are embedded to increase or enhance all learner engagement, particularly those who are at risk of disengagement?

Families and Communities for school assessment

Family involvement remains a key component in relation to a learner's education. Through the recognition of family involvement, particularly within the assessment process, provides excellent opportunities to understand the learner's ongoing development.Theoretically speaking, at the beginning of early childhood education we identify the importance of family involvement through the educational and community systems that are surrounding the child (Rutland & Hall 2013). However, it must be noted that in order to have good engagement with families, strong relationships must be built. Strong relationships are considered a key underpinning to a sense of identity, belonging and part of a community, particularly in creating and fostering inclusive environments (National Council for Curriculum and

Assessment, 2009). Rutland and Hall (2013) further recognise the importance of family involvement and highlight the limitations of their roles, lack of relationships within educational settings.

Henderson and Mapp (2002) emphasise the benefits of parental and community engagement including consistent retention rates and positive social skills. Epstein's six type involvement model highlights how family and community engagement between educational settings promote a deep sense of responsibility and collaboration. These partnerships may further create a more inclusive educational environment where all diverse perspectives are valued, and resources are allocated efficiently to meet the individual needs of all learners. She further states that family and community involvement not only enriches their educational experiences, but also strengthens the social development of the community therefore, fostering a culture of continuous learning and collaborative support (Epstein, 2011). The following indicators, while not exhaustive, may be useful to consider within your practice.

Communication

- Regular meetings and discussions in relation to the learner's individual progress.
- Ensuring that all families receive information in relation to their child's learning through modes of communication in which they can interpret and understand.
- Quarterly information days/evenings surrounding news and updates about the educational setting, trips, activities, parental and community involvement.
- Seeking family volunteering opportunities for further engagement.
- Developing parental committees and supporting shared decision making towards policies, curriculum design and support services.

Connections

- Providing learners with real- world experiences through shadowing programmes where they can attain professional skills and identify career paths.
- Developing partnerships with local businesses for sponsoring, funding, extra-curricular activities and projects.
- Engaging in the design and implementation of community-based projects that ensure involvement of all families and learners.
- Promotion and incorporation of the arts in the educational setting and community to inspire creativity, a sense of belonging and identity.
- Development of cultural events and programmes that celebrate diversity and cultural heritages
- Collaboration with community resources and wellness organisations
- Signposting for family resources within the community that navigates their understanding of the education system.

Engagement

- Designing types of surveys, suggestion areas and questionnaires for distribution to families and communities highlighting key areas for discussion for example; inclusivity, policy, feedback, improvements.
- Maintenance of communication- consistent with families through various modes.
- Focus groups and meetings to conduct with families and community members to attain a deeper insight into enhancing/supporting ongoing engagement.

School Assessment Key Areas and Examples of Questions		
Key evaluation areas	Possible indicators	Examples of questions
Family and Community		How can educational settings facilitate collaboration between educators, parents and staff?
		What methods of communication are used to keep all families informed and involved?
		How is feedback from families incorporated into the decision-making process?
	Connections	What partnerships exist between the school and community organisations?
		What events are organised to foster a sense of community, identity and belonging among learners, parents and staff?
	Engagement	How are families encouraged to participate in school activities?
		What supports are available to help families engage with the educational setting?
		How does the educational setting assess the level of family and community engagement?
		What measures are taken to improve/enhance it?

Process of school assessment in an inclusive education environment

The development of effective school assessment models has received increasing attention

in recent decades. European education systems and many others globally have prioritised the school assessment as a powerful means to accomplish the quality assurance of the education provided. The new trends in school system evaluation do not consider the external and the internal assessment as two distinguished procedures, highlighting them as complementary and beneficial to each other (Brown et al., 2018; OECD, 2013).

In regard to the internal assessment where primarily this work focuses, a recent empirical review (Mason & Calnin, 2020) stresses out the added value of the internal school assessment with respect to the improvements in school quality, teaching and advances in learners' outcomes. In literature, we meet a range of school assessment models (Brown et al., 2021; Cambridge University International Assessment, 2021; Irish Department of Education and Science, 2004; Msezane, 2020; NZMoE, 2016; Patil & Kalekar, 2014; OECD, 2019;Şahin & Kılıç, 2018) that usually are differentiated in their approaches depending on the mission of the school, the objectives, the context of the evaluation, and the legislative frame that guides the process.

Different education systems or schools may follow different or similar approaches when it comes to assessing their systems in regard to inclusion (Aziz et al., 2018; Brown et al., 2021). The process of school internal assessment consists of different phases and each of them play a significant role in its consistency and its quality. Typically, all the assessment phases are meaningful and include various activities that aim to contribute to the successful completion of the assessment process. An overview of different assessment models indicates that there are some commonalities in regard to the basic steps or phases of the assessment. The common phases we usually find are described as follows.

First phase: The planning and development phase which involves the following steps and actions.

1. Identify the focus of the assessment and the priorities. At this first step, it is important for the school to identify what it values highly as an inclusive school environment, and how it thinks an effective inclusive school looks like. This identification of the basic mission and vision of the school along with its priorities set out will build the basis for the next steps of the assessment.
2. Define the objectives. In this step, the school defines the objectives of its assessment which should be aligned with the focus and the priorities of the assessment and what the school values highly.
3. Design the methodology of the assessment. Next, the schools design the methodology of the assessment. The methodology refers to all steps that will be taken to ensure the quality of the process. When designing the methodology, various factors are taken into consideration based on goals of the assessment such as:

- period and timeline of evaluation
- information sources
- areas and indicators of evaluation
- tools used to gather the data
- the process of data gathering, and
- the methods of data analysis.

4.   Define the areas and the indicators of the assessment. The school defines the areas of assessment and the respective indicators that should be in line with assessment goals. The assessment areas and indicators should be chosen in a way that ensures that different aspects of the school are covered according to the school's evaluation goals and no exclusions are applied.

5.   Determine the information sources. Next, the schools decide on the information sources that will be used to derive the evaluation data. In an inclusive environment, it is crucial that all voices will be heard and all stakeholders and members of the school community will contribute to the assessment process. The plurality of sources will support the gathering of diverse data which should be considered in an inclusive education system. Possible information sources could be the school staff (principal, teachers, assistant teaching staff, other specialties working in school such as psychologists, social workers, cuisine staff, cleaners, etc.), students, parents, educational counsellors or institutions, other community members or community organisations that have cooperated with the school. It is crucial for inclusivity reasons the school to take care to inform all participants on time and to ensure that all will have access to the assessment process. If needed, for diversity reasons, the school should ensure that different assessment paths are provided for people with different needs and capacities.Here it is important to note that schools should adhere to GDPR issues as they are addressed by EU data privacy guidance and/or national legislation frames. The protection of the personal data of all people engaged in the evaluation process should be protected by the schools. Data should be used exclusively for the evaluation reasons and anonymity of participants should be protected. To motivate possible participants to take part in the school evaluation, it is crucial to communicate the aforementioned rules on the GDPR.

6.   Select assessment tools. In this step, the school selects the appropriate tools that will effectively contribute to the gathering of the data. Such tools can be interview protocols, questionnaires, focus groups, observations, reports, and others.

7.   Define the assessment moderators. At the end of this phase, it is helpful for the school to have defined the assessment moderators, the people who will be responsible for the assessment moderation and the procedure followed as has been designed.

Second phase: The implementation phase of the assessment. In this phase, the schools activate the procedure of gathering and analysing the data according to the initial assessment plan set out in the planning phase.

1. Gather evidence. Based on the assessment design, the schools deploy the tools to gather data. The data will be selected from all the information sources defined at the planning phase.
2. Analyse the data. Using appropriate methods, the school analyses all the data to produce the assessment results. These results will provide them with evidence on their effectiveness and quality as an inclusive school system. The results will help the school to answer fundamental questions in regard to its inclusivity as well as practices and policies related to inclusion.
3. Document the results of the assessment. Last but not least, the school documents the results in a way that is helpful and accessible to all stakeholders interested in it. These findings can be presented with respect to the objectives set out initially and the basic mission and priorities of the school. The overview of the results should give a clear picture of the strong and weak elements the results revealed in relation to the focus and the priorities of the assessment. The assessment results could be used by different parties and for different purposes including the schools themselves for improvement purposes, central educational or governmental organisations for the external assessment, and by local educational authorities for management purposes or for reporting to higher authorities (EACEA, 2015).

Third phase: Reflection and Action Plan phase. This phase follows the assessment results and comes to add in the next actions needed to follow.

1. Reflect on the results. Following the report of the assessment results, the school should reflect on the findings. Some reflective questions that might be helpful in this stage are: What do the results show? What has been done well so far? What elements need improvement? What did the school expect from the results? What has to be done to improve the level of inclusivity in school? What were the effective strategies so far? Which inclusive strategies seemed to work well and which not? What we learned from the results? Reflective practices will help all schools indepedently of their inclusivity level to problematise and think of possible actions that can improve the inclusion level of the school.
2. Design an improvement action plan. Based on the assessment results, schools can design an improvement action plan, if needed. The action plan should focus on different aspects of the school which need some improvement, ensuring

spontaneously that all participants will benefit from the changes that will be promoted.

3. Put action in plan. Upon the completion of the action plan, the school put it into action. This improvement plan will be assessed following the same assessment procedure as it has been described above.

It is comprehendible that the process of the assessment is cyclical. It starts and ends from the point it starts. It is a continuous process where each phase gives feedback to the other. The assessment process is briefly presented in the table below.

Fundamental Phases and Steps of a School Assessment Model	
First phase	The planning and development 　1. Identify the focus of the assessment and the priorities. 　2. Define the objectives 　3. Design the methodology of the assessment 　4. Define the areas and the indicators of the assessment 　5. Determine the information sources. 　6. Select assessment tools. 　7. Define the assessment moderators.
Second Phase	The implementation 　1. Gather evidence 　2. Analyse the data 　3. Document the results of the assessment
Third phase	Reflection and Action Plan 　1. Reflect on the results 　2. Design an improvement action plan 　3. Put plan into action

Conclusion

The purpose of this work was to shed light on the school assessment in inclusive education systems. Inclusive education is a door open to achieving social, economic and cultural inclusion for all members of the school community and its foundation is a means for an inclusive society (The Centre for Inclusive Education, 2021). From this perspective, the quality of the education, the policies and practices adopted in an inclusive education system can be explored thoroughly via a well-designed school assessment. As Cambridge

Assessment (2021) mentions, the school evaluation is "an essential part of helping schools to understand how effective they are".

Recent research has demonstrated the advantages of school assessment for various areas of schools (Mason & Calnin, 2020) which support them in "establishing an accurate view of their performance against a clearly defined set of standards" (Cambridge Assessment, 2021). It is important for schools to determine the standards that are meaningful for them and do not depend exclusively on external evaluation standards that might not be in line with their priorities and their inclusion vision. Their assessment goals should be defined mindfully in accordance to their focus, mission, vision and priorities. Without no doubt, in inclusive education systems, it is fundamental that a wide range of key areas will be assessed along with the use of a variety of indicators and diverse information sources across the school context. This will maximise the opportunities that all school voices will be heard and contribute equitably to the school assessment as a whole. The design of a school assessment in inclusive environments should adhere to the basic phases and steps, as outlined previously to ensure reliability and validity issues.

However, the question "Do we measure what we value or do we value what we can measure?" is one of the crucial concerns that an inclusive school needs to address in the context of a school assessment. It is important for the school to define at the preliminary phase of the assessment what it values mostly as an inclusive school and what an ideal inclusive school looks like. The areas or aspects that are valued as the most important for its inclusivity should be defined as the key areas for assessment. This process of identification encourages schools to consider the fundamental areas, the information sources and the indicators that are of high value for their mission to achieve inclusion and ensure equitable participation for all school community members. Otherwise, if the school do not define clearly its inclusion priorities during the planning phase of the evaluation and do not determine the appropriate goals of the assessment which should be aligned with its inclusion mission, there are high possibilities to value what the school can measure based on other cases of evaluations or examples or guided exclusively by the indicators of an upcoming external evaluation. In such a case, the school is distancing itself from its goals and ends up evaluating what it can really measure. Such an evaluation can lead to results that cannot contribute to a substantial reflection toward the school's achievements with respect to its inclusion vision.

To conclude, the school evaluation is a challenging but also important process for all schools that aspire to establish a clear view on their accomplishments and their inclusion related achievements. It is a means to reflective practices that can support improvements in school inclusive environments and work effectively with external evaluations.

Closing questions to discuss or tasks

- How can system/school assessment be used to identify and address systemic barriers to inclusion?
- Do we measure what we value or do we value what we can measure?

About the authors

Vana Chiou

Vana Chiou loves teaching and training future teachers on contemporary teaching methods and techniques. Her research interests include contemporary methods of teaching and assessment, teacher training, inclusion and education. Her published work includes editing books, chapters in books and articles in Greek and international journals.

Catherine Reid

Catherine Reid is a lecturer in Teacher Education at the University of

Glasgow. Her research focuses on widening participation in Higher Education for young people from areas of high deprivation. She is particularly interested in highly able learners and the role of teacher knowledge in education.

Leslie-Ann Webster

Leslie-Ann Webster is a lecturer in Early Childhood Teaching and Learning at Maynooth University, Ireland. She has a deep passion for educating and values the power of transformative education. Her research interests include children and educator well-being, relationships, progressive teaching methods and a specialised focus towards embedding trauma informed practices within educational settings.

Merve Ayvalli Karagoz

Merve Ayvalli Karagöz works as a lecturer at Akdeniz University in Antalya, Turkey. She has a Ph.D. in educational measurement and evaluation. Her areas of expertise include psychometric applications, educational assessment practices, and item response theory. Her scholarly work focuses on advancing robust assessment techniques that enhance the reliability and validity of educational evaluations, contributing to higher standards in educational measurement.

QUALITY DEVELOPMENT OF INCLUSIVE AND EQUITABLE EDUCATION ON SCHOOL LEVEL

Example Case

For some years, a vocational school in a city suburb has been experiencing the drop out of a considerable number of students. Both teachers and school leaders are worrying, but they feel quite powerless to change the situation. The students' population is characterised by a wide heterogeneity. The school leader, the teachers and the parents are complaining about the high fluctuation of teachers and about frequent violent episodes at school. Especially students with lower performances or disadvantaged social backgrounds are often victims of mobbing and, as a consequence, some of them leave school.

Looking deeper at the situation and talking with teachers, the impression is that teachers choose the school only to have a job, with the purpose of moving to another school as soon as possible, because they feel overwhelmed by the challenging context. "I'm really not prepared for such a job, I'm a good mathematics teacher, but I can't deal with all these social and educational problems," said a teacher who applied from another school.

The external evaluation pointed out the low inclusive quality of the school.

1. What is meant by the quality of inclusive and equitable education?
2. Which processes sustain the quality development of inclusive and equitable education?
3. What is the teacher's role in quality development of inclusive and equitable education?
4. How do students participate in the quality development of inclusive and equitable education?
5. Which actors are more important for the quality development of inclusive and equitable education?

Introduction to Topic

In this chapter, we focus on the quality development of equitable and inclusive education on the level of single educational institutions, like a school or a kindergarten. In an attempt to develop a theoretical-practical reflection useful for future teachers, we want to emphasise how the commitment to inclusion and equity should not only concern specific categories, but all students. Furthermore, we see it as a systemic issue: the individual work done by teachers and students in their own classroom needs to be accompanied with the reflection and improvement of school cultures and organisational practices so that the quality development of inclusive and equitable education becomes structural and is understood as a recursive circle.

After having clarified on a theoretical-conceptual level what we mean by quality development of inclusive and equitable education, we focus on processes that can be activated. The emphasis is on the participation of all actors, since equity and inclusion are not only to be understood as aims, but also as approaches that foster the various improvement paths. In doing so, the focus on the students' contribution is crucial: inclusion-development cannot exclude the school's main protagonists. This can be challenging within the asymmetric relationship between adults and children and youth at school. Also, for that reason, the quality development of inclusive and equitable education is a process that has never been completed once and for all, and which urges us to imagine virtuous paths to be co-designed for a democratic education.

Key aspects

Quality of Inclusive and Equitable Education: a definition and a frame of reference

With the combined use of the terms inclusion and equity we intend to refer, as other authors also do (Ainscow, 2020; Florian, 2017), to a broad understanding of inclusion as described in the Sustainability Development Goal 4 of the UNESCO Agenda 2030 for Sustainable Development. As elaborated in the "Education 2030 Framework for action" (2015) the Goal 4 lays inclusion and equity as the foundations for high quality in education and stresses that all forms of exclusion, marginalisation, discrimination and inequalities in access, participation and learning need to be addressed. This implies the development of democratic educational communities committed to offering to all learner's high quality participation opportunities and differs from narrow conceptualisations of inclusion focusing on the specific social and academic needs of children with so-called Special Educational Needs (SEN) in mainstream settings (Göransson & Nilholm, 2014).

We understand inclusive and equitable education as a process that is continuously oriented to increase presence, learning progress and participation (Ainscow, 2020) of all learners, with a specific attention to those that experience more barriers in the actual school system and are therefore more at risk of exclusion, underachievement or marginalisation. In doing so, we refer to the idea of social justice in education that calls for a constant commitment to ensure that everyone receives an excellent education that supports the development of the capabilities that are indispensable to lead a fulfilling life and exercise citizenship.

The contribution of post-colonial studies (Aman, 2017; Ashcroft et al, 2013; Young, 2020) and intersectional theory (Crenshaw, 2017; Hill Collins, 2019) allow us to emphasise the need to decentralise our gaze and to consider the multiple variables that come into play in people's educational and life paths: the commitment to equity only becomes concrete if we do not give in to compensatory logics whereby there is a norm to strive for and if quality standards are contextualised and not given once and for all (Kyriakides et al., 2020).

The development of inclusive and equitable education is complex and requires, this is our view, a systemic understanding (Ainscow, 2005; Kinsella & Senior, 2008). This understanding implies that change towards inclusion and equity in schools cannot be simplified as rules, action plans, single activities expected to impact linearly on all students' learning and participation. Rather, change requires "social learning processes within a given workplace that influence people's actions and, indeed, the thinking that informs these actions" (Ainscow, 2005: 113). Within a school these processes, as suggested in Bronfenbrenner's ecological understanding of organisations (1979), needs to be activated at several levels: the individual level of teachers and other professionals, the team level of classes or other collegial working groups, the whole school level, up to the level of the

school within the networks of its community. Furthermore, even if this moves beyond the intentions of this chapter, the single school institution needs to be recognised as part of a school system and of a society, that set principles and regulations that can influence – sustain or hinder – the quality development. Summing up, the systemic understanding of inclusive development warns of failure, there is a risk of over-simplified representations of the process and points out the importance of considering several levels of the educational system and their interactions.

For the definition of quality towards which development processes head to, we refer to the Index for Inclusion (Booth & Ainscow, 2011). The tool, explicitly designed for the development of inclusive schools, was firstly published in 2000 and then successfully translated and adapted into more than 30 languages. It shares the broad and systemic understanding of inclusion and equity in education outlined above and declines it in a set of indicators that describe how inclusive and equitable education looks in everyday life in schools. Indicators are organised on three main dimensions:

1. the dimension of inclusive cultures, with indicators related to values and relationships in the school;
2. the dimension of inclusive policies, that comprehends indicators addressing organisational aspects of school;
3. the dimension of inclusive practices, where indicators on the way learning and teaching is organised are collected.

Processes that sustain the quality development of inclusive and equitable education: reflection, research, and evaluation in a participatory pathway

The international community recalls the importance of quality education and training to improve the living conditions of individuals, communities, and societies. The quality development of inclusive and equitable education should be promoted by educational policies and supported by ethical values within schools, school leadership, and teachers' teaching practices. The perspective of inclusive and equitable education, in its broadest sense as a perspective of valuing the differences of each element (cultural, individual, contextual), involved in the educational and social process emphasises shared inclusive values. In other words, the prerequisite for being able to speak of processes that support an inclusive and equitable education is the commitment to certain pedagogical principles and values that are ethically coherent with the idea of inclusion and equity. Therefore, authentic attempts to foster agreement around these common values are necessary for the development of high-quality, inclusive, and equitable education. This can be reached with an open and constructive dialogue among all parties involved in the educational process, including teachers, students, families, and school administrators.

A framework that can help in the promotion of an inclusive dialogue on values within a

school is provided by the Index for Inclusion (Booth & Ainscow, 2011), already introduced above. The work puts forward a set of inclusive values: equity, rights, participation, community, respect for diversity, sustainability, non-violence, trust, compassion, honesty, courage, joy, love, hope, optimism, and beauty. They can inspire and invite to critically reflect on inclusive values and tailor them to their own educational context. In this way, the Index for Inclusion turns into a useful instrument for enabling a value-based school development where every student can experience a sense of acceptance, worth, and agency in their own education.

Reflective and research-oriented processes

The value system described in the Index requires actors in the educational context at all levels to take an approach oriented toward reflection and research for solutions by participatory change. Proceeding in the exploration of the processes that support the quality development of inclusive and equitable education highlights the importance of cultivating an overarching reflective attitude within school communities. Reflective practice is a concept that should be introduced into the operational dimension of the school as it is very important for its improvement (Maksimović & Osmanović, 2018). This means that all actors in the educational context spend time planning and reflecting on what they want to achieve, what the advantages and disadvantages are, what works well, and what needs to be changed and improved. Besides the fact that reflective practice influences the introduction of positive changes in educational practice, it is also a process for developing the quality of inclusive and equitable education. Reflective practice guides the work of the actors in the educational context toward finding the positive changes they want to produce in planning actions for the quality development of inclusive and equitable education (Ainscow, 2005).

Consequently, the reflective process, both during the planning and during the work itself, is directly connected with the pedagogical research process of concrete actions to remove the obstacles that hinder the development of inclusive and equitable education. The research process is not linear as developing the quality of inclusive and equitable education is always something more complex and challenging because each educational institution has its own specific needs and characteristics, its own unique resources and capacities.

Self-Evaluation in the quality development process

Reflective and research-oriented development usually contains an evaluation phase, within schools taking a look at the "state of the art." It is an unavoidable step that needs to be taken for monitoring the achievement of the goals identified during the reflection and research processes. Basically, evaluation, if understood with a formative function, should be oriented towards a quality development of inclusive and equitable education. Its aim is not

to produce rankings or to force competition between classes or teachers. School leaders have a great responsibility to lead the evaluation processes and results in a formative way.

Evaluation can have different starting points. "Concepts for self-evaluation are often combined with external evaluation as a new task for local and regional school authorities" (Buhren in Nevo, 2002: 262). Self-evaluation at school level can be mandatory or not for schools, but usually schools have a large range of choices about the topics to be evaluated, instruments and methodological approaches. According to MacBeath (1999) self-evaluation of schools should be led by a framework based on criteria referring to the essential purposes of education, which involves all parties involved by creating an inclusive climate, which provides starting points and guidelines without being prescriptive and which is flexible enough to use in a variety of contents and ways. In order to develop the quality of a single school or kindergarten, the reference to an inclusive focused framework, such as the Index for Inclusion, is needed. The methodological approach can be quantitative, qualitative or mixed, where the indicators become items for questionnaires or the values objects for discussions within the school community. Tannenbergerovà et al. describes useful formulations of indicators (Tannenbergerovà et al., 2018) based even on the Index for Inclusion and gives a rich overview of selected studies about quantitative and qualitative tools – mainly questionnaires – for evaluating school quality. The choice of the instruments mainly depends on the skills of the teachers in-charge (of course the school can also appoint evaluation experts from outside to develop the evaluation design and as support for the more technical part) or even on the dimension and complexity of the topic that should be evaluated (Simons in Nevo, 2002). An important precondition for a successful evaluation is to conduct the process following a structure like this (Kempfert & Rolff, 2018; Pfeil & Müller, 2020; Stockmann, 2007):

1. Focus on the topic
2. Definition of the target group
3. Choice of the instruments
4. Data collection
5. Evaluation of the collected data
6. Data presentation to the school community
7. Interpretation of data in a cooperative approach
8. Conclusion and derivation of changing measures
9. Evaluation of the applied measures after a while

Participation: the key element of inclusive and equitable quality development

Participation is a key element of democratic and inclusive practice. All forms of participation share an important pedagogical relevance because they are important tools for active citizenship education in a heterogeneous society (Sant, 2019).

For this reason, it is important to reflect on a number of issues, such as the function of participation in sustainable development and the place of schools in educating for participation and thus for democracy (Lysgaard & Simovska, 2015).

The presented reflections highlight that an important characteristic of participation forms and sharing processes is the relevance of the school sphere as a context for participatory action.

The school context is a sphere/place of action for effective qualitative change through participatory practices in which all school actors are "everyday makers" (Bang, 2005).

At the basis of this engagement is the reconstitution of collective identity based on the project of change towards qualitative improvement.

In order to build participatory development, it is necessary to have cultural resources and practices oriented towards constructive interaction in the sign of a reciprocal, non-hierarchical, open-to-listening, conflict-transforming confrontation. In general, a participatory development process is based on an approach of recognition, negotiation and cooperation in which interests and not positions are focused on (De Jong et al., 2019). In a participatory development process, an exploratory mode prevails in order to make everyone open to express their thoughts in order to include the many different points of view involved (Forester, 1999) and to build an active trust constantly sustained in a process of openness to the other, reciprocity and reflexivity (Giddens, 1994).

At the heart of the processes for seeking changes in school practice is the development of a common language and sharing values where members of the community can talk to each other about their practice and experience (Ainscow et al., 2013) in an exchange that, as discussed below, starts at the class level/group level (i.e., in smaller groups, class teams, multi-professional teams, subject working groups) and goes all the way up to broad participatory practices such as at school/organisation level due to the presence of school leaders who are committed to inclusive values and a leadership style that encourages a range of teachers to participate in leadership functions (Ainscow et al., 2013).

Inclusion is a process, an ongoing search for new and better ways to respond to diversity by experiencing how to live with and learn from differences (UNESCO, 2005).

In addition to actively involving teachers, the participatory process encourages critical reflection and a redesign of practices by all actors in the school community. This process begins with a rethinking of specific collegial moments in everyday life (such as various working groups, parents' meetings, student assemblies, and school councils), from which a series of methodological and pedagogical focus points arise. The goal is to improve participation that is based on the quality of relationships and mutual listening while also valuing the contributions of each member of the school community (Hugo Suárez, 2019).

In this way, the participatory process becomes a tool for the continuous improvement of the school institution, fostering the well-being and growth of all.

Students who actively participate in decisions affecting school life may feel more responsible and involved in their own learning process, which can lead to increased

motivation, academic performance, and a sense of belonging to the school. Parents can also contribute significantly to the school by sharing their experiences and knowledge, as well as actively participating in decision-making processes as members of collegial bodies. Of course, administrative, technical, and auxiliary staff play an important role in the school's day-to-day operations; their input into decision-making can help improve the efficiency and effectiveness of school services. Finally, school leaders are responsible for creating an inclusive and participatory school environment by encouraging dialogue among the various actors in the school community and promoting participatory initiatives.

These considerations, apparently trivial but often implicit and responsible for dysfunctional communication and relationships, could be translated into specific attention aimed at building an effective participatory process at the level of the entire school community. These actions could concretely include:

– care in the preparation of events, focusing not only on cognitive content but also on social, communicative, and affective dimensions.

– the ability to identify the most appropriate actions to materially and operationally translate intentions, values, and ideas.

– the ability to show what is done from a pedagogical point of view through documentation and the conscious use of communicative mediators.

– the ability to strategically solicit the motivation to participate in all actors.

The success of this perspective necessarily passes through the continuum in the involvement of all members of the community. In reflection and in the search for attitudes and practices aimed at improvement in the awareness for all that they are part of the change being sought.

The teacher's role in quality development of inclusive and equitable education

Teachers and other professionals working with learners in educational institutions such as kindergartens and schools are in the key-role of modelling attitudes related to inclusive and equitable education in everyday life in their classrooms. The closer the contact and relationship and the longer the time spent together, the stronger is the impact on learners in experiencing inclusion and equity or the opposite of them.

Coherently with a systemic understanding of education institutions, the teacher's role for improving inclusive and equitable education needs to be considered on more levels (Bernstein et al., 2010). At *the individual level* it is important for teachers to develop awareness about their own attitudes, their guiding values, their beliefs and even their struggles related to diversity, but also to be open for developing personal competencies and skills. Referring to the Profile for Inclusive Teacher Professional Learning (European Agency for Special Needs and Inclusive Education, 2022), the central areas of competencies can be described in: valuing learner diversity, supporting all learners, working with others, personal

and collaborative professional development, support all learners' well-being and listen to learners' voices.

In a more personal and self-reflecting approach, Kricke and Reich suggest going through a question-checklist (see attachment at the end of the chapter), trying to examine the own strengths and weaknesses for working in an inclusive setting (Kricke& Reich, 2015: 206-207).

The development of new skills and the awareness of "blind spots" in their own daily practice need a permanent reflection on the effects of their actions for quality of inclusive and equitable education. At the same time, the active personal participation in development and evaluation processes at school level is the task of every single teacher.

At *the collegial relationship level/group leve*l teachers that work cooperatively in smaller groups: i.e., class teams, multiprofessional teams, subject working groups, topic-oriented working groups or professional learning communities are addressed. At this level, it is essential that all teachers and other professionals go into dialogue valuing professional and personal diversity and using it to develop reflective and development practices. A target-oriented cooperation needs some basic requirements, such as reciprocal trust, openness to the unusual, the joy of experimenting, communication skills and high commitment (Kricke & Reich, 2015). To improve the quality of inclusive and equitable teaching, formats where the daily work can be reflected, analysed and where new solutions can be developed together through a research approach, can support and develop the teaching quality (Bernstein et al., 2010).

As far as *the school/organisation level* is concerned, there is a need to engage in a preliminary reflection on the role of governance and the most suitable models with respect to quality development of equitable and inclusive education. School governance is called upon to formulate educational policies at school level that are clearly oriented towards equity and inclusion (Karlsson et al., 2019; Ward et al., 2015). Adopting a distributed leadership facilitates these processes (Hickey et al., 2022; Mincu, 2022): the school leader is no longer a "one individual in charge," but responsibility is shared with the school community, who formulate proposals combining the level of classroom life with the institutional dimension of schools. This commitment takes on ethical contours (Peters, 2015) since it involves constructing a vision that is then operationalised and in which terms such as inclusion, equity, social justice are not neutral, but take on a precise and situated meaning. Associating distributed leadership with the construct of ethical leadership (Brown et al., 2005) can be useful in highlighting the need for a shared commitment to the common good (De Hoog & Den Hartog, 2009) that takes into account everyone's personal characteristics, the relational nature of educational processes and the impact that actions and policies can generate. It is precisely the ethical bent of the distributed leadership model that emphasises the participatory nature of quality development processes for inclusive and equitable education (Ahmad et al., 2017; Liu & Hin, 2023): only with the contribution of all is it possible to have systemic improvements.

According to the leadership model outlined here, middle management is of crucial importance. To keep the quality development process alive and permanent, as "into the on-going structure of the school" (Simons in Nevo, 2002: 25), it is crucial to designate teachers or teacher groups at the middle-management level and to delegate the tasks within the school structure. Specific working groups are given the formal role to constantly monitor the quality of inclusive and equitable education (Nevo, 2002). The task is to initiate, accompany and support a school-internal process of development, maybe starting with a (self-evaluation process focused on specific indicators), i.e., from the Index for Inclusion, or even starting with a new school program (see above under "evaluation"). Although the main responsibility for activating and nourishing the process lays on the designated teachers or groups of teachers, the whole school community is in charge to cooperate actively in promoting and developing the quality: Every piece counts.

Students' participation in the quality development of inclusive and equitable education

We see students' participation as a key lever for the development of inclusive and equitable education. If inclusion defines the process of improving all learners' participation opportunities, then listening to children's and youth's voices becomes a concrete inclusive act (Messiou, 2019). The idea is neither new nor original: many studies refer to such examples (Sandoval & Messiou, 2022). At their basis there is the idea of schools as communities where teachers, students and other partners collaborate in a democratic manner in order to constantly improve the quality of their own school. This requires a new definition of roles, both for students and for teachers (Fielding, 2011) as the adults' role strongly influences the actual impact of students' participation.

As a premise to it, having in mind the way power fosters relationships in most schools in western countries, it is important to recognise consciously that the teacher-student relationship is asymmetric. This means that in order to have "student voice" meaningfully involved in development processes teachers' validation and authorisation is required for students to express freely their opinion on the different aspects of school lives and to have the power to actively make proposals for changes that can improve the quality of their school experience (Fletscher, 2005; Robinson & Taylor, 2013). This can only happen if teachers and other professionals in school create a space for students' participation and share the power they have. This can happen in several ways, with students being sources of data, active respondents, co-researchers or researchers (Fielding, 2001).

The fact that it is an adults' responsibility to offer opportunities for participation also implies some risks. As it was clearly described in the popular ladder of children's participation by Hart (1992), adults' power can also lead to children's and youth's voices to be manipulated or to be used in a "decorative" manner, making their presence visible,

but not authentically considered as potential levers for change and development or only listening to what already meets the adults' expectations.

In this chapter, we argue that learners' genuine participation can sustain quality development of inclusive and equitable education from at least two points of view. As a first step, students can give feedback on learning and teaching processes. If evaluation is seen with a formative function, then data collected through evaluation are important in order to understand what works and what does not in learning and teaching. Students can develop learning strategies on the basis of this reflective process, but this is also important for developing the quality of teaching. If students self-evaluate the reached skills and competences and to evaluate the way teaching and learning was organised, they have some evidence on the fact that their offer is (or not) reaching all the students. Interesting examples of this form of participation have been collected in the Students' Voices Toolkit of the three-year project (2017-2020) funded by the European Union 'Reaching the hard to reach: inclusive responses to diversity through child-teacher dialogue' (https://reachingthehardtoreach.eu/pupil-voice-tool-kit/).

Second, students can also become co-researchers for quality development processes. As part of being directly involved in evaluation processes, they can take an active role in the planning of change, working together with adults in selecting development priorities and designing strategies to reach them. A recent research review (Sandoval & Messiou, 2022), identified by means of the analysis of 28 studies highlights a list of steps that are typical for development processes that employ student researchers approaches:

- 1) Initially, learner-centred activities activate and sustain all student's interest for school development.
- 2) Usually on a voluntary basis, but often also on the basis of shared criteria, some students decide to invest more in school development becoming co-researchers.
- 3) Student-researchers are trained.
- 4) Student-researchers collect data in order to evaluate/reflect on the school actual situation, usually having other students as targets.
- 5) Findings are shared within the whole school community.
- 6) Student researchers are involved together with adults in the process of change planning and implementation.
- 7) In very few studies, students are also involved in the phase dissemination of the research experience.

A good example of an approach that strongly supports the role of students as co-researchers, is the Inclusive Inquiry (Messiou & Ainscow, 2020). The approach promotes the creation of working groups composed both of students and of teachers for the development of high quality inclusive and equitable lessons. The group plans a lesson, a teacher teaches it while the rest of the group (students and teachers together) observe.

After the lesson, the same group reflects on what went well and on what can be improved in the lesson. Together, the group aims at planning lessons that succeed in reaching all students. Teachers' and students' perspectives go into dialogue trying to identify barriers for learning and to overcome them.

Thinking systemically: other actors involved in the quality development process of inclusive and equitable education

Teachers and students certainly play a crucial role in the quality development of inclusive and equitable education, but it is essential to refer to other actors involved in this process, not least because they enter into dialogue with students and teachers and make their own contribution to this improvement process. This attention is indispensable precisely because of the systemic nature of inclusive and equitable development (Roszak, 2009; Scheerens et al., 2003), as we mentioned at the beginning of this chapter: a culture of inclusion and equity can only be built through participatory processes that bring different visions into dialogue and find a common synthesis.

Within the school, school leaders play a crucial role in orchestrating participatory processes of quality development of inclusive and equitable education in which equity and inclusion are not only aims but also methods of action (Cambron-McCabe & McCarthy, 2005; Jean-Marie et al., 2009). As we said before, distributed leadership needs to be combined with elements of ethical and inclusive leadership (Kuknor & Bhattacharya, 2022; Ryan, 2006; 2007; Thompson & Matkin, 2020): the participation of all members of the school community needs to be co-constructed and planned day by day.

Parents can also be key actors in the quality development of inclusive and equitable education (Anderson & Minke, 2007). They are indirectly involved in their children's school experience and thus can provide important feedback on the level of equity and inclusiveness of schools (Stelmach, 2016). However, it is necessary to take into account the different socio-economic and socio-cultural backgrounds that may influence beliefs and values with respect to these issues (Dusi, 2012; Lawson, 2003): here again, the bringing together of different worldviews is preparatory to the co-construction of a common imaginary that allows everyone to identify with a constant virtuous path for improvement. They are not simple processes: conflict is always lurking, as well as the presence of perspectives that are difficult to reconcile. The challenge of educational co-responsibility, also on an institutional level, is to place students at the centre by enhancing the uniqueness of each one (Daniel, 2011; Yull et al., 2014): families and education professionals have complementary but well-defined tasks, so there must be no reciprocal encroachment.

In a systemic logic, also the contribution of other partners, such as municipalities, local school authorities, health system, social services and counselling services are crucial (Coombs et al., 2013; Gidley et al., 2010; Valeo, 2008). Aspects such as the accessibility of infrastructures and the removal of architectural barriers, the drafting of clear guidelines

and regulations that define inclusion not as something aimed only at specific diversities but at everyone's uniqueness, the planning of structural funding to support schools and out-of-school activities in the planning of initiatives with social impact, counselling support for teachers, students, families and parents, the development of protocols and evaluation tools require the cooperation of the school with other institutions in the local community. Schools cannot manage all these aspects alone, they must become objects of shared, collaborative and participatory planning instead (Bottrell & Goodwin, 2011; Feldman & Khademian, 2007). Particularly interesting in this area of cooperation is also networking with other schools that makes it possible to work in synergy on the co-creation of inclusive contexts even beyond the strictly school environment, in addition to fostering the exchange of virtuous practices on an institutional and classroom life level (Wohlstetter et al., 2003).

Furthermore, universities can play an important role in supporting schools in virtuous paths of improvement in terms of equity and inclusion. They can give schools methodological support, do research with them and not on them (Burton & Greher, 2007; Griffiths, 1998; Walsh & Backe, 2013): methods belonging to the action-research family (Baum et al., 2006; Catelli et al., 2000) are forms of educational research that on the one hand enable knowledge advancement and on the other hand make teachers and professionals protagonists of a sustainable improvement development process (Kyza et al., 2022), in a recursiveness between theory and practice that contributes to the improvement of school life in organisational terms and in terms of students' daily experience (Hine & Lavery, 2014; Mertler, 2019). The synergy between school and university through change-oriented research paths makes it possible to systematise innovations and improvements without them being lost over time (Ainscow et al., 2004; Calhoun, 2002). The process-oriented and participatory nature of these paths supports the professional development of teachers and managers and the transformation of school culture in a bottom-up logic.

Concluding, the role of teachers as members of a democratic school community has been discussed at several levels. Some changes at higher level require a political commitment outside school in order to be in dialogue with policymakers so that education policies are co-constructed with those who live schools on a daily basis (Whorton, 2017). Furthermore, in connection with the need to enhance the students' voice emphasised in the previous section, it would be useful for their perspective to carry political weight as well (Brooks et al., 2020).

Local contexts

Closing questions to discuss or tasks

- Think of your experience as a child in kindergarten or/and as a student in school and list some situations in which you have actively participated in quality development.
- Think of your first professional experiences in school (for example in the context of internships) and list situations you could observe in which teachers were involved in processes of the quality development of inclusion and equity.
- Look at the indicators of the Index for Inclusion (Booth & Ainscow, 2011) and select those that can support the reflection of:

1. the individual attitudes towards inclusion and the single teachers' competence to develop equitable lessons;
2. a class team competence in responding to learners' diversity.

Attachment: Checklist for Self-Evaluation for Inclusive Teachers

Every teacher in inclusive settings should also constantly reassess for themselves whether they are suitable to take on the challenging tasks for themselves and in the team.

The following list of questions may be helpful to check where your own strengths and possible weaknesses lie, firstly for yourself and then in dialogue with the team and others. If all these questions can be answered in the affirmative, then you are fundamentally suitable as a teacher for an inclusive school. If you have difficulties with individual points, these will have a negative impact on the chances of effectively implementing inclusion in your communicative, cooperative and teaching-related activities.

1. "Am I fundamentally willing and open to be an advocate and defender for a diverse culture, by working with families and learners from very different cultural backgrounds, with individual forms and values, with disadvantages and disabilities as well as with talents and peculiarities, by cooperating and communicating with those involved in order to promote and encourage the growth of all and support the growth

of all abilities of the learners? (my pedagogical basic attitude)

2. Are my actions fundamentally designed to be participatory, and can I avoid any know-it-all attitude, even if I may know more than others, in order to work together with the people involved in education and training in my inclusive school to combine existing resources with successful solutions? (my basic democratic attitude)

3. Can I adequately put into perspective my own cultural norms and values of my own socialisation and accept that families and people develop different attitudes, in order to develop a common respectful approach and mutual tolerance within the framework of a democratic culture? (my basic cultural attitude)

4. Do I have the highest expectations of all learners, and do I value the opportunities that each individual learner has? Do I value their efforts and successes in my communication with them and do I help them develop their personal excellence? (my pursuit of excellence rather than mediocrity)

5. Am I prepared to educate myself fully about the diversity of my learners and the current culture in order to bridge the gap between closeness and remoteness to education and to find measures that can help to bring inclusive development and education available to all? (my attitude towards equal opportunities)

6. Are the learners at the centre of my efforts to provide cooperative, communicatively successful forms to encourage all learners, even those with different backgrounds, to find their own ways of learning, to work together with others, to achieve successful results? (my learner-centred approach)

7. Am I prepared to use teaching methods that help to convey topics and contents in such a way that an external subject perspective with average expectations is not taken as the primary measure of success, but rather targeted on the basis of the different preconditions of the learners, which are to achieve their own personal excellence, in order to achieve the greatest possible progress in all culturally relevant areas of learning? (my realistic performance attitude)

8. Do I enable learners to have different perspectives and approaches to learning in order to reach learning outcomes, to present them and to share them with others? (my methodological support approach)

9. Do I ensure that the curriculum is related to the world of life and work and oriented to the learners, connected with their cultural backgrounds and with relevant topics in culture, science and technology as well as with the social living environment? (my realistic learning expectations)

10. Am I prepared to contribute with my knowledge and behavior constructively to a teaching and support team, to adapt to the needs and wishes of others, to creatively create and adopt a communicative, cooperative, helpful and supportive attitude towards all persons in the inclusive school? (my positive team attitude)

About the authors

Heidrun Demo

Her work centers on equity in education, with a particular focus on supporting diverse learners, fostering inclusive teaching practices, and driving inclusive school development. She is deeply involved in research and teacher training, dedicated to creating and sustaining inclusive learning environments.

Rosa Anna Ferdigg

Rosa Anna Ferdigg earned her degree at Bologna University in Italy and has since had a long career in the South-Tyrolean (Italy) school system, holding various positions such as teacher, headmaster, inspector, and evaluator. In addition to these roles, she collaborates with universities in Italy and Germany on inclusion topics. Rosa Anna is also a consultant for inclusive school development on an international level. Her interests are focused on system changing and development, exploring how people can learn and develop their skills, and how they can contribute to changing systems in an inclusive direction with their individual influence.

Valerio Ferrero

Valerio Ferrero does research in the field of intercultural education, focusing on equity and inequality in schools. He is also interested in community

philosophical practices, on which he also carries out training activities. Before starting his research work, he was a primary school teacher.

Veronica Punzo

Veronica Punzo is attorney at the Macerata Bar. Dealing with the governance and regulation of personal and non-personal data and ethical-legal consulting, her research area focuses on the domains of artificial intelligence and education with a focus on dignity, equality and fundamental rights enhancement and protection.

GENDER AND SCHOOL POLICY

Example Case

"Bella came out to her parents at age 8. She was born with a boys' name and used he/him pronouns before she came out. She used the name Bella at home for a long time but not at school. When she started 5th class (the penultimate class of Primary School in Ireland) at age 11 she started using the name Bella and girl's pronouns at school as well as at home. She was accepted by her friends and classmates with the help and support of the school.

Bella is starting secondary school in September and her new school has been told about her story and that she is starting school as a girl, even though her birth certificate still says she is male. The school has a lot of questions around how Bella should be treated at her new school. What uniform should she wear? What bathroom should she use? Should her peers be informed of her history? What if the parents of other students ask questions? Are there specific accommodations that Bella will need?"

Initial questions

In this chapter you will find the answers to the following questions:

- How does gender manifest itself in schools?
- How does gender interact with school policy?
- Who and what influences gender policies in schools?
- How can schools integrate gender sensitivity into their policies and practices?

Introduction to Topic

Gender can mean different things to different people, referring to the assigned sex at birth and/or the gender someone identifies with.

For the purposes of this chapter, we will use the World Health Organisation (n.d.) definition of gender which looks at the characteristics of women and men, girls and boys that are socially constructed. It describes gender as the norms, behaviours and roles of women, men, girls and boys, with associated notions of masculinity and femininity. Gender differs from society to society and it changes over time. Gender is hierarchical, and produces inequalities. Gender also intersects with other characteristics such as ethnicity, socioeconomic status, disability, age, geographic location, gender identity and sexual orientation, among others.

Gender is different but connected to sex, which refers to the different biological and physiological characteristics of females, males and intersex persons, such as chromosomes, hormones and reproductive organs. Gender is also connected but separate to gender identity, a person's internal sense of gender which may or may not correspond with sex assigned at birth.

How we look at gender in the education system and the areas of priority differ from context to context. In some contexts, the primary focus is on the inclusion of women and girls in education and the gendered experiences of all students in school. In other contexts, there is a focus on the inclusion of gender diverse students, the interactions of trans, non-binary and gender non-conforming students with gendered policies, and how potential discomfort can be relieved.

What does school policy encompass and how does gender affect school policies?

Policies are essentially a collection of ideas or plans that a group of people have officially agreed to follow under specific circumstances. In the context of education, policies serve as formal documents outlining the procedures and values that guide schools in their everyday practices. These educational policies are designed to create safe and supportive

environments where students can learn and thrive. Educational policies are set at different levels:

Global/international level educational policies are set by the international organisations such as UNESCO (Education for All) or the EU (Gender Equality Strategy). The UNESCO Gender Equality Monitoring Report (UNESCO, 2017), outlines who is responsible for what in ensuring gender equality in schools. The Education for All (EFA) Framework for Action emphasised that "gender-based discrimination remains one of the most intractable constraints to realising the right to education" (World Education Forum, 2000, 6). After all these years, although the context has evolved, addressing gender inequality in education remains a crucial focus of the global agenda.

Macro Level- National level policies are developed by the central governments. In some countries they are the only documents and are implemented by all schools in all contexts. For example, in Turkey, all public schools are under the authority of the Ministry of Education. Private schools are also closely regulated by the Ministry regarding curriculum implementation, rules, and other activities. As a result, decisions related to gender policies are made by the central authority.

At a national level in any country, governments are responsible for formulating and implementing policies that directly affect every aspect of the education sector. For example, policies related to admission requirements, free public school, providing different types of schooling (girls or boys school), staffing, teacher training, admission of teachers and the well-being of students are all national level policies in different contexts.Governments are generally responsible for developing policies related to sanitation facilities, gender sensitive teacher programs, non-discriminatory curricula, regulations and other policies (UNESCO, 2017).

Intermediary level policies are developed by regional governments, city councils, managerial bodies, religious groups and any local communities. For example, schools in Ireland generally have a patron body who makes decisions on policies for all schools under its ethos (see the section on the Irish context for more detail).

Institutional level policies are the school level policies that are related to daily operations of school to create a supportive, inclusive and gender sensitive environment conducive to learning. These include, for example, policies related to creating a positive school culture, operational efficiency to be sure that schools operate smoothly and curriculum policies at school and classroom level. Schools are responsible for respecting the regulations, training teachers and providing a comprehensive sexuality education, developing an inclusive bathroom policy and dress code (UNESCO, 2017). Some district and school administrators might not be aware of the requirements of trans children or lack expertise working with them. As a result, they might not think to create a policy in the school to address the needs of young people who identify as transgender, non-binary, or gender non-conforming (Meyer & Keenan, 2018).

This chapter will focus on gender and how it interacts with school policy. The way

policies are written and implemented at a school level has an impact on learners' and teachers' experiences of gender and the formation of gender roles and stereotypes at a more structural level.

Key aspects

How does gender manifest in schools?

In today's world, attending school essentially functions as a rite of passage for young children. In many ways, it is seen as the institution which shapes and instils in them ideas and values that are thought necessary as part of our social existence. This brings within its ambit the wide range of values, morals and ideals that a school seeks to ingrain among the students. Gender, as a form of identity, is inherently also a product of our relations and interactions with other people, including people from other genders. The manner in which people from a particular gender are treated, or "schooled", or expected to behave, all go on to shape the understanding of gender for young children. Young children going to schools are often made aware of the differential expectations in terms of their gender, as well as the requirements to qualify as a member of the binary gender system (McLeod, 2019). The legitimacy of the knowledge imbibed in schools is often unchallenged. "The very fact that certain traditions and normative 'content' are construed as school knowledge is prima facie evidence of their perceived legitimacy" (Apple & King, 1977, 342). The things taught in school, therefore, are treated by children as the objective truth of the world. This goes on to imply that schools have an important role to play in introducing and imposing gender on its students.

The ideas of gender, features and attributes of masculinity and femininity, are all parts of things that are understood in people's relationships and interactions with one another. In this context, therefore, it is important to identify the role of the school as a socialising agent. This comes with the understanding that gender is essentially something which is 'taught' or 'learned', in the context of culture and community. This is essentially a function of the hidden curriculum in schools. "Hidden curriculums are covert lessons that schools teach, and they are often a means of social control" (Martin, 1998, 498). Schools, in this sense, function as a primary agent which helps to impart ideas on gender, whether through overt policies of the education system, or through subtle aspects of the hidden curriculum. Moreover, by means of aspects of the hidden curriculum, teachers and administrators subtly reinforce gender stereotypes, roles and expectations, by means of comments and opinions which reflect traditional ideas of gender.

Masculinity and femininity are often treated as two opposing features which necessitates a strict separation between the two. The differentiation and separation that occurs, thereby relaying a binary idea of gender, is one of the primary ways in which gender is enforced. Schools tend to function in a way that effectively sets out differential roles and expectations

by categorising children into either of the categories. This has connotations for the manner in which girls and boys going to school receive different treatment. This can especially be in terms of disciplining mechanisms; the subconscious nature of our gendered mindset is reflected in the ways in which girls and boys are disciplined in schools. The disciplining of girls and boys as per their gender is very often the narrative which drives towards the ideal of man and women, as it is expected by society. This is reflected in the form of commands or punishments, which function to enforce the same. A girl speaking in a loud voice in a classroom may be silenced on the grounds that girls are expected to be docile and soft spoken, whereas the same for a boy would only be in the name of maintaining the required decorum within a classroom. Such acts or commands subtly reinforce the expectations from each gender, thereby contributing to the idea of an ideal masculinity or femininity. In many cases, the differentiation is also played out in terms of the kind of books or games that children are expected to read or play. Disciplinarian systems in schools function as nets of social control, the deviation from which invites sanctions in the form of punishment. This helps to ensure that there is gender conformity in terms of the ideals and values that are prescribed or expected of each gender in the particular community environment. The differentiation also exists in terms of sex education classes and sports activities, in which children are made to feel aware of the differences amongst them.

"I remember an incident in secondary school where a friend of mine was suspended for punching a boy. The incident that occurred happened in the corridor during break time. My friend was walking down the corridor when the boy came up behind her and lifted her skirt, showing her underwear, and then ran off laughing with his friends. My friend was obviously embarrassed and enraged, and so chased the boy and punched him. She got suspended for a day, and he got nothing other than "don't' do it again". Where is the justice and equality in that?" Hannah, Ireland.

In terms of school policy of single gendered schools, it is important to understand how spaces come to be gendered. Some schools view gender as the same as the sex assigned at birth, and therefore work to put people in boxes and curtail freedom of gender expression. Mixed schools, on the other hand, might have more equality inclusive policies, but these can also be restrictive in terms of the strict separation between male and female, and the lack of space for identities that do not fall within the binary. The differentiation and separation is also very often followed by a precedent for an enforcement of heteronormativity that seeks to understand relationships amongst children only in a singular pattern. In many Asian countries especially, fearing the development of romantic relationships in case of intermingling amongst boys and girls, this differentiation is further reinforced. This is dictated by the concern surrounding the protection of female sexuality, which imposes strict restrictions on their mobility as well as their agency and autonomy. "Formal education or schooling involves moving into public spaces, interaction with males (in coeducational schools and with men teachers); or being socialised (through the curriculum) as boys, and supposedly moving away from the eventual goal of wifehood and motherhood" (Chanana,

2001, 38). The idea is to keep the two genders apart, to ensure that the focus of children going to schools is only on their studies and not in other avenues. The policy or underlying principle of schools to maintain separate seating, separate entrance as well as other playtime activities on the basis of gender can also be argued to be driven by this mindset. The existence of same gender schools also overarchingly reflects this world view, with many parents opting to send their children to such schools, especially in the name of safety for young girls.

In same gender schools, there are disciplinarian processes which are in place to ensure conformity to behavioural patterns associated with a particular gender. For example, girls would be asked to comply with notions of how to sit, how to speak, how to conduct oneself in a classroom, the length of the skirt (if the skirt is a part of the uniform), and the manner in which hair is arranged. All of these are mostly associated with typifications into categories. All of these categorisations focus on different aspects of behaviour, which underlie the community notion of the ideal standard of femininity, that is to be aspired to. Even in the case for all boys schools, there is an ideal of masculinity which is sought to be strived for. In schools with co-educational learning, it is the strict separation between the two genders upon which most of the disciplinary practices are based. Any fusion of gender identities runs the risk of threatening the gender divide, which is crucial for dominant groups to perpetuate the hegemony of the male over the female sex. This also functions to typify relations amongst children in a singular pattern and thereby creates the idea of the 'other' in terms of opposing gender identities.

The attitudes and beliefs of teachers can reinforce gender roles and impact how teachers view the abilities of students. For example, a teacher is more likely to overrate a boy's ability in maths and underrate a girl's, recreating the status quo. Horizontal segregation can determine the subjects that girls and boys select, where girls may be discouraged from taking subjects perceived as male, and teachers may reinforce the gender stereotypes that exist in society (McCracken et al., 2015).

One of the key factors in developing educational policies that creates gender inequality in the schools is the feminisation of the teaching profession, where teaching in early childhood education and in elementary school has historically been dominated by women. At secondary level internationally, the percentage of women teachers is lower than at earlier levels. This global trend is deeply connected to factors such as economic development, urbanisation, women's societal roles, cultural definitions of masculinity, and the value placed on children and childcare (Drudy, 2008). The reasons suggested for the dropping numbers of male primary teachers indicates a bias towards seeing the ideal primary teacher as female, based on an essentialist belief that a woman's nature tends to make her better with children. This belief may be stronger among male pre-service teachers than among female pre-service teachers (Drudy, 2008). The feminisation of the teaching profession has raised concerns, particularly the belief that boys need male teachers as role models to develop properly, both academically and personally (Carringthon & McPhee,

2008; McGrath, Moosa, Van Bergen & Deevia 2019). This concern is often tied to the perceived underachievement of boys compared to girls in standardised examinations like PISA (OECD, 2019).

"As a parent with children in both primary and secondary school, I see a distinct difference in the percentages of male and female teachers in each of these school settings. Traditionally, my childs' primary school has always had predominantly female teachers, with perhaps only one male teacher within the school, often with no male teacher. On the other hand, my other childs' secondary school has a high percentage of male teachers with a ratio of approximately fifty percent. As long as women are seen as carers and nurturers in society, these 'soft' roles will always be dominated by women. Children need to see more male role models in their primary education ." Hannah Solley, Ireland

How does gender stereotyping impact students?

Neuroscientists have shown that there are very few structural differences between the male and female brains at birth. Cordelia Fine (2005), describes how "our minds, society and neurosexism create difference. Together they wire gender. But the wiring is soft, not hard. It is flexible, malleable and changeable." Further criticism of the notion of a male and female brain builds on this to suggest that by centering the brain as the only thing to explain behaviour, we then ignore the role of the body and the social environment, suggesting that it is not just neurosexism but neurocentrism that is the difficulty (Halberg, 2022). Society creates gendered patterns of behaviour that people then follow which shapes them. By imposing strict ideas of masculinity and femininity on children, we shape their entire lives and for many this causes difficulties and harm (School of Education and Social Work, Birmingham City University, n.d.).

"The first time I remember really noticing I wasn't "one of the boys" was on the playground. At lunch most of the girls would play skipping and the boys would play football. I remember how it felt to be told by the boys that they didn't want me to play because I was a girl. It hurt doubly due to what I later realised was gender dysphoria (a feeling of distress and discomfort around my gender), but besides that, the gender stereotypes at play meant that I was put at a distance from boys from then on. Our class in primary school was completely socially segregated by gender from about the age of 7 and your gender was meant to define your likes and dislikes. As a trans person, I constantly felt like the odd one out among groups of girls but there was no other option for me at school."
Sam, transmasculine, Ireland

Gender stereotypes impact on mental health for all genders. While girls crying or talking about their feelings is celebrated for emotional openness, boys often mask painful or distressing emotions, either through silence or behaviours designed to disrupt. Distress in girls may be diminished and taken less seriously, while distress in boys is missed entirely as a result of this stereotyping and lack of awareness of difficulties. The message that

boys should 'man up' prevents boys from speaking about their emotions and difficulties and sends a message that these are things that should not cause a problem or impact them so they should work through it themselves (Stentiford et al., 2024).

The lack of discussion of gender diversity and rigid gender roles also cause difficulty for trans and gender diverse (TGD) youth, with one study showing how the marginalisation of gender diversity "inhibited TGD youth's self-understanding and left some feeling confused, frustrated and alienated from their peers" (McBride et al., 2020, 13). TGD youth have been shown to have a higher rates of prevalence of depressive disorders, suicide ideation and self-harm than their peers (Becerra-Culqui et al., 2018). Studies suggest that social support, particularly from parents is associated with reduced symptoms of depression, anxiety, self-harm and suicide ideation (Tankersley et al., 2021). Studies have also shown that feeling unsafe in bathrooms was associated with greater levels of problematic anxiety in the past year. The experience of being unable to safely use a bathroom in school may cause or exacerbate anxiety, absenteeism, and a lack of belonging for transgender and gender non-conforming students (Weinhardt et al., 2017).

Of course, like all the dimensions of diversity discussed in this book, this issue needs to be understood through the lens of intersectionality. Poverty has a role in determining gender equality in schools due to the direct and indirect costs of sending children to school. Providing free education can address gender inequality in education but needs to be done alongside strategies to improve the wider social factors that influence familial decisions to send children to schools. In turn, the reduction of gender inequality in education has a significant impact on society. The increase of women's access to education improves health outcomes for all, particularly lowering maternal and infant mortality rates, preventing childhood malnutrition and reducing the rates of new HIV diagnoses (Bertini and Ceretti, 2020).

Making sure that all school-age children and youth (boys and girls) have equitable access to education is one of the concerns that should be taken into account when discussing gender policy in education. Girls face disproportionate exclusion and disadvantage in school in many nations, while boys underperform and drop out at higher rates than girls in other countries. Although there has been progress since 2000, through initiatives such as the UN Sustainable Development Goals, gender-related barriers continue to combine with other socioeconomic barriers to prevent girls and boys (and women and men) from accessing and benefiting from quality education and learning opportunities. Around the world, 119 million girls are out of school, including 34 million of primary school age, 28 million of lower-secondary school age, and 58 million of upper-secondary school age (UNICEF, n.d). Women make up only 35% of higher education students in Science, Technology, Engineering and Mathematics (STEM) (UNESCO, 2017a). The reasons vary among countries and communities. The most common reasons are poverty, child marriage, gender-based violence, traditions, religious beliefs etc. In general, poor families often favour boys when investing in education. In addition, in some contexts schools do not meet

the safety, hygiene or sanitation needs of girls and this may lead to drop out. In others, teaching practices are not gender-responsive and result in gender gaps in learning and skills development. Moreover, in countries affected by conflict (e.g. Yemen, Palestine), girls are more than twice as likely to be out of school than girls living in non-affected countries (Bentaouet Kattan, Khan, and Merchant, 2023).

Teachers and schools from early years onward have a significant part to play in the experiences of gender stereotyping. Teachers can consider gender in the toys available, the pictures and examples shown in books including textbooks for all subjects, as well as how they speak about subjects and address behaviour. We will give some examples for positive steps teachers can take later on and some resources that you may wish to look at.

How does gender interact with school policy?

Having discussed in detail the idea of gender and the definition of school policy, it is crucial to understand the point at which they interact. Gender as a form of identity is the most ubiquitous across all identities, and therefore, any school policy is bound to have connotations for gender and the way it impacts gender. National curriculum policies, for instance, are pivotal in how gender is depicted, as they have the effect of shaping ideas, expectations, roles and responsibilities through representations present or absent. In most cases, the national curriculum is adopted at the national level and implemented at all schools within the nation. This brings in important questions about cultural differences and context specificity. The manner in which the curriculum is designed is especially important in this context. Appropriate gender depiction, as well as adequate gender representation, needs to be addressed within policies which shape curriculum frameworks. Extensive cultural influence is at play when it comes to building the curriculum, thereby leading to social roles and expectations in schools. This kind of cultural imposition also functions to reinforce unequal gender roles, which can be in the form of gendered division of labour, for example the mother being depicted in curriculum materials as the home-maker, and the father as the breadwinner . Such representation tends to influence career goals and aspirations for children to a large extent, who may feel they do not belong to certain professions based on the lack of representation in school textbooks. With more awareness, the overall curriculum of the school can be largely inclusive and representative, and highlight aspects of equality and respect among people.

However, even when formal aspects of curriculum strive for gender equality, as noted above with regard to discipline, the hidden curriculum may still be one of the key drivers through which gender differences are carried forward by the school. Often, formal school curricula preach inclusivity and equality, and it is only by the attitudes of teachers and administrators that the hidden curriculum plays out. Largely reflected in the mindset of people within systems, the hidden curriculum is enforced and instilled through regular patterns of behaviour and attitude which perpetuate gender stereotypes and roles.

In terms of religious schools, school policy has connotations for the manner in which gender is handled and conceived. A narrow and traditional view of orthodox religions might

have the effect of being less open to diversity, and intolerant of diversity, or differential gender expectations and role assigning. In the context of India, for instance, the religious underpinnings tend to focus on female sexuality, and the need to protect it, along with notions of purity and impurity, which are linked to caste status and honour of kin groups (Chanana, 2001). As such, the influence of religion tends to have the effect of reinforcing and perpetuating gender norms and roles. In the case of non-religious schools, they are more likely to adopt policies which are more inclusive and tolerant, and more accommodating of gender differences in terms of identity or expression.

"In a convent school where moral science was a part of the curriculum and a compulsory subject to be studied, values suggesting morality were an important part of the course. This included the imparting of the idea of premarital sex as a sin, and something to be frowned upon. This, however, is also in direct contrast to the science subject which involves lessons on reproduction, and along with it- sex education, thereby sharing knowledge on safe sex practices. Such conflicts between religion and science are especially more visible in the context of school education for us growing up and studying in those schools and imbibing those values" Ayana (she/her), India.

Another important school policy to be analysed in the context of gender, as noted briefly above, is uniform. The policy on school uniform has connotations for the manner in which gender is treated, and thereby communicated to children. Such examples are measuring the length of girls skirts, making sure they are covering themselves in a way that does not draw attention.

"In an all-girls' convent school, a lot of emphasis was laid on 'decency' and acceptable ways of wearing our uniform. In order to enforce this, we were encouraged to wear a long slip underneath our shirts, to ensure that the transparency of white shirts concealed our underwear. As part of the disciplining process which consisted of checking the uniform, the skirts of all the girls would be lifted, to check the slip, or the length of it. In doing so, what started out as a process to maintain modesty entailed the violation of the basic dignity of all girls" Ayana (she/her), India.

Gender-specific school uniforms convey messages about gender separation and expectations based on gender. They also fail to be inclusive in their approach towards non-binary or trans students. A policy which aims at gender-neutral uniforms for students could be seen as the way forward, in an effort to be gender inclusive in their approach, and this is explored further below with regards to trans students.

The important thing to be noted in this regard is that policies need to take into account expressions of gender identity, which also includes within it, an expression of religious or other kinds of identity.

How are trans, gender-diverse and gender-non-conforming students affected by gender policies?

"Cisnormativity is deeply entrenched in societies and institutions, with children assigned from birth into a rigid binary. This system is reinforced throughout the school ecosystem in cisnormative policies, approaches, assumptions and cultures, with particularly negative consequences for trans children" (Horton, 2023, 86).

Cisnormativity is the assumption that everyones' gender aligns with the sex they were assigned at birth, and therefore all people are cisgender. This assumption permeates all societal systems, including school systems. It is ingrained in the school system with institutional cisnormativity operating without active or conscious effort. It is an invisible system that goes unnoticed by cis teachers, educators and students.

When gender is considered within school policies, specific and hidden policies, it automatically implies gender in a binary sense i.e. boys/males and girls/females. It also implies that gender is the same as sex assigned at birth, so the assumption is that all students are cisgender. This means that schools privilege cisgender young people who identify with their assigned birth gender (McBride & Neary, 2021) , whilst inherently excluding transgender, non-binary and gender non-conforming students from all school policies unless specifically mentioned, simply by not actively thinking about these students.

For instance when creating invisible bathroom policies in which segregated girls and boys bathrooms are the norm, it is already assumed which bathroom should be used by whom, but it is not automatically assumed that trans girls and boys will be allowed to use those bathrooms. Through the assumed cisgender lens, trans and non-binary students experience difficulties when trying to access appropriate bathroom facilities because they are omitted from being actively included in these policies. A study of institutional cisnormativity in primary and secondary schools in the UK saw that some trans pupils were denied access to appropriate facilities such as toilets throughout their time at primary school (Horton, 2023). Another study looking at the experiences of trans and gender diverse students in secondary schools in Ireland found that many students "experienced barriers accessing a bathroom facility that they felt comfortable and safe using following their transition" (McBride et al., 2020, 4), or "were prohibited from using (or felt unsafe using) the toilets that aligned with their gender identity" (McBride & Neary, 2021, 1100).

Another layer to the cisnormative culture within school bathrooms means that many schools only have male and female options for bathroom facilities which eliminates choice for non-binary students and some trans students who may not feel comfortable in gendered bathrooms and would prefer to use a gender neutral option.

Inclusive bathroom options are only recognised once a specific gender inclusive policy is incorporated into a school, and bathroom usage is looked at through a gender sensitive lens that incorporates gender diversity in all forms. You can find examples of gender inclusive

bathroom policies on the Gender Inclusive Schools website, as well as on the University of Limerick website.

Trans exclusionary policies can also be seen within school uniform policies. If a school has a uniform policy, it is usually a gender-specific one, with schools implementing a boys' uniform and a girls' uniform. Many trans and non-binary students find uniform policies to be "restrictive, while some were prevented from wearing a uniform that aligned with their gender identity" (McBride et al., 2020, 4). There may not be a gender-neutral option available unless a non-binary or trans student requests one. It may also be assumed that all trans and non-binary students will only wear a gender-neutral uniform option and that gendered uniforms may be excluded as an option for trans students, especially trans girls.

"There was greater contention around trans girls/women wearing skirts than there was for trans boys/men wearing trousers. Some schools permitted students assigned female at birth to wear either trousers or skirts, but only permitted students assigned male at birth to wear trousers. Such uniform restrictions made it more difficult for trans girls/women to wear a uniform that aligned with their gender identity and that they felt comfortable wearing" (McBride et al., 2020, 26).

It can be especially difficult in single gendered schools, which often have a rigid uniform policy in place:

"When I was 18 and almost finished secondary school, I told a teacher in my all-girls school that I was trans. Her response was to prioritise telling me that I would need to wear the school uniform including the skirt until I finished my final exams. At that point, I was really struggling at home and in school and would have really appreciated an adult who asked me about any of that. Instead, I found a rigid system that seemed to put the picture of the school before my wellbeing. Today, that school has a trouser option, and they have supported a number of trans students. I am relieved that other students will not share my experience"

Sam, transmasculine, Ireland.

Another area of exclusion for trans students is Physical Education And Sports (PES) choices, especially in secondary schools. Secondary schools sometimes approach PES in a very gender segregated mindset, with boys and girls being separated from doing sports together, as well as gender-specific sports uniforms that can make trans students feel uncomfortable. The barriers to PES participation shows that "TGD youth's gender presentation, the normative gender culture of PES and gendered sports uniforms, affect how trans youths use sports facilities and can lead to experiences of exclusion and harassment" (McBride et al., 2020, 35).

Gendered sports policies always exclude non-binary students who are forced to choose a gender with which to play in a team, even though they do not identify exclusively as male or female. They can also often exclude binary trans students, who can be excluded from playing with the peer group they identify with if appropriate policies are not in place, thereby excluding, disenfranchising and harming trans pupils (Horton, 2023).

Trans and non-binary students can be included in school policies positively by having a dedicated Gender Identity and Expression or Trans Inclusive policy that can be referred to when a student wants to transition whilst in school or if a trans student is starting in the school. Through having a policy dedicated to gender identity and expression, a school can then use this to inform all other policies in which gender is explicitly or implicitly implied. This should be taken into consideration when thinking about bathrooms, sports, uniforms, curriculum and anti-bullying policies.

However, a trans inclusive policy only works on the basis of a trans student identifying themselves to staff and therefore the school putting procedures in place to support the individual with accommodations. In this way a trans inclusive policy is still exclusionary because it is only ever in reaction to a person asking to be accommodated or welcomed into a cisnormative space, which actually "results in a fundamental silencing of and failure to address broader systemic impacts of institutionalised cisgenderism and cisnormativity" (Martino et al., 2020, 768). It also "highlights the need for knowledge about cisgenderism and cisnormativity to inform both policy and practice – that are designed to support trans youth specifically and gender diversity more broadly" (Martino et al., 2020, 768)

When schools gain more insight into the ways that cisnormativity affects the systematic marginalisation of trans and non-binary students, they can then use this to inform policies proactively that encompass all forms of gender and ways of expression, without the need of the embodied personal experience to enact change.

Who and what influences gender policies in schools?

Gender policy at schools is influenced by a complex interplay of various factors and stakeholders. Here are the key influencers:

- Government and Legislation: In many countries, there are laws prohibiting gender discrimination in educational institutions. In many countries constitutions guarantee equality or non-discrimination across sex and/or gender.
- Administrators: Elected or appointed bodies make policy decisions, including the policies related to gender.
- Educational Organisations and Unions: Professional organisation groups like the National Education Association (NEA) advocate for inclusive policies and provide resources and training for teachers and other stakeholders.
- Unions: Teacher and staff unions often negotiate policies related to gender equality and non-discrimination.
- Parent-Teacher Associations (PTA's) and Community Groups: These groups can influence school policies by advocating for inclusive practices and supporting specific initiatives.
- Students and student organisations: Students councils can push for changes in gender policy by voicing the needs and concerns of the student body in the community and in schools.

- Activist groups and student-led groups, such as LGBTQI+ alliances, can drive policy changes through activism and advocacy and be powerful voices for gender inclusivity in schools.
- Research and Academic Institutions: Studies conducted by educational researchers and reports from universities provide evidence-based recommendations for gender policies. Think Tanks focusing on education policy often publish guidelines and research that shape public opinion and policies in education.
- Non-Governmental Organisations (NGOs) and Advocacy Groups: NGOs work to influence gender policy through advocacy, litigation, and public education. Advocacy groups may focus on issues such as gender identity, sexual orientation, and gender equality in education.
- Media/social media: Portrayals of gender issues in the media can shape public opinion and pressure schools to adopt more inclusive policies.
- Social Movements: Broader social movements, such as feminism and LGBTQI+ rights movements, "Me Too" movement have a significant impact on schools' gender policies.

In summary, gender policy in schools is shaped by a diverse array of actors and influences, ranging from governmental bodies and educational organisations to grassroots activism and international standards. Each of these components plays a role in ensuring that schools are inclusive and equitable environments for all students and creating gender sensitive schools.

What is the impact of anti-gender politics on gender-sensitivity in schools?

Anti-Gender politics has seen an increase over the last number of years and can have a direct impact on schools and educational initiatives, sports and cultural programmes, healthcare and social services, and the use of public spaces in general.

The term 'anti-gender' refers to concerted and deliberate efforts, by certain groups of people, to undermine policy and legal provisions for such things as reproductive rights, gender-affirming care, sexuality and relationships education, and LGBTQI+ rights. Anti-gender politics will often position itself as a helpful and benign entity that is trying to protect traditional family values and children, whilst at the same time, attacking freedom of speech, freedom of identity and expression, sexuality and bodily autonomy (RESIST Project Team, 2024).

Ideologically, it refers to movements that see gender equality and diversity, sexual freedom, and feminism as threats to the sanctity of family and of national morality. This is a global movement involving networks of politicians, religious groups and media outlets, amongst others, that have overlapping interests and can work together through the availability of online networks and social media. These different groups often find gender

to be a common, unifying ground, as gender is constructed as an attack on either nature (religious actors), nation (nationalistic actors) or normality (conservative actors) (Kuhar and Zobec, 2017).

One of the core directives of anti-gender politics is to frame 'gender' as an ideology or theory rather than a factual part of the human experience that can be interpreted in a variety of different ways. In this way, gender itself can be attacked as a political ideology that is threatening family values, putting children's lives at risk and harming religious doctrines that this movement often stands for. One of the most important targets of the anti-gender movement in Europe is public schools and the educational process. Schools are often accused of brainwashing students or imposing the teaching of gender ideology (Kuhar and Zobec, 2017). This perspective can directly impact how schools approach gender equality and gender diversity – the latter defined as the recognition and respect for a range of gender identities beyond the traditional male-female binary. It also influences how schools create gender-sensitive environments. By framing gender as an imposed ideology, the anti-gender movement seeks to silence discussions about gender and sexuality, portraying them as threats to the safety of innocent children.

Anti-gender movements are also present in higher education in some countries. For instance, deans from several medical schools at Turkish universities have sought to remove the term "sexual orientation" from the universal Hippocratic Oath taken during graduation ceremonies. This change could have resulted in medical doctors refusing to examine LGBTQI+ individuals in hospitals.

The issue of access to bathrooms in schools and public spaces, explored above from a trans perspective above, often comes to the forefront in public discussions from an anti-gender perspective also, usually focusing on the question of who is allowed to use certain spaces and who is not. Trans and gender-diverse students frequently face exclusion from gendered bathrooms, where they are either perceived as a potential threat, or are advised not to use certain facilities under the guise of "protecting" their own safety. These arguments ultimately deny gender-diverse students not only access to bathrooms, but also autonomy over their own bodies and the right to choose spaces where they feel most comfortable. This treatment reduces them to an abstract notion of gender – one constrained by narrow definitions of "real" gender – instead of recognising them as people with valid and lived experiences.

The focus on "traditional" values by the anti-gender movement can exacerbate the policing of school uniforms described above, often (as already noted) subjecting the girls to more scrutiny than the boys. Within the anti-gender movement, uniforms can be politicised, so the legitimacy of who has rights to wear such uniforms becomes a political standpoint. Non-binary people are often left out completely of any uniform choice unless they are willing to fight for a neutral uniform policy within their particular school. Morwana Griffiths has made it clear that, "for any group of people to get an education of their own, the first need is to have a say and be listened to" (Griffiths, 2003, 34). Sadly, some, if not most, educational

systems are not willing to be flexible in their approach. Voices of marginalised groups are often stifled, which in turn 'others' trans people and fosters an environment of exclusion.

In some countries, the idea of gender as an ideology has been politicised so much that the word gender cannot even be discussed in schools and is seen as something that does not exist. For instance, a conservative/fundamentalist newspaper in Turkey argued that the traditional Turkish family unit was threatened by the term 'gender'. The argument's foundation is the notion that the term gender denotes gender equality, supports feminist movements, and affects young people's sexual orientation. By the influence of the campaign started by this particular newspaper and supported by religious groups, the term gender was forbidden to be mentioned in many of the governmental offices and various institutions started to remove the Gender Equality Policy Documents from their web pages. https://www.bbc.com/turkce/haberler-turkiye-47610198

People are often reduced to their physical anatomy, reinforcing rigid gender roles that limit expression for everyone—girls, boys, men, women, trans, and non-binary individuals alike. Although anti-gender discourse claims to protect traditional values, it imposes restrictive boundaries on how individuals can express their identities.

Reducing gender diversity to an 'imposed ideology' strips it of legitimacy, denying society a richer understanding of gender as a valid and natural spectrum of identities. This politicisation of gender undermines schools' ability to discuss gender openly and to teach relationship and sex education meaningfully, impacting students' understanding and acceptance. By framing gender as an ideological threat, anti-gender politics also erases the real, lived experiences of trans people, invalidating their identities and forcing them into a framework that dismisses gender as a core aspect of personal identity.

How can schools integrate gender sensitivity into their policies and practices?

Programmes to embed gender sensitivity and equality in schools and education systems require a whole of institution approach.

In the Higher Education Sector, work is ongoing where an institution will look at the data available in its context, analyse that data and then start to develop gender equality plans that apply to the specific institution. One of the programmes that looks at this is Athena Swan Charter, which is present in Ireland, the UK, Canada and Australia.

Athena Swan requires an organisation to bring together the quantitative data available relating to gender for students and staff, in relation to educational experiences and employment. The organisation will also collect qualitative data through surveys and focus groups to understand more the experiences of women, men and non-binary people across the organisation in every role. After collecting data, the organisation undertakes a self-assessment, analysing and reflecting on how the findings apply to its specific context. This process involves thorough self-reflection to identify priority areas for action. Additionally,

the data should be examined through an intersectional lens wherever possible, considering other factors that may contribute to inequalities and identifying targeted actions to address these intersecting disparities.

The next step is to create an action plan that addresses the areas relevant to the organisation's self-assessment. This action plan should be developed from the data collected, and should include specific, trackable objectives that can be continuously assessed to ensure ongoing improvement. While the areas covered will vary by institution, common focuses include employment practices, organisational culture (such as efforts to address gender-based violence), career progression, achievement, and intersectional considerations. For Athena SWAN, these plans are then peer-reviewed by colleagues from other organisations to ensure that the action plan is both ambitious and thorough, and that the organisation has critically examined its own challenges and areas for growth.

For primary and secondary schools, there are also some programmes in place, Gender Action is an award programme based in the UK that "promotes and encourages a whole-school approach to challenging stereotypes" (Gender Action Schools Award, 2023). Gender Action follows a similar approach to Athena Swan, focusing on Reflection, Evaluation and Planning at multiple stages from supporter, to initiator, to champion and finally as a beacon.

To synthesise the discussions throughout this chapter, below are some actions that schools may wish to consider and assess how relevant these are to their contexts.

Policy Review with a gendered lens:

All school policies encompass gender in some way. When policies are reviewed with gender sensitivity, it is important to take certain elements into account. Firstly, it is important to understand that children do not necessarily fit into specific gender stereotypes with a narrow set of social roles and behaviours that they are expected to comply with. It is important for children and young people to know that all emotions, roles, careers etc. are applicable to all genders. Secondly, it is vital to avoid the assumption that gender means only two things, male and female, and consciously include gender diversity in all ways of being and expression. To achieve this, the awareness level of teachers, students, parents and administrators need to be raised in a collaborative way. Thirdly, it is important to tackle the overarching cisnormative and heteronormative culture that is ingrained in the education system and school policies. When there is a comprehensive understanding that not everyone identifies as cisgender or heterosexual, this awareness will be reflected in the development of school policies that consider the diverse family dynamics and the needs of all children and young people in educational settings.

Period Dignity and Sanitary Policies:

To enhance gender equality, schools can implement policies regarding the availability of period products and sanitary bins. For instance, providing free sanitary products in bathrooms and installing bins in all facilities ensures proper sanitation for everyone (Department of Education, 2024). This approach accommodates not only menstruating

students but also boys who may need to use incontinence pads, as well as women, trans, and non-binary individuals.

Uniform:

Schools who choose to have a uniform may also consider the option of having an open, uniform policy that has lots of individual items available. This can make every student feel comfortable. The school could have a variety of items available for each student to choose which items of clothing they want to wear as part of the school uniform. This creates a universally inclusive clothing option for students.

Curriculum:

Curriculum is a key factor that should be included when discussing gender in relation to school policies. Recognising the importance of gender, a gender lens should be applied when addressing development and reviewing the curriculum. Key considerations include the diversity of the group developing the curriculum, the representation of individuals in the texts being created, and whose ideas and stories are valued. It is crucial that the curriculum does not reinforce stereotypes.

The Fawcett Society's report outlines this, calling for this issue to become a Government priority. From an education standpoint, they recommend that the early years sector should be valued better, with an increased investment in professional development for educators, improved salaries, funding for inclusive resources, and taking a whole-school approach to embedding gender equality (Fawcett Society, 2020).

Pedagogical practices:

These are the individual practices of teachers in the classroom, how we teach and what we teach. As a school, there may be policies about what language should be used in the classroom, but teachers should be conscious of this and their discourse. For teachers working in areas without the ideal policies, this is an opportunity for teachers to influence change and integrate gender inclusivity into the school and its policies. Teachers can create an environment that integrates gender inclusivity through their teaching materials, the language they use, how they support participation, challenging gender norms and creating a safer space for all genders (Teachers.Institute, 2024).

Local contexts

Closing questions to discuss or tasks

- Think about your own school or a school you have worked in, what policies exist that interact with gender?

- Are there any additional policies you think could be introduced?

- Are there any changes you would make, and how might you implement these?

- What are the barriers to gender policy implementation in schools in your own country and/or community?

- How can you think about school policies with a gender sensitive lens? And how does this change your interaction with these policies?

About the authors

Ayana Pathak

Ayana Pathak is an aspiring academic, currently pursuing her doctorate in the Department of Education from the University of Oxford. Her research interests surround the area of qualitative aspects of gender education in developing countries, with a focus on school education. This largely draws upon various theoretical concepts of sociology of education, as well as the concept of the hidden curriculum, through which the social construction of gender as a category is aimed to be evaluated. Her academic background is in the discipline of Sociology, having done her Bachelor's and Master's in the same, before embarking on an MPhil in Education and thereafter, the current DPhil programme at Oxford. She is a passionate feminist who aims to study questions of inequality in the field of education- through the lens of gender based reproduction theory.

Cennet Engin

Cennet Engin is a full professor who teaches undergraduate and graduate courses related to education, curriculum, social foundations of education, needs assessment and classroom management at the Faculty of Education. She worked as an expert and consultant at various international projects, on inclusion, gender equality in education, gender sensitive schools, strengthening democratic culture in primary education, prevention of domestic violence against women and digital citizenship. Her academic works included girls' education, democratic schools, inclusive education, democratic citizenship and human rights education, child labour and education and gender policy in education. She was awarded a Fulbright Senior Research scholarship and conducted research at the University of Wisconsin, Madison.

Hannah Solley

Hannah Solley (she/her) is a qualified Dramatherapist who has worked in the area of youth, family and mental health for over fifteen years. She has designed and implemented mental health awareness programmes as well as working in anti-bullying programmes in schools. She has been working with the trans community for several years, providing family and teen support, as well as educational guidance to schools and organisations in Ireland. This includes trans inclusive policies, best practice ways to support gender diverse students and peer education in gender diversity and allyship. She is

passionate about youth mental health and creating positive changes to help young people reach their full potential.

Sam Blanckensee

Sam Blanckensee (they/he) is a equality, diversity and inclusion practitioner based in Ireland with extensive experience in equality in Higher Education through their role as the Equality Officer at Maynooth University. Sam holds an MA in management for the nonprofit sector. Sam has worked within Irish LGBTQ+ organisations in voluntary and professional roles since 2013. Sam's work covers a broad range of equality, diversity, inclusion and interculturalism initiatives including LGBTQ+ matters, gender equality, anti-racism, disability awareness and access for those within the international protection system. Sam is a non-binary trans person who is also neurodivergent and queer, All Means All is a project where the personal meets professional for Sam.

TEACHING AND LEARNING DURING CRISIS AND UNREST: STRATEGIES FOR SUSTAINING EDUCATION FOR ALL

Dua Jabr Dajani; Julia Schlam Salman; Mridula Muralidharan; and Pamela February

Example Case

Below are three cases presented by people who were or remain involved in a crisis in their country.

Note: For the sake of clarity for the reader, we have amended the direct transcript in the examples. For the exact words, please watch the full interview with Sara, Gunalp and Baprinran. See the link to the video above.

Case Example 1: Italy (COVID pandemic)

Sara (2020-2021)

"In the context of the beginning of the COVID crisis in Italy at the very beginning, everything was evolving, and nobody knew what was happening. They were closing schools and all the public buildings at the end of February, and we were in lockdown at the beginning of March. Nobody knew how to handle this emergency, especially the teachers and the children. The situation was really confusing and what was especially important at the beginning was to understand the needs of the children at that time and how, as a researcher, I could have a good impact on the situation and give my help in dealing with this. There was no possibility of returning to school, having access to materials and teachers were struggling to reestablish the normal course of

education. The first thing we did as researchers was to work with a group of student teachers who were in their last year of the Masters in Primary Education. They started collecting the needs of the teachers they were in contact with. We interviewed teachers and saw they had a huge workload. In terms of the technical side, there was a lack of technical know-how and infrastructure. They struggled to keep contact with the kids because they did not have contact with some families before COVID. From the children's side, they were constantly saying that they really wanted to go back to school; not to be at school, but to be in contact with their friends. We also collected the needs from the parents' side. For example, a mother was very sad to see that not every class was possible for her child. For some children, it appeared as if some teachers just disappeared. Not many from my experience, but it was also possible to hear stories like that where there was no contact. So we focused on their need for contact and relationships, and we built a project based on it.

It was very common in our context that we woke up with news of something and we talked about this with our students. We usually sat down with our students and just asked them, "how much do you know about the situation"? We just wanted to make sure what they knew and if we needed to add something to it or just clarify something about the situation. We didn't want to hide issues from them, but also we did not want to give them extra information that could scare them. This also happened with families, so we sat down and talked to their parents and just asked them, how much do your children know about the situation? Or do you want us to maybe elaborate more on it? Do you want us to clarify something that it's not easy for you to do it? So I think we acted as supporters in this sense."

Case Example 2: Turkey (natural disaster)

Gunalp (6 February 2023)

"On the 6th of February 2023, we experienced a huge catastrophe in the southeastern part of Turkey and northern Syria where two huge earthquakes and a series of smaller ones hit the area. As an educator in Turkey, we found ourselves in the middle of this crisis where we didn't know how many people we had lost. Education completely stopped in the region. Schools were closed. We couldn't access the teachers that we are working with inside our community. As far as we know, there were around 50,000 individuals who lost their lives during this earthquake and a lot of people needed basic necessities, for example, access to clean water, food and nourishment. A lot of buildings were destroyed, the city centre was completely destroyed, and some regions were not accessible to the public because the roads were destroyed as well. So, humanitarian aid couldn't go there. A lot of rescue missions couldn't be organised in some regions. So we have lost a lot of people that way as well.

Teachers who found themselves in this zone were also the victims of the catastrophe as well, but they were trying to help each other, as they were trying to survive. An organisation called Teachers Network supported the region, where the educators in our community tried to focus more on teachers, learners, and others in the region by supporting them psychologically

and socially. We battled disinformation in the communication networks through critical digital literacy. We started to analyse the messages, and WhatsApp groups and fact-checked every piece of information. We discussed with educators what could be done with the students, learners, and children because people were living in tent cities. So together as communities of practitioners, we created a series of activities for psychosocial support, to be implemented in the region, outside of the school settings.

One great example I would like to share is about this one old woman attending one of the workshops. She claimed that she had this granddaughter. She said that "I'm attending this workshop because I want to help her, in whatever ways I can". So she joined us. She attended every meeting that was being implemented by our teachers. Afterwards, we found that she lost everyone in her life during the earthquake and she didn't have a granddaughter. Actually, I don't know if she had one before the earthquake, but we realised that she just needed contact with other individuals.

I think educators are the only ones in society in times of crisis that can detect a need like that because other people focus on basic needs, building infrastructure and so on. So I think through that programme that our teachers and the community of practitioners inside that region created, we could reach out to a lot of people and try to help them make sense of this catastrophe and normalise the situation in some way. I want to mention the power of community in times of crisis. As a person who is working with communities of practitioners all the time, I see that individuals in solidarity can change anything. Basically, as individuals, I know we have some power, but I think that as communities, while connecting, and forming interpersonal relationships, that makes a huge difference. I think that changes everything."

Case Example 3: Iran (alternative schooling as a strategy for sustaining democratic principles in education)

Baran (current)

"Our crisis is an ongoing situation. I'm from Iran, and as a country in the Middle East, we have so many social unrest situations in the region. We are always in contact with so many situations and circumstances that require care for our children. I am mainly focusing on the overall picture of the situation in Iran in terms of education and how our school functions within the situation. So we really try to incorporate the holistic approach in these kinds of situations where psychological care is as important as education. So as much as the information is necessary for our students to know about the situation, we also need to know how they feel about it, and how they are reacting to it. Thus, the holistic approach is important. I think in our context, since it's a continuous situation, it's not a crisis like you would also describe, there is no specific training that we could give to our teachers so they would be equipped in these situations. The only support that I can confidently say that we are constantly trying to provide to our teachers is mental health support. It's very important what they do to support the students

and their families, but at the same time, they need support. They need to also talk about their feelings, and how they feel, because they're also affected by the situation, of course. "

Note: We have condensed the interviews somewhat to capture the gist of the speakers. Please see the full interviews via the link above.

Initial questions

In this chapter you will find the answers to the following questions:

1. How do we define a complex concept such as " a crisis"?
2. What are the potential challenges for sustaining teaching and learning during times of crisis?
3. How do we respond to the educational challenges brought on by the crisis?
4. How can teachers be agents of change in a crisis?

Introduction to Topic

The authors acknowledge the complexity of crises, and the difficulty in addressing every crisis situation (i.e war) within the scope of this chapter. Thus, here we focus on the teacher's role in creating a safe welcoming space where meaningful learning takes place in addition to focusing on strategies for sustaining education for all during times of crisis and unrest.

Crises, by definition, are disruptive to the school environment. They affect planning, stability, and continuity, as well as teacher and learner safety and well-being. In this chapter, we present a framework for teachers and teacher educators to navigate both isolated incidents of crises and prolonged periods of duress. We begin by defining crises, highlighting variations in scope and severity and acknowledging the increasing impact of instability on regions, countries, communities, and schools. Building on the VUCA (Volatility, Uncertainty, Complexity and Ambiguity) framework (for further information see Bennett & Lemoine 2014; Stein, 2021), we then present some of the short-term and long-term challenges, which may arise during crises. Based on case studies from Turkey, Italy, and

Iran, and examples from across the globe, we outline guiding principles and practices for sustaining teaching and learning during times of crisis. The chapter concludes with additional references and resources for teachers.

Key aspects

Defining crises

Defining a crisis is not merely a matter of describing events; it can involve a complex and politicised process. The term "crisis" lacks a singular, universal definition, as these events are multifaceted and can affect individuals and groups in varying ways. What one person may view as a disaster, another might see as an opportunity for positive change. This diversity in perception stems from differing values, perspectives, and priorities. As a result, managing crises becomes challenging for governments and authorities, as there is no singular rulebook to follow. Instead, various groups, including political parties, activist organisations, the media, and citizens, interpret and respond to crises in their own ways.

The concept of a crisis encompasses a wide range of events and situations that significantly disrupt society and threaten stability across economic, social, political and educational sectors. From acute emergencies such as natural disasters to prolonged circumstances such as ongoing famine. These events share characteristics of destabilisation and the need for rapid and effective responses. Understanding the many aspects of crises is essential for creating effective strategies that reduce their impact and strengthen resilience, the ability to adapt, recover, and grow stronger in the face of adversity.

As societies continue to face complex challenges, from pandemics, to armed-conflicts to climate-related disasters, the ability to adapt, respond, and recover will become increasingly important. This underscores the need for continued research, preparation, and collaborative efforts across sectors and nations to build a more resilient global community. The Israeli-Palestinian conflict provides a powerful example of this complexity. The events of 1948 mark the Palestinian Nakba and Israeli Independence. For Palestinians, the Nakba (meaning "catastrophe" in Arabic) represents a profound crisis marked by the mass displacement of hundreds of thousands of Palestinians, the destruction of villages, and the loss of their homeland. From this perspective, the Nakba is a disaster with enduring consequences, symbolising a crisis of identity, loss, and ongoing struggle for rights and recognition. Conversely, for Jews, the same period is celebrated as a declaration of independence from the British Mandate and a return to their historic homeland after 2000 years of exile. From this viewpoint, the events of 1948 are seen as a triumphant moment of nation-building and self-determination. The crisis for Jews was the survival of their people and the creation of a sovereign state, which was achieved through the founding of Israel. These differing interpretations reflect how deeply political and value-laden the process of defining a crisis can be. What is seen as a devastating loss by one group can be perceived as a

historical victory by another. As a result, managing crises like these becomes challenging for governments and authorities, as there is no straightforward rulebook to follow. Instead, various groups, including political parties, activist organisations, the media, and the global community, interpret and respond to crises in their own ways, influenced by their unique historical narratives and contemporary realities.

Post-crisis debates often centre around what caused the crisis, its severity, and the lessons that can be drawn. These discussions are not just about the facts; they are also about broader worldviews and what actions should be taken. Therefore, terms like "crisis," "disaster," or "emergency" are not neutral descriptors but are embedded within a larger political discourse about how society understands and addresses major events (McConnell, 2020).

A crisis can be understood as a significant and destabilising event or phase that drastically affects key aspects of society, including the quality of life and future prospects of individuals, particularly the youth (Bojović et al., 2020). For instance, the COVID-19 pandemic severely disrupted educational systems, posing a threat to societal stability and progress. This situation necessitated rapid and effective responses from institutions, including a shift from traditional to remote learning models (Bojović et al., 2020).

Similarly, a crisis can refer to a substantial event or series of events that disrupt society and hinder development, often characterised by conflict, economic turmoil, political instability, and social upheaval. In Ukraine, the crisis brought on by war has profoundly impacted the education system, prompting swift modernisation and the adoption of crisis-responsive educational models. This situation hinders sustainable growth and liberal values, displaces communities, and calls for a reassessment and reinforcement of core values and national identity through education (Lavrysh et al., 2022).

Moreover, a crisis is an intense event that significantly affects societal structures, such as educational activities, by posing challenges related to infrastructure, mental health, security, and communication. The earthquake in Kahramanmaraş, Turkey, on February 6, 2023, exemplifies such a crisis, requiring immediate action from educators and policymakers to address the various challenges faced by teachers and students. This crisis highlights the need for both individual and collective strategies to restore normalcy and enhance preparedness and crisis management for the future (Arıcı et al., 2023). Furthermore, a crisis can manifest as a widespread and persistent problem that greatly disrupts societal well-being and development, often involving severe issues like hunger and malnutrition. In many African nations, the hunger crisis has been a persistent challenge over the past three decades, as evidenced by various Global Hunger Index (GHI) scores. This crisis is exacerbated by factors such as undernourishment, stunted growth, and wasting in children, and is linked to broader issues of human development, social security, and terrorism (Otekunrin et al., 2020).

The politics of crisis terminology is a nuanced and strategic aspect of political communication. The term "crisis" encompasses various events such as accidents,

emergencies, and disasters, typically characterised by high threat, uncertainty, and urgency. However, the absence of a universally accepted definition reflects the diverse ways societies and political actors attempt to understand and address extreme events. The language of crises is a powerful tool used by governments and opposition groups to shape public perception and influence responses. Governments may invoke crisis rhetoric to justify extraordinary measures, promote unity, or advance policies, sometimes for political gain. Opposition groups use it to highlight issues, pressure the government, or push for change. The framing of crises, through terms that emphasise scale, urgency, or causes, shapes how the public perceives and reacts to events. Recognising this political dimension is crucial for critically analysing how crises are presented and their broader societal impact.

Crisis language may be used to criticise opponents, accusing them of being unfit to lead during critical times or failing to support the country. In extreme cases, it may be used to suppress dissent, with the argument that criticism during a crisis can hinder effective problem-solving. Overall, crisis language is a powerful tool that governments use to drive change, silence critics, and shape public perception during challenging times.

The key takeaways in understanding the complexity of defining a crisis are:

1. Diversity of Crises: Crises vary widely, including health emergencies, conflicts, natural disasters, and persistent societal issues.
2. Impact on Society: They affect multiple facets of society, particularly vulnerable populations such as youth and marginalised communities.
3. Disruption of Education Systems: Crises often severely disrupt education, necessitating innovative approaches to ensure continuity and adaptation.
4. Necessity of Crisis Management: Effective crisis management requires both immediate action and long-term strategic planning to build resilience.
5. Opportunities for Transformation: Crises can present challenges as well as opportunities for societal transformation and the reinforcement of core values.
6. Global Interconnectedness: The interconnected nature of modern society means that crises often have far-reaching consequences beyond their immediate geographic location.

What are the potential challenges for sustaining meaningful teaching and learning during times of crisis?

Sustaining teaching and learning for all during times of crisis presents multiple challenges. Numerous factors can impact the quality and the conditions of the learning environment as well as the welfare of both the teachers and the students. Because crises are seen as disruptive, they jolt educational systems and impact the broader social and family equilibrium. This imbalance affects learners' immediate and long-term needs including physical needs, social needs and, ultimately, integrative needs (Prince & Howard, 2002).

The VUCA Framework

One model that can be helpful in understanding the challenges that stem from crises is the VUCA (volatility, uncertainty, complexity and ambiguity) framework. Initially conceived of as a mindset for leadership development in complex military and later executive business systems (McNulty, 2015), this paradigm has since been applied to a range of fields including crisis management. The COVID-19 Pandemic, for example, exemplified VUCA conditions and this framework provided a lens for helping leaders and decision-makers to navigate the health crises.

In the following section, we discuss how actors within educational systems (such as teachers, students, school administrators and support staff) can use VUCA thinking to respond to crises. Although some scholars have critiqued the VUCA framework for its limited applicability in societies where volatility, uncertainty, complexity and ambiguity are widespread (Eoyang & Jenkins 2020), we aim to demonstrate how this system of thought can be applied to both specific incidents of crisis, such as a school shooting, and prolonged periods of crisis, such as ongoing armed conflicts and war. In both circumstances, volatility, uncertainty, complexity and ambiguity are present. How individuals and, specifically educators, respond to VUCA conditions can impact educational continuity as well as both short-term and long-term challenges that stem from crises.

Crisis Challenges through a VUCA Lens

Notwithstanding the complexity of a crisis, all crises exhibit degrees of volatility, uncertainty, complexity and ambiguity, and can be classified on a continuum from low to medium to high (Mladjan & Cvetković, 2012). Examining crisis situations using VUCA categories can help determine how to act in similar circumstances.

Volatility generally refers to the surrounding environment where circumstances can be unpredictable and demand urgency. Changes can be sudden and difficult to prepare for and feelings of helplessness may ensue. To counter volatility, teachers need to set expectations and then adjust them based on the situation at hand. Doing and achieving become antidotes to helplessness as well as a means for fostering resilience among learners (Schlam Salman & Schvarcz, 2024). An important caveat when assessing volatility, concerns the degree of threat and uncertainty present. When threats are high, as in an active earthquake or a barrage of missiles, immediate action is required. Educational frameworks, particularly those in areas of ongoing crises, may already have plans in place for managing the volatility characteristic of crises. Sustaining learning through definitive, yet malleable, expectations, even in extreme circumstances, fosters positive self worth and the possibility of a return to stability and calm.

Uncertainty remains a feature of crises, in particular calamities characterised by widespread injury, destruction and, in the most extreme cases, death. A VUCA framework advocates for action despite uncertainty. This is necessary to preserve learners' social and

emotional wellbeing and to find a balance between scholastic goals and general welfare. It has been well-documented that learning is a cognitive, social and emotional undertaking that involves more than the mere transmission of knowledge (Zembylas, 2007). In order to manage and respond to the uncertainties present during crises, educators need to complement expectations with empathy and care. In particular, the model of Maslow's hierarchy of needs can help assess degrees of uncertainty and appropriate expectations. Learners whose basic physiological needs are not being met require modified and/or scaffold expectations as well as additional flexibility and out-of-the-box pedagogy. Nevertheless, maintaining learning and some scholastic expectations, even in the face of uncertainty and turmoil, is key to resilience and a return to societal functioning where attending school is the general and optimal norm.

Complexity exemplifies crisis situations. Both local, isolated incidents and major, geopolitical disasters tend to be dynamic and multifaceted with interdependent, and sometimes competing parts. Rarely do such circumstances fit into neat or simple "good-bad" slogans but instead reflect complex, interdependent interests and concerns. Complexity requires vigorous assessment of evidence as well as clarity and critical thinking. Teachers must grapple with information and misinformation fuelled, in part, by social media platforms where non-experts can easily disseminate "news" that may not be totally accurate. Teachers play a key role in helping learners to navigate complexity in crisis first by ensuring that the facts about the situation are descriptive and accurate and then by encouraging their learners to challenge hearsay and to check multiple information sources. See the example provided by Sara (Case Study 2 – COVID Pandemic in Italy) when describing how "news" was discussed with learners and their parents.

Ambiguity is present in most crisis situations and therefore demands a shift away from rigid predictions and control. Instead, it calls for fostering competencies that enable individuals to effectively navigate volatility, uncertainty and complexity.

In this context, critical and affective literacy can be pivotal. Critical literacy involves understanding socio-historical contexts and acknowledging how crises disproportionately affect certain ethnic and indigenous communities. Affective literacy entails teachers providing the opportunity to learners to reflect on personal desires and emotions and them taking responsibility for their consequences. Together, these literacies can empower individuals to confront discomfort without succumbing to it and to ultimately envision alternative futures. Thus, teachers need to acknowledge the ambiguity of the experience for all affected alongside a commitment to evidence-based information as this is imperative for mitigating duress in order to cope to some extent as this is ultimately important for sustaining education during times of crisis.

Unpacking the Challenges of Crises

A VUCA framework can be helpful in clarifying features that generally accompany crises,

namely volatility, uncertainty, complexity and ambiguity. These also contribute to and inform the challenges that stem from crises. In general, such challenges can be divided into (1) immediate or short-term challenges and (2) long-term challenges that persist even after the crisis has subsided. In addition, the ramifications stemming from the challenges generally correspond to the magnitude of the crisis (low, medium or high).

Short-Term Challenges

Short-term challenges for teaching and learning during times of crisis tend to revolve around basic physiological and safety needs. This is the case for many kinds of crises including natural disasters, health pandemics and armed conflicts. At times, school spaces may no longer be functional or safe. In these cases, there might be governmental bodies, which regulate the initial challenges such as determining whether it is safe for children to go to school at all. In the event that school spaces are not viable, determining where, physically, children can attend school is another immediate challenge. Solutions sometimes require creative and out-of-the-box solutions such as mobile schools or community-based schools. Another viable alternative, assuming connectivity and access to digital resources is online or hybrid learning. Yet another urgent short-term challenge pertains to infrastructure for ensuring children's safety. Schools being conducted in war zones, for example, ideally have bomb shelters or areas where children can take cover if necessary. This is also the case for natural disasters such as hurricanes and tornadoes. In all these cases, schools may have a crisis response policy, which ideally is familiar to all involved stakeholders. In their comprehensive article on maintaining education during wars, Salha et al (2024) outline different educational responses to short-term challenges focusing on the importance of maintaining education despite unrest.

Long-Term Challenges

Long-term challenges for teaching and learning during times of crisis tend to have lasting implications that correlate with socioeconomic levels and parental education levels (Blaskó et al., 2022). Long-term challenges can be divided into three broad categories: long-term scholastic challenges, long-term cognitive challenges and long-term psychological challenges.

Long-term scholastic challenges relate to specific knowledge gaps that impact future academic achievement. For example, children who have missed significant parts of first grade, where foundational literacy skills are often acquired, may continue to demonstrate delays in reading and literacy years later. Delays in scholastic skills may overlap with long-term cognitive challenges, which can include delays in abstract and critical thinking as well as delays in stages of development. Long-term psychological challenges may also overlap with academic and cognitive challenges, in particular those stemming from sustained volatility, uncertainty, violence and trauma. Mental health issues such as anxiety, stress

and depression may be pervasive. In addition, enduring ongoing crisis and unrest may result in other psychological conditions that impact learners' ability to maintain day-to-day functioning.

Addressing long-term challenges requires assistance from trained professionals who can guide teachers and other educational stakeholders. Several chapters in this modular open source textbook can provide further resources. They are linked here as follows:

*Teacher agency and inclusion

*Inclusive Education in diverse contexts (See section on Refugee Camps)

*Restorative Practice in School: Implementing restorative approaches to resolve conflicts and build positive relationships within the school community

*Breaking the silence: Empowering schools in the practice of trauma informed education

The impact of education on conflict and its resolution

As much as crises have an impact on education in terms of learning and teaching, education in turn can play a crucial role in shaping societies and can significantly influence both the emergence and resolution of conflicts. Understanding the dual nature of education, its potential to reinforce divisions or promote peace, is essential for fostering stable and harmonious communities.

How education reinforces, exacerbates, and prolongs conflict:

1. Reinforcing dominant narratives: Education systems can perpetuate dominant narratives, stereotypes, and ideologies that fuel conflict. For example, education in some areas may emphasise a particular ethnic or religious identity, creating divisions between groups. For instance, in Myanmar, educational curricula often emphasise a Buddhist-nationalist perspective, marginalising ethnic minorities such as the Rohingya. This has contributed to longstanding tensions and violence against minority groups as the educational system entrenches a singular national identity rather than promoting inclusivity.

2. Intensifying inequality: Inequalities in access to education can widen existing social and economic gaps, leading to resentment and feelings of marginalisation. For example, the educational disparities during Apartheid in South Africa and Namibia served to entrench social stratification and disenfranchise Black South Africans. The unequal provision of "Bantu Education" not only maintained the regime's control but also fueled uprisings, particularly among students who sought equal rights. Similarly, in Colombia, limited access to quality education in rural areas exacerbated inequality and drove the youth towards armed groups, perpetuating the cycle of violence.

3. Promoting polarising curricula: Educational materials can be biased or one-sided, promoting a particular political or ideological agenda, which can deepen divisions and fuel conflict. For example, History textbooks in Namibia and South Africa portrayed a biased view which did not include the history of the oppressed people. Similarly, the

use of biased history textbooks during the ethnic conflict in the former Yugoslavia contributed to entrenched ethnic divisions, as each group received a version of history that portrayed them as victims and the other groups as aggressors. Such curricula hampered reconciliation efforts and perpetuated animosities long after the war had ended.

4. Lack of critical thinking skills: Education systems that focus solely on rote learning or memorisation may leave students ill-equipped to navigate complex conflicts. In authoritarian regimes, such as North Korea, where the education system emphasises obedience and ideology over critical thinking, individuals lack the tools to question and challenge the status quo. This not only perpetuates existing conflicts but also stifles potential avenues for peaceful change and progress.

How education promotes peace and positive influences:

1. Fostering tolerance and understanding: Education can promote cross-cultural understanding, empathy, and tolerance by incorporating diverse perspectives and experiences. For instance, in post-genocide Rwanda, educational initiatives have included curricula that address the history and implications of the genocide while promoting unity and understanding among different ethnic groups. Programmes that encourage dialogue and shared experiences have been instrumental in fostering reconciliation.

2. Critical thinking and problem-solving: Education that emphasises critical thinking, problem-solving, and collaboration can help individuals develop skills to address conflicts constructively. In Finland, educational reforms highlight project-based learning and cooperative tasks that encourage students to think creatively and work together, equipping them to approach conflicts with innovative and collaborative solutions.

3. Conflict resolution skills: Education can impart conflict resolution techniques, such as mediation, negotiation, and dialogue, to help individuals manage disputes effectively. Programmes like "Peace Education" in various conflict-affected zones, such as Gaza and Israel, teach students how to engage in dialogue, manage disagreements, and seek collaborative solutions, fostering a culture of peace.

4. Social cohesion: Education can promote social cohesion by emphasising shared values, common goals, and a sense of shared humanity. In countries like Lebanon, initiatives that bring together students from different religious and cultural backgrounds through joint learning opportunities can build bridges and foster mutual respect, laying a foundation for a more harmonious society.

Recommendations for maximising the positive impact of education

To maximise the positive impact of education in crisis and conflict-affected contexts, it's essential to:

1. Develop inclusive curricula that promote critical thinking, tolerance, and understanding. Curricula should promote critical thinking, tolerance, and understanding, integrating diverse perspectives to foster an environment of mutual respect.
2. Provide access to education for all individuals, regardless of their background or circumstances. Ensuring access to education for all individuals, regardless of their background or circumstances, is essential in preventing marginalisation and resentment.
3. Foster safe learning environments that prioritise student well-being and protection. Learning spaces must prioritise student well-being and protection, encouraging open dialogue and resilience in the face of adversity.
4. Encourage community engagement and participation in education planning and implementation. Actively involving communities in educational planning and implementation can foster a sense of ownership and relevance, ensuring that the education system aligns with the needs of the populace.

By acknowledging and addressing the complex role of education in both perpetuating and resolving conflict, we can work towards building more peaceful, inclusive, and resilient societies. Through strategic interventions in education, we can lay the groundwork for understanding, empathy, and collaboration in the face of division and discord. (Adapted from Di Maio, Brück & Miarri, 2022).

How do we respond to the educational challenges brought on by the crisis?

In times of crisis, the role of teachers and educators extends beyond the physical boundaries of the school walls and being the mere convenors of structured and formalised academic content. The examples provided at the beginning of the chapter help us understand that crises such as health pandemics, natural disasters, or social and political upheaval tend to not only disturb but could potentially also disrupt a student's traditional learning environment, creating unprecedented challenges for teachers. It is here that we acknowledge the centrality of 'care' in education, for its role has become more prominent and apparent. The chapter relies on two pedagogical approaches that have emerged as crucial in addressing the various challenges of teaching during different crises. These are 'pedagogy of care' (Noddings 1992; Mortari, 2016; Mehrotra, 2021) and 'trauma-informed pedagogy' (Brunzell et. al, 2019), and they are used as the foundational theories for addressing the challenges since they recognise and emphasise the emotional and psychological needs of the students during these unusual times.

As stated earlier, both 'pedagogy of care' and 'trauma-informed pedagogy' recognise 'care' as a core principle that guides and dictates the pedagogical interventions. Care is essentially fundamental in education, particularly during times of crisis. This section, therefore, will attempt to define the theories briefly. Drawing from the two theories, the chapter will shed light on the various principles, values, and strategies educators can adopt during these difficult periods.

Pedagogy of Care

The theory of pedagogy of care is widely used in education and emphasises empathy, nurturing, and creating enduring bonds between teachers and pupils. Emerging from feminist theories, humanistic education, ethics of care, and particularly Nel Noddings' (1992) work, it highlights the centrality of 'care' in education. It sheds light on previously ignored emotional and mental needs of students, alongside their academic needs, as a way to promote a more comprehensive education and pedagogical system. We recognise and acknowledge the need for it in today's time, which are often dictated by unprecedented events and crises. The pedagogy of care, therefore, has regained its importance.

The foundational idea of the pedagogy of care is rooted in the philosophy of ethics of care, which emphasises relational dynamics over individualism. Nel Noddings (1992), a proponent of the theory, argued that education should prioritise caring relationships between teachers and students. For her, care is both a moral and educational imperative. Noddings (1992) highlights that students thrive in environments where they feel valued, respected, and emotionally supported. Ethics of care is the philosophical and foundational principle of pedagogy of care. It prioritises and emphasises the building and development of nurturing connections between educators and learners, providing care as both morally and educationally necessary (Noddings, 1992). These educational settings, therefore, foster a sense of worth, respect, and emotional support that are conducive to students' well-being.

A critical aspect of the pedagogy of care is the emotional labour required by educators. As Mortari (2016) suggests, care involves nurturing emotions that contribute to a healthy, respectful relationship between the 'caregiver' (educator) and the 'care receiver' (learner). In an educational context, this means that teachers must be emotionally attuned to their students' needs, providing them with a sense of safety and belonging, which facilitates learning. However, what lies at the core of this progressive pedagogy is the emotional labour that educators must perform. According to Mortari (2016), providing care entails fostering feelings that support a positive, mutually respected connection between the care provider and the person receiving it. This implies that in an educational setting, educators have to be sensitive to the emotional needs of their pupils to provide them with a sense of security and acceptance, which promotes learning, which given the uncertain circumstances of crisis is an important aspect. Mortari (2016) further investigates how

care in educational environments nourishes students' emotional and intellectual growth. The focus is on seeing care as an active, continuous process that calls on teachers to develop relationships of trust with learners to foster a conducive and thriving learning environment. This care is not solely for learners but should be extended to communities of care for all educators who operate in the learning environment because without their well being catered for, they cannot in turn care fully for their learners.

Ba (2022) highlights the importance of fostering community and well-being, even in the face of mass disruption and loss, and how the duty of care, during such times, is not merely about delivering structured academic content but ensuring the mental and emotional well-being of students, due to heightened anxiety and stress levels. Arguing on similar lines, Mehrotra (2021) reflects on the need for collective well-being and community care in educational space while emphasising the importance of co-creating meaning and fostering a sense of belonging, the practice of care, herein, is not a peripheral concern but central to the educational mission, especially in times of widespread distress. This educational philosophy is also closely tied to the belief in social justice, wherein we recognise and acknowledge how the various systematic and institutional barriers disproportionately affect marginalised students. Therefore, when we attempt to centre 'care', educators resist the commodification of learning and create spaces where students are seen as whole persons, bringing their identities and the challenges that come along with it, rather than mere consumers of knowledge (Noddings, 1992; Mehrotra, 2021).

Trauma-informed Pedagogy

Another key theory that compliments the theory of pedagogy of care is Trauma-informed pedagogy. It has emerged as an essential framework in modern educational systems to support learners who have experienced adverse life events and therefore is relevant to learners in citations of crises (Brunzell et al., 2019). It is grounded in principles of psychological safety and therefore gives importance to mental and emotional well-being, empathy and understanding. The strength of this theory lies in acknowledging the deep impact of the trauma of an event or a crisis on the learners' ability to be part of a structured academic program and therefore impacting their learning and ability to be a part of a formalised academic setting. This educational theory is rooted in the understanding that trauma is not a rare event, unfortunately. Hence, it is necessary for educators to incorporate trauma-informed practices into their teaching to create an environment where the learners most importantly feel physically and mentally safe, supported and a flexible model of learning is offered to them (Brunzell et al., 2019).

The implementation of trauma-informed pedagogy necessitates more than just a mere understanding of trauma but rather involves understanding how a shift in how educators approach teaching and interacting with students ought to occur. As Brunzell et. al (2019) suggest, trauma-informed strategies can include flexible learning environments, emotional

regulation activities, and practices that prioritise relational connection over academic content alone. This includes, firstly, an effective strategy for developing safe classrooms, where the learners are encouraged to express their feelings without fear of judgement. This could include creating routines, open and safe communication, and practices that ease the stress (Brunzell et al., 2019). Most importantly, however, is that this approach incorporates positive behaviour and restorative practices. Understanding that behaviours of 'indiscipline' during the classes may stem from trauma allows teachers to respond with empathy and support rather than punishment (Cramer, 2018).

Trauma-informed pedagogy represents a vital shift in how educators approach teaching, wherein they prioritise safety, trust, and empowerment in situations of crisis, whether short-lived or ongoing therefore, these educators create classrooms that are not only spaces of academic learning but also places of healing and growth (Brunzell et al., 2019).

The educational response to different crises can be as varied as the nature of crises themselve varies. As the term crisis implies, a significant disruption affects the normal functioning of a society, leading to immediate challenges that require urgent response and recovery efforts. Also, crises can take many forms, including natural disasters, armed conflicts, pandemics, and socioeconomic upheavals. Each type of crisis can have profound implications for education systems, necessitating tailored responses that consider the specific context and needs of affected populations. Thus, the authors do not claim that the responses discussed below are the only viable ones.

In the next section, we will explore how educational institutions and stakeholders can respond to the challenges posed by crises, focusing first on the principles and values of care, followed by practical response measures involving various stakeholders.

Principles and Values of Care in Education

1. Empathy and Understanding:

In times of crisis, it is essential to cultivate an educational environment that prioritises emotional well-being. Research suggests that supportive educational environments contribute to better mental health outcomes for students and can mitigate the negative impacts of stress and trauma (Brymer, et al., 2012). Schools can introduce comprehensive support systems where teachers are trained to recognise and respond to emotional distress.

2. Inclusivity and Equity

The COVID-19 pandemic has highlighted existing inequities within education systems worldwide. The United Nations Educational, Scientific and Cultural Organization (UNESCO) stated that marginalised groups are disproportionately affected by educational disruptions

(UNESCO, 2020). Emergency educational responses must ensure equitable access to learning resources, particularly for vulnerable populations.

3. Flexibility and Adaptability

Education systems must demonstrate flexibility to adapt to rapidly changing circumstances. The World Bank emphasises the importance of agile education systems that can switch between various modes of learning (World Bank, 2022). This flexibility could involve using online learning platforms, hybrid models, or community learning hubs to ensure continuity in education.

4. Collaboration and Community Engagement

Stakeholder collaboration enhances the effectiveness of educational responses. Evidence shows that schools engaged with parents and the community during crises saw improved educational outcomes and student engagement (Epstein & Sheldon, 2022). Building partnerships with local organisations can also facilitate resource-sharing and support programs.

5. Safety and Protection

Ensuring safety in educational settings is paramount, particularly in crisis situations. The Global Coalition to Protect Education from Attack emphasises the necessity of implementing protective measures and protocols to safeguard students and teachers from violence and trauma (Global Coalition to Protect Education from Attack, 2019). This could include training educational staff in crisis response and establishing secure infrastructures.

Response Practices for Different Stakeholders

1. Governments and Policy Makers

Governments must lead in establishing frameworks for educational continuity during crises. The United Nations Children's Fund (UNICEF) outlines the necessity for responsive policy frameworks to secure educational planning and resource allocation even in emergencies (UNICEF, 2020). This guidance leads to actionable steps in prioritising education during and after crises.

2. Schools and Educators

Schools need to adopt trauma-informed approaches to education as part of their crisis response. Research indicates that trauma-informed practices positively affect academic

performance and student behaviour (Casale & Linderkamp, 2024) Educators trained in understanding trauma can create supportive learning environments to help students recover and engage meaningfully.

3. Non-Governmental Organisations (NGOs)

NGOs often fill gaps when governmental responses may falter. They have the expertise and flexibility to implement programs targeting unique educational needs during crises. For instance, organisations like Save the Children provide emergency education responses that adapt to the changing conditions in conflict and disaster zones (Save the Children, 2021).

4. Families and Communities

Families and communities are integral to educational success, particularly during crises. Communities can play a vital role in advocating for educational needs while establishing networks for support. Research has shown that family engagement positively influences children's academic achievement (Henderson & Mapp, 2002).

4. How can teachers be agents of change in a crisis?During times of crisis, teachers play a crucial role as agents of social change, assuming multifaceted responsibilities that go beyond traditional and expected educational duties. Such challenging times create an environment of heightened stress, fear, and uncertainty. The safety and well-being of learners, especially those from socially marginalised communities, are often compromised (Davis et al. 2021). Classrooms, embedded within the fabric of the community and society, reflect this diversity, encompassing students of various social identities, such as class, caste, gender, religion, ethnicity, and disability. See the chapter on Teacher Agency

Teachers are essential in fostering physically and emotionally safe spaces where learners feel secure. This involves providing emotional support to alleviate anxiety and stress. They must ensure the safety and security of all learners while maintaining a sense of 'adaptive normalcy' and providing targeted support in the case of learners with specific educational needs.

One of the essential tasks for teachers during crises is to unpack the nature of the crisis thoughtfully and respectfully. This includes but is not limited to facilitating discussions that explore the crisis, encouraging critical thinking and promoting empathy among students, helping them process complex emotions and develop nuanced perspectives on current events. This has to be done in an age-appropriate manner (UNESCO, 2020).

Extending learning beyond the confines of the school is another critical role for teachers. Teachers make education more relevant and impactful by embracing the pedagogy of care (Noddings, 1992; Mortari, 2016; Mehrotra, 2021) and trauma-informed pedagogy (Brunzell et al., 2019), as discussed in the previous sections, by moulding school knowledge and linking it to real-world events. This approach fosters a sense of purpose and engagement,

helping students see the value of their education in real-life contexts. The curriculum must adapt to accommodate diverse learning styles, ensuring meaningful engagement for all students.

Teachers also serve as role models, demonstrating empathy, resilience, acceptance, and flexibility and encouraging respect and morality (Cappy 2016). By embodying these traits, teachers reinforce positive coping mechanisms and encourage adaptive behaviours among students. Creating a safe and inclusive classroom environment, coupled with open communication and empathy, is crucial. It also fosters a sense of belonging and mutual respect. As discussed, these practices are at the core and embodiment of 'care'.

Mindfulness practices can help both teachers and students manage stress and maintain focus amidst uncertainty. Lastly, collaboration among teachers is essential for enhancing support systems and promoting effective crisis response strategies (Ba, 2022). By sharing resources and best practices, educators can better meet the evolving needs of students and the community.

Conclusion

In times of crisis, whether due to global pandemics, natural disasters, or societal upheavals, the role of education becomes more critical than ever. This chapter has examined the multifaceted challenges faced by educators, students, and communities during these troubled periods, and it has highlighted strategies for maintaining meaningful education amidst such adversity.

Key insights include:

1. The importance of understanding crises through frameworks like VUCA (Volatility, Uncertainty, Complexity, and Ambiguity) to better anticipate and respond effectively.
2. The vital role of teachers as change-makers, going beyond academic instruction to offer emotional support, create safe spaces, and nurture resilience.
3. The necessity of adopting learner-centred pedagogies, such as the 'pedagogy of care' and 'trauma-informed pedagogy,' which emphasise students' emotional well-being in tandem with academic development.
4. The need for adaptability and flexibility in educational methods, including the use of technology and alternative learning models when traditional approaches are disrupted.
5. The power of collaboration between educators, families, communities, NGOs, and policymakers to create robust support systems that prioritise teachers' and students' learning and well-being.

As we navigate an increasingly unpredictable world, the ability to sustain education during crises is essential for educators and educational systems. By fostering empathy, inclusivity,

and flexibility, we ensure that learning continues to thrive even in the most challenging conditions.

The lessons from global crises reveal that education is not just about imparting knowledge, but also about building resilience, fostering community, and nurturing hope. As we move forward, let us embrace these insights, continually supporting educators who, despite being overwhelmed, remain committed to their work and break the silence on their challenges.

Refaat Alareer, a distinguished Palestinian professor and writer, dedicated his life to amplifying Gazan voices through literature and initiatives like "We Are Not Numbers." Tragically killed in a Gaza airstrike on December 7, 2023, his legacy endures. If his work and poems teach us anything, it's that even in the darkest times, education preserves stories and keeps alive the hope that one day, these voices will be heard, Refaat Alareer wrote:

> If I must die,
> you must live
> to tell my story
> to sell my things
> to buy a piece of cloth
> and some strings,
> (make it white with a long tail)
> so that a child, somewhere in Gaza
> while looking heaven in the eye
> awaiting his dad who left in a blaze —
> and bid no one farewell
> not even to his flesh not even to himself —
> sees the kite, my kite you made, flying up above,
> and thinks for a moment an angel is there
> bringing back love.
> If I must die
> let it bring hope,
> let it be a story.
>
> REFAAT ALAREER

Alareer's poem, despite the immense tragedy that it is related to, gives us a message of hope and love. It teaches us that at the heart of every crisis, human beings suffer, and despite this suffering, human beings are resilient.

Closing questions to discuss or tasks

Having read the chapter, discuss in small groups your own experience(s) with a crisis situation/crises. Reflect on:

1. What makes it a crisis? Use the definitions discussed under 1. Understanding the complexity of defining a crisis to assist you in formulating your answer.
2. What challenges did you and your community encounter?
3. How did these challenges influence learning and teaching during/after the immediate crisis?
4. What was the response to these challenges? (See 3. How do we respond to the educational challenges brought on by a crisis?)
5. In your opinion, how can these responses be improved in crisis situations?
6. How can you as a prospective teacher be an agent of change so that inclusive strategies can reach all learners in your class/school/community to mitigate to some extent the far-reaching impact of a crisis?
7. Once your groups report back to the whole class, take note of how the challenges and responses are different based on the different types of crisis.
8. More importantly, take note of how the challenges and responses are similar across the various crises.

About the authors

Dua Jabr Dajani

Dua Jabr Dajani, Ph.D., is the regional counselor for English language teaching at East Jerusalem School and holds a lecturer position at the David Yellin College of Education. Her research interests encompass enhancing critical thinking in schools, exploring the impact of schooling on cognitive development, English teaching methodologies, and preparing educators to lead professional learning communities effectively.

Julia Schlam Salman

Julia Schlam Salman, Ph.D., is a lecturer and teacher educator at the David Yellin Academic College of Education in Jerusalem. She also teaches in the MA TESOL program and the Division of Languages at Tel-Aviv University. Her research interests include language education, language learning and teaching, and English language learning in areas of intractable conflict. She lives near Jerusalem with her spouse and four children.

Mridula Muralidharan

Mridula Muralidharan is a sociologist and social worker specialising in education, disability, and gender studies. Her doctoral research focuses on inclusive schooling practices for students with disabilities in India. In addition to her academic pursuits, she serves as the Digital Outreach Manager for the National Platform for the Rights of Disabled (NPRD), a pan-India cross-disability rights organisation.

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics

education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

INTERNATIONAL SCHOOLS FOSTERING OR HINDERING EQUAL EDUCATIONAL OPPORTUNITIES

Example Case

"The Peace School"

"The concept of The Peace School originated in 2005 in Iran as an innovative and alternative approach to education. Despite its progressive vision, the school faced significant challenges, as neither the government nor other organisations supported or approved of its methodology. Consequently, students graduating from the school were left without official diplomas and had to take mainstream assessment tests independently. After 19 years of suppressed operations in Iran, without national or international support or a platform for a voice, a new branch of The Peace School began operating in Toronto, Canada, in 2024 as a private, international elementary school.

The primary goal of establishing this new branch was to support Iranian students by providing them with recognised diplomas for their continued studies. The Peace School is a hub for international students, offering a unique environment where students from diverse backgrounds can learn, share experiences, and influence one another. The school's philosophy centres on a humanistic, child-centred approach, anticipating that students will be motivated to learn beyond mainstream educational requirements.

Collaboration in decision-making and lesson planning is emphasised, involving families, students, and teachers to create a supportive learning environment. We believe unilateral decisions by any single group — students, parents, or teachers/staff — can compromise education. Regular communication among all parties helps tailor personalised curricula that cater to each child's unique needs, abilities, and interests. We focus on sparking curiosity and creativity through project-based learning rather than a linear, textbook-driven approach. Instead of conventional numerical grading, we employ a descriptive evaluation process to assess a child's progress. This holistic approach comprehensively explains each child's growth and development.

We believe peace is not merely the absence of war; it encompasses principles such as love, empathy, and compassion, which must be learnt during childhood. Our vision is to create a community of positive, optimistic citizens equipped to make transformative impacts on their own lives, the lives of others, and society as a whole. We aim to nurture children who are aware of and engaged with the world, capable of addressing obstacles with innovative solutions, and can contribute meaningfully to a more compassionate and equitable global community."

Initial questions

1. International schools are microcosms of society. What are some of the gaps that exist within international schools?
2. Diversity is the core of international schools. How can international schools effectively integrate diversity, equitable practices and foster inclusion?
3. Students are agents for change. How can international schools empower students to better foster diversity, equity and inclusion?

Introduction to Topic

In this chapter, we focus on international schools and how they foster or hinder diversity, equity and inclusion. Through examining international schools as microcosms of society, clearly gaps exist within some international school ecosystems. What are the cultural, economic and social gaps? In addition, diversity is a core strength of international schools,

so how can diversity, equity and inclusion be fostered? Finally, with an understanding that students are agents for change, how can international schools empower students to better foster diversity, equity, and inclusion as they develop as global citizens?

In an increasingly globalised world (Bittencourt & Willetts, 2018), the international education industry continues to develop and expand in countries around the world (Bunnell et al., 2017; Hayden & Thompson, 2015). Highly influenced by colonialism (Poole & Bunnell, 2021), neoliberalism (Robertson, 2003) and capitalism (Rojo & Percio, 2020), international schools historically cater to the elite social class (Silva-Enos et al., 2022), typically populations of international expatriates from diplomatic, missionary, military, and multinational business organisations (MacDonald, 2009). Over time this has increasingly shifted to include a higher proportion of local host nation upper-middle class children and their families (Hayden, 2011; MacDonald, 2009). However the purpose of international schools has largely remained the same on paper, which is to educate and develop individuals who were socially competent and accepting of political differences, while also highlighting the human rights of all people (UNESCO, 1974).

Some researchers began noticing differences and developed three distinct definitions for the types of international schools that exist (Thompson & Hayden, 2013). These are described below.

The definitions of international school types

"'Type A' 'traditional' international schools: established principally to cater for globally mobile expatriate families for whom the local education system is not considered appropriate" (Thompson & Hayden, 2013: 5).

'Type A' example: The first documented international school is the International School of Geneva (Ecolint), founded in 1924 by visionaries and officials of the League of Nations and International Labour Organisation (Ecolint, 2024). It was founded to cater for children of expatriate and transient families who often change from year to year (Heyward, 2002). These mobile students might also include a percentage of children referred to as Third Culture Kids (TCKs) or transnational youth (Tanu, 2018). 'Type A' international schools, like Ecolint, are often private institutions that cater to the diverse elite and globally advantaged (Gardner-McTaggart, 2018). International mindedness and global citizenship are overarching values of 'Type A' international schools (Tarc, 2018) due to their associations with accrediting bodies such as the Council of International Schools (CIS), Western Association of Schools and Colleges (WASC), and New England Association of Schools and Colleges (NEASC). These schools also tend to adopt an international curriculum such as the International Baccalaureate (IB) (Silva-Enos et al., 2022), but may also specialise in more regional curriculums such as the French Baccalauréat, American Common Core or the British National Curriculum, with students aiming to complete their Baccalauréat (BAC)

diploma, Advanced Placement (AP) courses, General Certificate of Secondary Education (GCSE), or Advanced Level (A-Level) qualifications (Bates, 2011).

"'Type B' 'ideological' international schools: established principally on an ideological basis, bringing together young people from different parts of the world to be educated together with a view to promoting global peace and understanding" (Thompson & Hayden, 2013: 5).

'Type B' example: 'Type B' international schools are established with a clear vision of bringing together young people from different parts of the world to be educated in a shared environment. By doing so, they aim to foster a sense of global citizenship and mutual respect among students from diverse backgrounds. These institutions are not just centres of academic learning but are also hubs fostering cultural diversity, where students from various nationalities blend in, sharing their unique experiences while developing new, universal ones with their peers in the host country. In these 'Type B' schools, such as The Peace School, the emphasis is on creating a collaborative and inclusive atmosphere that transcends traditional educational boundaries. Students are encouraged to engage with each other's cultural perspectives, leading to a richer understanding of global issues and the promotion of international harmony. This approach aligns with the schools' ideological foundation, as they actively work towards building a more peaceful and interconnected world. By nurturing these values, 'Type B' international schools play a critical role in shaping the next generation of well-equipped leaders to navigate and contribute positively to our increasingly globalised society.

"'Type C' 'non-traditional' international schools: established principally to cater for 'host country nationals' – the socio-economically advantaged elite of the host country who seek for their children a form of education different from, and perceived to be of higher quality than, that available in the national education system" (Thompson & Hayden, 2013: 5).

'Type C' example: The initial step in the development of Type C international schools was recognising the growing demand among wealthy local families for an education that could provide a global perspective and competitive edge for their children. This demand was fuelled by the perception that the national education system was not adequately preparing students for the globalised world (Thompson & Hayden, 2013). To meet this demand, these schools designed a hybrid curriculum that integrates elements of internationally recognised programs, such as the International Baccalaureate (IB) or Cambridge International Examinations, with aspects of the local education system. This blend ensures that students receive a comprehensive education that respects local traditions and requirements while also providing a global outlook. Singapore International School (SIS) in Vietnam exemplifies the emergence of 'Type C' international schools. Established to cater primarily to the children of affluent Vietnamese families seeking a globalised education, SIS recognised the growing demand for an alternative to the traditional local curriculum (Nguyen, 2017).

International education's illusion of an accurate definition is the result of the diverse and varied contexts schools are situated in (Poole & Bunnell, 2021), however it is acknowledged

that international schools predominantly deliver curriculum in English, both in- and outside of English-speaking countries (Brummit & Keeling, 2013). It can be seen then that international schools are intricate social contexts (Grimshaw & Sears, 2008).

Defining diversity, equity and inclusion

Diversity, equity and inclusion (DEI) has become public discourse across many industries. Much like international schools, defining DEI is a contentious topic, with various scholars and practitioners debating each component and its importance. Variations of DEI that you may come across include:

- Diversity, equity, inclusion, justice (DEIJ)
- Justice, equity, diversity, inclusion (JEDI)
- Diversity, equity, inclusion, belonging (DEIB)
- Equality, diversity, inclusion (EDI)
- Inclusion via diversity, equity, antiracism (I-DEA)
- Diversity, equity, inclusion, accessibility (DEIA)
- Anti bias anti racist (ABAR)

For the purposes of our chapter, we will be using these definitions as defined by Arsel et al. (2022: 920):

"Diversity refers broadly to real, or perceived physical or socio-cultural differences attributed to people and the representation of these differences in research, market spaces, and organisations. Equity refers to fairness in the treatment of people in terms of both opportunity and outcome. Inclusion refers to creating a culture that fosters belonging and incorporation of diverse groups and is usually operationalised as opposition to exclusion or marginalisation."

Key aspects

International schools: A global industry

The number of international schools is rapidly rising with currently over 5000 worldwide (Bates, 2023). According to Brummitt (2007, 2009), the most rapid growth is occurring in Asia (especially China), Europe and Africa. However, these figures may not reflect true reality due to the highly contested definition of international schools (Tanu, 2018). Our working definition for this chapter refers to three types of international schools as defined by Thompson & Hayden (2013; see above), and when discussing the rise of these types of international schools, two factors can be attributed. First, as a result of globalisation and the growth of the middle class in so-called developing countries (World Bank, 2007), there is support for the expansion of the 'international school industry' as theorised by Bunnell

(2007) and MacDonald (2006), from an elite status to a more general status. Second, the education industry is generally gaining recognition as a global service industry worth billions of dollars (Bates, 2023), and its prospects for privatisation and commercialisation are highly valued (Susan Robertson, 2003). As a result, international schools are a global multi-billion dollar industry with double bottom lines, one educational and one business (MacDonald, 2006).

The growth of international schools is not purely numerical, as it has also coincided with the evolution of neoliberal ideologies in reorganising societies and social relations (Bates, 2023). Robertson (2008) elaborates that neoliberalism has three main goals:

"(1) the redistribution of wealth upward to the ruling elites through new structures of governance, (2) the transformation of education systems so that the production of workers for the economy is the primary mandate and (3) the breaking down of education as a public sector monopoly, opening it up for strategic investment by for-profit firms" (Robertson 2008: 12)

With this in mind, international schools vary widely, and the identities of these schools often deal with the tension between being market driven and ideology driven or falling on the spectrum between the two (Hayden & Thompson, 2008). As international schools are largely considered to be diverse hubs that are internationally minded and foster global citizenship (Tarc, 2018), the major issues that shape complex international school contexts and practices arise from the dichotomy between global culture and local culture in a global market (Bates, 2023). Tanu (2018: 5) explains that "international schools catered mainly to the children of expatriates, who made up 80 percent of the student body more than thirty years ago, rather than to local children, the trend has been reversed in recent years with local students making up 80 percent of the student demography." It is clear that international schools are ecosystems full of tensions, differing interests and bottom lines.

Existing gaps in international schools

When international schools were first created and developed, the identity of these schools were often determined by Western countries, such as the United States, the United Kingdom, Australia and Canada (Bates, 2011). With the specific target audience and clientele being largely expatriate, these international schools emerged to create a "school from home, away from home" (Gibson & Bailey, 2023: 410). As private institutions, international schools are complex social contexts (Grimshaw & Sears, 2008) that often form a community of diverse racial, cultural, and ethnic families (Brooks & Watson, 2019). In an increasingly globalised world (Bittencourt & Willets, 2018), where cultural, economic, and social divisions continue to widen (Putnam, 2015), schools need to be environments where diversity, equity and inclusion is fostered for all students (Riley, 2019). Interestingly though, Hayden (2011: 221) notes that "it is ironic, then, that schools that developed originally to promote greater social harmony and understanding between different people, as well as

to facilitate mobility, seem to be contributing to a growing educational gap between social groups and thus to growing inequality in societies."

Students spend a large portion of their youth at school, and developing a sense of inclusion and belonging is important (Maslow, 1954). At international schools, students are often forced to assimilate to the dominant culture, which is largely white and Western (Datnow & Park, 2008), and Anglo-Christian (Gardner-McTaggart, 2019). Reinforcing neoliberal and neocolonial ideologies, education sustains white supremacy at the most structural and societal levels, indoctrinating the dominant culture of whiteness and white privilege (Genao & Mercedes, 2021). This can lead to a divide between global and local culture, and identity confusion. Belonging, defined as being in a physical or virtual space where one can be confident and safe in one's identity, while also feeling valued and at ease (Flewitt et al., 2017; Riley, 2017), is an important aspect within international school communities. Despite the need for international schools to foster belonging through diversity, equity and inclusion, across OECD countries there is a declining trend with 1 in 4 international school students feeling that they do not belong (OECD, 2017). This could be due to the dynamic and transient nature of expatriate international teachers (Caffyn, 2010), or the understanding that the diverse cultural, social and racial make-up of the school population adds another complex layer to developing a sense of belonging in a global community (Brooks & Watson, 2019). It is no longer enough to assume that diverse student populations (Khalifa et al., 2016) and core values of global citizenship and international mindedness (Hill, 2014; Tarc, 2018) are markers for belonging in international schools.

What are some of the gaps that exist in international schools that are hindering diversity, equity and inclusion?

Socio-cultural gaps

"International schools hold great potential as transformative spaces to initiate planetary action for peace, equality, justice and environmental change" (Gardner-McTaggart, 2020: 1).

International schools, particularly those offering the International Baccalaureate (IB), operate within a unique global space that is independent of any single nation-state's political aims (Bourdieu 1996). Yet, while these institutions are unbound from national power structures, they often perpetuate a neoliberal ideology that has gained prominence in so-called Western democracies over recent decades (Gardner-McTaggart, 2020). This neoliberal orientation manifests as a form of cultural hegemony, where the international school landscape replicates Western, particularly Anglo European, values and norms under the guise of global education (Gardner-McTaggart, 2020). This globalised model not only reinforces social privilege and power but also promotes a largely uncritical adherence to Western ideals, cultivating a specific worldview in students that prioritises individual achievement and market-based values over communal or locally contextualised perspectives.

Despite a veneer of inclusivity, international schools often maintain an underlying framework of whiteness that pervades their curricula, staffing, and institutional culture. Predominantly led by white educators and operating with an unexamined Anglo-centric perspective, these schools risk advancing a limited view of global citizenship that may inadvertently obscure systemic issues such as colonial legacies and racial inequities. Even well-meaning initiatives, such as advisory programs and assemblies, that aim to address racism can fall short, treating it as an individual rather than a systemic problem, and leaving foundational power structures unchallenged (Bartoli et al., 2016). By examining the implicit racial and cultural biases embedded in international education policies and practices, it becomes evident that these schools play an active role in maintaining a globalised, Western hegemony, repackaging it as progressive education while neglecting critical interrogations of race and privilege (Gardner-McTaggart, 2016).

"How often did we as international students feel unrepresented in the course topics that were assigned to us? And how many of us, upon the death of George Floyd, felt the jolt of realisation that we know nothing about systemic racism, colonialism and its undiscussed modern successor?" (David, 2020: website)

In so-called developing countries, IB schools are typically private and cater to privileged demographics, whereas in Anglo European countries, the IB program is increasingly integrated within public (state) schools, appealing to middle-class families seeking high academic standards (IBO, 2012a; Resnik, 2012). Both of these reflect Type A and Type C international schools. This trend underscores the cultural capital linked to IB enrolment, which offers a sense of distinction and academic prestige (Bourdieu, 1984). The IB's mission promotes so-called Western humanist ideals, encouraging intercultural understanding and lifelong learning with an appreciation for diverse perspectives (IBO, 2020a, 2020b). As part of a loosely regulated global market, IB schools are prized for their IB World School status, which positions them competitively within a neoliberal marketplace that capitalises on the demand for globalised, elite education.

Socio-economic gaps

Being international is an ideology that has shaped international schools and the transnational and national class structures of the global economy (Tanu, 2018). The theme of social class is not unusual in the literature on international education. Class analysis in the research on international education has been underscored to reveal the role of elite institutions in reinforcing the privilege of the elite class (Gaztambide-Fernández & Howard, 2010; Howard & Kenway, 2015; Kenway & Koh, 2015; Koh, 2014; Stevens, 2009). Therefore, the study of social class and international education overlaps with the research on elites and elite education to a large extent (Ball, 2015; Howard & Kenway, 2015; Weis, 2014; Weis & Dolby, 2012). The concentration of wealth in both so-called Western and developing countries has enabled emerging elites or ruling classes to afford enrolling their children

in international schools. These parents hope their children will gain the qualifications and networks necessary to access their social class or the global professional labour market. MacDonald (2006: 198) estimated that these schools generate over 5.3 billion US dollars annually in tuition revenue. He also found that the average annual fee for international schools' ranges from US$6,429 to US$10,451, with the highest recorded fee being US$54,264, which surpasses the fees of the British public-school Eton (MacDonald, 2006: 198). These statistics indicate that international school programs, regardless of their specific nature, are predominantly, though not entirely, attended by the wealthiest segments of the global population.

In contradiction with this line of research, Young's (2018) case study on a type C international secondary school in Beijing discovered that most families under study held precarious social positions in an accelerating divergent society: most were members of 'new rich' entrepreneurial class or internal migrants. While these groups have a certain amount of economic capital, they lack other kinds of capital (for example social/cultural capital) to enable their children to progress or gain an academic advantage in the standard/ local education system. For these families, the initial reason for enrolling their children in international education is not to obtain an 'elite' education or global citizenship mindedness, but to enable their children to pursue higher education. This type of international school provides a remedial rather than international environment when it comes to its academic program, which is a noticeable departure from the elite institutions depicted in the academic literature and popular media. In this case, the 'new rich' class families use their economic capital to help children accumulate cultural capital. This suggests that international education may accomplish different goals for different social groups, but financial resources are the condition for this education phenomenon.

Therefore, the socio-economic gap plays a significant role in shaping access to and participation in international education. On one hand, elite international schools tend to reinforce social class privileges by catering primarily to the wealthiest families, enabling their children to build the networks and accumulate the capital necessary for maintaining or improving their social status. These institutions serve as vehicles for the perpetuation of elite class structures and global economic advantages. However, not all families in international education fit this elite mould. As seen in Young's (2018) study, some families, particularly from emerging entrepreneurial classes or internal migrant backgrounds, enrol their children in international schools as a way to overcome deficits in cultural or social capital. For these families, international education is viewed more as a remedial strategy to improve academic outcomes and secure future educational opportunities, rather than a path toward elite status. The primary unifying factor, however, is that financial resources remain the key determinant for accessing international education, although the motivations and benefits of such education differ across socio-economic groups.

In contrast to Type A and Type C international schools, Type B schools are less recognised as institutions that prepare students for advanced studies or an elite

educational pathway. Instead, Type B schools primarily emphasise ideals of global citizenship, cultural diversity, and promoting peace through collaborative learning rather than exclusively prioritising academic advancement. This focus can create certain challenges for families when choosing these schools, as not all parents are primarily concerned with academic elitism or their child's pursuit of advanced higher education. Some families may even consider alternatives, like homeschooling, to align more closely with their values and priorities.

Families choosing Type B schools often value a globally minded education and a supportive, inclusive learning environment. These parents may seek a balanced approach to education, one that combines personal growth with exposure to diverse perspectives, rather than focusing solely on academic achievement. It is difficult to categorise Type B school families within any particular socio-economic bracket. While not necessarily wealthy, these families prioritise a meaningful, well-rounded education and are willing to invest in it, even if it may require financial sacrifice. Ultimately, Type B international schools appeal to families who believe that fostering their children's global awareness and intercultural understanding is as essential as traditional academic success.

There is yet to be a definitive solution to address the financial gaps faced by families considering Type B international schools. While some schools may offer financial aid or flexible payment plans to accommodate families from diverse socio-economic backgrounds, others provide no such support, leaving families to bear the total cost. Additionally, in certain countries, governments may offer financial assistance or tax reductions for families pursuing alternative education options; however, this is not universally available. Unfortunately, there is no consistent, globally applicable solution or support system for families interested in these schools, as Type B international schools are neither the dominant educational model nor widely recognised and supported by the public or governments.

Integrating diversity, equitable practices and fostering inclusion

Striving for diversity, achieving equitable practices, and fostering inclusion are essential components of a holistic educational framework that enhances learning and promotes belonging for all students. Holistic education recognises each learner's uniqueness and diverse backgrounds, creating an environment where everyone feels seen, heard, and empowered. By incorporating diversity into the curriculum and facilitating collaboration among all participants, students are exposed to various viewpoints that foster empathy, respect, and appreciation for differences.

The Peace School emphasises the importance of collaboration in decision-making and planning, involving caregivers, students, and teachers and all staff. The school believes that education can be compromised if decisions are made unilaterally by any single group and

underscores that people possess more power and ideas when collaborating, brainstorming, and sharing a common goal.

In traditional schooling, education and curriculum planning decisions in a behavioural approach or behaviourist schools are made solely by specialists. Education-specialised individuals decide what students should learn or study throughout their school years. The plan and schedule are mainly predetermined, with limited flexibility based on what students want to learn. In contrast, schools that follow a high-scope approach mostly rely on a student-centred approach, where curriculum and lesson planning revolve entirely around the students.

However, at The Peace School, we follow a humanist educational approach, where educational planning happens through the collaboration of all entities involved, including specialised people, teachers, parents, students, and even the community they live in. The curriculum is continuously prepared and adapted through ongoing interaction and collaboration among all entities, who constantly communicate to make the best decisions for the benefit of students.

We have a framework we call the 'Triangle' (Figure 1). On the Triangle, the student is placed at the top, with parents and teachers/staff at the base, and the community in the centre. This triangle represents an ongoing, collaborative process among these three corners of education, connecting learning to our community and daily life. Each corner requires training, conversation, time, and a voice to express opinions without judgement.

Figure 1: 'The Triangle'

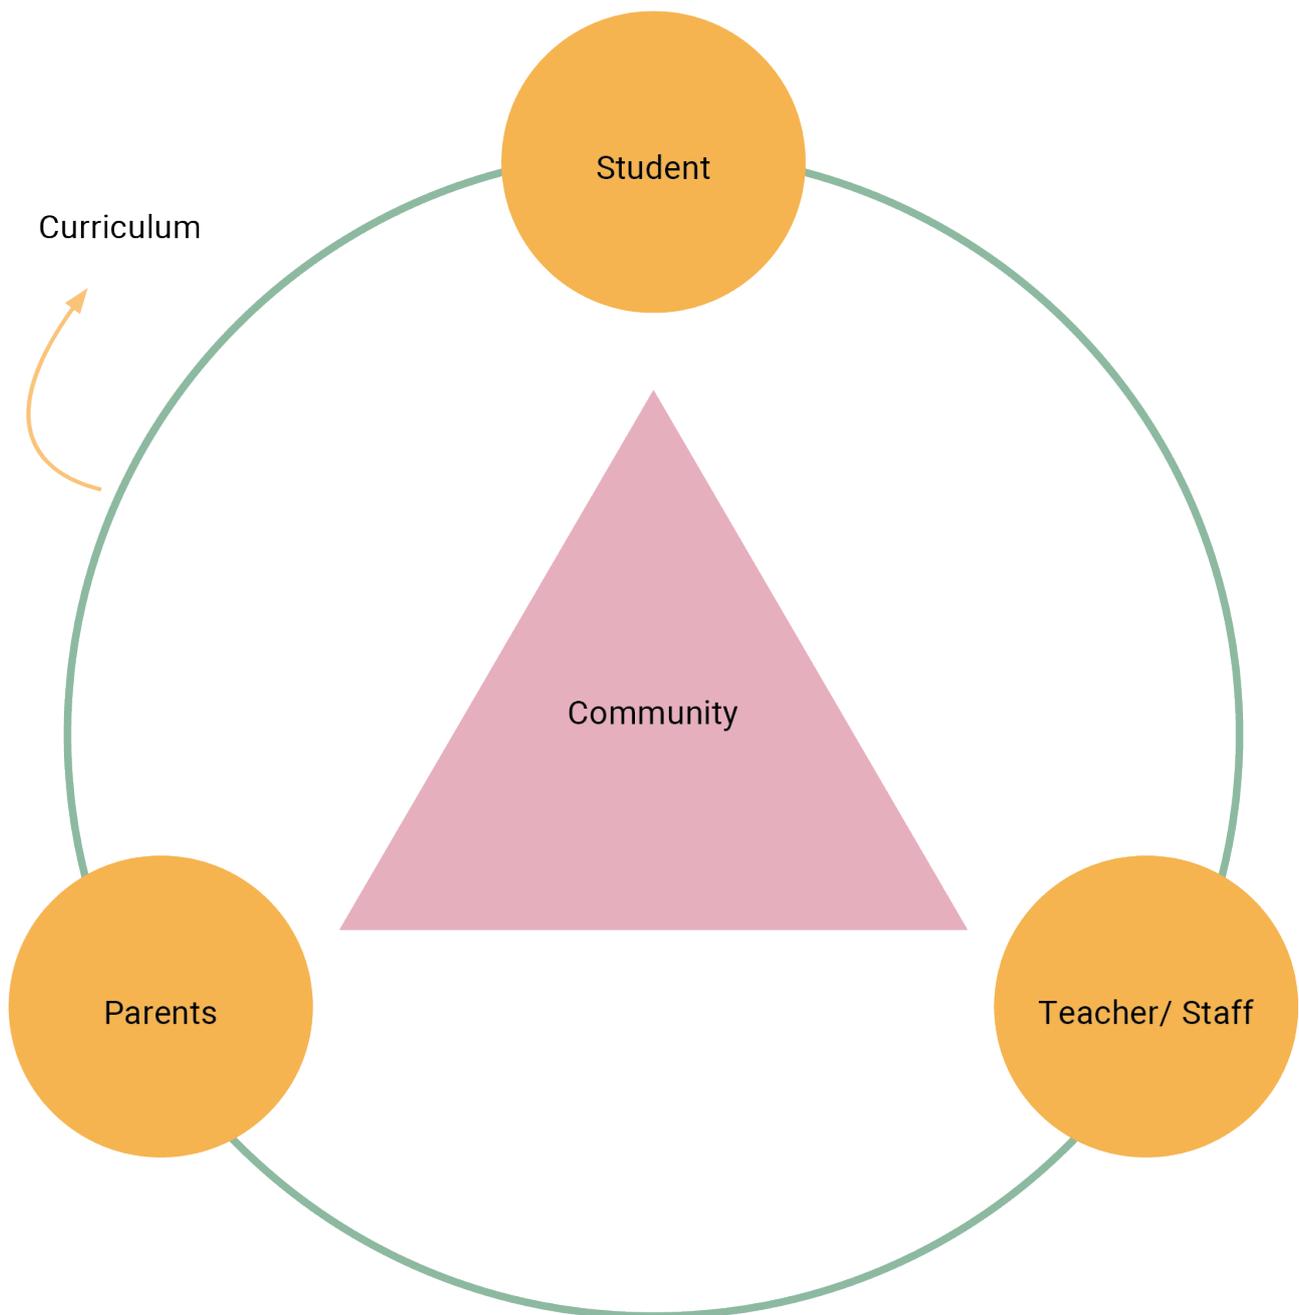
Parents

Teacher/ Staff


Our approach begins with the child's starting point, catering to their specific needs, abilities, and interests. We focus on sparking curiosity and creativity, emphasising project-based learning rather than a linear, behavioural approach based on universal textbooks. Teachers and staff provide valuable input on the educational process, as they spend several hours with students, observing their interests in learning. Parents' input is also crucial as they can offer learning opportunities outside the school environment. Therefore, the essence of connectedness among these three corners is critical. The Triangle approach ensures a holistic, collaborative, and student-centred educational experience, fostering a strong sense of community and shared responsibility for each child's growth and development.

Enrolment

Enrolment differs in each school type and requires its own specified process. The Peace School, a Type B international school aiming to foster collaboration and participation and committed to a humanist educational approach that integrates the principles of a culture of peace and living values, strongly encourages families to enrol their children early, ideally starting in preschool or Grade 1. The school's experience has shown that students who join in the upper grades often face significant challenges in adapting to the unique educational system, which differs markedly from mainstream approaches.

To ensure that prospective families are fully informed and aligned with the philosophy, the school strongly emphasises caregiver involvement during the enrolment process. This

begins with a general introduction session where they present the school's values and educational approach. Following this, they invite families to participate in a 20-session camp held over 20 days, with each session lasting 2 hours specifically designed for new families. Each session focuses on a key principle or aspect of our educational philosophy, offering families a deep and comprehensive understanding of our school's approach. This camp also provides an opportunity for families to meet and interact with the entire school community, including management, staff, and teachers.

The primary objective of these sessions is to equip families with the knowledge and insight necessary to make an informed and deliberate decision about their child's education. Following the family sessions, the school conducts approximately ten orientation sessions for new students over the summer, with each session lasting an entire school day and held once a week, ensuring they are well-prepared and comfortable before the school year begins.

These orientation sessions are crucial in helping families and children acclimate to the school environment and culture. By making an informed decision after experiencing the school firsthand, parents and children can determine whether the school's educational approach aligns with their expectations and aspirations.

Making an informed decision – after experiencing the school firsthand – caregivers and their children can decide whether the humanist educational approach aligns with their expectations and aspirations for their education.

Ultimately, this process fosters a strong partnership between the school and families, ensuring a smoother transition and a shared commitment to the child's learning journey.

Recruitment

Like many educational institutions, The Peace School has evolved and refined its recruitment process over the past twenty years. While they have a preferred process in place, it remains flexible and can be adapted based on the individuals and circumstances involved. The school encourages all prospective teachers to immerse themselves in their school community by participating in regular department meetings. Each department, including science, mathematics, arts, literature, and more, holds weekly meetings where staff discuss lesson plans, share ideas, and develop collaborative projects across various grades.

In addition to these regular meetings, the school also holds inter-departmental sessions where, for example, science teachers may attend art department meetings to brainstorm and develop interdisciplinary projects for the students. It is essential for prospective teachers to attend these meetings before formally joining our teaching staff. This allows them to become familiar with the school's methods and participate in several projects before they begin teaching classes.

The school also strongly encourages new teachers to enrol in a bespoke teacher training

course. The course consists of ten classes over ten days, totalling 60 hours, and covers a wide range of topics, including educational approaches, the Convention on the Rights of the Child, living values and the culture of peace, children's literature, play and games, drama, early childhood development, art, storytelling, project-based learning, and more.

This type of commitment to fostering collaboration and continuous professional development not only enhances the quality of education but also creates a supportive community where teachers can thrive and make a meaningful impact on their students' lives.

Curriculum

As dictated by law, many international school teachers are working in schools and countries in which there are limitations on the kind of content educators can share with students. These limitations may range from content that accurately depicts shared racialised and ethnic history, to content that affirms LGBTQ+ identities. This is an acknowledged reality. Engaging in any approach to teaching and learning that centres diversity, equity and inclusion is going to be in direct opposition to the system that employs educators (Reid, 2024). Educators must continue to engage anyway, especially in international school contexts where the student body has a diversity of social identities in a myriad of ways.

For example, recent discussions of global citizenship education as a way to counter the "single narrative story" have noted the lack of critical analyses of global power relations and colonial histories that has left educators without frameworks to address the structures of inequality that shape students' experiences of difference (Dyrness 2023). Taking a case study of an international school in Costa Rica, a typical Type A international school, many students perceived the IB's formal curriculum as Eurocentric, finding it conflicted with the school's goals for embracing diverse perspectives. An Eastern European student expressed disappointment that the curriculum sidelined cultural learning in favour of content dominated by Western perspectives. Another student from Asia, highlighted the prevalence of Western case studies in her Global Politics course, reinforcing the idea that the "global" is often framed through the lens of the Global North. Such critiques indicate a disconnect between students' diverse lived experiences and the knowledge deemed valuable or relevant within the IB structure (Bourdieu, 1984). Students also noted how these limitations in the curriculum diminished opportunities to discuss pressing issues within their own communities, reflecting an implicit prioritisation of so-called Western knowledge systems.

In contrast, students found that co-curricular activities, such as Regional or Culture Weeks, allowed more space for sharing diverse perspectives, though they critiqued these events for their focus on celebratory and performative aspects of culture. A student from an Afro-Caribbean background, explained that these events often reduced cultural appreciation to superficial encounters with food, dance, and costumes, neglecting deeper issues like colonial histories or ongoing socio-political struggles. Similarly, a student from North Africa

noted that while the school provided a platform to showcase culture, it rarely supported discussions of the challenges faced by their communities. Such events, as students observed, align with Melamed's (2006) critique of "neoliberal multiculturalism," where cultural diversity is idealised but stripped of discussions on race, class, and power. This sanitised approach to diversity promotes a form of "domesticated" tolerance (Andreotti, 2011) that leaves structural inequities unchallenged.

Students are crying out for a more affirming curriculum that really represents the diversity within the world, rather than an Anglo European or so-called Western perspective that is rampant in international schools across the globe, whether they teach the IB curriculum or any other internationally recognised state systems.

Assessment

In Type-A and Type-C international schools, one of the pervasive issues with assessment practices is their overwhelming focus on university admission requirements, which often distorts the broader educational experience. These schools tend to align their curricula and assessments with the standards set by higher education institutions, particularly international universities, rather than focusing on holistic learning or fostering critical thinking (Brummitt & Keeling, 2013). This phenomenon is especially pronounced in East Asia, where Type-C international schools cater to families seeking an alternative to the highly competitive local education systems. In these schools, teaching is often oriented toward preparing students for standardised tests, such as the SAT, A-levels, or IB exams, and meeting the specific criteria for applications to prestigious universities in the West (Bunnell, 2016). This narrow focus on assessment not only restricts the curriculum but also places students under immense pressure to perform academically, sidelining other important aspects of education such as creativity, emotional development, and extracurricular engagement (Doherty, 2009). Consequently, while these schools may provide a pathway to higher education, they contribute to an educational environment driven by instrumental goals rather than comprehensive learning.

At The Peace School (Type-B example of international schools) believes that the traditional model of individualised evaluation through exams and grades is inherently inhumane. The schools reject the behaviourist approach to education, which emphasises exams and grades as the primary tools for assessment. Instead, they advocate for evaluation methods that genuinely support students in deepening their understanding of subjects. In their view, evaluation should involve a collective effort that includes students, parents, teachers, staff, and the broader community.

Their assessment process is designed to focus on students' holistic development, taking into account their emotional, social, ethical, and academic needs. They believe assessing aspects of a student's growth that are often overlooked, such as their character, needs, interactions, and other values, is crucial.

However, they also recognise the importance of being mindful of our evaluation. What aspects of a child's development should be the focus? Should we assess only their academic achievements or also their personal growth and memory? In humanistic schools like The Peace School, evaluation criteria are detailed, extensive, and adaptable. These criteria evolve over time and involve input from teachers, students, and families. For example, one student might be evaluated on their courage and encouraged to exhibit more courageous behaviours, while another might be guided toward greater patience and carefulness. In other words, the evaluation process is personalised to suit each student's unique needs.

The schools employ various methods of assessment, including:

1. **Observation:** A diverse group of observers, including teachers, administrative staff, counsellors, and families, continually assess students throughout different periods. This evaluation extends beyond the classroom to include observations during breaks, lunchtime, field trips, and other activities. Observing students in various contexts gives us a more comprehensive understanding of their development. All staff members are encouraged to share their insights and observations about students.

2. **Student Engagement:** One of the most effective assessment methods is to involve students directly. This does not mean traditional verbal exams but rather engaging them in meaningful conversations. We ask questions that help identify their needs: Are there areas where you require additional support? Do you need to learn new skills? Are you struggling with certain subjects? This approach helps students become aware that their challenges have been noticed, and we are here to support them.

3. **Group Dialogue:** Frequent group discussions where students can share their opinions and engage in discussions on various topics. This method allows the school to collaboratively assess their knowledge, awareness, and viewpoints.

4. **Collaborative Review:** Teachers, staff, and caregivers – parents and on some occasions other family members, including the grandparents – meet regularly to discuss students individually and in groups. By gathering diverse perspectives, the team gain a holistic view of each student's development and can tailor our approach to meet their specific needs.

These are just a few examples of how The Peace School integrates evaluation into our educational model, moving beyond quantitative assessment to create a more humane and comprehensive approach to student development.

How can international school teachers empower students?

In an increasingly interconnected world, international schools have a unique opportunity and responsibility to nurture global citizenship beyond traditional academic metrics. By

embedding values such as diversity, equity, and inclusion into their curricula, international schools can empower students to become agents of positive social change. Programs like the International Baccalaureate (IB) facilitate this mission through courses and experiential learning opportunities that engage students in real-world challenges, such as the Theory of Knowledge (TOK) and Creativity, Activity, Service (CAS). Through these frameworks, students explore pressing global issues and cultural diversity while developing empathy, critical thinking, and a commitment to social responsibility. Partnerships with local organisations, initiatives on intercultural understanding, and active home-school collaboration further reinforce these values, allowing students to apply their learning toward creating inclusive communities. By integrating global citizenship into both academic and co-curricular activities, international schools prepare students to address systemic inequalities and advocate for a more equitable world.

Integrating Global Citizenship Beyond Academic Metrics in International Schools

International schools could play a vital role in nurturing global citizenship as a means of empowering students to become agents of change, particularly in promoting diversity, equity, and inclusion. Global citizenship education focuses on fostering a deep understanding of cultural diversity, social responsibility, and global interconnectedness. Implementation of the International Baccalaureate (IB) curriculum could embed these principles through both academic and extracurricular activities. In the Theory of Knowledge (TOK) course, there are opportunities for students to critically examine global challenges, such as climate change, migration, and inequality, from multiple perspectives. Additionally, the Creativity, Activity, Service (CAS) program requires students to engage with real-world issues by participating in service projects that promote social justice and environmental sustainability. Teachers in their daily teaching practice need to be aware of the importance of implementing these values, rather than solely focusing on the quantitative results related to university admissions. For example, students at the International School of Geneva have engaged in projects to support Syrian refugee families through educational initiatives, helping to bridge language and cultural gaps while addressing immediate social needs. These experiences enable students to translate abstract concepts of global citizenship into concrete actions that promote equity and inclusion (Savva & Stanfield, 2018).

Intercultural understanding is another key component of how international schools promote global citizenship. By bringing together students from diverse cultural, ethnic, and linguistic backgrounds, these schools offer daily opportunities for cross-cultural interactions. Schools often encourage these exchanges through structured programs like cultural festivals, language immersion days, and collaborative global projects. For instance, at the United World Colleges (UWC), students are deliberately recruited from different parts of the world to live and learn together, fostering an environment where intercultural dialogue is not just encouraged but is integral to the learning experience. UWC students are tasked

with solving real-world problems collaboratively, often addressing issues such as global poverty, human rights abuses, or climate justice. One specific example is the UWC in Costa Rica, where students designed a sustainable community garden that integrates agricultural techniques from different cultures while addressing food security for marginalised local communities. Through this hands-on approach, students learn to see diversity not as a challenge but as a strength in solving global problems (Hill, 2012).

Furthermore, international schools can empower students to address systemic inequalities by integrating discussions of race, gender, and class into their academic programs. This helps students develop a critical understanding of how these issues manifest both globally and locally. For example, the British International School in Cairo offers a program called "Global Issues Network," where students engage in debates and workshops on topics such as gender equality, racial justice, and economic disparity. These forums not only raise awareness but also require students to design and implement projects aimed at tackling inequities within their own communities. One notable project involved students working with local NGOs to develop an educational campaign addressing gender-based violence in rural Egypt, combining their academic knowledge with practical action. Through these initiatives, students are equipped with the skills and confidence to challenge discriminatory practices and advocate for more inclusive environments (Yosso, 2005).

Additionally, international schools can also support global citizenship through partnerships with local organisations that focus on social equity. The International School of Manila, for example, has partnered with Gawad Kalinga, a local nonprofit dedicated to eradicating poverty, to engage students in service-learning activities. Students not only participate in the construction of homes for underprivileged families but also work directly with community leaders to understand the social and economic barriers these families face. This kind of collaboration teaches students about systemic inequities and empowers them to take meaningful actions to address them. Such experiences help students see the interconnectedness of global and local issues, encouraging them to become advocates for change in diverse contexts (Gaudelli, 2016).

Empowering: A New Framework on Empathy, Compassion, and Responsibility

Every individual possesses a full range of human qualities, such as empathy, compassion, responsibility, freedom, etc. What matters is which of these qualities we nurture and provide opportunities for growth and expression. Many human values should be practised with children, allowing them to experience them. If we do not offer students these opportunities, we hinder their chance to develop and allow positive traits to emerge. As Gramsci (1971) states, "Men are not born free; they become free." This illustrates that no values are inherently present in humans; rather, they require active engagement and practice to be acquired.

To provide opportunities to learn and practice values such as empathy, compassion, and responsibility, The Peace School dedicates classes titled "Understanding Living Values," following the curriculum recommended by the Foundation for Living Values. However, they recognised that these important topics should be open to more than just one class. Subjects like empathy, love, respect, co-operation, and kindness are universal themes that should be woven into the fabric of every lesson across all subjects. This realisation led them to explore how to integrate discussions, or dialogues, on empathy, compassion, and responsibility into subjects like science, history, literature, mathematics, and beyond. While classes like art, literature, and history naturally aligned with this initiative, maths and science teachers were initially uncertain about how to incorporate these themes into their lessons.

In the science department, one class began by reading Frans de Waal's insightful book on empathy and designed lessons, activities, and discussions around the concepts it introduced. However, many maths teachers initially wondered whether topics like empathy and compassion were relevant in a maths class. Despite these reservations, the school's team discovered a unique way to experience and teach empathy through mathematics.

While preparing a lesson on percentages, one teacher posed practical questions to the students: What percentage of the school's students are girls? What percentage are between the ages of 9 and 10? What percentage of parents are doctors? The students analysed various data points and calculated the percentages accordingly. One set of data focused on the mortality rate in traffic accidents, specifically the statistic that one out of every hundred people worldwide die due to a car crash. For some students, this 1% statistic didn't seem particularly alarming; many believed that the death of one person out of a hundred was not cause for concern. Sensing the need for deeper reflection, the maths teacher encouraged the students to consider the human story behind this statistic.

Together, they began to ask: Who is this one person? They reflected that this individual, reduced to a mere number in the statistic, could be someone's mother, father, sister, brother, or child. Is this "one" just a number for that person's family? What if this one person out of a hundred was someone close to us? Would it still be just a number? What if this one person was you or me? Can we say that one person out of a hundred isn't significant and doesn't warrant concern?

This line of questioning sparked a transformative project. The students, guided by their teacher, reached out to families who had lost loved ones in traffic accidents. They listened to these families recount the emotional impact of their loss and how they coped in the aftermath. For a parent who has lost a child, is the number "one" in maths merely a number?

This project expanded into a broader initiative focused on preventing traffic-related deaths. Following this experience, the students' empathy for the news and statistics they encountered grew significantly. They began to connect more deeply with the data on children suffering from malnutrition, those caught in war zones, displaced by conflict or facing other life challenges.

In the maths class, numbers took on a new, profound meaning. No longer could anyone dismiss a percentage as too small to matter. Even if just one person is harmed to these students, it is one too many.

In conclusion, by embedding values such as empathy, compassion, and responsibility into the curriculum, schools like The Peace School not only enhance students' academic learning but also prepare them to become compassionate, engaged citizens. This holistic approach fosters a deeper understanding of the world and promotes the development of a caring and responsible community. Ultimately, cultivating these values from an early age empowers students to make meaningful contributions to society.

The Role of Home-School Collaboration

In international schools, the relationship between families and schools serves as a foundational pillar for empowering students to become agents of change, particularly in the realm of fostering diversity, equity, and inclusion (DEI). This collaborative effort between educators and parents creates a dynamic environment where inclusive values are consistently modelled and reinforced, both at school and at home. Research has demonstrated that active parent engagement enhances student outcomes by promoting a shared understanding of the educational and social goals, including the importance of DEI in students' daily experiences (Hill & Tyson, 2009). In the context of international schools, which often cater to diverse student populations from various cultural, ethnic, and socio-economic backgrounds, the family-school relationship is even more critical. By aligning the home environment with the school's DEI mission, students are better equipped to internalise these values and apply them in their communities.

A key element of this partnership is clear and sustained communication between the school and parents. International schools can facilitate this through regular workshops, informational sessions, and open forums where issues of diversity, equity, and inclusion are discussed openly. For example, the International School of Kuala Lumpur (ISKL) has established a "Parent Engagement Program" where parents are invited to participate in DEI workshops alongside educators. These sessions provide a platform for both parties to discuss strategies on how to address and support diverse identities within the school community. The outcome of such communication fosters a collective responsibility for nurturing an inclusive school culture. Students, observing the collaboration between school and home on issues of DEI, are more likely to see these values as integral to their own actions, thus enhancing their capacity to be agents for social change. Indeed, while fostering a shared commitment to inclusive values is beneficial, it's also essential to recognise and respect the diversity of perspectives that families may bring to the table. Acknowledging and navigating these differences can, in fact, enrich the learning environment, as it helps students understand and engage with the complexities of diverse worldviews and value systems. This approach not only prepares students to handle real-

world contradictions but also underscores for teacher candidates the importance of flexibility and cultural humility in promoting DEI.

Moreover, international schools often encourage parents to participate in co-curricular activities that celebrate and promote cultural diversity. For instance, some schools, like the United Nations International School (UNIS) in New York, organise annual "International Fairs" where families can represent their respective cultures through food, performances, and art. These events highlight cultural diversity in a positive, celebratory manner and actively involve the school community in appreciating and respecting different cultural backgrounds. Through such involvement, parents help create a school culture that celebrates diversity, thus showing students the value of inclusion through action. The presence of parents at these events as active participants reinforces the idea that diversity is not simply an abstract concept discussed in classrooms but a lived experience that needs to be nurtured within the community. This can though, as discussed earlier in the curriculum section, be seen as performative, and should therefore be done in conjunction with a robust and diverse curriculum that sits alongside the co-curricular program.

In addition, governance structures such as parent diversity committees or advisory boards provide another avenue for parental involvement in DEI efforts. Schools that establish diversity committees with parent participation, such as the American School in London (ASL), empower both parents and students to take leadership roles in creating more equitable school environments. These committees often work on policy recommendations, develop anti-bias training, or spearhead initiatives like inclusive curriculum development. When students witness their parents contributing to such initiatives, they are more likely to view themselves as stakeholders in efforts to promote equity and inclusion. This active parental involvement not only enhances the school's DEI initiatives but also serves as a practical demonstration for students on how they can take leadership roles in their communities and beyond.

Finally, home-school collaboration enhances students' leadership and advocacy skills by fostering an environment where critical thinking about global inequities is encouraged. For example, at the International School of Brussels (ISB), the school's collaboration with parents on sustainability and social justice projects empowers students to address global challenges in meaningful ways. Parents are invited to participate in and mentor student-led initiatives such as the "Green Schools" project, where students take the lead in reducing the school's carbon footprint. By working alongside their parents and teachers, students gain the confidence and skills to advocate for global change on issues related to environmental sustainability, which directly aligns with broader DEI goals, as climate justice is deeply intertwined with social equity.

In conclusion, the collaboration between international schools and parents is essential for cultivating students who can act as agents of change in promoting diversity, equity, and inclusion. Whether through enhanced communication, participation in cultural events, involvement in governance structures, or collaboration on global initiatives, parents play a

crucial role in reinforcing the DEI values that schools seek to instil. By involving parents in meaningful ways, international schools not only create a supportive environment for students but also empower them to take these lessons into the world, advocating for inclusivity and equity in their future endeavours.

Reflection on the Concept of "International Schools"

The notion of "international schools" often conjures images of a globalised educational environment, designed to cater specifically to expatriate communities and students from diverse backgrounds. However, it is imperative to critically examine the implications of emphasising this concept. Why should the label of "international schools" be confined to certain institutions, and what does this mean for inclusivity within education?

Emphasising the international nature of these schools can inadvertently create a form of exclusion. By designating certain institutions as "international," there is a risk of marginalising local educational systems and the students who belong to them. This distinction can foster a perception that international students are inherently different or superior to local students, leading to a bifurcated educational landscape (Perkins & Neumayer, 2014). The reality is that educational inclusivity should transcend these labels, as effective education is fundamentally about embracing diversity in all its forms.

The differences between international and local students often revolve around cultural, linguistic, and experiential factors. International students may come from various cultural backgrounds and possess different educational expectations and experiences compared to their local counterparts. Nevertheless, the distinction is not as clear-cut as it may seem. Local students may also embody significant cultural diversity and linguistic variations that deserve recognition and accommodation within the educational framework (De Jong & Harper, 2021). Therefore, the dichotomy between international and local students often oversimplifies the complex tapestry of student identities and experiences.

As educators committed to advancing inclusive education, it is crucial to recognise that the strengths of international schools lie not only in their global focus but also in their ability to embrace the rich diversity of students' backgrounds. Respecting and valuing the different cultural, linguistic, religious, gender, sexuality, class and ideological perspectives of all students is essential for fostering an inclusive educational environment. This approach not only enriches the learning experience but also prepares students to navigate an increasingly interconnected world (Banks, 2019).

In conclusion, while the concept of "international schools" holds significance in promoting a globalised education, it is vital to approach this label with caution. Educators must strive to dismantle the barriers that these distinctions can create and work towards fostering an environment where all students, regardless of their backgrounds, feel valued and included.

Closing questions to discuss or tasks

As authors of this chapter, we have only scratched the surface of international schools and their ability to foster or hinder diversity, equity and inclusion. Further questions that could be explored include:

1. What are the specific impacts of the three types of international schools on inclusion? Do they offer different perspectives for the future or are they in "different stages of development?"
2. How do educators deal with diversity, equity and inclusion in international schools within the neoliberal field of the education industry on a global scale?
3. How can international schools grapple with the impact and influence of whiteness on power structures, hiring, curriculum and co-curriculum?
4. What hidden curriculum is being perpetuated across international schools?
5. How will international schools impact the future of so called developed and developing countries? What are the challenges, and do they pose issues of white saviourism?
6. How can democratic education impact international schools?

About the authors

Baran Yousefi

Baran Yousefi holds a degree in Health Studies from York University in Toronto, Canada. As a graduate of the Participatory School, Iran's first

alternative and democratic school, she brings extensive hands-on experience in educating children through a humanistic approach. Currently, she serves as the coordinator and a key member at the Peace School in Toronto, and she is a board member of Humanist Kids. Baran is deeply committed to promoting humanistic values and fostering a culture of peace through education. She has completed numerous courses in educational methodologies, UN sustainable development programs, and participatory systems, all of which align with her dedication to humanistic psychology and UNESCO's peace charter. Her unique blend of lifestyle, educational philosophy, lived experiences, and academic background has positioned her to make a meaningful impact in the field of children's education.

Kristina Pennell-Götze

Kristina Pennell-Götze (she/they) (M.Ed) is a queer Filipino-Australian social change agent, focusing on diversity, equity, inclusion, justice and antiracism (DEIJAR) in international education. She is an educator and leader with experience working in public, private and international schools in England and Germany. She is the facilitator of the student Social Justice Committee and the Gender and Sexuality Alliance groups, providing support and opportunities for students to lead. Kristina is a leader within Association of International Educators and Leaders of Color (AIELOC), and a former fellow of the organisation, providing guidance and support to educators and leaders who are AIELOC school and community members, in addition to creating space for BIPOC to lead and share. Additionally, Kristina founded the Association of German International Schools' (AGIS) Diversity, Equity, Inclusion and Justice (DEIJ) working group and developed the first DEIJ student-led conference hosted at the Bavarian International School in 2024. She has led multiple workshops and keynoted on topics related to DEIJAR at various conferences around the world and online.

Linjie Zhang

Linjie Zhang is a researcher at the University of Vienna. Her primary research interests encompass structural inequality within the educational system, the development and management of international schools, elite education, neoliberalism and globalization, educational policy, and the application of capital theory in education.

PART VII

CONCLUSION: LOOKING AHEAD—INSPIRING IDEAS FOR SCHOOLS OF TOMORROW

UTOPIAS - WHERE DO WE GO FROM HERE? INSPIRING IDEAS FOR SCHOOLS OF TOMORROW

Example Case

"Utopia as an ongoing process that embodies values and visions, rather than merely a final destination" (Maryam Mohammadi, Tehran, Iran)

The example below is a true story of how one family's vision, with the support and help of their community, created a Participatory School in Tehran, Iran. A concern with Iran's traditional system is its focus on a singular approach, leaving no room for diverse educational methods. The formation of the Participatory School was an effort to diversify approaches within Iran's educational system and to make educators and teachers realise that not all students are meant to follow a single method, model, or approach to teaching and learning. Their Participatory school is their inspiring vision toward the creation of a Utopia. The content of the case example

is inspired by Dr Nasser Yousefi's [1]'Humanistic Education' book[2], coupled with an educational journey of co-creation of the Participatory School in Teheran. Maryam, an Art Teacher, Executive Director and Advocate for Children, shares her story to inspire thinking of Utopia:

*I am proud to discuss our work on Utopia as a representative of the Participatory School founded by Dr. Nasser Yousefi approximately 18 years ago and rooted in a Humanistic Philosophy. **A crucial question we must ask ourselves is: where does true education take place, and what constitutes the best educational environment?** Most discussions focus on traditional educational centres—schools with specific buildings that adhere to certain standards, adequate lighting, classrooms with tables and chairs, or libraries. These discussions put emphasis on the physical structure of the classroom and the idea that all educational activities occur within the school, minimising the need for external engagement (Yousefi, 2022). In our school, however, **we redefine what the school can be**. We do not view it as a confined space with walls dominated by systems of control. Instead, we believe that the entire community serves as the school. Every aspect of our community, including museums, parks, sports clubs, shops, and even parents' workplaces, is considered part of the educational environment. In our philosophy, a school is any place where a child can engage in diverse experiences. The entire local community becomes part of the learning journey, allowing children to learn from real-life contexts. **We do not insist on concentrating all urban facilities within the confines of the school; instead, we believe it is essential to cultivate a sense of freedom in students. The resources and spaces within our community are integrated into the educational experience**. In a diverse learning environment, children come to understand that not everyone thinks or lives in the same way. This awareness supports the freedom to express individuality while respecting others' differences. At our school, listening to the voices of others and fostering an environment conducive to dialogue is of utmost importance. We recognise that each child is unique, and education must start from where they are. Considering children's differences, one of the most rewarding aspects is the intrinsic connection between education and real life. When individuals are provided with opportunities to explore their interests, talents, abilities, self-esteem, empathy, and inner peace, these qualities naturally manifest in their personal and professional lives. Key concepts such as participation, commitment, choice, togetherness, and problem-solving within the life context are fundamental to our educational approach. These principles form the core of our identity, and we consistently integrate them into our curriculum and teaching methods.*

1. Dr. Nasser Yousefi was the Principal of the Peace School in Toronto, Canada (2023) and Participatory School in Tehran, Iran(2005-2024)

2. Yousefi, Nasser. (2022). Humanistic Education. Kargah koodak.

Our school represents Utopia, not only for its founder and his family but also for many others. Dr. Yousefi's personality, vision, and belief in human agency, with unwavering commitment and responsibility for education,have motivated me to continue working within this inspirational educational ethos.

The example from the Participatory School in Tehran (Iran) shows that a school community can follow its dreams and visions, even in the face of contexts not conducive to supporting their enduring educational values. At the selected school, it was initially the fundamental values and expectations of one family who had set themselves the goal of playing a decisive role in shaping the educational biography of their own daughter. This shows the power of individual key figures who, as pioneers, have influenced policy and practice of (inclusive) education worldwide (Boban & Hinz, 2008; Merz-Atalik, 2022). However, the fact that the 'Participatory School' exists today and represents these values within its' educational ethos was only possible because the founder sought allies and fellow campaigners who shared his vision to develop their inclusive approach to education together.

Initial questions

The following questions have guided the chapter.

- What is a utopia?
- What significance do utopias have or could have concerning the transformation and development of educational institutions?
- How can visions (based on utopian designs of a 'better school and education for tomorrow') inspire educational transformation?
- What options and methods exist for using Utopias to develop transformative professionalism in teacher and educator training?
- What can we learn from individual schools and peoples' Utopias to influence change that will have a lasting effect on a school or the education system?

Introduction to Topic

There are many definitions of Utopia. This chapter aims to aid reflection on Utopias and

the 'Schools of Tomorrow.' It does not intend to give any final definitions nor commit to one theoretical framework. Instead, it invites the reader to embark on a journey of theorising and co-creating Utopia in educational spaces, within learning and teaching, reflecting on past, future and existing educational practice, philosophy and theory. Considering individual values, unique human perspectives and contexts, the chapter starts an exploration of the authors' belief in inclusive education and, presents the authors' idea that

There are as many Utopias as there are people in the World.

The word utopia is derived from the Greek oὐ (not) 'τόπος' (tópos), translating to non-place. If the word ending is switched to *eú* from *oú,* the positive, optimistic side becomes visible in a 'good' *eutopia,* making its exceptional power better understood (Hennerfeind et al., 2020). Sir Thomas More first proposed the ideal, imaginary nature of utopia in his 1516 novel written in Latin and titled *"De Optimo Republicae Statu deque Nova Insula Utopia"*. Sir More's search for justice led to a Utopian World where everyone's needs are always met, with little to no hierarchy. His proposed ideal society does not experience a power struggle or greed, keeping morality, fairness and equality at its core. Hennerfeind et al. (2020) reflect on the difference between Thomas More's historical, already-existing yet distant, perhaps difficult-to-reach Utopian entity (in a satirical sense) versus more current understandings of Utopia. These are explored in this chapter, tentatively suggesting *"the positive development of something that does not yet exist (…)"*; more so, seeing Utopia as a dynamic *"vision of the future"* (Hennerfeind et al., 2020: 92).

Utopianism brings mixed emotive responses in people, and there is controversy around its meaning and intention. Considering largely Western societies, Manuel and Manuel (1979) take *utopia* with Thomas More from the fifteen and sixteen century Renaissance through Rousseau and Kant in the Enlightenment Era. Nineteenth-century utopian socialism leads to Karl Marx and his counter-opposition via Engels or Comte, ending in the not-so-modern (anymore) times of Darwin and, later even Freud. Admired and criticised for not considering distinct disciplines, such as psychology, sociology, economy, or politics, in human societies, Manuel and Manuel's *'major utopian constellations'* (1979:13) explore meanings of utopia over time, albeit failing to explain why they existed (Kilminster, 2014). While education undeniably features as a distinct discipline, its evolution cannot be separated from the evolution of human societies and interdisciplinary influence. Hence, considering a wide variety of educational contexts worldwide, against (more current and specific to education) global neoliberal rhetoric that impacts most active attempts of change, *utopia* as a wordmay feel uncomfortable, archaic or purely naive (Busby, 2015).

Paradoxically, the thought of one person's Utopia, understood as ideal, becoming another person's Dystopia seems ever so possible in the reality of 21st-century society. Following the dystopian theme, Bauman (1976), as the 'sociologist of misery' (Dawson, 2012: 556), warns about the *'corrosive nature'* of tomorrow. Still, in his notion of *'active utopia'* Bauman's sociology draws a line between the pessimistic and optimistic views of future morality. Focused largely on choice and fate in society least concerned with the morality of human

action, Bauman makes historical links to the moral decisions of 20th-century humans, with numerous examples of turmoil, war and unrest, some of which resemble inconsolable differences and continuous conflicts so apparent in the reality of current times worldwide. The chapter's opening example features a similar schism. Although it introduces what is understood by authors as a 'realised utopia' in the form of the existing Participatory School, its social and political context is characterised by a strong divide of opinions and controversy. Despite the powerful impact of religious beliefs impressing political autonomy with directives limiting educational freedom, utopian dreams become a reality and continuously inspire hope and possibility. Jacobsen and Poder (2008: 208) provide a helpful take on the nature of utopian thought:

"Utopianism has remained a continuous and conspicuous yet always ambivalent presence in social and political thought. It has been "praised and castigated, valourised and condemned, worshipped and ridiculed, and yet it has, in some form or other, survived and continued to inspire thinking, dreaming and action throughout most parts of human history."

Busby (2015) explores tenets for the '*pedagogy of utopia*' in her work, drawing on Paul Ricoeur's thinking that proposes a critical recognition of the current reality, with an immense desire and a possibility to change it, where **'the utopia is not only a dream, it is a dream that wants to be realised'** (Ricoeur, 1986: 289). There is a strong indication of *change transformation* in Busby's account of Ricoeur's original thought. She further parallels the philosophical tenets of bell hooks's (2003) Pedagogy of Hope, supported by Henri Giroux (2004), highlighting their dynamic nature and anticipation, a promise of different possibilities (Busby, 2015: 414). Ricoeur (1986) attributes the same possibility to 'social imagination', arguing it is responsible for human critical exploration of the status quo (present) to develop an image of an alternative (future). He insists that utopia intends to change or disrupt, proposing three levels, illustrated in Figure 1, below.

Figure 1: Three Levels of Utopia by Paul Ricoeur (1986)

Three levels of utopia

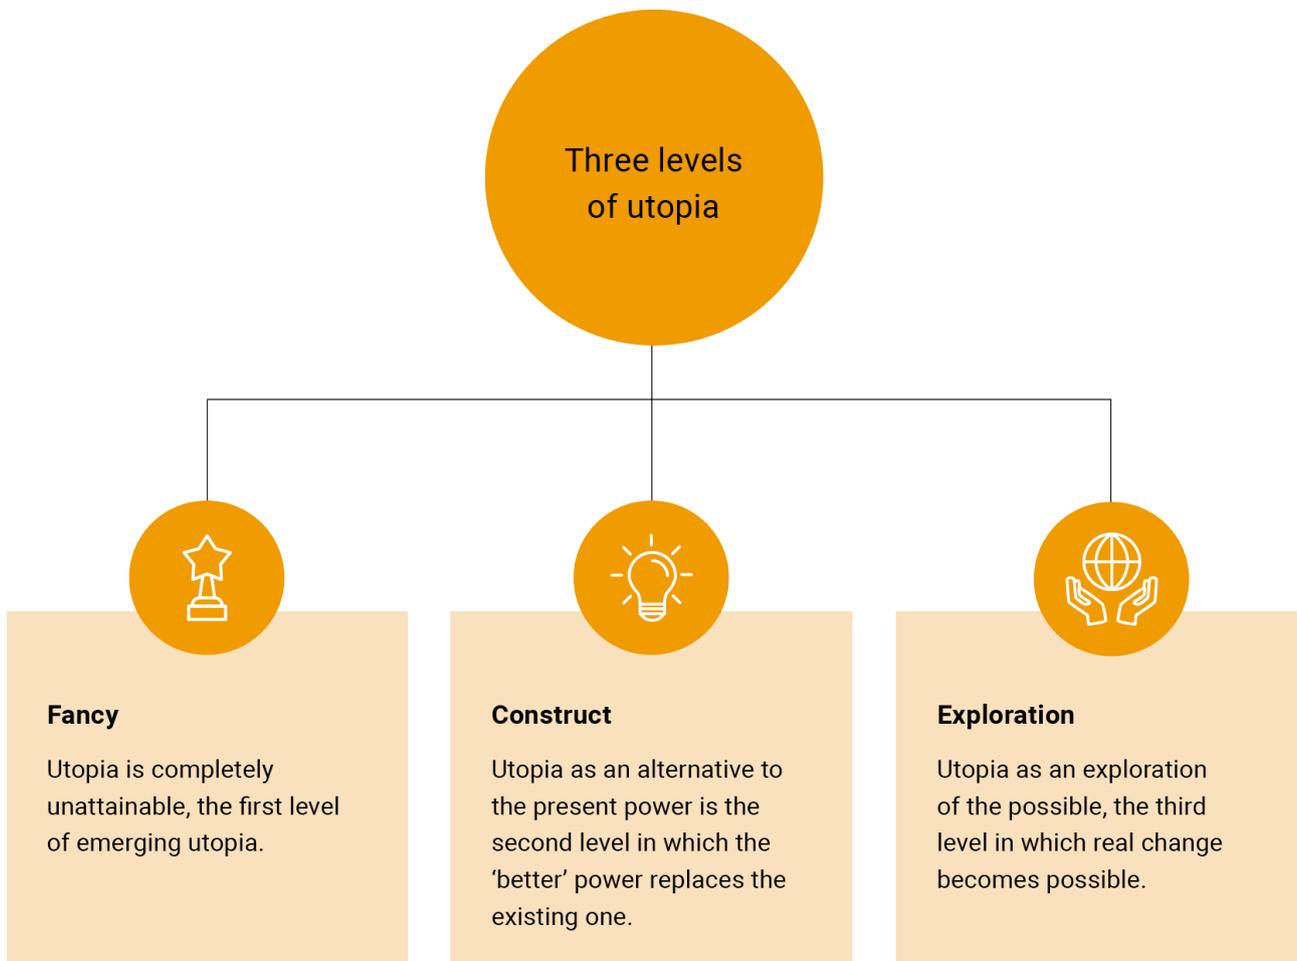
Fancy

Utopia is completely unattainable, the first level of emerging utopia.

Construct

Utopia as an alternative to the present power is the second level in which the 'better' power replaces the existing one.

Exploration

Utopia as an exploration of the possible, the third level in which real change becomes possible.


**by Paul Ricoeur (1986) adapted from Busby (2015)**

Based on Busby (2015);

Ricoeur's notion of Utopia may be formulating an ultimate goal or blueprint, but there is an argument that it can be conceptualised as a *method* (Levitas, 2013). Instead of an ideal destination, Utopia as a method provides a way to reconceptualise the present for an alternative future (Levitas, 2013; Van Dermijnsbrugge & Chatelier, 2022). Since utopia explores the contexts of human flourishing, the rationale for understanding it as a method provides an opportunity for dedicated, active work through the reconstruction of 'doing' and 'being' education, critically reflecting and questioning the dominant current status of education and the educational system (Van Dermijnsbrugge & Chatelier, 2022). Moreover, the notion of Utopia as a method can be seen as a crucial element in teacher education, as the concept reflects future teachers' values and ideas about their ideal school and professionality. Considering how frequently inclusive education is left behind, students in teacher education today may translate it as a Utopian idea, challenging to anchor within the complex reality of everyday school education experiences (based on the contextual environment). It is expected to see inclusive education perspectives conceptualised as illusive, as a never-to-be-reached goal failing against the rigid complexity of educational

systems that leave little to no room for inclusion. Störmer (2021:19) discusses this area of tension in his "Inclusion between Utopia and Reality," suspecting that the concept of inclusion is frequently accompanied by an empty promise or, as some authors prefer to describe an "inclusion lie" or "false magic" moving towards a more dystopian picture. Part 3 of this chapter further explores 'Utopia as a method' while considering inclusive education and inclusion as an overarching aim.

Piezunka et al. (2017: 208) described the postulation of four understandings of inclusive education in schools in German-speaking countries, further illustrated in Figure 2., below. Firstly, the reference to the United Nations Convention on the Rights of Persons with Disabilities (2006) places inclusion near the legal footing, showing many countries' commitment to confront discrimination, with still variable implementation into individual countries' domestic laws, policies and educational practice. A pragmatic understanding of individual performance development, with a frequent focus on children with Special Educational Needs and Disability (SEND), provides a second prism to grasp. Piezunka et al. (2017) further add that each child's participation, recognition, and well-being are central to performance development and go beyond the performance principle, as inclusion is an ongoing process. The fourth understanding defines **inclusion as a Utopia**, an ideal of complete inclusion (Piezunka et al., 2017: 213, 216-217).

Barriers to a Utopian Educational Journey

Many barriers and different beliefs exist within the multiple layers of global educational

systems. This causes tensions between different stakeholders and their perspectives, legal and political aspects frequently associated with resources and funding, and the mismatch in the value placed on inclusion, its meaning, and its place in education. While authors acknowledge a vast disparity among approaches to inclusive education worldwide, selected pressures are briefly explored here to encourage reflection on where these overlap with the same relevance globally and consider alternative pathways.

Key aspects

Hidden Politics and Neoliberal Rhetoric

The overwhelming weight of the current neoliberal ideology in education is frequently 'tangled' with the politics of funding and resources that fuel its performative culture. Such reality created by the dominant discourse in education makes Ricoeur's (1986) 'social imagination' a vital starting point, inviting the possibility of utopia into the dominant ideology. Reflecting on what it is to be human, recognising one's values and core beliefs that make us who we are when faced with the reality of now, provides the opportunity to imagine an alternative. Yet, back in the 'real world,' neoliberalism is undeniably an embedded feature of modern education. Many argue that its aspects are necessitated by progress, modernity, and growth and that profit-oriented focus is simply a pragmatic approach essential to organisational survival. In the meantime, the social and economic barriers become more visible, with education systems and their educators continuously seeking, integrating and fighting value approaches and principles that directly oppose each other (Ball, 2016).

The idea of the 'Politics of Education' is far from new, and any further considerations of methods, models or frameworks proposed in this chapter are likely to be at least inspired, if not well rooted, in Freire's pedagogical thinking. Well theorised in his 'Pedagogy of the Oppressed' (1968), critical pedagogy is undoubtedly a cornerstone of modern educational thought, continuously revisited, critiqued and reinvented throughout the second half of the twentieth century and prevails with much relevance in today's reality. Freire (1968) understood education as largely political in its shape and form, seeing the *banking model of education* as a politically necessary way to retain societal power imbalance and oppression. The banking model of education remains visible across higher education institutions, certainly within Western-centric societies. Existing neoliberal ethos sees students as consumers purchasing specific services, where knowledge is expected to be 'deposited,' at the price of students' own independence, skill development and critical thinking ability. Associated with Marxist thinking yet aligned more with radical liberal thought, Freire's pedagogy seemingly has a less direct focus on inclusive education as it is understood today. Yet, his insistence on the role of education as *"the practice of freedom"* (Freire, 1968:62) and a vehicle to raise the *critical consciousness* of all learners through *problem-posing education* feeds directly into the modern vision of inclusive teaching and learning.

Freire's belief in the creative power of *dialogue*, underpinned by a profound love for the world and the people in it, remains a recurrent theme in negotiations of inclusion.

Despite all the reforms, interventions and proclamations for inclusive education, most school systems internationally do not change (significantly) (Kruschel & Merz-Atalik, 2022: 2). There are manifold reasons attributed to this, and three aspects are selected to explore their systemic nature. They can be seen as barriers to utopian thinking as well as barriers to the implementation of utopian visions. 1) the loose coupling of the systems; 2) the recontextualisation by the actors; and 3) the path dependency of developments (ibid.). The education system comprises many loosely coupled systems, institutions and organisations. Changes and reforms need to be considered in terms of their concrete effects on all the different levels and parts of the system. Therefore, it seems crucial that all actors actively participate in constructing the vision behind the process and the process itself. Path dependencies exist; all actors have contributed and invested in the system. The causes of these phenomena are to be found in historical developments and settings with which paths have been taken in the education system in terms of norms, structures, or cultures. These paths have led to firmly anchored rituals of action and arrangements at all levels of the system, which can now only be abandoned with great effort and solid impulses for change (Kruschel & Merz-Atalik, 2022). Institutional arrangements and institutionalised activities are complicated to change (Blanck et al., 2013: 270) in the long run. Government policies define education and offer guidance and support, but they can also constrain it. Some government policies are used to 'measure' the benefits of education (Goodson, 2003). Walsh (2006) claims that this measurement of performance has led to critical voices not being heard at policy level. Tensions further arise when the school's ethos does not marry with the political agenda of government policies (Hayes, 2013).

Culture, Ethos and Professional Identity

Further pressures arise when teachers realise that the school's ethos is not aligned with their individual, professional ethos (Hayes, 2024). Creating spaces where the teachers can grow, feel valued, connected, and empowered is imperative (Hagenah et al., 2022). The development of professional learning communities allows like-minded educators to follow their Utopian thinking by sharing experiences, collaborating, and offering solutions that further benefit the students in the classrooms. There is an acknowledged tension between the initial idealism or Utopias of new teachers embarking on their careers, and the realities experienced teachers face (Buxarrais, 2021). The development of teachers' professional identities can get lost in the current testing and results-driven climate that has engulfed education (Furnera and McCulla, 2019). The bureaucratic nature of box-ticking and exam readiness has led to a focus on outcomes instead of learning, somewhat reminiscent of Freire's (1968) concern with the nature of the *banking model of education* and, more

importantly, its purpose. As ethos within schools succumbs to this global neoliberal trend, the value system, by default, alters.

The ethos of a school is defined as *"those values and beliefs that the school officially supports"* (Donnelly, 2002: 34). Therefore, as the school supports a value, it becomes ingrained into the school's culture. Tensions arise when the ethos in the school does not marry with the political agenda of government policies (Hayes, 2013) or other ideological differences, as illustrated in the chapter's example. This leads to a lack of educator agency (Robinson, 2012) with a primary focus on the constraints of paperwork related to complying with policies. The level of administrative burden increases as the system becomes more outcome-focused, leaving teachers burnt out and questioning their professional identities. The disparity between the 'ideal' and the 'reality' continues to widen when the ethos and culture of the educational institution are at odds with the teacher's ethos (Robinson, 2012), leaving a limited scope for Utopian thinking. Such tensions break down the foundation of professional identities and moving forward to create a shared vision becomes harder to realise.

Following the case example earlier in the chapter, its second part expands on the importance of culture, ethos and teachers' professional identity.

Example case 2/3:

According to the example of the Participatory School, it is essential to highlight that diversity in the educational environment makes a significant contribution and can play a crucial role in overcoming obstacles. ***In this system, there is a strong belief that diversity is critical incultivating a vibrant and dynamic society.Embracing diverse perspectives and experiences fosters a culture of creativity and innovation.****Individuals exposed to and accepting of diversity are more likely to develop enhanced creative thinking skills. Furthermore, diversity is instrumental in promoting peace by encouraging understanding and acceptance of different lifestyles, beliefs, and values. Recognising and respecting these differences is essential for nurturing harmonious coexistence. Embracing diversity enriches human relationships by fostering communication and mutual understanding, encouraging individuals to make deliberate efforts to understand one another and thereby strengthening social bonds. This educational model posits that classroom diversity enhances the learning experience for all students. By fostering an inclusive environment where differences are celebrated, and every student is given equal opportunities to participate, inclusive education promotes social cohesion and eliminates barriers to learning.*

On the other hand, a critical factor in overcoming obstacles and tensions in the educational path through a humanistic approach is the participation of families in educational programs. We advocate for involvement in social programs that include travel, exploration, scientific inquiry, and knowledge creation. Educational programs should be culturally, socially, and environmentally aligned, ensuring they resonate with and enrich everyday life. ***Sustainable education thrives when it originates and evolves in harmony with life, shaping and being***

shaped by its continuous processes. *Understanding the audience's perspectives on human life, existence, and education is essential. Life and education are interconnected and filled with challenges, doubts, contradictions, and complexities. Emphasising interdisciplinary perspectives enriches the educational dialogue. The active involvement of families in educational programs helps integrate life-centred ideas into educational practices.*

*Another important and noteworthy point is that dreaming and a sense of wonder through ideas and imagination can be seen as forbidden or hindering factors in traditional educational paths. In conventional educational systems, children are often asked to follow a specific, linear path. However, we must recognise that this rigidity can be one of the obstacles to creating a utopia. This is where the humanistic approach fosters a sense of wonder and encourages students to approach every phenomenon with curiosity and exploration. Certainty can inhibit curiosity and limit students' ability to perceive the world as a realm of possibilities. By nurturing curiosity and wonder, students are motivated to engage in discovery, creation, and experiences that continuously shape and evolve their understanding of reality through social interactions and life experiences. The goal is to develop an educational system that produces knowledgeable students and cultivates wise, capable, and compassionate individuals who are prepared to impact the future positively. Achieving this vision requires substantial changes in mindset, curriculum, teaching methods, and school culture. Nonetheless, this vision is worth pursuing, as it inspires and motivates both educators and students. In this educational context, there is a belief that personal dreams are crucial and significantly contribute to individuals' learning and academic processes. **The school and the school community provide opportunities for everyone to pursue their dreams to the fullest extent possible.***

As a private institution, we operate independently of government approval, which sets us apart from the traditional educational system. Our school serves approximately 240 students, both boys and girls aged 6 to 18, a practice that diverges from the prevailing educational norms in our country. To further support our students and advance our educational objectives, we recently established a new branch of the school in Toronto, Canada, called "The Peace School." This branch is a member of several international organisations, including the European Democratic Education Community, the Alternative Education Resource Organisation, and Humanist Kids (You can find out more about Toronto Peace School in the International Schools chapter).

Utopias as a method: Impact on transformative actions

Creating a Vision

Hennerfeind et al. (2020: 94) consider vision as more tangible than utopia, pointing out its limited reach over truly transferable change aspired for:

"Although the word is also used to describe something that has not yet happened, it is visible from afar. It is more likely to concede the possibility of coming true than utopia. It is

closer to events and more comprehensible. What makes it possibly inferior to utopia is its reach. Due to its closer perception, it seems to be associated with less risk. This makes it more attractive in fast-moving times. So, when it comes to quick, short-term changes, people tend to think of visions rather than utopias. However, if far-reaching and sustainable change is required, the vision would be too short-sighted."

The starting point for any change is a critical reflection on educational practices, their history, and the evolution of differential approaches and understandings of education and its purpose, role and meaning for learners (that includes teachers). Here again, Freire's (1968) concept of critical consciousness relates to the development of the learner's critical, questioning mindset, more importantly, however, the necessity to revisit educators' own 'conscientizacao' (Freire, 1968: 55). Problem-posing education invites learners to consider their relationship with the world around them and transformative role of dialogue, enables educators learning, from and with the students they teach. Education becomes a transformative process, anchored in the learner's reality, where education cannot take place unless all actively participate.

"True dialogue cannot exist unless the dialoguers engage in critical thinking -thinking which perceives reality as a process, as transformation, rather than as a static entity- thinking which does not separate itself from action, but constantly immerses itself in temporality without fear of the risks involved. (…) For the critic, the important thing is the continuing transformation of reality." (Freire, 1973: 92)

This inquiry then leads to consultation with and consideration of all parties to reimagine alternative tomorrows, with a critical pedagogic lens inviting (if not challenging) student teachers to think critically about their practice and learning. Values, biases, and opinions of all participants are considered, and more importantly, how they are considered matters. Biesta's (2012; 2013) framework for public education suggests three lenses: 'for the public', 'of the public', and 'in the interests of the public' (Biesta 2012; 2013). Education 'for the public' is an education aimed at the public, where the public is instructed on how to think and act. This erases plurality and ensures that all learners are equal. Education systems are assumed to know what is best for the public and will teach it to them (O'Toole, Dowling and McElheron, 2023). Education 'of the public' emphasises learning rather than instruction, moving towards a system based on citizenship, emancipation, and visibility. Consultation and incorporating the voices of educators, children, parents, and communities into pedagogy, policy, and planning are carried out. However, Biesta (2013) argues there is a flaw within this viewpoint that 'everyone's voice is equal'; some voices may not be fair or inclusive. 'In the interest of the public' allows us to question which voices are helpful to living together in unison and which are hindering (O'Toole et al., 2023). Using Biesta's framework with national and international diversity, equality, and inclusion charters (UNCRC, 1989; UNESCO, 1994) supports the inclusivity of voices through an inclusive lens. O'Toole et al. (2023) argue that consultation is insufficient to ensure a fair and equitable narrative becomes visible. Instead, the 'consideration' of all parties should be reviewed. They further

argue that these considerations are not discrete and must be understood in dynamic synergy. There are, of course, often tensions between different perspectives. Negotiating these tensions is part of a democratic society (O'Toole et al., 2023).

To 'consider' all parties, their voices must be accessed, heard and used to enact change. Lundy's Model of Participation (2007) can be used to access students' voices. This model conceptualises Article 12 of the UNCRC, which states, **"I have the right to be listened to and taken seriously"** (UNCRC, 1989) through the lens of accessing children's voices. Lundy's model (2007) requires four elements: Space, Voice, Audience and Influence. Space for children/students to feel safe to voice their opinions is essential to ensure meaningful engagement. Children and young people will express their voices in spaces where they feel safe and where the relationship is caring and nurturing. Creating a trusting and healthy relationship prior to utilising techniques to access voices will be discussed in more detail later in this chapter. It is imperative to ensure the children/students have an audience that includes people who would and could take them seriously and support getting their opinions brought to decision-makers. The children/students should be seen as co-decision makers where appropriate. The final element is influence. This is where the children/student's voice and opinions influence practice. Therefore, practices are altered to consider the views of children, students, and young people.

Creating a space to explore and co-create utopias for inspirational, inclusive practices of tomorrow

Koenig et al. (2022) speak of a teaching dilemma in teacher education – we are teaching for an inclusive education system that does not widely exist today. Even if a highly inclusive aspiration has been developed during studies or training, it is often almost impossible to put it into practice in insufficiently inclusive organisations in education today. Nick Peim has restated recently that **_education has not been delivering on equality: inequality is precisely what it is for!_** (Peim, 2023: 2).

Peim has long argued that it is the socially disadvantaged who are particularly ill-served by the so-called 'gift that keeps on giving'. For many people, the offer they cannot refuse is often one they are not in a position to accept, partly because this is someone else's aspiration. Although there are obvious parallels to Freire's (1968) work in Peim's account, bell hooks (1994) was more explicit in highlighting the point about meaningful sharing of education relevant to creating the space to explore and co-create. Her work was much inspired by Freire's insistence on common, mutual human growth, with privileged and less privileged influencing each other to transform. Seeing 'education as the practice of freedom', bell hooks understood the flaws of education systems in their frequent omission of learners' social reality (class, gender, sex, racialised positionalities and relevant experiences). Thanks to Freire, education opened up a possibility 'to move beyond boundaries, to transgress,' making a true, authentic difference in the world (hooks, 1994:207). This raises the question of educators' understanding of the role they play in

the dynamic nature of learning and teaching, seeking to transform their own practice and thinking, continuously learning from each other as much as their students.

"Inclusion [presupposes] a change of pattern [...] – understood as an intentional process of turning away from a mode of optimising, which in a way would only mean a further affirmation of the status quo. Instead, a transformative understanding of inclusion requires actors (in organisations) to be both aware of the way current structures have become and to intentionally shape an active process of 'future-forming' (Gergen, 2015) and reflexive future work" (Koenig et al. 2022: 22).

Sharpe et al. (2016) consider that people can develop forms of future consciousness and, thus, of changing patterns. Teachers and all other participants of education systems should be empowered to continuously and proactively develop approaches, knowledge and skills that make it more likely for them to be able to:

- Orient themselves in the permanent – neither foreseeable nor linear – transformation process towards a more inclusive education system, in the sense of the vision in a self-reflective, networked and more targeted manner.
- Meet the challenges associated with the recognition of human diversity and diverse educational pathways in organisations and institutions with diversity-sensitive and inclusion-oriented attitudes and practices.
- Position themselves as a transformative actor for more equality and educational justice in the constantly changing education system and be able to simultaneously remove barriers to participation and learning for all (Booth & Ainscow 2017).
- Develop a willingness to further professionalise themselves by the changing demands posed by the diversity of learners and the living conditions in our society within the framework of their professional biography (Merz-Atalik, 2024).

Danforth (2017) says successful inclusive educators are characterised by a unique approach:

"They do not ignore the gap between their ethical beliefs and their daily work in schools. They intentionally toil in the gap. They enter into that uncomfortable space, explore their commitments and behaviour, and figure out how to better enact their most cherished ideals" (Danforth, 2017: 8).

Epistemic knowledge alone cannot facilitate the levels of change needed to address contemporary societal challenges, and according to Sharpe et al. (2016), other forms of practical knowledge are required. The adaptation options for the potentially adaptive human system can be based on the past and the future. Sharpe et al. (2016) claim that without such "reframings", it is practically impossible to reconcile the "objective" world out there with people's subjective perceptions of the future. Sustainable solutions are not only related to political will and action.

They "also require **a collective ability to co-create and convene spaces for genuine**

transdisciplinary co-operation and participation across the full spectrum of human diversity and difference in order to address the question "what type of society [do] we want to live [in] and who [is] the 'we' […] answer[ing] that question (Abbott et   al., 2017: 815)" (Koenig et al., 2022: 127; highlighted by the authors).

Utopias cannot be traced back to previous experiences from the past, either from the perspective of the individual or the system, as there is still no (organisational) memory for such experiences (Koenig & Strasser, 2022), for example, with inclusive education. Therefore, when embarking on co-creating Utopia, the authors want to bring people together to go on a journey that will be characterised as a collective intelligence creation process. Two critical points must be present for an authentic and meaningful shared vision to be created: it must be possible to reach all people and levels of the system (Whole-System-Approach), and all individuals involved must be able to contribute to the change (participation in the process). Koenig et al. (2018: 34) consider that **"the potential for transformation lies in the flexibility to think about the future beyond the continuation of the past."**

When revisiting Ricoeur's (1986) levels of utopia within classrooms, coupled with a whole system approach where all individuals can participate, the created space allows positive relationships to flourish (Lundy, 2007). Positive relationships are integral to children's and young people's education (Ebbeck & Yim, 2009). Supportive and warm interactions throughout the classroom, teacher and student, and peer interactions lead to a productive learning environment (Wubbles et al., 2012). When all opinions of the children, students, parents and educators/teachers are sought, the commonalities can be reviewed, and a shared vision can be created. This shared vision becomes how the classroom looks and feels.

Defining shared value

Considering value systems starts with a reflection of personal values. These values are individual to each person and frequently relate to how people construct their identities. Intrinsically, each person 'knows' what matters most to them…or at least they think they know until they are confronted with questions, situations or circumstances that challenge these deeply integrated ideals and are forced to reconstruct, change, or transform their thinking. This begins with a personal journey of discovery where each person uncovers which values are important to them. Deconstructing these personal assumptions and biases is an integral element of understanding one's own personal value system (Brookfield, 1995).

Creating a space where students can discuss their values and co-create shared values allows essential questions to be answered. Establishing the importance of individual and personal values and how they may interact with the educational context supports the ability to reconcile, at times problematic, alignment of personal and professional lenses. A deeper

level of reflection may support further understanding of how these individual values may be translated into inclusive educational practice.

Referring back to the authors' starting proposal that ***there are as many Utopias asthere are People in the World***highlights that every person's vision of their Utopia is different. Therefore, reflection on understanding one's own values before inviting other people's perspectives and values is necessary. Linking individual utopias within a group to create a shared vision often engages working with deeply personal values to co-create a space where Utopian visions can be realised. Common values associated with educational systems are community, democracy, love, relationships, uniqueness, play, identity and belonging, compassion, equity, empathy, advocacy, passion, agency, and autonomy. These shared values within a classroom can lead to the overall values of the school. Creating a cohesive vision from learners and educators and the wider community to principals and boards of management and leaders shows how these shared values can bring about considerable change.

Example case 3/3:

"Based on the values mentioned above, the vision for future education in a participatory school focuses on areas that benefit everyone, especially children, as outlined below."

*In this way, there is a desire that we plan in detail how to support an educational environment, especially for the benefit of children and adolescents, and it helps us move forward to **co-create a path for the creation of children's/student's utopia**.*

One significant focus is on young children, particularly those up to two years of age. We aim to develop resources to identify their needs and create diverse experiences from birth to two years old. This involves organising continuous training courses for educators of young children, enabling them to address essential topics and shift their perspectives on child development and education. These programs are designed to be child friendly. We are also working to establish connections between organisations involved in child development, including government and non-governmental organisations, charities, schools, the private sector, and individuals interested in enhancing children's lives. This initiative aims to create a collaborative network that promotes the well-being of children and fosters a cooperative environment among various stakeholders. Another goal is to emphasise diversity in educational approaches, encouraging families to advocate for schools to incorporate children's voices and opinions into educational programs. Enhancing children's health, safety, and care is another goal, particularly addressing the high incidence of accidents, from natural disasters to road and traffic accidents. There is a lack of official co-operation and commitment to developing child-friendly, safe urban environments. Despite our efforts in this area, progress has been limited, and we remain hopeful for future advancements in ensuring children's health, safety, and care. In addition, promoting environmental sustainability is a priority. We advocate for planting trees and developing forests, leveraging the extensive potential of children and their families nationwide to contribute to forestry efforts. Another

initiative we are considering is the prevention of malnutrition among children. This project aims to engage governmental and non-governmental organisations to determine their role in addressing this issue.

*Supporting the family unit is also a crucial objective. While the definition of family forms may evolve, the core principles of co-operation, love, empathy, and care remain fundamental. We aim to promote and strengthen these principles within society. To this end, a Family Education Working Group was established years ago to conduct regular meetings, focusing on improving knowledge and awareness through group readings and critical thinking. Finally, we seek to deepen our understanding of the culture, art, and heritage of our land. This involves introducing teachers, coaches, families, and children to the cultural background of our region, fostering a greater appreciation and connection to their cultural roots. Understanding and promoting a culture of peace among children through Augmented Reality (AR) can be a significant objective of future educational programs. **Teaching childrento listen to and accept othersis crucial for fostering an environment where peace, equality, and diversity coexist.** Additionally, there is a critical need to focus on support and educational programs for children with special needs. This encompasses all children requiring special care, whether in the short or long term, including those in crisis, children from rural areas, immigrant children, minorities, and other vulnerable groups.*

In alignment with the goals above, our efforts aim to broaden the educational horizons of children and teenagers. We assist them in moving toward their utopias, encouraging them to envision and articulate their dreams. Through workshops and programs, we foster collective dreaming, empowering them to travel fearlessly toward the utopian future that represents our aspirations today.

Models and methods of reflection

If we define Utopia "as a defining property of any educational experience that wishes to retain a genuinely contestatory power" (Lyotard, 1993; Readings, 1995), utopias could thus not be an anticipation in any 'natural' or logical sense. We can use different methods and follow different concepts or starting points to anticipate an ideal future. There are various tools for working with the future, so we would first like to stress some fundamental frameworks.

Figure 3: Tools for working with the future adapted from Sharpe et al. (2016)

Tools for working with the future

Complexity

Agency

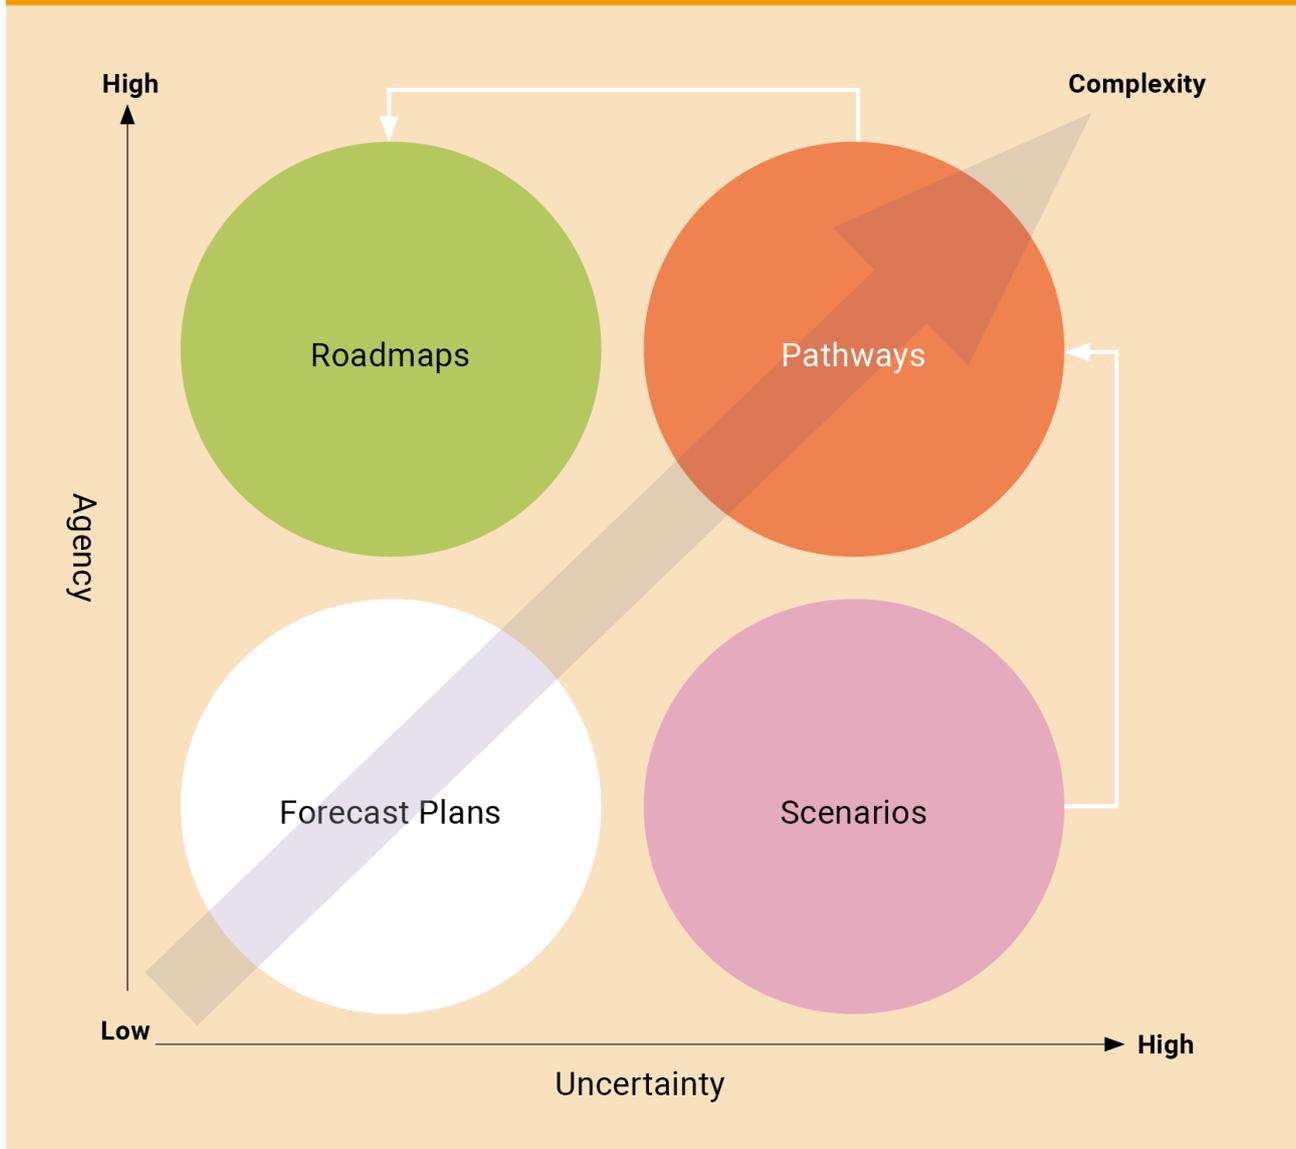
Roadmaps

Pathways

Forecast Plans

Scenarios

Low

High


Uncertainty

Adapted from Sharpe et al. 2016

Based on Sharpe et al. (2016)

Some tools for working with the future tend to focus on a clear goal (like a final destination or status), which brings a lower capacity of uncertainty, as the goal is clearly defined and shared in the contextual environment of the change process. For example, to just add new aspects into the curricula instead of changing its basic structures and values. In other change processes, like inclusive school reforms in the whole education system, we find a relatively high demand for agency and feelings of uncertainty because the reform itself is complex and has to include many different levels of the system, stakeholders and agents. The number of players involved in the transformation processes is almost unmanageable. Pathways approaches attempt to deal with complexity and raising agency, for example,

PATH (Planning Alternative Tomorrows with Hope). The method has been developed as a strengths-based, person-centred planning process by John O'Brien, Marsha Forrest and Jack Pierpoint. The PATH process is designed to help a focused person establish their own vision for their life and imagine what support and connections will help them achieve this vision. PATH is also intended to be a community-building opportunity and is not limited to systems. Therefore, it focuses on an individual and their personal tomorrows and dreams. The process starts with creating a picture of the future (the North Star) and then going backwards, what should be developed three months before, six months before, and so on.

"Don't be afraid of utopia and vision if you are not trapped in them; they are both helpful, strategic tools without which there would have been no significant further development of humanity" (Hennerfeind et al., 2020: 95).

Brookfield's model of critical reflection:

Through critical reflection, a sense of one's value system, beliefs, and assumptions are interrogated. Brookfield refers to these as "hunting assumptions" (Brookfield, 2021: 7). He argues that understanding one's assumptions is highly challenging and often resisted. Further contesting that "assumptions frame our thinking and determine our actions" (Brookfield, 2021: 1). He reviews three types of assumptions: paradigmatic, prescriptive and causal assumptions:

Paradigmatic Assumptions: These assumptions are the hardest of all to uncover, and, when critically reviewed, they are the ones that have the most significant impact on our lives. These worldview assumptions relate to how we see and order the world. They are fundamental to how we live our lives, which is why they are so hard to uncover. An example of a paradigmatic assumption could be that children are independent learners who learn through taking risks and exploring their environment.

Prescriptive Assumptions: These are what we think should happen in different situations. These are grounded in our paradigmatic assumptions but are more accessible to uncover. To follow the paradigmatic assumption mentioned earlier, a prescriptive assumption could be that educators/teachers should provide challenging environments for children to show their independence and encourage them to take risks.

Causal Assumptions: These assumptions are the easiest to uncover and understand. They are assumptions about how things work and about the conditions under which these can be changed and how we can impact those processes. Our causal assumptions are also grounded in our paradigmatic and prescriptive assumptions. Following on from the paradigmatic and prescriptive assumption given above, a causal assumption could be: That children should take risks, although these risks may cause a minor injury, because this encourages their independence and understanding of the world around them. Throughout our lives we are making causal assumptions, be them conditional or retroactive (historical). If the assumption is conditional, then we assume that if we do one thing another will happen. If the assumption is retroactive, it means that we are assuming this because

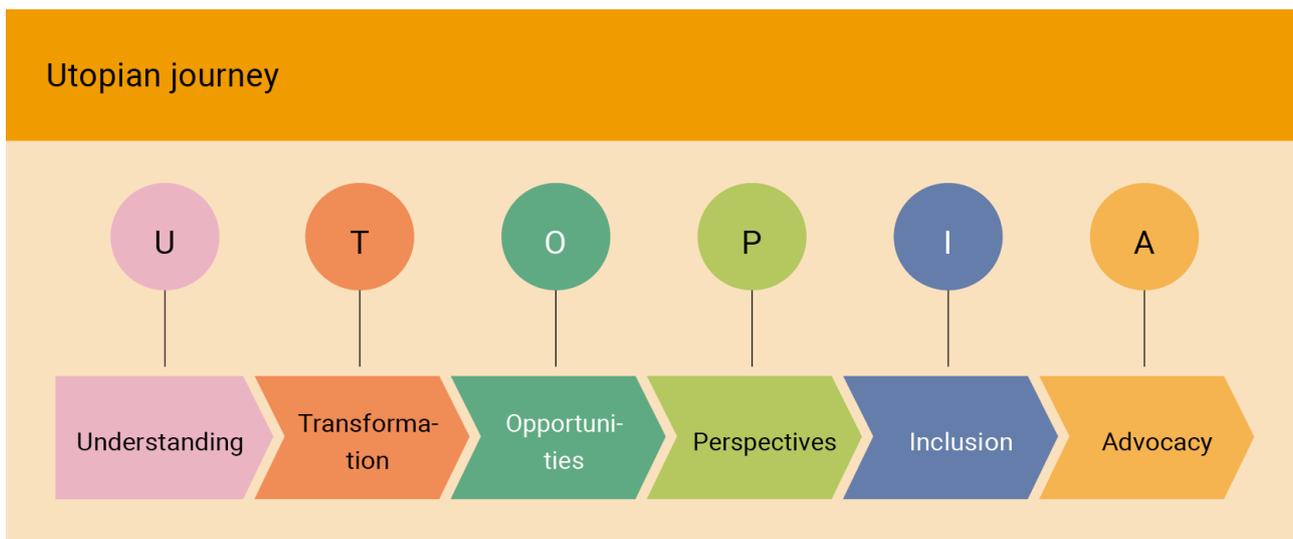
historically this is what happens (Brookfield, 2021). By unpacking these assumptions, we create opportunities and a willingness to understand them, which in turn creates an understanding of our value system and allows for critical reflection.

Embarking on a Utopian Journey

"If you want to build a ship, don't drum up the men and women to gather wood, divide the work, and give orders. Instead, teach them to yearn for the vast and endless sea" (Saint-Exupéry, 1943).

The following framework is an easy-to-follow guide, where the elements are grounded in research that allows individuality for each group to establish their utopian journey. This is supposed to be a framework that utilises **U**nderstanding, **T**ransformation, **O**pportunities, **P**erspectives, **I**nclusion and **A**dvocacy.

A framework to support a Utopian journey

Figure 4: Framework to support a Utopian Journey in education.


"The most beautiful things in the world cannot be seen or touched, they are felt with the heart"
Antoine De Saint-Exupery

U – 'Understanding': At the beginning of the journey, it should be ensured that mutual 'understanding' is recognised as an essential starting condition for the joint reflection process by all actors involved. The attitude and the activities should always be geared towards identifying the individual perspectives and histories of all persons and groups involved. To this end, guiding principles should be developed and recognised for the methodological approach, interactions and communication. Mutual understanding and trust are fundamental prerequisites for beginning to design and create shared visions for a

school of the future. These 'understandings' involve building relationships within the group that are based on mutual trust and respect.

T – 'Transformation': Transformation is critical to embark on a journey to co-create utopia. Visions are the driving force behind "Transformations" in the sense of complex changes (for example, from a social norm-oriented, ableist to a subject-oriented, appreciative pedagogy) instead of purely adaptive changes. The willingness to change and transform a system to reflect the needs and desires of the group is essential. If there is no willingness to change, then alternatives for tomorrow will never be realised. This element involves deep reflection and transformation of practices and principles; therefore, the willingness and desire to change are essential.

O – 'Opportunities': Creating opportunities to ensure all actors feel safe and willing to participate, unpack, and share their opinions is an integral part of this framework. Fostering nurturing relationships and creating a safe and inclusive environment for the school community to openly and honestly feel they can share their opinions about what should change is challenging to achieve. Integrity, openness and a willingness to take on board people's views to change shows professional integrity, but it also takes courage and strength. This is easier to achieve in a learning community with like-minded professionals but can be developed in any group or constellation with the right considerations.

P – 'Perspectives': The perspectives of all actors must be unpacked and understood as all perspectives are critical to hear to gain a deep understanding of other people's value systems. However, not all perspectives are helpful, as discussed earlier in this chapter when reviewing Biesta's framework (2012). Ensuring that all perspectives taken onboard are embedded in inclusive strategies and inclusive policies nationally and internationally is crucial. This provides the foundation of a shared vision with the integral elements of rights, inclusion, agency, and equality.

I – 'Inclusion': Inclusion of all those involved in the educational process is integral to the journey. Deciding who is involved and ensuring that all are included is imperative. This network of actors who should be included in the transformation process of the education system are families, children, students and other social caregivers; this consists of all school specialists, teachers and other people involved in the management and organisation of the education system. Inclusion is a 'transformative task for the future' (Koenig et al, 2022). Inclusion is the path, the process and the goal. Inclusive education systems need transformative professional self-images or identities from the professions involved (Merz-Atalik, 2024). Utilising methods to ensure the inclusion of everyone consists of reflecting on how to access all voices of the actors involved. Ensuring inclusion involves embedding practice in inclusive, reflective practices that support all actors involved.

A – 'Advocacy': This is an essential element involving much thought and reflection. Discovering what you advocate for involves deeply understanding your views, opinions, and biases. Using Brookfield's model to uncover personal assumptions supports unpacking one's value system and allows one to realise who and what one advocates for (Brookfield,

2021). Ensuring there are shared values is an integral element of the utopian journey for all actors involved.

An example of creating a shared vision and values towards a utopian approach in a classroom

 "For any group of people to get an education of their own, the first need is to have a say and be listened to" (Griffiths, 2003: 34).

The following is an example from a Child Care Centre:

I would like to share some experiences from my work as a leader of two early childhood settings regarding using shared visioning methods to transform the educational environment and programme of our children, their parents, and our educators. Creating a shared vision and discussing our utopias was recently carried out in a class of mine with children aged 4 to 6 years. We began by talking about **'What each of us would like in the classroom to help us learn and play to the best we can.'** *Pseudo names are used throughout this example; the main comments from the children are shown in Figure 5. The parents' responses are illustrated in Figure 6, and the teacher's and educator's responses are illustrated in Figure 7 below.*

Figure 5: Shared Vision Example from Child Care Centre, Children's Comments

Shared vision Children's comments

| We need more toys

We need more equipment | We need to have respect for everyone, not just our friends

I like it when Mum and Dad see my work | We need space to play and learn, maybe we could use the garden too? | I would love music but soft music because Tom's ears hurt when it is too loud. | I like it when we learn in groups because I can learn with my friends. | I would like more time. I don't like having to finish up just because it is time to go out.

Sometimes I take a different time to learn then Josh does. |

'What each of us would like in the classroom to help us learn and play the best we can?'

Adapted from Dowling (2024)

Figure 6. Shared Vision Example from the Child Care Centre, Parents' Comments

Shared vision Parents' comments

'What each of us would like in the classroom to help us learn and play the best we can?'

My child needs lots of movement

My child needs to work in groups and talk to make sense of the world

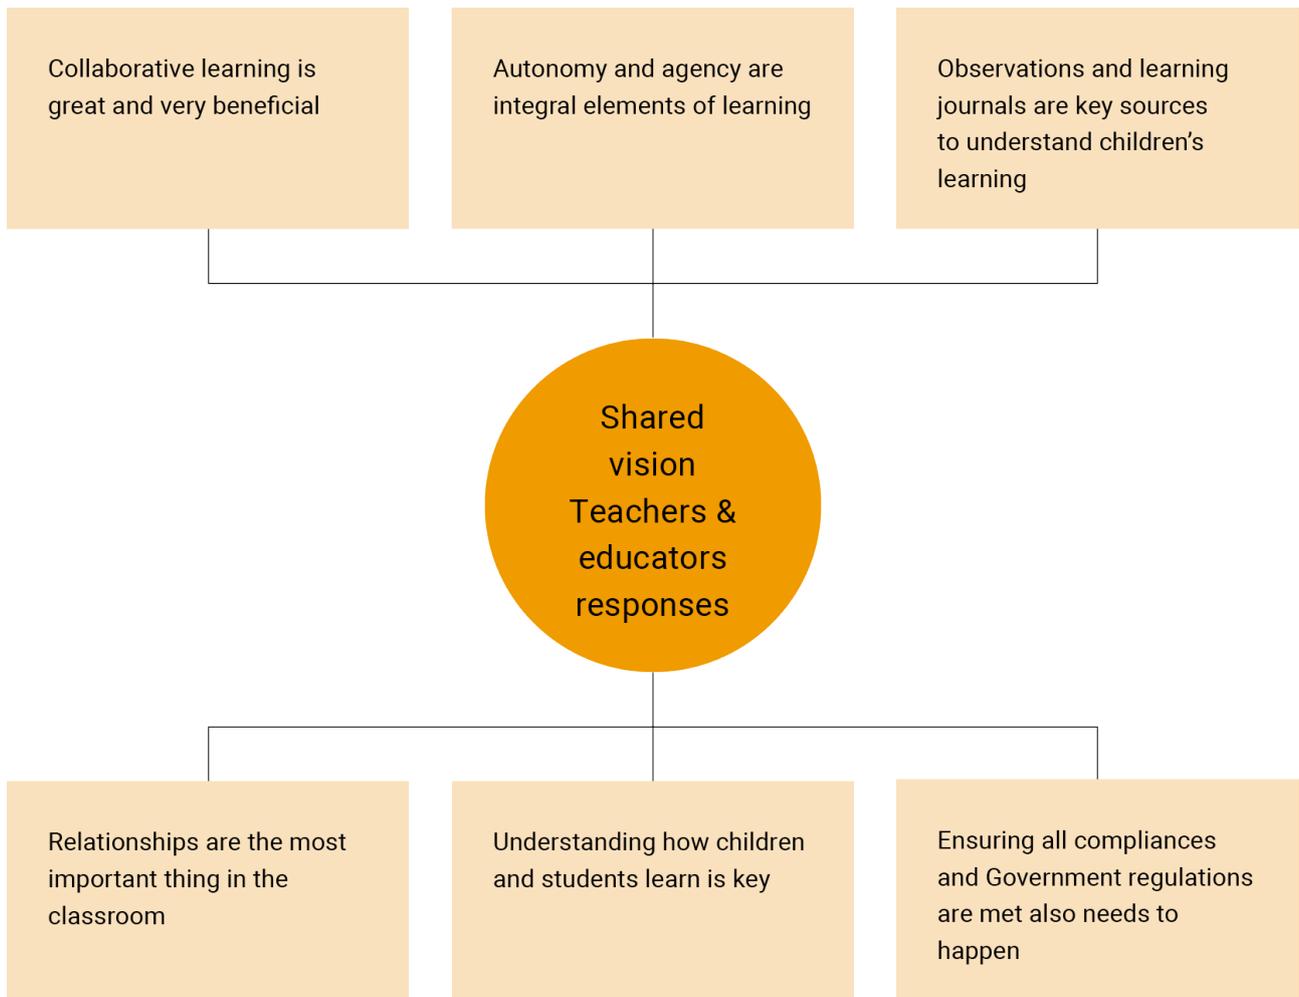
Reading and writing skills are integral

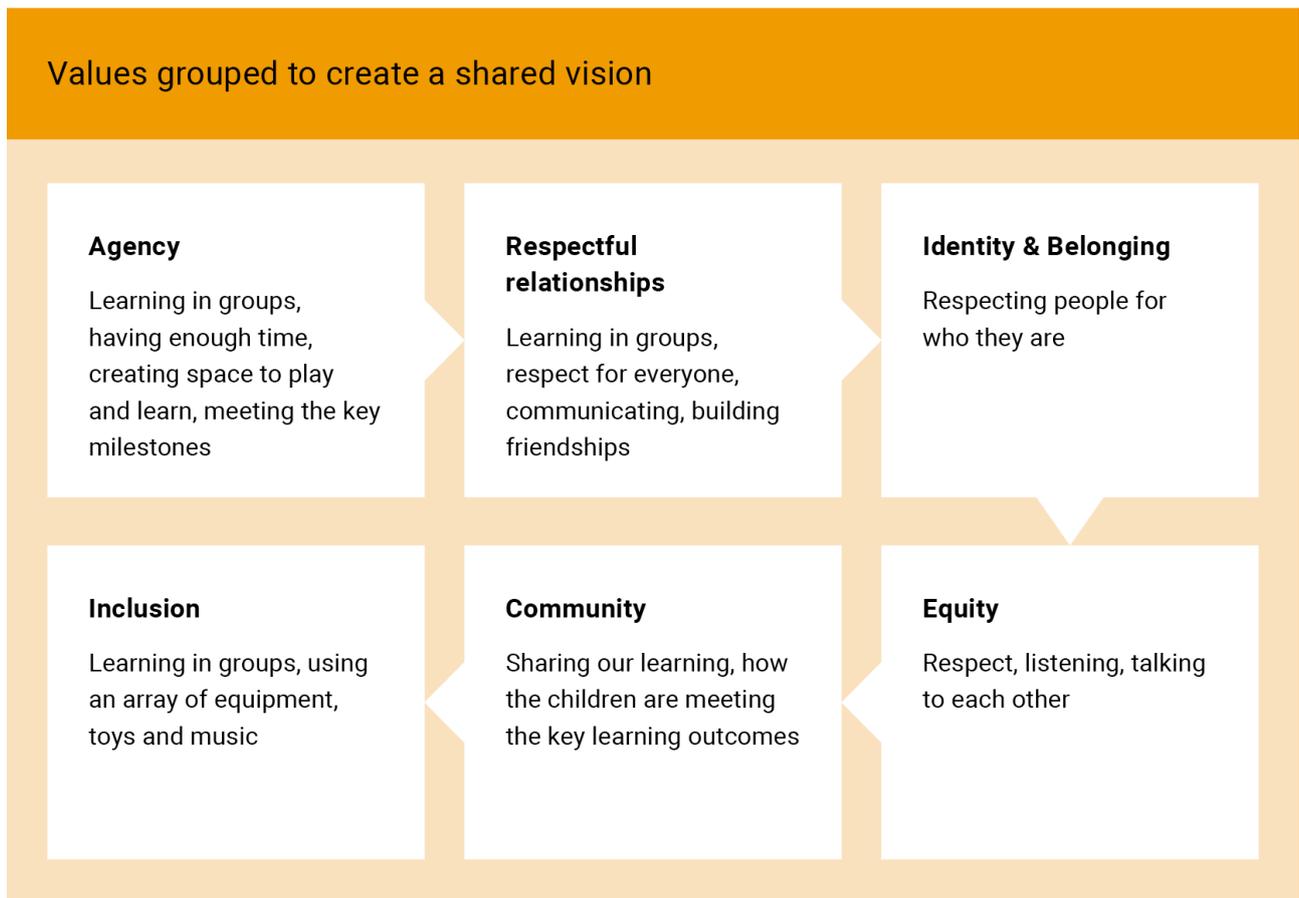
Friendships are very important.
Communication is key. If there is an issue, I need to know

Creativity is important
Maths and logic are key skills

I want my child to love learning

Adapted from Dowling (2024)

Figure 7: Shared Vision Example from the Child Care Centre, Teachers and Educators responses




'What each of us would like in the classroom to help us learn and play the best we can?'

Adapted from Dowling (2024)

Thematic analysis was used to ensure all contributions were captured effectively and the nuances of their answers understood (Hejil and Petersen, 2024). These elements were then grouped to form our values and our shared vision that led to collaborative agreement illustrated in Figure 8 below.

Figure 8: Shared Vision Example from the Child Care Centre

Values grouped to create a shared vision

Agency

Learning in groups, having enough time, creating space to play and learn, meeting the key milestones

Respectful relationships

Learning in groups, respect for everyone, communicating, building friendships

Identity & Belonging

Respecting people for who they are

Inclusion

Learning in groups, using an array of equipment, toys and music

Community

Sharing our learning, how the children are meeting the key learning outcomes

Equity

Respect, listening, talking to each other

Child Care Centre, Ireland (2024)

Adapted from Dowling (2024)

Figure 9. Child Care Centre, Classroom Agreement
In our classroom, we agreed:

Source: Adapted from Dowling (2024)

When I reflected on my practice, I found that there were areas I needed to alter.

I reviewed how I could support the class to ensure I facilitated and created a space where they could best learn. The review of practice led to more project-based work with added time and flexibility, a universal design for teaching, and a review of the spaces we could utilise within the building and the community. I also reviewed how we could involve the community in sharing our learning, focusing on innovative ways to communicate our knowledge to others.

*This scenario showed how a teacher/educator used the UTOPIA framework above within her classroom. Mutual **'understanding'** was recognised as an essential starting point for the joint reflection process in this scenario. This **'transformative'** approach by engaging in critical reflection took place through fostering positive relationships and creating **'opportunities'** to gather information involves ensuring the environment is based on trust, respect and*

*inclusion. This created an avenue to ensure that honest **'perspectives'** were gathered that reflected the actual thoughts and feelings of the people involved. This ensured the **'inclusion'** of all and the integrity of inclusive charters and policies visible within the ideas. An insight into what all the actors were **'advocating'** for appeared, and a shared vision of alternative realities emerged. This example shows how teachers can quickly gather perspectives to create a vision and allow everyone to go on a utopian journey to better their learning.*

Conclusion

The Participatory School in Tehran (Iran) example shows that a school community can follow its dreams and visions, even in conditions and contexts that may not be conducive or supportive. At the selected school, it was initially the fundamental values and expectations of one family who had set themselves the goal of playing a decisive role in shaping the educational biography of their daughter. This shows the power of individuals is key worldwide (Boban & Hinz, 2008; Merz-Atalik, 2022). The Participatory School (Teheran) exists today, representing these values in its educational approaches because it co-created a more powerful collective voice that made the dream a reality, like many other schools internationally that went on a Utopian Journey.

Reflecting on one of the opening concepts, *'There are as many Utopias as there are people in the world,'* reinforces that utopia is different for everyone. This chapter highlights that it is not an elusive dream that cannot be achieved. Instead, it is a method and a journey that you, as a teacher, can choose to embark on with your students (on every level of education, including places of adult- or teacher-education). Beginning with conversations about what Utopia is to them and concretising that abstract into creating an environment in which they can see, hear, and feel. Defining shared values and creating shared goals allows these illusionary ideas to become an authentic environment where meaningful teaching and learning can occur. Then, the creation of alternative tomorrows becomes a reality.

Closing questions to discuss or tasks

- When creating a shared vision, who's voice would you access?
- How would you access these voices?
- What models would you use to reflect on your practice?
- How would you try to understand your students' UTOPIAS?
- Has the ethos and culture of your educational facility altered your professional identity?
- How would you bring your students on their utopian journey?

About the authors

Aga M. Buckley

Aga M. Buckley is a social pedagogue, social work academic, and doctoral researcher at Kingston University London, UK, where she leads the Master of Social Work programme. As a neurodivergent educator and a parent of children with learning differences, she favours relational, creative, and progressive approaches to learning and teaching. Aga is a Senior Fellow of the Higher Education Academy (SFHEA) and a lifelong learner, advocating for equity, inclusion, and human agency. She is part of Kingston's Network of Equality Champions and Equality, Diversity, and Inclusion (EDI) Action Group, as well as a member of the British Association of Social Workers (BASW) EDI Advisory and the Neurodivergent Social Worker Special Interest Group. Before joining Kingston's Department of Social Work and Social Care, Aga worked in acute psychiatric NHS settings, advanced statutory roles, and workforce development.

Georga Dowling

Georga Dowling is a Lecturer in Early Childhood Education in the Froebel Department in Maynooth University, Ireland and an experienced practising Early Childhood Educator. Her research interests include accessing the voices of young children from birth, examining their participation within their learning journey, inclusive teaching practices and innovative qualitative research designs. She is an advocate for children's rights, quality early childhood education and children's participation in their education. She has co-authored several chapters on these research topics.

Kerstin Merz-Atalik

Kerstin Merz-Atalik has been working as a special education support teacher in mainstream classes (in Berlin during the 90s). Since 1995 she was working at different German Universities as a researcher, her actual research focus is on teacher education for inclusion, governance of inclusive education and transformation processes in the actor network of education systems. Since 2004 she has a full professorship at the University of Education Ludwigsburg for "Education, considering disability and Disadvantage/ Inclusion" and is actively engaged into developing an inclusive teacher education.

Maryam Mohammadi

Maryam Mohammadi holds a master's degree in painting and brings 17 years of teaching experience as the Executive Director of the Participatory School in Iran. The school fosters a humanistic approach to education, focusing on alternative methods that emphasise active participation from children, parents, and teachers to promote the holistic development of young learners.

For years, Maryam and her colleagues have worked to build an inclusive environment where all students, regardless of their background or abilities, can thrive. Addressing individual needs, they help students cultivate self-awareness, confidence, empathy, and a deeper understanding of themselves and the world.

Contributors

Abdellatif Atif

Abdellatif Atif is a postdoctoral researcher at Galway University specializing in the intersections of political and educational theory. He is particularly passionate about exploring the instrumentality of education in general and within populist discourses in specific. Rather than dismissing populism and instrumentality as mere pathologies to be condemned, Abdellatif adopts a nuanced approach that examines their complex relationship with education. His work seeks to advance democratic education by offering updated and constructive responses to the challenges posed by populism.

Aga M. Buckley

Aga M. Buckley is a social pedagogue, social work academic, and doctoral researcher at Kingston University London, UK, where she leads the Master of Social Work programme. As a neurodivergent educator and a parent of children with learning differences, she favours relational, creative, and progressive approaches to learning and teaching. Aga is a Senior Fellow of the Higher Education Academy (SFHEA) and a lifelong learner, advocating for equity, inclusion, and human agency. She is part of Kingston's Network of Equality Champions and Equality, Diversity, and Inclusion (EDI) Action Group, as well as a member of the British Association of Social Workers (BASW) EDI Advisory and the Neurodivergent Social Worker Special Interest Group. Before joining Kingston's Department of Social Work and Social Care, Aga worked in acute psychiatric NHS settings, advanced statutory roles, and workforce development.

Akangshya Bordoloi

Akangshya Bordoloi is an Assamese Indian social researcher from Department of Sociology, Maynooth University, Ireland. Her research interest lies in gender, sexuality, deviancy studies and social movement. She is also interested in classical sociological theory and considers herself a Foucauldian. She has been awarded the John and Pat Hume Doctoral Awards, the Department of Sociology Teaching Studentship, and the National University of Ireland Travelling Scholarship for my doctorate research.

Akshita Rawat

Akshita Rawat is a PhD researcher at the University of Vienna. Her research focuses on social inequality and education in India. Her research interests include teaching-learning practices in classrooms, sociology of education and qualitative research methods. Her research aims to inform policies and practices that promote inclusivity and equity in education.

Alessandra Galletti

Alessandra Galletti is working as an educator in a secondary school, focusing on supporting students with learning difficulties. In addition to her role in education, she founded an association on Autism in Südtirol, GRETA. Her broader work centers on rethinking school spaces to ensure they are functional and inclusive, fostering a sense of well-being for teachers and students alike. She collaborates with educators, administrators, and designers to promote a culture of inclusivity in schools. By adopting a multidisciplinary approach, she integrates diverse expertise to create solutions that address the needs of the majority of users effectively.

Alessandra Imperio

Alessandra Imperio has a Ph.D. in General Pedagogy, Social Pedagogy, General Didactics, and Disciplinary Didactics. She has been a primary school teacher for about 18 years and is currently a research assistant at the Free University of Bozen-Bolzano, Faculty of Education. Her main research interests are formative and inclusive assessment, pedagogy of the question and dialogic teaching/learning, learning approaches for inclusion, and life skills development.

Alessio Di Paolo

Alessio Di Paolo is a PhD candidate in "Didactics, Special Pedagogy, and Technology for Inclusive Education" at the University of Salerno. His research interests focus on the inclusive potential of music in teaching-learning processes and the educational aspects it can have in formal and informal contexts, all following the theoretical framework of simplexity.

Alexandra Anton

Alexandra Anton, researcher specialising in teachereducation at the Åbo Akademi University. Her research is situated at the intersections of early childhood, teacher agency, and just pedagogies for multicultural and multilingual learners. She is an experienced practitioner in early childhood, language learning and teaching, and is involved in cross-cultural research projects.

Alison Stapleton

Dr Alison Stapleton is a multiply neurodivergent Chartered Psychologist, lecturer, and advocate. Alison co-founded the Association for Contextual Behavioural Science (ACBS) Neurodiversity-Affirming Research and Practice Special Interest Group, served on the ACBS Board of Directors (basic science Member at Large), and assists psychological services in identifying, accommodating, and supporting a range of neurotypes. Alison has published several book chapters and scientific articles, including contributions to The Oxford Handbook of Acceptance and Commitment Therapy and a systematic review of adults' experiences of being identified as autistic in adulthood.

Andreas Hinz

Andreas Hinz was a teacher. From 1999 to 2020 professor for Inclusive Education at Martin-Luther-University Halle-Wittenberg in Eastern Germany, from 1986 to 1999 member of a research team on 'integrative' school experiments in primary schools in Hamburg. Co-founder of a small inclusive hotel (barrier-free and with a mixed team of employees) in Hamburg, working since 1993. Active in Democratic Education since 2008, ten years cooperating with the Institute for Democratic Education at the Kibbutzim College for Education in Tel Aviv, joining lots of European and worldwide conferences of the Democratic Education movement. E-Mail: andreas.hinz@paedagogik.uni-halle.de.

Andrew Campbell

Andrew B. Campbell (DR.ABC) is an Assistant Professor, Teaching Stream, in Leadership for Racial Justice in Teacher Education in the Master of Teaching Program at the Ontario Institute for Studies in Education (OISE), University of Toronto OISE. He is the Coordinator for the Black Future Educators' Program (BFEP) and the Director of the Centre for Black Studies in Education (CBSE). DR. ABC is known to the OISE and broader community for his leadership on advancing equity, leadership, 2SLGBTQIA+ community, and teacher education. He presently teaches courses in anti-discrimination education, leadership, educational change, urban education, and Black Educators' Identity and Pedagogy. He has presented at numerous conferences and has delivered many presentations as a keynote speaker, motivational speaker, and workshop facilitator. He loves people, food, fashion, travelling and bringing his community together for a good meal.

Angele Deguara

Angele Deguara is a resident academic and subject co-ordinator of Sociology at the Junior College of the University of Malta. She also lectures in gender and sexuality within the Department of Gender and Sexualities, Faculty for Social Wellbeing. She conducted her PhD research in the anthropology of religion and sexuality with LGBT Catholics in Malta and Palermo, Sicily. She is the author of *Life on the Line: A Sociological Investigation of Women working in a Clothing Factory in Malta* as well as a number of other published works. Her main research interests are gender, homosexuality and religion. She co-founded and chaired the Diversity Committee at the Junior College for a number of years. She is an activist for social justice and civil rights with Moviment Graffitti and has previously volunteered with other organisations such as the Malta LGBTIQ Rights Movement and within the Fair Trade movement.

Angeline Aow

Angeline is an international educator, author, consultant and pedagogical leader. She has undertaken multiple roles within schools, as a teacher, curriculum coordinator, accreditation coordinator and professional learning and development coordinator. Angeline is an advocate of inclusion, coaching, concept-driven learning and teaching and contributes as an active citizen on social justice issues through her role as a country network leader of WomenEdDE, facilitator of the Humanising Pedagogy Committee of the International Schools Anti-discrimination Task Force and work with the Council of International Schools. Her book, Becoming a Totally Inclusive School: a Guide for Teachers and School Leaders was published by Routledge in November, 2022.

Ann-Kathrin Arndt

Ann-Kathrin Arndt, research, teaching and developing teacher education in the field of inclusive education. PhD on collaboration between general and special education teachers (Leibniz University Hannover). Main research areas: Multidisciplinary teamwork, constructions of difference in inclusive classrooms, inclusive, diversity-sensitive teacher education.

Anna Frizzarin

Anna Frizzarin has a PhD in Pedagogy and Didactics and works as a researcher in the field of inclusive education. Her research focuses on inclusive teaching and learning, inclusive development processes of educational contexts, attitudes and social representations in relation to perceived diversity and the resulting implications for students' participation in schools.

Anne Piezunka

Anne is an educational researcher from Germany. In her research she is interested in educational relations, the implementation of inclusive education and the potential and limitations of data collection on discrimination. She is also involved in an initiative to improve educational relations called "Reckahner Initiative für Pädagogik".

Assimina Tsibidaki

Assimina Tsibidaki is an Associate Professor of Special Education in the Department of Primary Education at the University of the Aegean, Greece. Her research interests include students with special educational needs and disabilities (SEND), families raising children with SEND, home-school collaboration, social support networks, technology in inclusive education, and the portrayal of disability in children's literature and cinema. She has authored two books and contributed to edited volumes, academic journals, and conference proceedings. Additionally, she has presented her work at numerous national and international conferences.

Ayana Pathak

Ayana Pathak is an aspiring academic, currently pursuing her doctorate in the Department of Education from the University of Oxford. Her research interests surround the area of qualitative aspects of gender education in developing

countries, with a focus on school education. This largely draws upon various theoretical concepts of sociology of education, as well as the concept of the hidden curriculum, through which the social construction of gender as a category is aimed to be evaluated. Her academic background is in the discipline of Sociology, having done her Bachelor's and Master's in the same, before embarking on an MPhil in Education and thereafter, the current DPhil programme at Oxford. She is a passionate feminist who aims to study questions of inequality in the field of education- through the lens of gender based reproduction theory.

Baran Yousefi

Baran Yousefi holds a degree in Health Studies from York University in Toronto, Canada. As a graduate of the Participatory School, Iran's first alternative and democratic school, she brings extensive hands-on experience in educating children through a humanistic approach. Currently, she serves as the coordinator and a key member at the Peace School in Toronto, and she is a board member of Humanist Kids. Baran is deeply committed to promoting humanistic values and fostering a culture of peace through education. She has completed numerous courses in educational methodologies, UN sustainable development programs, and participatory systems, all of which align with her dedication to humanistic psychology and UNESCO's peace charter. Her unique blend of lifestyle, educational philosophy, lived experiences, and academic background has positioned her to make a meaningful impact in the field of children's education.

Beausetha Juhetha Bruwer

Beausetha Bruwer, instructor of inclusive education, deaf education, and sign language. Experiences as a teacher of deaf children and as a teacher and sign language interpreter trainer at college and university level. Her key areas of research interest include, among other things: language education, early literacy and language acquisition/development for deaf learners, sign language linguistics and practices, Deaf culture, mother tongue education, multilingual education, early childhood inclusive practices, play pedagogy, outdoor pedagogy, and teacher preparation for inclusive practices.

Becky Ward

Becky Ward, PhD, is a collaborative researcher in psychologically-informed practice. She pursues research with and for marginalised groups and individuals, but also has a particular interest in neurodiversity, homelessness and young people. She supervises and teaches both undergraduates and postgraduates in Psychology, including Clinical, Developmental and Educational Psychology. Her PhD from the University

of Southampton explored a collaborative model of co-producing school staff ADHD resources. She is an experienced youth worker, trainer and advocate with a demonstrated history of working with vulnerable young people.

Bhuvan Israni

Bhuvan works as an Assistant Lecturer at Technological University Dublin. Before joining Technological University Dublin, she worked at DBS, ECBM, and IBAT colleges in Ireland. She holds a Bachelor's (Hons) and a Master's degree in Psychology, both with first-class honours, and is currently completing her doctorate.

With over five years of experience as a Special Educational Needs (SEN) teacher in India and Ireland, Bhuvan is deeply passionate about Equality, Diversity, and Inclusion (EDI). Her research in this field has been featured at both national and international conferences. A strong advocate for continuous professional development (CPD), she is actively engaged in advancing her academic and professional journey.

Bhuvan has contributed multiple publications to RTE Brainstorm and maintains an active ResearchGate profile, where her work continues to make a meaningful impact.

Bodine Romijn

Bodine Romijn is a researcher and lecturer at Utrecht University. Her work focuses on equality, diversity and inclusion in early childhood and primary education. She studies professionals' intercultural competences and the role organisations play in supporting and facilitating their staff in implementing culturally sensitive and inclusive practices.

Brian Lynam

Brian Lynam was born and raised in Ireland and has experience of working in international education, specifically in the PYP International Baccalaureate program and International School Teacher training. He is passionate about inquiry based learning, inclusive education, UDL and the role of technology within education.

Büşra Gündeş Orman

Büşra is a researcher in early childhood education from Istanbul Aydın University in Turkey. She has experience teaching children aged 3-5 and has worked on various projects with children from diverse groups, especially those affected by poverty and migration. Currently, she supervises teacher candidates during their practicum.

Her research interests include school well-being, socio-emotional learning, children at risk, and inclusive education.

Carlos Moreno-Romero

Charlie's academic and professional journey spans across disciplines: philology (BA), anthropology (MA), and education (PhD). In 2019, he funded a democratic school (Suvemäe) within a public school (Tallinna Kunstigümnaasium) in Estonia, where he worked as head of studies until 2024. Furthermore, he has researched various topics (Educational Commons, Democratic Education and Social Justice, Nation-State Formation and Education) within the framework of Erasmus+ and Horizon 2020-funded projects. He currently works as a consultant on democratic education, self-directed learning, media literacy, and fostering social justice through education.

Catherine Reid

Catherine Reid is a lecturer in Teacher Education at the University of Glasgow. Her research focuses on widening participation in Higher Education for young people from areas of high deprivation. She is particularly interested in highly able learners and the role of teacher knowledge in education.

Cennet Engin

Cennet Engin is a full professor who teaches undergraduate and graduate courses related to education, curriculum, social foundations of education, needs assessment and classroom management at the Faculty of Education. She worked as an expert and consultant at various international projects, on inclusion, gender equality in education, gender sensitive schools, strengthening democratic culture in primary education, prevention of domestic violence against women and digital citizenship. Her academic works included girls' education, democratic schools, inclusive education, democratic citizenship and human rights education, child labour and education and gender policy in education. She was awarded a Fulbright Senior Research scholarship and conducted research at the University of Wisconsin, Madison.

Chee Shien Tan

Victor Tan Chee Shien has over ten years of experience in special education and is a trained counsellor and educational psychologist. He recently

received his Associate Fellowship in higher education from the University of Stirling. His research interests include special education, higher education, and international mobility (ORCID: 0009-0006-3403-4649).

Chloë Keegan

https://orcid.org/
0000-0001-9759-6370

Dr. Chloë Keegan is a Lecturer in the Froebel Department of Primary Education and Early Childhood in Maynooth University. With over a decade of experience in the early childhood sector as a researcher, lecturer, educator, content developer, and early childhood specialist, Chloë's passion lies in conducting qualitative research directly with young children and advocating for children's voices to be heard and reflected in policy and legislation. Her research has explored how power dynamics, educational structures, and shared environments between adults and children shape children's participation through her Doctor in Philosophy (Ph.D) in Education entitled "It's Like a Baby Jail!' The impact of regimented daily routines on children's participation in early childhood education". Chloë has led national and international campaigns and initiatives as an outdoor and nature specialist in early childhood education, contributed to Ireland's alignment with international practices, particularly for outdoor play, policy and provision, and is conducting research to inform national Irish policy and guidance for children and adults with disabilities.

Christine Carstens

Chris Carstens, based in Bremerhaven, brings extensive experience in teaching English and German, alongside certification as a trauma educator with a specialization in supporting children and young adults facing social and emotional challenges.

Claire O'Neill

Claire O'Neill is a writer and researcher with a background in education. Her research focuses on Neurodiversity and Neurodivergence. Core principals of the Neurodiversity paradigm and Universal Design inform her research, writing and approach to education.

Clíona O'Keeffe

An experienced educator, Clíona is Principal at a large all-boys primary school on the outskirts of Dublin. Having previously worked as a classroom

teacher, in curriculum development and in teacher education she has a wide range of research interests these include leadership selection processes in education, inclusive education particularly in relation to learners with additional educational needs, Catholic education and social teaching, and the teaching of History, Geography and Science.

Cynthy K. Haihambo

Cynthy Kaliinasho Haihambo Ya-Otto is a teacher-educator at the University of Namibia. Her teaching and research areas are in Educational Psychology and Inclusive Education.

Damini Sharma

Damini Sharma is an educator and researcher specialising in inclusive education and child development. She has worked as an inclusive facilitator at schools in India. Damini's work focuses on social justice, teacher education, and policy development, exploring inclusive practices and their implementation to promote equitable education.

Danielle Farrel

Danielle Farrel has both lived and professional experience in the field of disability. She has a passion for changing the narrative for disabled people and those from other marginalised groups. Danielle graduated with her PhD from the University of the West of Scotland in 2015 and her thesis was entitled 'The 2012 Child Abuse Scandal: The Multifuctional Nature of Online Discourse'.

Dean Vaughan

Dean Vaughan is an experienced primary school teacher in Ireland. He holds a Bachelor of Education, Master of Education and Postgraduate Diploma in Leadership & Management. Dean has spent most of his teaching career in the infant classroom where he is passionate about playful approaches to teaching and learning and works closely with student teachers as a research supervisor and part time lecturer in teaching training colleges. Throughout his M.Ed, he recognised a communication for all approach which focused on inclusive practices through Play in the classroom.

Declan Markey

Declan Markey works on a programme called Turn to Teaching, which provides an alternative pathway to becoming a teacher for students who have experienced educational disadvantage or are from communities who are under-represented in the teaching profession in Ireland. Turn to Teaching's objective is to diversify the teaching profession and support teachers and schools in becoming more inclusive teaching and learning environments. Through his work he constantly encounters the impact and legacy that teachers have on their students – be that teachers who inspire students to break-through societies preconceptions or judgements and reach their full potential or those teachers that uphold these prejudices and stereotypical beliefs, which then impact negatively on their students. All teachers have the opportunity and, it could be said, the responsibility to ensure that they become the former – the teacher that can inspire.

Deirdre Forde

Dr. Deirdre Forde is a distinguished lecturer in Inclusive Education at Maynooth University. With a background as a qualified primary teacher and a chartered child and educational psychologist, she brings extensive experience from various educational settings and psychological services to her role. Deirdre's research and teaching interests are diverse and encompass areas such as disability and the dynamics of inclusion and exclusion within educational and societal contexts. She is particularly passionate about amplifying children's voices, advancing relational education, and shaping policies related to Equality, Diversity, and Inclusion (EDI). Her work is dedicated to fostering inclusive environments that acknowledge and celebrate diversity.

Dror Simri

MA, education counsellor and family and couples therapist, working from 1992 until 2018 at Hadera Democratic School as a teacher, mentor and mentoring supervisor.

Dua Jabr Dajani

Dua Jabr Dajani, Ph.D., is the regional counselor for English language teaching at East Jerusalem School and holds a lecturer position at the David Yellin College of Education. Her research interests encompass enhancing critical thinking in schools, exploring the impact of schooling on cognitive development, English teaching

methodologies, and preparing educators to lead professional learning communities effectively.

Eileen Schwarzenberg

Eileen Schwarzenberg is a qualified special education teacher. Eileen graduated with her PhD in 2013 and is since then working as a lecturer in inclusive education in a university in Germany. Before that, she worked as a research assistant and lecturer at various universities in the field of special education. Her research interests are teacher education, teaching assistants and inclusive education for students with profound intellectual and multiple disabilities and Augmentative and Alternative Communication.

Emer Byrden

Emer Byrden is the Deputy Principal of a primary school in south-east of Ireland, and is doing a PhD in the School of Education in Maynooth University, Ireland. Her interests are relational pedagogy, inclusive education and restorative practice, particularly where these areas intersect. Her current research is on the relational soundscape of the primary school classroom. Emer is contributing a chapter on relational research to the upcoming Routledge Handbook of Relational Pedagogy.

Emma Pearson

Emma Pearson works in the Froebel Department of Primary and Early Childhood Education at Maynooth University in Dublin. Her research and outreach work centres around understanding and documenting the perspectives and experiences of children and families from under-represented communities. During the past 15 years, she has worked with a range of international, regional and national government and non-government early childhood agencies (including UNICEF, UNESCO, Plan International and the UK Department for International Development / FCDO) to advocate for policies that promote community-centred, equitable access to early childhood education and development supports.

Eva Kleinlein

Eva Kleinlein is a university assistant and PhD student at the Centre for Teacher Education at the University of Vienna, Austria. In her research and her work she mainly focuses on inclusive education in an international comparative /

transcultural perspective. Moreover, she is engaged in topics such as inclusive assessment, digital methods in qualitative research, inclusive teaching practices, and teacher diversity.

Evrim Çetinkaya Yıldız

Evrim Çetinkaya Yıldız is working as an associate professor at Akdeniz University, Türkiye, Department of Psychological Counseling and Guidance. Her research interests are inclusive education, prevention of student problem behaviours, and school counsellor education.

Fatma Kurker

Fatma is a PhD candidate in Psychological Counselling and Guidance and works as a research assistant. Her research interests include basic psychological needs, social media-mental health, international students' mental health, and racial microaggressions in the university environment.

Federica Festa

Federica Festa focuses on participatory practices in schools and conducts research on how to include individuals with predominantly or entirely non-verbal communication in such practices. She works as a special education teacher in upper secondary schools and teaches in specialization courses for special education teachers. Her teaching focuses on how to analyze oral and written texts in schools from a sociolinguistic perspective, aiming to design their accessible adaptation within an inclusive framework.

Fetiye Erbil

Dr. Fetiye Erbil is a researcher and a lecturer at Bogazici University. She completed her PhD at the Learning Sciences Program of Bogazici University. Her research interests include social-emotional learning, teacher professional development, children's rights and participation and educational policies.

Francesca   Mara Santangelo

Francesca Mara Santangelo is a pedagogist with expertise in disability, marginality, and Behavioral Neuroscience. Her research focuses on Special Education and Inclusion. As a musician and teacher trainer, she also works on designing and implementing

early educational interventions coordinating networks of schools, institutions, families, and various stakeholders. Her professional experience combines solid expertise with a continuous commitment to promoting inclusive education and fostering neuropsychological well-being starting with children.

Frank J. Müller
UNIVERSITY OF BREMEN
https://www.uni-bremen.de/en/
fb12/arbeitsbereiche/abteilung-
c-inklusive-paedagogik/sekundarstufe/team/
prof-dr-frank-j-mueller

Prof. Dr. Frank J. Müller is a professor for "Inclusive Education for Learning and Intellectual Development Impairments in Secondary Schools" following his work as a special ed teacher at the Grünauer Gemeinschaftsschule in Berlin.

He works on support structures for teachers in heterogeneous learning groups through inclusive open educational resources, research-based study programs to make the history of inclusive education accessible to future generations, and questions of including more dimensions of diversity.

Georga Dowling

Georga Dowling is a Lecturer in Early Childhood Education in the Froebel Department in Maynooth University, Ireland and an experienced practising Early Childhood Educator. Her research interests include accessing the voices of young children from birth, examining their participation within their learning journey, inclusive teaching practices and innovative qualitative research designs. She is an advocate for children's rights, quality early childhood education and children's participation in their education. She has co-authored several chapters on these research topics.

Graham Maher

Graham Maher is a teacher in a secondary school in Dublin, Ireland. He has been working in secondary schools around Dublin, ranging from private schools to DEIS (Delivering Equality of Opportunity in Schools) band 1. The reason he became involved in All Means All is to increase the diversity of teaching in Ireland. Graham is a white, middle class, highly educated, Irish national; and this is mirrored across most of the education sector in Ireland. The representation of diverse teachers must increase to better reflect the multi-cultural development of Ireland. This increase of diversity, he believes, will increase the inclusivity, diversity, and equality in Irish education.

Grit Alter

Grit Alter is a Professor of Teaching English as a Foreign Language at the University College of Teacher Education in Innsbruck, Austria. Her research focuses on using picturebooks in English language teaching, diversity education, teaching methodology and digital literacy in the primary English classroom as well as critical pedagogy. She is currently involved in research projects on critical textbook studies, teaching in Canada and the development of school quality.

Günalp Turan

Günalp Turan is an NGO professional and an educator with a focus on communities of practice and teacher empowerment. He has a BA in language education and has taken graduate studies in cultural studies. He has been managing and advising national and international projects and organizations on inclusive education, critical thinking, community building, and andragogy.

Halil Han Aktaş

Han is a researcher in the Curriculum and Instruction field. He has completed Ph. D. in the Curriculum and Instruction program at Middle East Technical University, in Ankara-Turkey with the dissertation titled "Constructing a democratic school community: A grounded theory study". He participated in the project "Increasing Participatory and Democratic Processes in Schools" funded by Friedrich Ebert Stiftung in Ankara. His scholarly and personal research interests include curriculum as a generative and generated force of cognition, reciprocality of culture and education, democratic education and alternative education.

Hannah Solley

Hannah Solley (she/her) is a qualified Dramatherapist who has worked in the area of youth, family and mental health for over fifteen years. She has designed and implemented mental health awareness programmes as well as working in anti-bullying programmes in schools. She has been working with the trans community for several years, providing family and teen support, as well as educational guidance to schools and organisations in Ireland. This includes trans inclusive policies, best practice ways to support gender diverse students and peer education in gender diversity and allyship. She is

passionate about youth mental health and creating positive changes to help young people reach their full potential.

Heidrun Demo

Her work centers on equity in education, with a particular focus on supporting diverse learners, fostering inclusive teaching practices, and driving inclusive school development. She is deeply involved in research and teacher training, dedicated to creating and sustaining inclusive learning environments.

Hermione Xin Miao

Dr Hermione Xin Miao was born at a rural village in China, raised by her maternal grandparents since she was eight. She stayed in her hometown for schooling while her parents migrated to a big city to make a living. She was one of millions "left-behind children" who experienced exclusion in education. Hermione is a first-generation university student in her family. She has developed research interests in curriculum making, teacher agency, climate change, inclusive education, and intersectional feminism. She has degrees in both geography and education, and a PhD degree from University of Stirling (2024). Hermione has been involved in creative and participatory methods in both research and community building, in particular early career researchers' network communities. Hermione also has started an Mapping Inspirational Women initiative from 2023 as open educational resources to re-tell women's contribution to the world.

Hazar Chaouni

Hazar Chaouni is a passionate disability rights advocate and a member of Feminists Against Ableism, an intersectional disability justice collective. She actively advises organizations on inclusive policies and accessibility, working to ensure that spaces and practices are inclusive and just for all. Through her essays, workshops, and speeches, Hazar aims to create awareness about disability and ableism, promoting intersectional justice and systemic change. Her advocacy is deeply rooted in her personal and professional experiences, and she emphasizes the importance of the principle "nothing about us without us" in all her work.

Ines Boban

Once teacher in so called Integration-Classes at a comprehensive school (Reformschule Hamburg Winterhude), from 2002 until 2017 researcher and lecturer for Inclusive Education at the Martin-Luther-University Halle-Wittenberg.

Ira Schumann

Ira Schumann works on the topic of inclusive school development at the University of Bremen. She also gives workshops on topics such as inclusion, diversity, racism/critical whiteness and fat acceptance/fat liberation.

Irati Sagardia-Iturria

Irati Sagardia-Iturria after completing her studies at Mondragon Unibertsitatea (Spain) in Primary Education and specialising in Special Education, she adopted the principle of creating inclusive environments and processes as a core value in her life. Motivated by this, she decided to further her education by pursuing both a master's and a doctorate at the same university, with a focus on educational transitions and inclusive processes. This academic journey provided her with a unique opportunity to actively engage in a research project led by the Zehar and Hazitegi groups, which also forms the context for her thesis, following the purpose of generating and transferring knowledge in the field of innovation and intervention in inclusive education. Additionally, she has gained experience as a university lecturer across various modules, aiming to raise awareness of the importance of the healthy development of all children (emotional, social, cognitive, motor, and linguistic), and the role of the educational community in that development and creating inclusive contexts (the role of the teacher, organisation of time and space).

Jane O'Toole

Jane O'Toole is a primary school teacher who specialises in language education. Jane's doctoral research explored student and parent engagement with the Irish language utilising a participatory action research methodology. Jane has also served as a school principal and has a special interest in inclusive education and curriculum. Jane has been a coordinating member of the Collaborative Action Research Network (CARN) since 2016.

Janneke Eising

Janneke Eising is an enthusiastic teacher trainer with a passion for learning and developing; and languages and literature. To foster inclusive education, she works on topics such as formative assessment, differentiation, classroom management, teaching adolescents and mentoring. Using practitioner research, for instance the Lesson Study approach, she works with (student-) teachers on how to enhance all students' learning in the classroom.

Jean Karl Grech

Jean Karl Grech is from Malta. A gay primary teacher with a particular passion for inclusion and cultural integration. A recent graduate with a Master's in Euro-Comparative Education. In his studies at the University of Malta, he focused on the inclusion and visibility of the LGBTIQ+ community in schools through subjects and daily school practices.

Jessica Lament

Jessica Lament is a specialist in inclusive practice, especially for students with disabilities. She has worked in schools in the US, Singapore, and France supporting teachers – from pre-k to secondary school to teachers in higher education training programs – always with the same goal, to increase the implementation of research-based inclusion.

Josefine Wagner

Josefine Wagner is a postdoctoral researcher at the Department of Education and Social Work at the University of Luxembourg.

She has completed several postdoctoral fellowships with a focus on inclusion and the origins of special needs education, including a visiting fellowship at the United States Holocaust Memorial Museum (2020), at the Departments of Education and Anthropology at the National University of Ireland, Maynooth (2024) and the Department of Teacher Education and School Research at the University of Innsbruck in Austria (2021-2024).

Jules Buendgens-Kosten

Dr. Jules Buendgens-Kosten is a researcher and teacher educator at Goethe University Frankfurt. Their research interests encompass computer-assisted language learning and inclusive education.

Julia Bialek

Julia Bialek is working as a research assistant at the University of Bremen in the "All Means All!" project. She is a pedagogist, has a degree in special education, and has been working in the field of trauma-sensitive education for many years. She teaches this topic at the university, in training courses for educational professionals, and works as a trauma therapist.

Julia Schlam Salman

Julia Schlam Salman, Ph.D., is a lecturer and teacher educator at the David Yellin Academic College of Education in Jerusalem. She also teaches in the MA TESOL program and the Division of Languages at Tel-Aviv University. Her research interests include language education, language learning and teaching, and English language learning in areas of intractable conflict. She lives near Jerusalem with her spouse and four children.

Karen Buttigieg

As a science educator, Karen Buttigieg is committed to advancing *Bildung*-oriented, transformative, and inclusive pedagogies within neoliberal contexts through research and practice. She believes in inclusion and the provision of quality education to every child and young person and strive to develop educational practices that are not only effective but also accessible to all learners. This conviction guides her approach to teaching and academic research. Karen is also an activist for women's rights and disability issues, trying to raise awareness, influence policy, and implement practices that bring about positive change towards equality and inclusion.

Katarina Rončević

Katarina Rončević has more than 10 years of experience in education for sustainable development and inclusive education and has been working on whole school approaches. Since 2019 she works for Greenpeace Germany in the education team and is a PhD Student at the University of Vechta(Germany). Katarina is a member of the international ESD Expert-Net and CO-Founder of The Turquoise Change e.V.

Kavyta Raghunandan

Kavyta is a course leader for the MA in Race, Education and Decolonial Thought and Senior Lecturer in Race and Education at Leeds Beckett University. Her teaching cuts across undergraduate and postgraduate levels and she teaches on Education Studies degrees, as well as contributing to undergraduate, masters, and doctoral degree supervision. Her teaching, writing and research interests lie in intersectional ways of thinking through race, gender and identity across multiple platforms namely education, popular culture, graphic novels and more recently nature spaces. Her work, so far, has also been influenced by anti-racist pedagogies and decoloniality as a theoretical framework to examine South Asian representation.

Kerstin Merz-Atalik

Kerstin Merz-Atalik has been working as a special education support teacher in mainstream classes (in Berlin during the 90s). Since 1995 she was working at different German Universities as a researcher, her actual research focus is on teacher education for inclusion, governance of inclusive education and transformation processes in the actor network of education systems. Since 2004 she has a full professorship at the University of Education Ludwigsburg for "Education, considering disability and Disadvantage/ Inclusion" and is actively engaged into developing an inclusive teacher education.

Konstantin Korn

Konstantin Korn is interested in subjects around critical political and civic education (in German schools). He wants to highlight overheard student-voices in educational settings and research about didactics. In particular, through participatory action research. His aim is to democratise education and society towards anti-discrimination and against neoliberalism.

Kristina Pennell-Götze

Kristina Pennell-Götze (she/they) (M.Ed) is a queer Filipino-Australian social change agent, focusing on diversity, equity, inclusion, justice and antiracism (DEIJAR) in international education. She is an educator and leader with experience working in public, private and international schools in England and Germany. She is the facilitator of the student Social Justice Committee and the Gender and Sexuality Alliance groups, providing support and opportunities for students to lead. Kristina is a leader within Association of International Educators and Leaders of Color (AIELOC), and a former fellow

of the organisation, providing guidance and support to educators and leaders who are AIELOC school and community members, in addition to creating space for BIPOC to lead and share. Additionally, Kristina founded the Association of German International Schools' (AGIS) Diversity, Equity, Inclusion and Justice (DEIJ) working group and developed the first DEIJ student-led conference hosted at the Bavarian International School in 2024. She has led multiple workshops and keynoted on topics related to DEIJAR at various conferences around the world and online.

Laura Torres Zúñiga

Laura Torres Zúñiga is a lecturer and teacher trainer at the Department of Philologies and Didactics of the Universidad Autónoma de Madrid (Spain), where she teaches English Language, Syllabus Design and Children's Literature in English to pre-service teachers of all educational stages. Her research interests center on contemporary short narrative forms, English language teaching and active learning methodologies.

Lea Bussas

Lea Bussas studied a bachelor's degree in history and Spanish with the option to become a teacher in Berlin and a master's degree in history at the University of Bremen. She then studied inclusive pedagogy for primary schools in Bremen.

Leah O'Toole

Dr Leah O'Toole is Associate Professor of Early Childhood Education in the Froebel Department of Primary and Early Childhood Education in Maynooth University, Ireland. With an academic background in Psychology, her research interests include early childhood education, particularly accessing the voices of the youngest children from birth, relational pedagogy, bioecological theory and working with parents and communities. Inclusion across multiple dimensions is central to all elements of this work.

Leslie-Ann Webster

Leslie-Ann Webster is a lecturer in Early Childhood Teaching and Learning at Maynooth University, Ireland. She has a deep passion for educating and values the power of transformative education. Her research interests include children and educator well-being, relationships, progressive teaching methods and a specialised focus towards embedding trauma informed practices within educational settings.

Lina Render de Barros

Lina Render de Barros is a queer of color activist from Pernambuco and Münsterland. She completed her first state examination (teaching degree) and her master's degree in bilingual European education at the University of Education in Karlsruhe and her master's degree in sociology at the Goethe University Frankfurt. She researches, lives and works in Cologne, always with the aim of taking a stand against group focused enmity and contributing to a more peaceful coexistence.

Linjie Zhang

Linjie Zhang is a researcher at the University of Vienna. Her primary research interests encompass structural inequality within the educational system, the development and management of international schools, elite education, neoliberalism and globalization, educational policy, and the application of capital theory in education.

Lisa Johansson

Lisa Johansson is a lecturer of English within the teacher training programs at the University of Gävle. She teaches courses in proficiency, language structure, didactics, and world English across primary, secondary, and upper secondary school levels. She has a teacher's degree in English and history for upper secondary school and her interests cover sociolinguistics, language and gender dynamics and language and power.

Lisa Marie Rosen

Lisa M. Rosen is a University researcher and teacher at PhD level, working on the topic of various forms of (policy-based) concepts of diversity and inclusion and their contextualized enactments in educational settings from comparative and intersectional perspectives.

Ludovica Rizzo

https://orcid.org/
0009-0009-2371-5870

Ludovica Rizzo holds a Master's Degree in Primary Teacher Education from the University of Salento (Italy). She has been awarded a scholarship for a PhD Programme of National Interest in Teaching & Learning Sciences: Inclusion, Technologies, Educational Research and Evaluation. Her research field is twice-exceptionality, differentiated instruction for gifted

and twice-exceptional students, personalisation of teaching and learning processes and educational technologies.

Lydia Murphy

Lydia Murphy is a trained educator in Early Childhood Care and Education. Her special interests include relational pedagogy, love in education, empowering voices, and reflective practice. As an early years researcher she studies the role of the early years professionals supporting reciprocal relationships with themselves, babies /toddlers/children, their carers and educational environments/communities. Within this she explores potential deficit narratives that trickle into communities particularly those experiencing disadvantage.

Madhusudhan Ramesh

Madhusudhan Ramesh is an assistant professor in inclusive education. He heads a PG diploma programme in Inclusive Education designed for mid-career educators. His research interests include teacher agency, inclusive pedagogy, teacher professional development, and children's experiences of difference and disability.

Mahvand Sahranavard Espily

Mahvand is educated in English Literature. She is educated kids music teacher at Adamak institute (orff schulwerk association) in Iran. She is a vocal coach and kids music teacher around 21 years. She is teaching in an alternative school in Iran (kodakan Donya) from 2013 until now, also has experiences in working with kids 3-5 years old, Working with autistic children , low concentration children and hyperactive children. Managing many different kids event such as Pinocchio, Little black fish, Alice in wonderland, manage play week, nations celebration, manage many internal and external travels for kids, manage different visit for kids and invite many different musicians, manage many workshops for parents in different fields, member of literature work group,music work group, child friendly work group and report writer work group. She's got many certifications about vocal pedagogy, education and kids music in Iran and outside of Iran.

Mai Trang Vu

Mai Trang Vu is Associate Professor of TESOL Teacher Education, Department of Language Studies, Umeå University, Sweden. Her teaching and research areas include teacher education, teacher professionalism, teacher knowledge, critical pedagogy, and education policy. She has also conducted research on inclusive education, gender, and internationalisation.

Margaret Flood

Dr Margaret is an Assistant Professor in Inclusive Education and the MAP Academic Advisor for the Education Department. Her experience in inclusive and special education includes teaching, teacher professional learning design and delivery, policy development and curriculum design. She is a leading expert in UDL. Margaret's research interests include contextual dimensions and the role of teachers in inclusive policy and practice enactment, teacher engagement with professional learning for inclusion and student voice. As a Fulbright Scholar, in 2021 Margaret worked with Lynch School of Education and Humanities at Boston College and CAST to explore equity, diversity, inclusion, and social justice through the lens of UDL. Margaret is the creator and host of the Podcast 'Talking about all things Inclusion'.

Maria Moscato

Maria Moscato is deeply passionate about democratic human development and global citizenship. During her academic journey, she has specialised in Methodologies of Teaching and Special Education, concentrating on critical areas such as Inclusive Education, Outdoor Education, participatory and transformative processes, teaching strategies, and the professional development of teachers and educators. Her extensive experience as an educator, teacher trainer, and workshop facilitator for prospective teachers has further enriched her profile. Throughout her doctoral studies, she has had the opportunity to contribute to research and projects focused on Inclusive Education and inclusive strategies.

María Pilar Gray Carlos

María Pilar Gray Carlos was born and raised in Spain but spent over 20 years living and working in the United Kingdom, where she built a distinguished career in higher education. Her primary role was at the **University of Reading**, where she implemented, managed, and coordinated the Spanish program at the Institution-Wide

Language Centre. Under her leadership, the Spanish program became one of the most successful alongside French and Mandarin Chinese.

Pilar also held notable academic roles as a visiting lecturer at **Oxford University** and as an external examiner for Spanish programs at the **University of Manchester** and the **University of Sheffield**. Beyond teaching, she contributed to university-wide initiatives, including the **Electronic Management of Assessment (EMA)** project, which streamlined and digitized the submission and evaluation of assessments across all schools and programs at the University of Reading.

Pilar holds a **BA in English Literature and Linguistics**, an **MA in Translation**, and an **MSc in Digital Education**, reflecting her commitment to both language and technology-enhanced learning.

Currently based in Spain, she has worked as a consultant for online Spanish language teaching start-ups and as an associate professor of Spanish at **IE University**. Currently she teaches part-time at the **Universidad Autónoma de Madrid** and the **Universidad Internacional Menéndez Pelayo**.

Her career has been enriched by her dedication to social impact. Pilar has worked on community development projects in Mexico, raised awareness about endemic violence against children and women in the Middle East (Lebanon, Syria, and Jordan), and created programs for Spanish learners to enhance their language skills while participating in development projects with communities in Nicaragua.

Her current focus is on exploring the impact of technology on teaching and learning, particularly how shifts in delivery methods influence pedagogy, methodologies, and the experiences of educators and students.

Marie McLoughlin

Marie Mc Loughlin is a qualified primary teacher with experience of teaching in educational disadvantaged schools. She also worked as a national co-ordinator for a programme of teacher professional development and is currently working as a teacher educator in initial teacher education in a university in Ireland. Her research interests are play, early childhood education, organisational culture, mergers and teacher education.

Maryam Mohammadi

Maryam Mohammadi holds a master's degree in painting and brings 17 years of teaching experience as the Executive Director of the Participatory School in Iran. The school fosters a humanistic approach to education, focusing on alternative methods that emphasise active participation from children, parents, and teachers to promote the holistic development of young learners.

For years, Maryam and her colleagues have worked to build an inclusive environment where all students, regardless of their background or abilities, can thrive. Addressing individual needs, they help students cultivate self-awareness, confidence, empathy, and a deeper understanding of themselves and the world.

Melanie Eilert

Melanie Eilert has lived experience as someone living with personal assistants. Graduated with a Bachelor Professional in HR Management she is employed at a service provider that provides personal assistance to people with disabilities.

Melike Özüdoğru

Melike Özüdoğru completed her doctorate in the Curriculum and Instruction Department at Middle East Technical University (METU) in Turkey. She is interested in flipped learning, integrating technology into the teaching and learning process, differentiated instruction, teacher training, curriculum design, learning environments, teacher identity, situated learning, reflective thinking using videos in the teaching practicum, and curriculum evaluation. She obtained her associate professorship from the higher education institution in Turkey.

Merja Kauppinen

Merja Kauppinen is adjunct professor (language didactics and literature education) and senior lecturer of the pedagogy of L1, L2 (Finnish) and literature in the Department of Teacher Education at the University of Jyväskylä in Finland. In addition to this, she works as a poetry therapist. Her main work and research areas are multiliteracy, arts-based learning, creative methods in language learning, (reading and writing) literacy pedagogy, holistic literature education (Store® – Stories Make Readers -model) and poetry therapy in educational context. She works in both pre- and in-service teacher education in the levels from elementary to secondary education.

Merve Ayvalli Karagoz

Merve Ayvalli Karagöz works as a lecturer at Akdeniz University in Antalya, Turkey. She has a Ph.D. in educational measurement and evaluation. Her areas of expertise include psychometric applications, educational assessment practices,

and item response theory. Her scholarly work focuses on advancing robust assessment techniques that enhance the reliability and validity of educational evaluations, contributing to higher standards in educational measurement.

Miriam Cuccu

Miriam Cuccu, pedagogist and subject expert in general and social pedagogy at the University of Macerata (Italy). She is involved in projects focused on intercultural education with a community-based and arts-based approach. She collaborates in monitoring and evaluating interventions to counter educational poverty and in training for education professionals. Her main research interests include dialogue between cultures, community participation and empowerment through creative languages.

Miriam Sonntag

Miriam Sonntag, practitioner and researcher in the field of inclusive education, focusing on interdisciplinary and multiprofessional collaboration. Experiences as a special education teacher in inclusive schools, research associate, teacher trainer, in-service trainer, director of a pedagogical consulting centre for inclusive school development, lecturer at colleges and universities.

Mridula Muralidharan

Mridula Muralidharan is a sociologist and social worker specialising in education, disability, and gender studies. Her doctoral research focuses on inclusive schooling practices for students with disabilities in India. In addition to her academic pursuits, she serves as the Digital Outreach Manager for the National Platform for the Rights of Disabled (NPRD), a pan-India cross-disability rights organisation.

Nariko Hashida

Nariko Hashida is a Japanese educational researcher at Chiba University. She specialised in social education and lifelong learning and worked as a social education officer in a community learning centre. Her doctoral thesis was a study of learning activities for the inclusion of people with disabilities, based on fieldwork in Japan and the UK. She is the author of the book "Learning Activities to Develop a Sense of Agency around Disability Issues" (Akashi Shoten, 2024, in Japanese).

Nico Leonhardt

Nico Leonhardt is research assistant at the Leipzig University (Institute of Special Education). His work and research focuses are inclusive school development and social space orientation, inclusion-sensitive higher education development, accessible language, participatory research and teaching.

Nicola Ryan

Nicola Ryan, clinical nurse specialist in child & adolescent mental health, cognitive behavioural therapist, senior lecturer at Kingston University in the UK. Areas of interest and research include intersectionality, child and adolescent mental health, neurodiversity, psychological and behavioural therapies, education of autism and ADHD for students and educators.

Nika Maglaperidze

Nika Maglaperidze is an English teacher and a beginning educational researcher from Georgia. A first-year PhD student from the Department of Education, Maynooth University. His research focus centres on teacher education, social justice in education, curriculum making and philosophy of education.

Nina Goretzko

Nina Goretzko studied special needs education and democracy education in Cologne and Berlin. She worked as a teacher in different inclusive and special schools in Bonn and Berlin and as a research assistant at the university of Cologne and at the research institute anDemos in Dresden. Her work focuses on democracy education, theory of democracy, educational and social inequality and inclusion.

Nysha Chantel Givans

Nysha Chantel Givans is currently pursuing a Professional Doctorate in Education at the University of Wolverhampton, with a research focus on the educational challenges faced by marginalised communities from lower socio-economic backgrounds. Her work encompasses a range of topics, including navigating the English education system, decolonising education, and addressing Afro hair discrimination. Employing methods such as autoethnography, film analysis, and literary text examination, her doctoral thesis will delve into Shane Meadows' This Is England to illuminate the

educational barriers encountered by working-class individuals and explores the impact of communitarianism on these communities.

Outi Kyrö-Ämmälä

Outi Kyrö-Ämmälä, PhD, is a University Lecturer in Teacher Education at the University of Lapland, Finland. Her research interests include teacher education and teacher professional development, inclusive and special education, and students' cognitive skills. She has been involved in several national and international projects developing inclusive education and teacher education. Outi is also a member of the Finnish Teacher Education Forum.

Özge Özdemir

Özge Özdemir works in extracurricular political education with a strong focus on anti-racism, anti-discrimination and empowerment. During and after her studies of political science and sociology in Frankfurt am Main, she specialised in working with young people and adults in educational work. Her activist experiences form the basis for both her practical educational work and her academic career.

Dr. Pamela February

Dr Pamela J. February is a senior lecturer in the Department of Early Childhood Education and Care in the School of Education at the University of Namibia. Her areas of interest and expertise include inclusive education practices; early childhood education and care; deaf education; how learners/students learn and how we should assess them; reading acquisition and fluency; vocabulary acquisition; mathematics education and the use of technology to enhance inclusive learning. In addition, she has written articles and book chapters and supervised postgraduate students in these areas.

Patricia Kennon

Dr Patricia Kennon is an Associate Professor in children's and young-adult literature and youth culture at Maynooth University, Ireland. She is the General Editor of The International Journal of Young Adult Literature, and the Secretary of NAES (the Irish national section of the European Society for the Study of English). Her research interests include global citizenship education, power and childhood, and inclusive education.

Paty Paliokosta

Paty Paliokosta is an Associate Professor in Inclusive Education at Kingston University and a Senior Fellow of the Higher Education Academy. With over two decades of experience in the field of special and inclusive education, my journey has been dedicated to promoting social justice and empowering diverse learners, particularly those with special educational needs and disabilities (SEN/D). As an educator, inclusion manager, local authority advisor, researcher, and advocate she has actively contributed to shaping inclusive policies, leading innovative participatory research projects, and championing social justice within schools, local authority, higher education and the community. She leads the 'Inclusion and Social Justice' SIG and the 'Inclusivity, Anti-oppression and Underserved Communities' bidding network. Her full profile can be found here: https://www.kingston.ac.uk/staff/profile/dr-paty-paliokosta-730/

Penny H. C. Dinh

Penny H. C. Dinh is first and foremost a social justice activist – an active campaigner for decolonial and antiracist education within her trade and students' unions. She is currently researching teacher activism and anti-racist education in Wales as part of her PhD at Cardiff University.

Petra Auer

Petra Auer is a trained primary school teacher qualified to teach children with special educational needs. She holds a PhD in General Pedagogy, Social Pedagogy, General Didactics and Disciplinary Didactics. Her main research interests are diversity and inclusion in education settings, children's values, value transmission, and socialization and acculturation in the school context.

Petra Elftorp

Elftorp, Petra; Dr., Associate Professor, lecturer and course director of a Masters in guidance counselling and lifespan development at University of Limerick in Ireland. Key research interests relate to inclusive practices, person-centred approaches and career development. E-Mail: petra.elftorp@ul.ie

Ramona Thümmler

Ramona Thümmler is an educational scientist and child and adolescent

psychotherapist who works at various universities in Germany. She conducts research on refugee children, multi-professional cooperation and the professionalisation of teachers.

Rhianna Murphy

Rhianna is a former primary school teacher with international teaching experience. She has a background in educational research, with a focus on curriculum-making and teacher agency. She has also worked on a range of small scale research projects with British Educational Research Association (BERA) and has experience lecturing on a range of teacher education courses.

Rosa Anna Ferdigg

Rosa Anna Ferdigg earned her degree at Bologna University in Italy and has since had a long career in the South-Tyrolean (Italy) school system, holding various positions such as teacher, headmaster, inspector, and evaluator. In addition to these roles, she collaborates with universities in Italy and Germany on inclusion topics. Rosa Anna is also a consultant for inclusive school development on an international level. Her interests are focused on system changing and development, exploring how people can learn and develop their skills, and how they can contribute to changing systems in an inclusive direction with their individual influence.

Rose Ryan

Dr Rose Ryan is Director of Access at Maynooth University with responsibility for leading strategic change in relation to widening participation in higher education in Ireland. Dr Ryan leads the Maynooth University Access Programme (MAP) which works in partnership across the University and alongside under-represented learners, schools, and communities to increase equity of access and support student success.

Sam Blanckensee

Sam Blanckensee (they/he) is a equality, diversity and inclusion practitioner based in Ireland with extensive experience in equality in Higher Education through their role as the Equality Officer at Maynooth University. Sam holds an MA in management for the nonprofit sector. Sam has worked within Irish LGBTQ+ organisations in voluntary and professional roles since 2013. Sam's work covers a broad range of equality, diversity, inclusion and interculturalism initiatives including LGBTQ+ matters, gender equality, anti-racism, disability awareness and access for those within the international

protection system. Sam is a non-binary trans person who is also neurodivergent and queer, All Means All is a project where the personal meets professional for Sam.

Sandra Fietkau

Fietkau, Sandra; Dr., social worker, has been working on different projects promoting inclusive structures and societal development in the south of Germany for almost 20 years, researcher on support circles, more inclusive service settings and social space development, also a facilitator for Person Centred Planning and convinced of the generative power of these forms of planning and getting together. E-Mail: mail@sandra-fietkau.de

Sara Baroni

Sara Baroni is Doctor of Research in Pedagogy and Didactics and primary school teacher. She is interested in wellbeing and equity at school, education in emergency situations, teacher reflective practices and inclusive education. She is part of different research groups in Italy and abroad.

Sarah Volknant

Sarah Volknant is an educator and researcher from Germany with a passion for the topics of inclusion, multilingualism, and intersectionality with a focus on teacher education. Her work delves into prejudiced perceptions of language within educational contexts, aiming to uncover the underlying beliefs and socially constructed norms. Sarah's approach involves critically reflecting on and deconstructing biases by employing intersectional perspectives.

Seán Gleasure

Seán Gleasure is an educational researcher in the field of sociology of education. With a background as a primary school teacher, his research focuses nurture and care in schools, particularly those serving working-class communities, as well as pedagogy in schools more broadly, with an emphasis on children's rights, voice, and participation. He lectures on issues related to in/equalities in children's learning and children's rights, voice, and participation.

Sebastian Nemeth

Sebastian Nemeth teaches social education at VIA University College in Denmark. With a specialization in the philosophy of social education, he is actively involved in the Research Centre for Management, Organisation, and Social Sciences. Sebastian's work focuses on norm-critical perspectives in youth pedagogy, demonstrating his passion for exploring and addressing issues of diversity and inclusion. Beyond his academic pursuits, he enjoys engaging in creative projects and sharing his insights through various publications and podcasts, he has been involved with the LGBT+ in Denmark and is reward-winning for creating safe and meaningful spaces for youths and women in boardgame and roleplay communities across Denmark.

Seun Adebayo

Dr Seun Adebayo has over 10 years of experience and a diverse background in global education, equity and quality education, EdTech, research and policy advocacy. His dedication lies in cultivating transformative learning journeys that transcend barriers and amplify possibilities, particularly for learners from marginalized communities. His journey encompasses collaborations with international organizations, steering curriculum improvements, and integrating technology to establish an educational landscape that is both inclusive and poised for the future. His passion revolves around ensuring education's accessibility, equitability, and readiness for all.

Sevcan Karataş

Sevcan Karataş is a Assistant Professor in First and Emergency Aid Program, Istanbul Yeni Yuzyil University (Turkey). She completed her doctorate in Florence Nightingale Nursing Faculty Mental Health and Psychiatric Nursing Department, Istanbul University-Cerrahpaşa. Her research focuses on different topics in the field of mental health, especially sexual identity and sexual orientations.

Shichong Li

Shichong Li is a PhD candidate at the University of Leeds, UK, with a research focus on the Left-behind Children (LBC) in China and their agency in peer relationships. Her work challenges the dominant narrative of LBC's vulnerability and emphasises the importance of LBC's relational agency in peer relationships within and beyond the school setting. Holding a master's degree in curriculum and instruction from Southwest University, China, she has contributed to research projects on teacher training, an experience that has significantly shaped her current PhD research. She advocates for

incorporating children's perspectives into teacher training programs to support diverse learners better.

Silver Cappello

Silver Cappello has accomplished a PhD in General Education, General and Social Pedagogy at the Free University of Bolzano-Bozen (Italy). He is qualified as primary school teacher with a specialisation as support teacher and he has worked as primary school teacher (mainly teaching second language), as assistant for people with disabilities, and as research assistant on different research projects at the Competence Centre for School Inclusion of the Free University of Bolzano-Bozen.

Silvia Dell'Anna

Silvia Dell'Anna is a postdoctoral researcher in inclusive education, working at the Free University of Bozen/Bolzano. Her primary research areas include the evaluation of the quality of school inclusion, the design of inclusive teaching strategies, and the prevention of educational poverty, underachievement, and early school leaving.

Simon Klippert

Simon Klippert is a Berlin-based teacher and teacher trainer. He has been working in various educational contexts: coordinating youth exchange programs in France, teaching students at university in Colombia, giving classes for newcomer-students in Berlin. For the last 10 years, he has been working as a class teacher at a secondary school in Berlin-Neukölln, with a focus on language and political education, trying to empower less privileged students. Furthermore, he shares his experience as a teacher trainer in Berlin-Kreuzberg. Simon is a founding member of related (www.related-bildung.de), an initiative fighting injustices within the German school system.

Sofia Ahlberg

Associate Professor Sofia Ahlberg is Vice Dean at the Faculty of Languages, Uppsala University, with responsibilities for education and public engagement. Her research is in the intersection of literary studies and pedagogy. She is the author of Teaching Literature in Times of Crisis (Routledge, 2021) and Magic, Literature and Climate Pedagogy in a Time of Ecological Crisis (Bloomsbury, 2024).

Suzanne O'Keeffe

Suzanne O'Keeffe is Assistant Professor of Education in the Froebel Department of Primary and Early Childhood Education, Maynooth University, Ireland. Her work focuses on sociological questions in education, with a particular interest in questions of gender and masculinities. Areas of interest include children and childhood, feminist research designs, and gender and sexualities. Recent publications include *Masculinities and Teaching in Primary Schools* (2022, Palgrave MacMillan).

Tamara van Woezik

Dr. Tamara van Woezik is assistant professor in teacher education with a focus on affective learning processes. She coordinates and teaches courses about pedagogy and teacher professionalisation. Her research focuses on sense of belonging, inclusion and autonomy-support using qualitative and arts-based methods.

Thomas Joseph O Shaughnessy

Thomas is a graduate of the University of Limerick at both undergraduate (BSc. in Computer Systems) and postgraduate level (MSc. in Software Engineering). With a background in accessibility, teaching and assistive technology, Thomas has extensive experience promoting and facilitating inclusive practice in primary, post-primary and post-secondary education. Thomas has experience guest lecturing at undergraduate and postgraduate levels in assistive technology, accessibility, and Universal Design for Learning (UDL). Thomas's interests include wider institutional approaches to inclusive practice, the role of third space professionals in higher education and the use of communities of practice in fostering and promoting more inclusive practice.

Tommaso Santilli

Tommaso Santilli conducts research in the area of Didactic and Special Pedagogy and holds a Master's Degree in Communication and Digital Cultures. He is a trained WOSM educator and a visual designer. His main research interests concern inclusive processes in educational and recreational settings, educational technologies, inclusive design practices and accessibility of cultural contexts.

Tracy Fletcher

Tracy Fletcher is a teacher in the subject of English, and researcher, originally from the U.K but has been based in Sweden for the last 14 years. She has experience of curriculum planning and management, co-ordinating CPD for teachers, as well as working to support newly arrived immigrant students integrate into a new school system. Her research interests include anti racist education, inclusive education, and student mental health. She is also an activist for autism awareness and trans rights.

Tracy McElheron

Tracy is a practising early childhood educator and Lecturer in Early Childhood Education. She has worked in the early childhood sector in Ireland for 25 years, teaching children from 2 to 5 years old. Her areas of expertise include curriculum and assessment for early childhood education, and the theory and practice of play as a pedagogy in the early years. Her doctoral work explores the implications of the hidden curriculum on children's articulation of gender in early childhood education. She is a passionate advocate for the transformative capacity of relational pedagogy to build child, family, and educator identity.

Ulla Sivunen

Ulla Sivunen is a doctoral researcher at the University of Jyva ̈ skyla ̈ (Finland), focusing on media use, multiliteracies, and linguistic agency among young deaf and hard-of-hearing individuals using signed languages, primarily Finnish Sign Language. Throughout her career, she has worked as a teacher, lecturer, in NGOs, and in the media. This diverse experience and being as a member of a minority group, the deaf community, has provided her with a broad perspective and deep expertise in her research areas.

Valentina Zambito

Valentina

Valeria Occelli

Valeria Occelli is a lecturer in psychology at Edge Hill University. Her work focuses on human sensory and cognitive processes, and how they are affected by individual variability in personality traits, beliefs, as well as neurodevelopmental

conditions. She is interested in the promotion of inclusive practices in higher education and scientific research environments.

Valerio Ferrero

Valerio Ferrero does research in the field of intercultural education, focusing on equity and inequality in schools. He is also interested in community philosophical practices, on which he also carries out training activities. Before starting his research work, he was a primary school teacher.

Valerio Rigo

Valerio Rigo is a PhD student at the Free University of Bozen/Bolzano and works on formative assessment from the perspective of the capability approach. He has a master's degree in philosophy and a second master's degree in education. He is coordinator of the Evaluation Team of the Movimento di Cooperazione Educativa (MCE, a movement inspired by the pedagogy of Célestin Frenet).

Vana Chiou

Vana Chiou loves teaching and training future teachers on contemporary teaching methods and techniques. Her research interests include contemporary methods of teaching and assessment, teacher training, inclusion and education. Her published work includes editing books, chapters in books and articles in Greek and international journals.

Veronica Punzo

Veronica Punzo is attorney at the Macerata Bar. Dealing with the governance and regulation of personal and non-personal data and ethical-legal consulting, her research area focuses on the domains of artificial intelligence and education with a focus on dignity, equality and fundamental rights enhancement and protection.

Wurud Jayusi

Dr. Wurud Jayusi is a senior lecturer, researcher, and the head of the Arab Academic Institute at Beit Berl College. Being a member of the Palestinian minority in Israel, Wurud Jayusi is passionate about fostering greater understanding and acceptance among diverse cultural groups. Through Wuruds research and academic work, wurud has published articles, presented at conferences, and co-edited two books on

diversity, including topics such as integrating Palestinian teachers into Jewish schools, peace education, and creating a shared society.

Wurud strongly believes in the power of diversity in teaching. A diverse teacher embodies various facets, such as being an ethnic minority educator in a predominantly different cultural setting in my case, or simply a teacher with cultural competence who fosters multiculturalism, equality, and respect for others who are different from them.

As a researcher Wurud has had the privilege of interviewing Palestinian teachers as part of the research on their integration into Jewish schools. Their stories are both enlightening and inspiring. The stories reflect Engaging, Being emotionally and culturally competent.

Yasemin Acar Ciftci

After working as a primary school teacher and principal for 20 years, Yasemin Acar Ciftci has been serving as a teacher educator for the past years. She is a faculty member at Istanbul Yeni Yuzyil University in the Child Development and Youth Services Department. Yasemin holds a PhD in Educational Sciences with a specialization in Curriculum and Instruction. Her PhD thesis focused on multicultural education and teacher competencies, and her academic work is primarily guided by critical theories.

Yuko Uesugi

Yuko Uesugi, Ph.D (American literature), a Japanese professor of English at Eikei University of Hiroshima, a newly founded public university located in the central part of Hiroshima. Yuko has over 20 years of teaching experience at a junior high school, high schools, the National Institute of Technology, and universities. Yuko has two specialties: one is American literature, and the other is global/ inclusive/ education. Yuko has obtained Grants-in-Aid for Scientific Research from the Japanese government on Developing Global Collaboration and Intercultural Competencies for L2 Learners: The International BEVI Project. Yuko has dedicated her career to promoting CLIL and cross-cultural understanding, by conducting active learning communication lessons with partner universities overseas online.

Yuzhen Xu

Xu, Yuzhen; worked as an itinerant teacher in 2006, helping teachers to plan to profile and address the needs of students, and has chaired research programs on changes of special schools in the context of inclusive education, transition for the disabled children, etc. E-Mail: yzxu2003@163.com

Zeynep Karaosman

Zeynep Karaosman is a Palestinian-Syrian queer, feminist and peace activist and a teacher. She was born and grew up in Turkey. She studied English Language Teaching(BA) at Anadolu University and English Language&Literature at Istanbul Aydin University. After 8 years of teaching English in Turkey, she moved to Germany in 2020. She is currently a student in the Turkish language teaching department at the University of Essen and has been working as an Inclusion Assistant at a secondary school for 3 years. Apart from her teaching profession, she has been doing queer, feminist activism. She is also one of the founders of *Palestinian and Jews for Peace* activist group. Considering teaching as a political act, she advocates for anti-bias education for everyone.

Zhicheng Huang

Zhicheng Huang, is professor of Institute of International and Comparative Education in East China Normal University, Shanghai, China. His research interests include comparative education, international education theories, curriculum and instruction, teacher education, inclusive education, educational administration, Latin America education, Paulo Freire education theory, etc. In 2004 he published the first book in China on *Inclusive Education——All means all*. He was visiting scholar in Chile, Mexico, Spain, USA, UK, Germany and Japan. He has managed several national and international cooperative research projects on inclusive education and others topics. He was vice-dean of Faculty of Education, director of Department of Curriculum and Instruction, director of Institute of International and Comparative Education in East China Normal University. He was vice president of China Association of Comparative Education.
